Ger. literature is notable too for its wealth of scientific and critical writers. Whether the reader turn to philosophy, philology, medicine, the natural sciences, archæology, hist., economics, jurisprudence, astronomy, mathematics, or theology, he will find that a number of the most reliable, erudite, and compendious treatises have been written by Gers. Thus Mommsen (1817-1903) has left behind him a monumental work on Roman hist., Humboldt (1767-1835) by his *Travels* and *Cosmos*, etc., gave an extraordinary stimulus to scientific inquiry; Kepler (1571-1630) discovered certain laws of primal importance in astronomy, Euler (1707-83) ranks as one of the great mathematicians, and in the last century Virchow eminently distinguished himself in pathology, and Mehnholz in the newly conquered dominion of physiological physics. Bluntschli (q.v.) and Pufendorf (q.v.) are among the great writers on jurisprudence, von Haruack (q.v.) is a leading theologian, Schwimfurth (q.v.) ranks high among archæologists, Nauck, H. von Arnim and Wilamowitz Moellendorf are among the numerous distinguished writers on G. literature the last named indeed laid the foundation for modern criticism in that sphere.

A short list of other individual writers of eminence is herewith appended that the reader may refer to their biographies for further information. Gottfried of Strasbourg (d. 1220), Meister Eckhart (c. 1260-1327), Johann Tauler (c. 1300-61), Sebastian Brandt, the satirist (1458-1521); Jacob Ayrer, sixteenth century dramatist, Ulrich von Hutten (1488-1523) and Huldreich Zwingli (1484-1531), Protestant writers contemporary with Luther, the Catholic Johann Schelller (Angelus Silesius, 1621-77), Sebastian Franck (1499-1512), and Paul Gerhardt (1607-76), all famous hymn writers, Jakob Bohme (1575-1624) and Johann Arndt (1553-1621), two mystical religious writers, the monkish Abraham a Sancta Clara (1644-1709) and Johann Kischart (c. 1550-90), two leading anti-life writers of succeeding centuries, two Silesian authors, Friedrich von Logau (1604-55), the epigrammatist, and Andreas Gryphius (1616-64), the dramatist. Winckelmann (1717-68), the writer on æsthetics, and Johann Zimmermann (1728-95), author of *On Solitude*; Voss (1751-1826), the light of the *Gott-ringer Dichterbund* and his associates Gottfried Burger (1747-94), and the two Counts Stolberg, August Kotzebue (1761-

1846), the author of lively comedies, and Johann Tieck (1773-1853), a leading Romanticist; Heinrich von Kleist (1777-1811), the first of Prussia's dramatic writers; Ludwig Uhland (1787-1862), the chief of the Swabian school; Karl Gutzkow (1811-78), a member of Young G.; Wilhelm Hauff (1802-27), K. Spindler (1796-1855), and Wilhelm Haarer (1789-1871), who wrote novels after the manner of Scott; Franz Grillparzer (1791-1872), the finest Austrian dramatist; E. Geibel (1815-84), the lyricist; the novelist Gottfried Keller (1819-90); Ferdinand Lassalle (1825-64) and Karl Marx, two of the best intellectual writers on social democracy; three historians of note, L. von Ranke (1795-1886), H. von Sybel (1817-95), and H. von Treitschke (1834-96); the Austrian Anzenberger (1839-89), who depicted on the stage the life of his native peasantry; the favourite humorist and fiction writer, Fritz Reuter (1810-74), who wrote in Platt Deutsch; F. Heibel (1813-63), the dramatist, author of *Maria Magdalene* and *Die Nibelungen*; Gustav Freytag (1816-95), novelist, author of *Soll und Haben*; and G. J. Bierbaum (1863-1910), the composer of popular lyrics.

Twentieth-century German literature.—Before the First World War Ger. literature experienced comparative calm. Important writers of this period were the dramatists Gerhart Hauptmann (1862-1913), his contemporary Sudermann (1857-1928), and Frank Wedekind (1864-1918), whose influence over European literature is still felt, and the poets Dehmel, Rilke, and Stefan George. The main influences of this period were naturalism and its opposite 'art for art's sake,' Hauptmann leading the former school and Stefan George the latter. The Impressionist novel, derived from the naturalists with, however, a greater emphasis on character, particularly as manifested in the artistic temperament. Outstanding among the Impressionist novelists are Emil Strauss (b. 1866), Hermann Hesse (b. 1877), Jacob Wassermann (1873-1931), and particularly the brothers Heinrich and Thomas Mann, the latter especially a notable figure in modern world literature. Interest was shown by the poets in machinery and the subjection of physical resources to the use of civilised man. Towards the end of the First World War war weariness and despair, accentuated in G. by the revolution (1918), had its effect on the younger writers. Johannes Becher in his works violently opposed war, and the chaotic state of life was expressed generally in literature by expressionism (q.v.), a movement borrowed from painting in a spirit of almost ecstatic mysticism. Some writers, such as Armin T. Wegner, turned from the cities and roar of machines to find satisfaction and peace on the land and in the countryside. Labourer poets of the war were Karl Broger, Gerrit Engelke, Max Barthel, and Heinrich Lersch. War novels were written by Remarque and others, and the state of G. at home was shown in the novels of Clara Viebig; while one of the greatest war books is *Opfergang*, written by Fritz von Unruh in the trenches

in 1916. Post-war G. was mirrored in Ernst Toller's tragedy *Hinkemann*, and Reinhard Goering in the drama *Seeschlacht* represents the attitude of the navy in the First World War. Expressionist drama, dealing with types and making use of allegory, was written by Walter Hasenclever, Fritz von Unruh, Franz Werfel, Arnold Bronnen, Ernst Toller (e.g. *Seren Plays*, Eng. trans. 1935), Georg Kaiser, and Anton Wildgans. Satirists of the twentieth century are the novelist Heinrich Mann and the dramatist Carl Sternheim. The Expressionist writers were as a rule Socialists, Kurt Eisner (q.v.), the poet, being assassinated, while another tendency revealed in their work was their changed attitude towards women, relationship between men and women being intellectual rather than emotional. In 1922 Expressionism subsided and painters and writers, tired of dealing with types and symbols, sought new forms. Some writers, such as von Unruh, made use of historical subjects, while others have shown a renewed interest in the Catholic religion. Another interesting tendency was the marked manifestation of Jewish temperament, owing to the great number of Jewish writers who achieved international fame—Wassermann, already mentioned, Feuchtwanger, Stefan Zweig, Bruno Frank, and Emil Ludwig. Scientific writers include E. Schrödinger (*Science and the Human Temperament*) and Einstein, one of whose important works, apart from those on relativity, is *The World as I see it*. Among poets Rilke gained in stature until his death in 1926, and is now recognised as one of the major poets of the twentieth century. Thomas Mann's reputation also extended beyond G. with the pub. in 1924 of his great symbolical novel *Der Zauberberg* (trans. into Eng. as *The Magic Mountain*), and later under the Nazi regime and during the Second World War he became a rallying point for that Ger. culture which the Nazis did so much to suppress. Even under the Nazis, however, literature managed to survive persecution and dictation principally by devotion to historical and biographical work in which hostility to the regime could be disguised. Alfred von Martin's *Burckhardt und Nietzsche* (1941) and Matthias Gelzer's *Julius Caesar* (1941) are examples. The Ger. tradition of classical scholarship was kept alive by notable eds. of Gk. and Rom. authors. Free thought was also encouraged by eds. and trans. of the great Fr. and Eng. writers, notably Prof. Schücking's ed. of *Hamlet*.

Music. Few would gainsay the assertion that G. is pre-eminent in music, though some would perhaps prefer that the word music was qualified by 'modern,' in recognition of the early supremacy of Italy in opera and in sacred music. It is at least certain that it is to G. alone that the world owes the 'magnificent development of instrumental music.' The Germans point to great musicians who are representative of every school, and who excel in every branch of musical activity. In some way the decentralisation of Ger. states and the multiplicity of Ger.

courts were favourable to the cultivation of the art. It is true that the princes and dukes were often generous patrons, whilst all of them had their court musicians and held concerts from time to time, which offered a suitable occasion for the performance of new works. Music moreover was always associated with the religious life of the people. Thus not only in the towns but even in the smaller villages there were chapel-masters (*Kapellmeister*) whose business it was to train the choir and to conduct the orchestra, which played so great a part in the social life of the people. In every cap. too, like Dresden and Leipzig, there were opera houses which offered scope for the labours of a musician whether player or composer, and it should not be forgotten that public subsidies were again and again voted for the upkeep of these centres of musical culture.

Sebastian Bach, the 'father of modern music' (1685-1750), gave a splendid scientific foundation to his art, and by his improvement of the existing forms of composition made possible the glorious work of Haydn and Mozart. It was through these men, his successors (1733-1809 and 1756-91), that the world first learnt that in the modest unassuming Bach it had lost truly a master spirit, for they were never weary of confessing their indebtedness for all that he had taught, and especially for the lessons learnt from his immortal *Preludes and Fugues*. Under Haydn and Mozart the sonata and the symphony—probably the greatest vehicles for musical expression ever invented—grew apace, and posterity is still as delighted as ever with the freshness, the melodious wealth, the grace, and the dignity of their many masterpieces. Yet Haydn and Mozart were but stepping-stones to Beethoven (1770-1827), who stands in solitary grandeur—solitary save for the companionship of such men as Raphael, Phidias, and Shakespeare. For he found the secret of expressing in sound the profoundest thought and the loftiest spiritual yearnings of which mankind is capable. Whether his pianoforte sonatas, his opera *Fidelio*, or his oratorio *The Mount of Olives* be considered, the same prodigality of fine conceptions, the same beauty, and the same extraordinary power make themselves felt, whilst his inexpressibly glorious symphonies (nine in number) are still the example and at the same time the despair of every orchestral composer of ambition.

Later Ger. composers are Schubert (1797-1829), the exquisite song-writer and the creator of the *Unfinished Symphony*; Schumann (1810-56), the leader of the Romantic school, who found relief for the unrest of his fiery spirit in his brilliant and imaginative pianoforte pieces; and Richard Wagner (1813-83). Before Wagner's time opera (and oratorio) had already engaged the attention of Mozart (*Le Nozze di Figaro*), Handel (1684-1759), Gluck (1716-87), the author of *Orpheus and Eurydice* and *Iphigenia in Tauris*, and Mendelssohn (1809-47), but the new composer came forward with a host of

revolutionary ideas which were the foundation of the 'Music of the Future.' To Wagner the resources of his art were boundless. He believed that only by the marriage of music with the sister arts, painting and poetry, could all the cravings and all the greatness of the human soul find adequate expression. Thus his operas were conceived on a titanic scale; in them there is nothing of the trivial sentimentalities of the 18. school, and what is of more vital importance, the function of the orchestra is no longer merely to accompany the singer, but to suggest moods, phases, and conceptions which are inexpressible in words. Thus in the vast cathedral-like structures which he built up in *Parsifal*, *Lohengrin*, and *Tannhäuser* the orchestra forms an integral part, without which the whole fabric would collapse. In his lifetime Wagner was the victim of ridicule, but the performances of *Die Walküre*, *Siegfried*, etc., were the dawn of a new and noble epoch in the annals not only of Ger. but of European music. There are a number of late nineteenth- and twentieth-century writers of opera who have imitated Wagner: Peter Cornelius, Carl Graumann, Eugène D'Albert, Alexander Ritter, August Bungert, Wilhelm Kienzl, Felix Weingartner, Siegfried Wagner, and Engelbert Humperdinck. These men are imitators, but an exception is Carl Goldmark. G. in the twentieth century took the lead in instrumental music. Johann Raff (1822-82) forged the link between the classic school and that of Liszt. Felix Dausseke, a virile composer, Max Bruch, Joseph Rheinberger, Heinrich Hoffmann, Johann Huber, Frederick Gernsheim, Heinrich Herzogberg, Moskowski, Xaver Scharwenka, and Sholtz are all late nineteenth-century composers of the newer instrumental music, while three composers, Carl Reinecke, Solomon Jadassohn, and Frederick Hill are followers of the classic tradition. Johannes Brahms (1833-97) started the world by outstripping even Wagner with his indifference to old forms and canons, but his title to the highest musical honours is assured, while other composers who have written advanced instrumental music are Anton Bruckner (1821-96) and Richard Strauss (b. 1864). Strauss is the composer of the operas *Salome*, *Elektra*, *Rosenkavalier*, and followers of Strauss who may be named are Gustav Mahler, Felix Weingartner, and Hugo Wolf, who is a lyric artist of importance. Schönberg, a skilled technician, achieved European repute with his exploitation of new forms. G. also possesses many important musicians, singers, and directors, and the writings of Kierkegaard and others have advanced the hist. and aesthetics of music. Under the Nazi regime the musical life of the country was controlled by the Nazi *Kulturpolitik*, and the racial laws were rigidly applied to composers and musicians. The works of Jewish composers were banned, and composers such as Schönberg, Ernst Krenek, Kurt Weill, and Ernst Toch went into exile. The loss of first-rate performers, such as Schnabel, was

even more serious. Of the modern composers favoured by the Nazis mention may be made of Carl Orff, Werner Egk, and Rudolf Wagner-Regeny. With the end of the war in 1945 the musical life of the country was fostered by the occupying authorities, and among composers Paul Hindemith, whose popularity the Nazis had never been able wholly to subdue, came into his own as the leading German composer of his time.

Germination, resumption of development of the seedling from the embryo

contained in the seed, in consequence of exposure to the necessary conditions of moisture, warmth, etc. The radicle, or young root, is the first to make its appearance, and begins to grow vertically downwards; the plumule, or young shoot, then begins to grow upwards, while the cotyledons take an approximately horizontal position.

Germiston, third largest tn. in the Transvaal, S. Africa, 9 m. from Johannesburg. It is the centre of the world's largest gold-producing area, having developed rapidly since 1886. After a period of depression about 1916, the introduction of new labour conditions and more scientific methods, and the reduction of overhead charges, renewed the prosperity of the tn. Engineering and other enterprises, including the Victoria Falls Power Company and the Modderfontein dynamite factory, were established to serve the needs of the gold-mining industry. In the nearby regions many small farms have been developed. The tn. is becoming popular as a holiday resort. There is an airport adjoining the township of Lambton, and the tn. is an important railway junction, with large railway workshops. Industrial sites are sold by the municipality at low prices, with railways, electricity, and water supplied. Pop. 102,100, comprising about 37,000 Europeans, about 62,500 natives, and about 2500 Indians.

Gerome, Jean Leon (1824-1901), Fr. painter, b. at Vesoul. In 1841 he became a pupil of Paul Delaroche. In 1847 his 'Cock-fight' was exhibited. In 1855 'Le Siècle d'Auguste et la naissance de Jésus-Christ' placed him among the leading Fr. painters. The state purchased it, and bestowed upon him the Cross of the Legion of Honour. The 'Duel' of 1857 increased his reputation, and the 'Gladiators' (1859) was looked upon as his masterpiece. Among his oriental studies are 'Turkish Prisoner', 'Prayer', and 'Slave Market'. He excelled also in historical subjects, 'Louis XIV. and Molero' and 'The Death of Marshal Ney' being famous examples in this class.

Gerome, see G. HARDMERE.

Gerona: 1. Prov. in the N.E. of Spain, bounded on the N. by France, on the E. by the Mediterranean Sea, on the W. by Barcelona, and on the S. by the Mediterranean and Barcelona. It is important for its fisheries and fish-curing, as well as for its cork industry. There are also mineral springs in the prov., and its mines produce coal, copper, lead, and iron. It also manufactures linen, cotton, paper, cloth, and leather, and has hydraulic cement and other works. Its most important port is Portbou, and its area is 2264 sq. m. Pop. 320,300. 2. Fortified tn. in Spain, cap. of the above prov., about 53 m. N.E. of Barcelona. It is famous for its fifteenth-century cathedral and its siege at the hands of the Fr. in 1509. It is also the seat of a bishop. Pop. 17,600.

Gerry, Elbridge (1744-1814), Amer. statesman, b. in Massachusetts; graduated at Harvard in 1762. From 1774 to 1775 he was a member of the Massachusetts

Prov. Congress; a member of the Continental Congress (1776-81), and was a great advocate of the Declaration of Independence. From 1810 to 1812 he was governor of Massachusetts. His administration was marked by the enactment of a law by which the state was divided into new senatorial dists., which gave an unfair advantage to the party in power. From this has arisen the term gerrymander. In 1812 he was elected vice-president of the U.S.A., and was an ardent advocate of war with Great Britain. *See* J. T. Austin, *Life of Elbridge Gerry*, 1828-29.

Gers, dept. in the S.W. of France, formed from various dists. of Gascony. Its prin. rivs. are the Save, the Gimone, the Gers, and the Bayse, and chains of hills run from N. to S. of the dept. The prin. cereals are wheat and oats, but the vine occupies more than 15 per cent of the surface, the average production being more than half that of France generally. Pop. 190,400.

Gershwin, George (1898-1937), Jewish-Amer. composer; b. Sept. 26 at Brooklyn, New York; son of Morris G. He studied the piano under Charles Hambitzer; harmony under Edward Kileny and Rubin Goldmark. Composed musical comedy and orchestral wks., *as* *la, Lucille!* (1919); *Our Nell* (1923); *Lady, be Good!* (1924); *Rhapsody in Blue* (1921); *Tell Me More* (1925); *O! Thee I Sing* (Pulitzer prize), 1932; and *Porgy and Bess* (1935).

Gerson, Jean Charles de (1363-1429), Fr. scholar and divine, b. at the vil. of Gerson, in the dept. of Ardennes. He studied at the college of Navarre, Paris. In 1395 he was elected chancellor of the univ. of Paris and made a canon of Notre Dame. His chief work was his endeavour to abolish the papal schism at the councils of Pisa and Constance, also fighting hard against the exiles in the church. At least implicitly he held the council to be above the pope. After the council of Constance G. had to leave France owing to the enmity of the duke of Burgundy, and spent some time at Rattenberg in Tyrol. Here he wrote his famous book, *De consolatione theologica*. On his return to France he retired into a monastery at Lyons, and devoted the rest of his life to teaching and study. The *Imitation of Christ* has been wrongly attributed to him. See monographs by J. B. Schwab, 1858; H. Dacremont, 1931; and A. Combès, 1910.

Gerson, John, *see* under KEMPIS, THOMAS A.

Gersonides, or **Levi ben Gershon** (1288-1344), Fr.-Jewish philosopher, mathematician, and physician; b. at Tagnols-sur-Cèze in the co. of Orange. Sometimes called Rabbag- that being a vocalisation of the initial of Rabeau Levi ben Gershon. He came of a family of scholars, but the identity of his father is in dispute. His prin. work is *Mahmot Adonai* (Wars of the Lord); a treatise on immorality, prophecy, omniscience, providence, the celestial spheres, and the eternity of matter. He followed Aristotle, being the first Jew that dared, in so doing, to join issue with Heb. theology. He d. at Perpignan.

Gersoppa, Falls of, on the Sharavati R. in Bombay, are considered the finest in India. The riv. divides in its descent into four cascades, and the cliff over which it falls is 830 ft. high.

Gerstaecker, Friedrich (1810-72), Ger. writer and traveller, b. at Hamburg. For some years he lived an errant life in America, of which he pub. an account on his return to Germany. Later he travelled extensively in both America and Africa (1850-68). His narrative descriptions of his travels, written in vivid style, have enjoyed considerable popularity. He also wrote many novels, the plots of which were founded on his experiences.

Gerstenberg, Heinrich Wilhelm von (1737-1823), Ger. poet and critic, b. at Tondern, Schleswig. He studied at Altona and Jena, entered the Dan. Army, and served in the Russian campaign of 1762. He left the army for the civil service, but resigned his appointment in 1812. He did good service to Ger. literature by his *Brise über Merkwürdigkeiten der Literatur* (1766-70), as well as by his tragedy, *Ugolino* (1768), which was one of the prin. forerunners of the classical period of modern Ger. literature. *See* A. M. Wagner, *H. W. von Gerstenberg*, 1920.

Gertrude (d. 1143), daughter of Emperor Lothaire II. (q.v.). She married Henry the Proud, of Bavaria (1127) and was mother of Henry the Lion, of Bavaria (q.v.).

Gertrude, Saint (c. 1250-1303), Ger. mystical writer who lived in the convent at Helfta, near Eisleben. She is sometimes confused with the abbess of the same name, but Ledos's book, *Sainte Gertrude*, (1901), throws light upon this subject. A book entitled *Exercises of St. Gertrude* is famous in mystic theology; it was trans. into Eng. in 1863. She anticipated the 'modern' Rom. Catholic devotion to the Sacred Heart of Jesus.

Gervase of Canterbury, Eng. monk who flourished during the second half of the twelfth century. He was an eye-witness of the burning of Canterbury Cathedral and wrote *Tractatus de combustione et reparatione Dunelmensis ecclesiae* (1184). All his books are written in Lat., the chief of which are *Narrative of the Dissensions between Archbishop Baldwin and the Monks of Canterbury; a History of the Archbishops of Canterbury, to the accession of Hubert in 1193; and a Chronicle of the Reigns of Stephen, Henry II., and Richard Cœur-de-Lion*. His *Mappa Mundi*, a topographical account of England, survives in MS. *See* W. Stubbs (editor), *Historical Works*, 1879-80.

Gervase of Tilbury (d. c. 1235), Eng. historical writer, said to have been a native of Tilbury. Before 1177 he was a student of law at Bologna, and witnessed the meeting of the Emperor Frederic I. and Pope Alexander III. at Venice. He was first employed by Henry II., for whom he wrote a jest-book, and later entered the service of William of Champagne, cardinal archbishop of Rheims. About 1190 he was with William II. of Sicily, who gave him a country house at Nola, and in 1198 entered the service of the Emperor

Otho IV., who made him marshal of the kingdom of Arles, and married him to an heiress. It was to amuse the emperor that he wrote his best-known book, *Otia Imperialia*, which contains an historical geography of the world as well as a good deal of legendary matter. The *Otia Imperialia* is printed entire in Leibnitz's *Scriptores rerum Brunavicensium*.

Gervex, Henri (1852-1929), Fr. painter, b. in Paris. He first devoted himself to the painting of mythological subjects and the painting of the nude, but afterwards took up the study of modern life with great success. He executed sev. important official paintings, for instance 'The Distribution of Awards' (1889) at the Palais de l'Industrie and the 'Coronation of Nicolas II.' (1896), besides paintings for the decoration of public buildings. Other pictures of his are 'Satyrs playing with a Bacchante,' 'Members of the Jury of the Salon,' 'Communion at Trinity Church,' 'Return from the Ball,' 'Dr. Pëan at the Salpêtrière.'

Gervinus, Georg Gottfried (1805-71), Ger. historian, b. at Darmstadt, and brought up for the mercantile profession, but he soon abandoned this for the study of hist. In 1835 he was appointed professor-extraordinary at Heidelberg, and in 1836 prof. of hist. and literature at Göttingen, from which he was dismissed in 1837 for signing the protest against the conduct of King Ernest Augustus. He went to Heidelberg, and in 1847 started the *Deutsche Zeitung*. In 1848 he was chosen a member of the Frankfurt National Assembly, and in 1850 was sent to London on a diplomatic mission in which he was unsuccessful. G. was a true patriot and a defender of constitutional liberty which is shown by his writings as well as by his conduct; his *Introduction to the History of the 19th Century* and his *History of the 19th Century* led to his imprisonment. His other most important works are *History of German Poetry* (1835) and *Shakespeare* (1849). See J. Dürfel, *Gervinus als historische Denker*, 1908, and M. Rychner, *G. Gervinus* (Bernie), 1922.

Geryon (from γέρων, the howler or roarer), represented in Gk. mythology as a monster with three heads. He was the son of Chrysaor and Callirrhoe, and king of the is. of Erythraea. He had herds of red cattle which were guarded by the giant shepherd Eurytion and the two-headed dog Orthrus. One of the twelve labours imposed upon Hercules by Eurystheus was the capture of these cattle.

Gerzen, Alexander, see HERZEN.

Gesenius, Heinrich Friedrich Wilhelm (1786-1842), the great reviver of Heb. philology, b. at Nordhausen. He studied at the univs. of Helmstadt and Göttingen. In 1811 he was elected prof. of theology at Halle, a post he held to the day of his death. G. set him self to revive the study of Heb., bringing forward a new and improved method of treating the language by separating the grammar and the lexicon. In 1810-12 he pub. *Hebräisch-deutsches Handwörterbuch des Allen Testaments*; in 1815 appeared *Neues Hebräisch-*

deutsches Handwörterbuch; both these lexicons have been trans. into Eng. See H. Geseuius, *Wilhelm Gesenius*, 1886.

Gesner, Conrad von (1516-65), Swiss writer and naturalist, b. at Zürich. Hallam says: 'Endowed with unwearied diligence, and with a mind capable of omnifarious erudition, Gesner was probably the most comprehensive scholar of his age.' He studied at Strasburg, Bourges, and Paris, and was appointed prof. of Gk. at Lausanne in 1537. In 1541 he became prof. of natural hist. at Zürich. G.'s favourite study was probably botany, and he pub. in 1542 a *Catalogue of Plants* in four languages: Lat., Gk., Ger., and Fr. He enriched his botanical knowledge by frequent journeys, and founded a small botanical garden at Zürich. Another important work of his is *Bibliotheca universalis*. This is a catalogue of all the writers who had ever lived, with their works, and is written in Heb., Lat., and Gk. In 1551-58 appeared his great zoological work *Historia animalium*. Besides these he wrote *Mithridates de differentiis linguarum*, an account of about 130 languages, and the *Lord's Prayer* in twenty-two tongues. See H. Buess, *Schweizer Arzte als Forscher Entdecker und Erfinder*, 1915; also studies by P. A. Cap, 1861; J. Hainhart, 1924; and W. Ley, 1929.

Gesner, Johann Matthias (1691-1761), Ger. classical scholar, b. at Roth near Nuremberg, and studied at Jena. In 1715 he became prof. and librarian at Weimar; in 1728 he was made headmaster of the gymnasium at Ansbach (Anspach). In 1730 he was appointed head of the Thomas School at Leipzig, and in 1731 became prof. and librarian at Göttingen. His works include *Philopatris* (1714), ascribed to Lucian; edn. of the *Scriptores rei rusticae* of Claudian, Horace, Quintilian, and Pliny the Younger; *Prima linea usages in eruditione universalis* (1756); *Novus linguae eruditionis Romanae thesaurus* (1749); *Opuscula minora rari argumenti* (1743-45); *Thesaurus epistolicus Ciceronianus* (ed. Klotz, 1768-70); and *Index etymologicus latinitatis* (1749).

Gessner, Salomon (1730-88), Swiss painter and poet, b. at Zürich. He first became famous by his *Lied eines Schwärzers* in 1751. Other writings of his are *Daphnis* (1751), *Idyllen* (1756), *Unkel und Der Tod Abels* (1754), and *Erander und Alcimna* (1768), which latter was trans. into many languages, including Welsh, and may be described as 'a sort of idyllic prose pastourel.' His works are sentimental, insipid, and feeble, but they achieved universal popularity at the time of their pub. owing to the appreciation of Goethe, Lessing, and Herder. His paintings are mostly in water-colours, but he also executed some very fine engravings. His *Letters on Landscape Painting* were pub. in 1772. His paintings border on feebleness. See Bertha Reed, *The Influence of Salomon Gessner on English Literature*, 1905.

Gestapo, abbreviation for *Geheimer-*

staatspolitie, the Ger. secret police. It was deliberately organised as an integral part of the Nazi machinery of coercion soon after the rise of Hitler to power in 1933. Its ramifications extended throughout G. into every kind of anti-Nazi organisation, and by methods of terrorism it soon stamped out all resistance to Hitler. Its agents supervised the conduct and even the utterances of the whole population and exercised the power of arbitrary arrest wherever opposition was found. The head of the G. was Heinrich Himmler (q.v.), supreme commander of the *Schutz Staffel* (S.S.) (q.v.). The G. was pronounced at the Nuremberg trial of war criminals (1946) to be a criminal organisation. See also CONCENTRATION CAMP; AUSCHWITZ; BELSEN.

Gesta Romanorum ('Deeds of the Romans'), name given to a collection of short, didactic Lat. stories which was compiled probably at the end of the thirteenth century, or at the beginning of the fourteenth. Its authorship is unknown, and its title is only partly appropriate, for at the present time it contains fragments of oriental and European origin as well as those from Lat. and Gk. hist. The style of the book is bad, but it is interesting from a literary point of view, for it contains the sources of the writings of Gower, Chaucer, Shakespeare, and others, e.g. Chaucer's *Man of Lawes Tale* and the main outlines of Shakespeare's *King Lear* and *Pericles*, and the incidents of the caskets and the pound of flesh in *The Merchant of Venice*, and Longfellow's *King Robert of Sicily*. The first printed ed. of the modern form of G. R. was issued at Utrecht about 1173, and an ed. in Eng. was printed by Wynkyn de Worde, 1510-15. There is a good modern trans. by C. Swan in Bodin's Library and a selection trans. into Ger. by H. Hesse.

Gestation, the retention of the young in the uterus from the time of the fertilisation of the ovum—that is, conception—to the moment of delivery. The period of G. varies with the number of the offspring and the degree of their development at birth, with the size of the mammal, and, above all, with its status in the scale of evolution. The longer duration of the condition of pregnancy is an important factor in the growth and evolution of the higher species. For women the period varies considerably above and below nine months. As regards animals which have litters the normal length of G. for a rat is 28 days, for a rabbit 35, and for a bitch 62 days. The G. of a sheep, cow, and mare usually lasts five, nine, and eleven months respectively. For a giraffe the period may be 430 days, and for an elephant more than 600 days.

Gesualdo, Carlo, prince of Venosa (c. 1580-1613), It. musician, b. in Naples; son of Fabrizio, second prince. Carlo was renowned as a performer on the bass-lute. He married his first cousin Maria d'Avalos, who, though only twenty-one, had already been married twice and had children. Carlo and she had one son. She became paramour of Fabrizio Carafa, third duke of Andria; Carlo

killed them on the night of Oct. 16, 1690, and caused her lately born child to be shaken to death. He fled to the castle of G. and succeeded his father as prince (1591). In 1594 he married Eleonora d'Este, at the court of whose family, at Ferrara, he afterwards resided, occupying himself with melancholy music—being, as a composer, a law unto himself. He is supposed to have returned to G., where, in remorse, he founded the Convento dei Cappuccini, and to have d. there. See C. Gray and P. Heseltine, *Carlo Gesualdo*, 1928.

Getae, tribe of Thracian extraction, mentioned in hist. in the time of Alexander the Great as dwelling on the banks of the Danube. In the middle of the fourth century they settled in Transylvania and were conquered in 515 B.C. by Darius, king of Persia. Both Alexander the Great and Lysimachus made attempts to subdue them, but without success. They became politically united with the Dacians in the early part of the first century B.C., and during the greater part of the first century A.D. continued to harass the Rom. legions. In A.D. 106 they were conquered by Trajan and their country incorporated in the Rom. Empire. See H. Meiss, *Die Dobruđa in Altertum*, 1911.

Gete, riv. in Belgium, which flows through prov. of Brabant and Limbourg. It joins the R. Demer near Diest. Its banks were the scene of a fierce battle in May 1940 to delay the Ger. advance.

Gethsemane (Aramaic, from *gath*, wine press; *shemen*, oil), small place, about three-quarters of a mile from Jerusalem, at the foot of the mount of Olives, on the E. of the brook Kidron. It contained a garden, the favourite resort of Christ and His disciples, and was the scene of the agony on the night before the Passion. The site is identified with a square enclosure and is supposed to be near the real location, though recent explorers consider it to be too near Jerusalem to be G. itself.

Gettysburg, U.S.A., bor. and c. seat of Adams co., Pennsylvania, situated on the W. Maryland and the Philadelphia and Reading railroads, and 35 m. S.W. of Harrisburg. It is an agric. region, built on and surrounded by picturesque hills, and contains sev. mineral springs of medicinal value. It is the seat of a Lutheran theological seminary and of Pennsylvania College, founded in 1826 and 1832 respectively. The industrial establs. comprise granite-yards and various manufs. G. was founded in 1770 and incorporated as a bor. in 1806. The battle named after it, and one of the most important of the civil war, was fought here in 1863 when the S. general, Robert E. Lee, was defeated by the northerners under Meade, and a battle monument, surmounted by a statue of liberty, now rises from the brow of the hill. Abraham Lincoln's celebrated dedicatory address was made here on Nov. 19, 1863. Pop. 5900.

Geulincx, or Geulinx, Arnold (1624-1669), Dutch philosopher, b. at Antwerp, and one of the disciples of Descartes. Studied philosophy and medicine at

Louvain and graduated as doctor. He lectured at Louvain Univ., 1646-58. In 1665 he was appointed prof. of philosophy at Leyden. G. is a leading exponent of the speculative doctrine known as 'Occasionalism' and the salient point of his teaching is an endeavour to explain the relations existing between body and soul. In his lifetime there were pub. only the theses which he defended on graduating at Louvain *Saturnalia, seu quaestiones disputatae* (2nd ed. 1665). His chief works in the hist. of philosophy are *Metaphysica vera* (1691) and *Sive Ethica, post theoria auctoris fata* (1696 first part 1665). Besides these he wrote *Physica iura Logica restituta* and *Annotata in Principia Philosophiae R. Cartesii*. See J. P. N. Lund 1

separated from it and given to Geneva, the rest becoming part of the dept. of Ain. Pop. 2000.

Geysers (Icelandic *geysa* to burst out violently), jets of hot water and steam of an eruptive nature met with in various quarters of the globe, more especially in Iceland and New Zealand. A geyser consists of two parts, a basin and a tube. Deposits of silica, formed as the water evaporates and sometimes becoming like a crater, form the basin of the geyser, whilst the tube leads beneath the surface, and in it water accumulates and is gradually heated until steam overcomes the pressure of the water, and a column of hot water is projected into the air through the tube. The G. in Iceland are the best known in the world. They are situated

Hot Springs, New Zealand

ERYING PAN HOT GEYSER, ROTORUA, NORTH ISLAND, NEW ZEALAND

Goulinex und seine Philosophie 1853) J. Grimm *Im Mitgeheimen* *Erkenntnisstheorie und Occasionalismus* and studies by E. Pfeiffer (1852) and G. Samtleben (1881).

Geum, genus of herbaceous perennial plants of the order Rosacea, including about forty species, of which the wild *avena* (*G. rivale*) with orange flowers and the wood *avena* (*G. urbanum*) are found in Britain. The wood *avena* and other species are grown in gardens as border and rockery plants.

Gevelsberg, tn in Westphalia, Germany, 28 m. from Düsseldorf. It has iron and steel works, and manufactures steel wares, gas stoves, and machinery. Pop. 22,000.

Gex, tn of France in the dept. of Ain on the Jura R. on the E. side of the Jura Mts, 11 m. N.W. of Geneva. It has a station on the form. Paris-Lyon-Mediterranean railway. There are tanneries in the tn, and cheese is made. G. was formerly a dist. of anc. Burgundy and, in the sixteenth century, Geneva and Betno disputed its possession with the duke of Savoy. Henry IV. acquired it by treaty in 1601. In 1815 six cantons were

within sight of Mt. Helv. and are the hottest springs in Europe. The G. of New Zealand are celebrated principally on account of the beautiful terraces associated with them. The basins connected with these G. are much used by bathers and resorted to by invalids. The Yellowstone region in N. America also abounds in G. The three localities mentioned are where G. attain their highest development, but they also exist in many volcanic regions such as Japan, S. America and the Malay Archipelago.

Gezelle, Guido Pierre Théodore Joseph (1810-99) Flemish priest and poet was b. at Bruges, the son of a gardener. He was trained for the priesthood and after ordination held teaching posts at Roulers and at Bruges until he was chosen by the part of his superiors to succeed him to accept a curacy at Courtrai. There he spent twenty-five years, and did not return to Bruges till the last year of his life. He is one of the most individual figures in the revival of Flemish poetry, his work being marked by a blend of religious and patriotic fervour. He was elected a member of the Flemish academy. Besides various trans. from

Eng. and Fr. he pub. *Kerkhofblommen* (1858); *Dichtoerfeningen* (1858); *Gedichten* (1863); *Volledige Gedichten* (4 vols., 1878-1880); *Liederen* (1880); *Sijfkrans* (1893); and *Uitsmooer om en om het jaar* (1897). His collected works were pub. 1901-5.

Gezer, city in Palestine, referred to in the Bible as the city of Dan. It is situated in the low hills W. of the Jerusalem Mts. In ant. geography it was a Canaanite city within the ter. of Ephraim. Its site is the modern Tel Jezar. About 1500 B.C. it is noticed as a trib. to Egypt. Since 1902 the Palestine Exploration Fund has been employed in excavating, and has made some interesting discoveries. See R. Macalister, *The Excavations of Gezer*, 1912.

Gfrörer, August Friedrich (1803-61), Ger. historian, b. at Calw in the Black Forest. He studied theology at Tübingen, and afterwards went to Lausanne, Geneva, and Rome. In 1830 he became librarian in the public library of Stuttgart, and devoted himself almost entirely to historical studies. In 1831 he produced *Philo und die judisch-alexandrinische Theosophie*, followed in 1835 by *Gustav Adolf*, chiefly written with the object of bringing into prominence the political role of the Swedish king, rather than the religious. In 1847 he was called to the chair of hist. in Freiburg, and in the following year was sent to the Frankfurt Parliament. His other most important works are *Allgemeine Kirchengeschichte* (1841-46); *Untersuchung über Alter, Ursprung, und Werth der Decretalen des falschen Isidorus, on the pseudo-Isidorian Decretals* (1848); *Urschichte des menschlichen Geschlechts, on the primitive hist. of mankind* (1855); *Geschichte der Karolinger* (1858); and *Papst Gregorius VII.* (1859). All his works display great learning, but his conclusions are ingenious rather than sound. He d. at Carlsbad. See life by M. Omelin, 1879.

Ghadames, see GADAMES.

Gharapur, or **Gharapuri**, see ELEPHANTA ISLAND.

Gharbiya, maritime prov. of Lower Egypt. Area 2818 sq. m. Pop. 2,338,896.

Ghardala, see GARDIA.

Ghat, ln. and sandy oases in the Sahara desert of Africa, which has belonged to Turkey since the year 1874. Pop. about 4000.

Ghats, or **Ghauts** (Sanskrit, gates, passes, or land-stairs), two converging ranges of mts., known as the E. and W. G., running parallel with the E. and W. coasts of S. India. The W. range starts from the Tapti valley and forms an almost unbroken and precipitous barrier of rocks, the prin. passes being the Thalghat and the Bhorghat. On the landward side there is a gradual slope to the table-land of the Deccan, and the W. G. appear as low hills, forming the edge of the plateau. The E. G. begin in the neighbourhood of Belasor and run through Madras. They are of a more broken character, with an average height of 1500 ft. Both ranges abound in health resorts.

Ghazali, **Abu Mohammed Al** (1058-1111), Moslem theologian and philosopher, known in the W. as **Algazel**, b. at Tus in

Khorassan. He studied both at Tus and Nishapur, and was appointed to a chair of philosophy in the univ. of Bagdad at the early age of thirty-three. He held this position for only four years, after which he spent some time in travelling and teaching at Damascus, Jerusalem, and Alexandria. G. struck a serious blow at the philosophy of the Arabians, for he represented the critical, if not sceptical, side of Arabian philosophy, casting doubt on the metaphysical teachings of the exponents of Aristotelianism. After his travels he returned to his native city, where he founded a Sufic College, to which he dedicated the remainder of his life in religious and philosophic meditation. He pub. numerous works, the most notable of which are the *Opinions of the Philosophers and Tendencies of the Philosophers*, introductions to his prin. work, *Destruction of the Philosophers*. See lives by D. B. Macdonald in *Jour. of Amer. Oriental Society*, 1899, and C. de Vaux, 1902.

Ghaziabad, tn. in the United Provs. of India in the Meerut dist., situated 15 m. E.N.E. of Delhi. There are barracks and a trade in leather, skins, grain, etc. It is an important railway junction. Pop. 12,000.

Ghazipur, city of India in the United Provs. It is the cap. of the G. dist. and is situated on the l. b. of the Ganges, 44 m. N.E. of Benares. It is the headquarters of the gov. opium dept., and the opium is manufactured here. The city extends along the Ganges for about 2 m., and the ruins of the Palace of the Forty Pillars are to be seen here. There is also a marble statue erected to the memory of Lord Cornwallis. A trade in sugar, rose-water, tobacco, coarse longcloth, etc., is carried on. Pop. 10,000.

Ghaznevids, or **Ghaznevides**, famous Moslem dynasty of twenty-one rulers, founded by the freedman, **Alpteghin** (Alp-Tigin) of Bokhara, at Ghazni, Afghanistan, about A.D. 962. He withstood the Samani dynasty, and his successors Sebuktigin (Sabuk-Tigin), 977-97, and Mahmud, 999-1030 (the most celebrated of the line), extended their sway over Kabul, Peshawar, and Lahore to N. and E., to Bagdad and the Caspian on W. and N.W. The poet, Ferdusi, and the philosopher, Avicenna, flourished at Mahmud's court. Later rulers were Masud I. (1030-41), Masud II. (1042-48), Farrukh-zad (1053-59), Ibrahim (1059-1099), Bahram (1117-50), Khusrn Malik (1160-86, last of the dynasty). The cap. was moved by the last three kings from Ghazni to Lahore in India. The power of the G. was shattered by the rulers of Ghur (about 1152), and finally overthrown by Shihab ud-Din Mohammed, Prince of Ghur (1186). Ghazni was destroyed by the Mongols under Jenghis Khan in 1224. It was the site of Brit. struggles for possession in Afghanistan in 1839 and 1842.

Ghazni, **Ghuznee**, **Ghizni**, or **Gazna**, tn. and port of S.E. Afghanistan, on R. G., 80 m. S.W. of Kabul. Near by are ruins of the ant. city, important in the Middle Ages and one of the finest cities in Asia

under Mahmud (eleventh century). G. is surrounded by a mud wall, and is commercially important as being on the caravan route from Persia to India. It stands about 8000 ft. above sea level. The Brit. stormed the fn. in 1839, and recaptured it from the Afghans in 1842. There are two famous towers, and the site of Mahinud's tomb. The celebrated 'gates of Samnath,' kept here from about A.D. 1000, were removed to Agra by the Brit. in 1842. Moslem pilgrims frequently visit its numerous shrines. Trade

and sixteenth century), one of the best examples of pure Gothic in Belgium, and with magnificent marble interior decoration. The cathedral is rich in art treasures, amongst them the famous 'Adoration of the Lamb' by the brothers van Eyck. Other famous churches are the thirteenth-century church of St. Nicholas, the church of St. Jacques, with its twelfth-century Rom. façade, the sixteenth-century church of St. Michael containing van Dyck's 'Crucifixion,' and the baroque church of St. Peter Nor 19 G.

Ghent (Kleinisch Gent, Fr. Gand), cap. of the prov. of F. Flanders and one of the most important cities in Belgium. It is situated at the junction of the Rts. Lys and Scheldt, 31 m. from Brussels. The city is divided by its many streams and canals into twenty-six is., connected by sixty-four bridges. The building of new roads and streets has destroyed much of the medieval character of the city, but many of the old buildings are still preserved in their original states. The city has an area of 14 sq. m. and a pop. of 166,000; or, including the suburbs of St. Amadsberg, Ledeborg, and Gentbrugge, 20 sq. m. and 217,000 people. The best view of the city is to be had from the 315-ft. belfry (1183-1339) in the city centre. In most famous of the many churches the cathedral of St. Bavo (twelfth-

and sixteenth century) is one of the best examples of pure Gothic in Belgium, and with magnificent marble interior decoration. The castle of Gruvenstein (1180) is considered the most perfect example of a medieval fortress in Belgium. Also worth seeing are the Duivelsteen (1245), the Cloth Hall (1325), the fn. hall (1519-1620), and the numerous old guild houses, one of which dates back to the thirteenth century. There is still to be seen an arch of the old Prinsenhof, where Charles V. was b. in 1500. G. has about twenty monasteries and three *beguinages* or convents, the oldest being of the thirteenth century. The squares of G. have played a great part in hist., especially the Marché du Vendredi. There are also sev. museums. G. is a great industrial centre, and leads all Belgium in textile production, which employs about half the city's available man-power. The cotton mills of G. house twice as many spindles as all the rest of the country. Machinery and chemicals are also manufactured in considerable quantities. In and around the city are hundreds of nursery gardens, producing

large quantities of azaleas and begonias for export. A world-famous flower show, the Floralia, is held in G. every five years. G. is the second port of Belgium, and has excellent harbour and port facilities to cope with its large volume of foreign trade. A ship canal gives direct communication between the Grand Bassin and the harbour of Terneuzen in Holland and the Scheldt. A new lock at Terneuzen allows passage to vessels up to 26 ft. draught at any tide between that port and G. G. is the seat of a bishopric—and of the Royal Flemish Academy—it has a court of appeal, a commercial court, and sev. consular representatives.

G. has played a great role in hist.; it was first mentioned in the seventh century. It waged violent wars against Flanders and Burgundy, and Charles the Bold rebelled against Charles V. and Philip II., and was sev. times captured by the Fr. It was incorporated in the kingdom of the Netherlands under the peace of Paris in 1814, and passed to Belgium on the estab. of that kingdom in 1830. During the First World War G. was occupied by the Gers. from Oct. 1914 till the armistice. In May 1919 the retreating Allies blew up many of the bldgs., and there was also some bomb damage, but fortunately no historic monuments were affected. In May 1940 G. was again occupied by the Gers. and was liberated on Sept. 6, 1944.

Gherardesca, Ugolino, *see* UGOLINO DELLA GHERARDESCA.

Ghetto name of the Jewish quarter in It. cities, and later in others. Originally Jews were strictly confined to this part and quite separated from their Gentile neighbours. The G. of Rome, instituted by Pope Paul IV., 1556, was only removed in 1885 on the making of the new Tiber embankment. There were 'Jewries' in England, in London, Lincoln, Oxford, and York. The derivation of the word is very uncertain (*borghetto*, little bor.). The system became obsolete about 1870, but the name is still used to mean Jewish quarters. *See* H. Heine, *Der Rabbi von Bacherach* (included in his collection entitled *Der Salon*), 1834 40; D. Philipson, *Old European Jewries*, 1894; I. Abrahams, *Jewish Life in the Middle Ages*, 1896; and *The Jewish Encyclopedia*; also works of C. Franzos and I. Zangwill.

Ghibelline, *see* GUELPHS AND GIBELINES.

Ghiberti, Lorenzo (1378–1455), It. goldsmith, painter, and sculptor. He studied design under Bartoluccio, and in 1400 executed a fine fresco at Rimini in the palazzo of Pandolfo Malatesta. His design for the bronze gates to the baptistery of St. John at Florence was preferred to those of his competitors, Brunelleschi being one of them. Scenes from the O.T. were represented, and later G. did another still finer gate. Michelangelo gave them the highest praise. The first gate was completed in 1424, the second 1452. Other masterpieces are statues of St. Matthew, St. John the Baptist, and St. Stephen for the church of Orsanmichele (1414–22); bas-reliefs for the Catherine of Siena and sarcophagus of St. Zenobius in

Santa Maria del Fiore, Florence; sepulchral monuments of Dadd and of the Albizzi at Florence (c. 1427). The bas-reliefs of the shrine of San Zenobi are especially fine. G. did much to restore the antique style in sculpture. In beautiful ornamentation and perfection of form and finish in all details he has never been surpassed. His earliest known work, a bronze-relief of the 'Sacrifice of Isaac', is in the Uffizi. G. was chosen as colleague of Brunelleschi in the erection of the Florentine Duomo. *See* L. Ciognara, *Storia della Scultura*, 1823; I. Scott, *Ghiberti and Donatello*, 1882; C. Perkins, *Ghiberti et son école*, 1885; G. Vasari, *Lives of the Painters and Sculptors*, 1885; and Lord Balcarras, *Evolution of Italian Sculpture*, 1909, and lives by H. Gollob, 1929, and J. von Schlosser, 1941.

Ghika, Helena, Princess Koltzoff, Massalsky (1829–88), Rumanian writer, better known by her pen-name 'Dora d'Istria.' A daughter of Prince Michael, she married a Russian prince, 1849, and travelled widely in Europe. After 1855 she lived mostly at Florence. She studied classics under Pappadopoulos, and was a distinguished landscape painter. Her works include *La Vie monastique dans l'église orientale* (1855); *La Suisse allemande* (1856); *Les Femmes en Orient* (1860); *Des femmes, par une femme* (1864); *Gli Albanesi in Romania* (1873); *Storia dei Principi Ghika . . .* (1873); and *La Poésie des Ottomans* (1873). *See* B. Cecchetti, *Dora d'Istria*, 1871.

Ghika, Jon (1817–97), Rumanian statesman, studied at Paris, becoming prof. of mathematics and political economy at Jassy, 1843 45. A leader of the revolution of 1848 in Wallachia, he was representative of the provisional gov. at Constantinople. In 1854 the sultan made him governor of Samos, and prince, 1856. Next year he returned to Wallachia. G. was Prime Minister under Prince Charles, 1866–67 and 1870–71. He helped to establish the hereditary principality of Rumania, 1866. He was Rumanian minister in London, 1881–90. His works include *Convorbiri Economice* (1866–73); *Letters to Vasili Alecsandri* (1887); *Memoirs of Trile* (1890); and trans. of sev. plays of Shakespeare. His collected works were pub. in 4 vols. (1914–15).

Ghilan, prov. of N.W. Iran between the S.W. border of the Caspian Sea and the Elburz Mts. It is low-lying, swampy, and unhealthy towards the Caspian, but more salubrious where the ground rises to the S. Has vast forests. The soil, where cleared, is fertile and well cultivated. The fisheries are good.

Ghillias, *see* GILYAKS.

Ghilzais, warlike clan of Pathan stock in N. Afghanistan, between Kabul and Kandahar. By language they are Aryan, and Hoidich (1899) believes them to be of Turkish origin. A race of sturdy farmers and shepherds, they were a severe menace to the Brit. troops during the retreat from Kabul, 1842. They profess Mohammedanism, but some of their customs tend to reveal the existence among them of a primitive Christianity.

Ghirlandajo, or **Ghirlandajo**, **Domenico** (c. 1449-94) (properly Domenico Bigordi, or Corradi), surnamed **Il Ghirlandajo** or **Grillandajo** (garland-maker), after his father Tommaso Bigordi, a goldsmith. He was a celebrated painter and mosaicist; founder of a famous school of painting and the first Florentine to attain skill in aerial perspective. He studied under Baldovinetti, and was influenced by Castagno, Masaccio, and Verrocchio. Among his pupils were his two brothers Davide and Benedetto, Michaelangelo, Francesco Granacci, and Bastiano Mainardi. Domenico painted numerous scenes from the lives of the Virgin and John the Baptist. He executed frescoes in Florence in the church and refectory of Ognissanti (1480), only 'The Last Supper' and 'St. Jerome' being left; in the Sassetti chapel in Santa Trinita (1485); 'Life of Saint Ema' in the Capella Ema (1475); in the choir of Santa Maria Novella ('St. Francis', 1485-90); in the chapel of the Innocent (1483); and in the Palazzo Vecchio (1481). His pictures include two 'Holy Families' (Berlin); 'Adoration of the Shepherds' (1485) (Florence Academy); 'Madonna and Child with Saints'; 'St. Catherine of Siena' and 'St. Lawrence', in the Pinakothek at Munich; 'Adoration of the Kings' (1487); 'The Visitation' (1491) (now in Louvre); 'The Birth of the Virgin' (1490); 'The Calling of St. Peter and St. Andrew' (1485) (Sistine Chapel Rome). See R. Zurcher, *Italienische Wandmalerei*, 1914; also studies by E. Steinmann (in Knackfuss's *Kunstler Monographien*), 1897; C. S. Davies, 1908; and J. Laus, 1943.

Davide (1452-1525), and **Benedetto** (1458-97), brothers of Domenico, assisted him in his works, but left no original ones. Davide helped Domenico in the mosaic of the 'Annunciation' over the N. portal of Florence cathedral, and executed others at Orvieto, Florence, and Siena.

Ridolfo (1483-1561), son of Domenico, was a skilful painter and friend of Raphael. His works include 'Coronation of the Virgin' (1503, in Louvre); 'Annunciation' (Uffizi, Florence); 'Goldsmith' (Uffizi Palace), formerly attributed to da Vinci; 'Nativity' (Berlin Museum); 'St. Zeno obdurate raising a Dead Child' and 'Burial of St. Zanobius' (Uffizi, Florence); 'Madonna della Misericordia'; 'Virgin adored by Saints'.

Ghizah, see GIZAH.

Ghizni, see GHAZNI.

Ghoorkhas, see GHURKHAS.

Ghose, **Lalmohun** (otherwise **Lalamohan Ghosh** (1849-1909) Bengali politician and orator; b. Dec. 17, at Krishnagar, son of Rai Bahadur Ram Lochun G., of a Vikrampur family. In the early seventies he was called to the Eng. Bar. In 1879 he returned to England to protest in a representative capacity against certain features in the policy of the viceroy, Lord Lytton. John Bright took the chair at one of his meetings. He came to England again in 1880, and again at the end of 1884; and in the general elections of 1885-1886 he stood as a Liberal for Deptford. Member of Bengal Legislative Council,

1892-95. In 1903 president of the Indian National Congress at Madras. He left an unfinished *Life of Napoleon*. See A. Banerjee (ed.), *Speeches of L. Ghose*, 1883-84.

Ghost (animal), see LEMUR.

Ghosts, see APPARITIONS; HALLUCINATION.

Ghâr, or **Ghore**, **Gaur**, **Gour** (Sanskrit, fort), mt. region of W. Afghanistan, 120 m. S.E. of Herât, stretching towards Kandahar. It is in part the site of the anc. Paropamisus, and medieval Gharshistan. In all ages the country has been inaccessible, and the site of the old cap. Firoz Koh cannot be definitely fixed. The peak Chalap Dulan or Koh-i-Kaisar is 13,000 ft. high. The present pop. are mostly Nagaras or nomad Aimaks. Since 1815 G. has been included in the ter. of Herât. It was famous in the twelfth and following centuries as the seat of a native dynasty, the Ghûri, founded by Ala-ud-Din Jahan-saz, who burnt Ghazni, 1132, and harassed the Ghaznevids. His successors extended their empire and completely subdued Ghazni, 1188. Out of their victories grew up the Mogul kingdom of Delhi, and the preponderance of Islam in Hindustan dates from this time. Their power was broken by Mohammed Shah, and Jhalî Ed-Din of Khwarezm (Khiva), 1211-16. A short revival took place under the Kurt dynasty, 1245, but the final overthrow came with Timur's capture of Herât, 1383. See also AFGHANISTAN. See J. Ferrier, *Arrian Journeys*, 1856.

Ghûrkhas, **Goorkhas**, or **Ghoorkhas**, predominant race of Nepal in the Himalayan region. They are hardy mountaineers of Hindu descent, speaking a Sanskrit dialect. Driven out of Katputana by Moslem invaders, they conquered Nepal after much fighting, 1676. The G. now form some of the best troops in the Indian Army. The E. India Company came into conflict with them, 1814, but peace was soon declared, the company obtaining possession of the S. slopes of the Himalayas, but recognising Nepal's independence. Ghûrkha is the name of a number of famous Indian regiments. They were loyal to England during the mutiny, and the Sirmoor Battalion greatly distinguished itself at Delhi, for which it was given the status of a 'rifle regiment,' and granted a unique trophy called a 'truncheon,' which much resembled a very ornate drum-major's staff made of silver. This unit was later designated the 2nd King Edward's Own Ghûrkha Rifles. All of the ten regiments of G., served during the First World War, either in France, Flanders, Gallipoli, Mesopotamia, Persia, Baluchistan, Egypt, Palestine, or the N.W. Frontier of India. Their roll of battle honours commences with Bhurtপুর, and includes the Second and Third Afghan wars, Burma campaign, Indian mutiny, and China 1900 campaign. Also fought under Gen. Wavell against the Ha. in the battle of the W. Desert, 1940, and later in the Burma campaigns and on the W. Front.

Ghuznee, see GAZNA.

Giambattista, see TIPOLO, GIOVANNI BATTISTA, and CIPRIANI.

Gianibelli, or Giambelli, Federigo (c. 1530-92), It. military engineer, inventor of the 'infernal machines' that wrought so much havoc among the troops of Parma near Antwerp, 1585. By means of an explosive ship he destroyed the bridge built by the Spaniards across the Scheldt. G. then went to England and assisted in the preparations against the Armada, designing the fire-ships sent among the Sp. fleet. See Motley, *United Netherlands*, Vol. 1.

Giannone, Pietro (1676-1748), eminent It. anti-papal historian. He studied law and practised as a barrister at Naples, spending many years in composing his *magnum opus* - *Storia civile del regno di Napoli* (1723). This attack on the abuses of the Rom. Catholic Church led to his banishment. He retired to Vienna, Venice, and finally Geneva, where he wrote his diatribe *Il Tricennio* against papal authority. He was enticed into Savoy by Gualaldi (1736), arrested by order of the king of Sardinia, and confined at Turin till his death. His *Opere Postume*, containing 'Anecdotes ecclésiastiques' (1738), appeared 1760. Mancini issued his *Opere Inedite* (1859). See Panzini, *Vita di P. Giannone*, 1767; Fabroni, *Vite Illustrium doctum excellentium*; Pierantoni, *Autobiografia di P. Giannone*, 1899; Tibaldi, *Biografia degli Italiani illustri*; and Corniani, *Secoli della Letteratura Italiana*.

Giannuzzi, Giulio Pippi dè, see GILIO ROMANO.

Giant Hill, above Cefne Abbas, 8 m. N. of Dorchester, England. On it is the figure of a man, cut in the chalk, of indeterminate age, but believed to date from the Rom. era in Britain.

Giants (Gk. γίγας, giant), name given to adult human beings of abnormal size and stature. All races have a standard average height both for men and women. The average height of the whole human species is 5 ft. 5 in., the tallest giant exceeding this by about 3 ft. 10 in. The Akkas of central Africa are about 4 ft. 5 in. in height, the Scottish farmers of Galloway 5 ft. 11 in. The true causes of such noticeable differences in racial stature are much discussed by ethnologists. The ancients held that the first men on earth were mighty and god-like, and that they degenerated in vigour and size. Others have tried to prove that the first men were of dwarfish appearance. Among famous G. may be mentioned Og, king of Bashan (Deut. 33. 11); Magrath, Bishop Berkeley's giant; Patrick Cotter (1761-1801); Charles Byrne; Winkelmater's Austrian (d. 1847); Topinard's Finlander (9 ft. 4 in.); Chang, the Chinese giant; and the Russian Machnow (9 ft. 3 in.) who appeared at the London Hippodrome, 1905. Such abnormal beings are often dull of intellect, weakly, and ungainly. As a disease 'gigantism' is closely allied to 'acromegaly', caused by a morbid process in the splenoid bone of the skull, an excessive development of the anterior lobe of the pituitary body. If this condition occurs in early youth the whole of the limbs are affected and gigantic proportions are the result.

Remains found in the Mentone caves and in Scotland go to prove a gigantism that was racial and not the result of disease. The villagers of Balmacollan in Galloway are taller on the average than the oft-quoted Tehuelches of Patagonia. In mythology the title giant was applied to men of pre-eminent strength or prowess, not necessarily of great size. Among the various Gk. conceptions were Enceladus, Typhæus, Briareus, the Titans, and the

(W. Jones)

THE GIANT'S ORGAN, GIANT'S CAUSEWAY

Cyclopes. The great representation of the Titanomachia (a mighty battle between the G. and the gods, later than Zeus's overthrow of the Titans, but mentioned neither by Hesiod nor Homer) is sculptured upon the altar at Pergamum. See C. Weinhold, *Die Riesen des germanischen Mythos*, 1858; E. J. Wood, *Giants and Demons*, 1868; Sir E. Tylor, *Early History of Mankind*, 1878, and *Primitive Culture*, 1891; M. Mey er, *Die Giganten und Titanen in der antiken Sage und Kunst*, 1887; R. Gould, *Enigmas*, 1920; and P. H. Fletcher, *Giants and Dwarfs: the Anterior Lobe of the Hypophysis*, 1923.

Giant's Causeway, famous promontory of closely packed basaltic columns on the

coast of Antrim, N. Ireland, W. of Benger Head, 8 m. from Portrush. Its origin was a great outpouring of basalt in the Tertiary period but legend ascribed it to Finn McCool or Fingal, who built it as a bridge between Ireland and Scotland for the giants to cross from Antrim to Staffa. The columns are mostly hexagonal or pentagonal about 40,000 in number perfectly articulated by means of convex and concave joints. The three chief portions are the Little, Middle and Grand Causeway. The last extends 500 ft out to sea and is 60 to 120 ft broad. Other detached groups are called Giant's Loom, Giant's Organ, Lady's Fan. I. of the Causeway is the Giant's Amphitheatre, a bay with cliffs 30 ft high. Beyond is Sp. Bay, where an Armada vessel was wrecked. (Hinnny Point and Pleashin Head are also near and the ruined castles of Dunseverick and Dunlough. See also PORTRUH.)

Glaour (corruption from Arabic *laifr* unbeliever or Persian *gaur* infidel) name by which the Turks designate all those who reject Mohammedanism especially European Christians. The word is spelt in the It. fashion popularised by Byron and usually employed in an offensive sense.

Gib, Adam (1714-88) Scottish 'anti-burgher' leader and preacher b. at Castletown Perthshire. He was the only Edinburgh minister who strongly upheld the Protestant succession (1745). He led the minority in the Anti-Burgher Synod of 1747, and in after years his fame as a preacher drew enormous congregations to his church in Nicolson Street. He earned the sobriquet of *Lope Gib* on account of his dictatorial manner. Chief works: *Proceedings of the Associate Synod* (1748), *The Present Truth* (1774), and *Sacred Contemplations* (1796).

Gibara, well known Cuban seaport on the N. coast of the prov. of Santiago de Cuba. It has a well fortified harbour and civil and military hospitals. Trades in fruit, corn, tobacco, coffee, sugar. It is a port of call for the Amer. Hudson line. Pop. 7000.

Gibbaros, see **JIVAROS**.

Gibbet, species of gallows erected near the scene of a crime on which the convicted criminal was suspended in chains after his execution by order of the courts of justice. The body thus hung, encased in an iron frame was supposed to serve as a public warning to terrorise the evil minded. This practice legalised in 1752, was abolished in 1834. *G* was the name of the highwayman in Farquhar's *Heaut-Stratagem* who boasted himself as the best conducted man in his profession. See **A. Hartshorne**, *Hanging in Chains* 1891.

Gibbon, Edward (1737-94) most celebrated of the Eng. historians whose great work *The Decline and Fall of the Roman Empire* has placed him among the most celebrated of the world's historians. He was b. at Putney, the eldest child of Edward G. and Judith Porten who had five other sons and one daughter. The Gs. were an old Kentish family. The

historian's grandfather, Edward was an enterprising and very prosperous London merchant who lost a fortune in the South Sea Company's catastrophe, and built it up again by his extraordinary energy of character and his profound knowledge of commerce. His father was educated at Westminster and Cambridge then became M.P. for Petersfield a mkt in near Bursdon in Hampshire where the G. estate was situated. His mother often in poor health and plagued by the social duties inseparable from her husband's position was reluctantly forced to yield up the care of her son in great part to her sister Catherine Porten to whose unflinching devotion *G.* pays a tender tribute in his autobiography. He was in

EDWARD GIBBON

living after a long illness.

extremely delicate boy and his aunt nursed and watched him through the sicknesses to which he was a constant prey, educated him to, whenever an interval of improved health afforded the opportunity. At seven he received some training in arithmetic. Ten and a half from a private tutor and at nine he went to school at Kingston on Thames. His mother d. in 1747 and after spending some months at Bursdon *G.* went to Westminster School in 1749. He passed many hours in his grandfather's library at Putney, and here he developed an enthusiastic love for reading. At school poor health caused his progress to be very slow. At use of treatment at Bath and at the house of a Winchester doctor proving futile the idea of education at school was given up and he was instructed henceforth intermittently by tutors. His love of reading hitherto indiscriminating, now led him into a preference for hist. and when once interested in a subject of hist. he devoured all he could find upon it. In every book to which he could gain access, not reading the book all through but

pursuing his subject into every hole and corner. Doubtless this instinctive 'method' laid the foundations of the clear-thinking and sense of proportion which enabled the future historian to mass the complicated materials of his vast picture. In his sixteenth year his health improved as if by miracle, his constitution became 'fortified and fixed,' and from that time onwards he was free from ailments. The same year (1752) he went to Oxford as a gentleman commoner of Magdalen College. Fourteen months of desultory reading and of gaiety, during which he read Bossuet and declared himself a Rom. Catholic, ended in his being expelled by an outraged univ. and sent by an angry father to Lausanne to the home of a Calvinist minister, M. Pavillard, 'there to be brought to a better way of thinking.' Under excellent guidance he here pursued a course of serious study, including the Lat. classics, Locke, Grotius, Montesquieu, and Pascal, together with logic and mathematics. During this period he renounced his Rom. Catholicism, had some intercourse with Voltaire, and fell in love with Mlle. Curchod; but, his father disapproving, he tells us: 'I sighed as a lover, I obeyed as a son, and the lady afterwards became the wife of Necker, the famous minister of Louis XVI. Returning to England in 1758 he pub. in 1761 a little book in Fr., *Essai sur l'étude de la littérature* (an Eng. trans. appeared in 1764). After two years of 'military servitude' as captain in the Hampshire militia, he set out on the 'grand tour.' In Paris the intellectual world welcomed him, and happy days were spent in Switzerland, but Rome was his bourn. Here, amid the ruins of the Capitol, in 1764, he conceived the idea of writing the *Decline and Fall*. Hardly daring to attempt so vast a work, he contemplated his idea 'at an awful distance,' for some years working laboriously and honestly, studying original records, inscriptions, medals, etc. His father's death in 1770 leaving him independent, he settled in London, became M.P. for Liskeard in 1774, and accepted a gov. sinecure, which supplemented his income by about £800 a year. Losing this on a change of gov., he retired to Lausanne and settled there with his great friend Deyverdun. In 1776 the first vol. of the *Decline and Fall* was pub. The work aroused tremendous enthusiasm, and was sold out in a few days, a second, and then a third ed. becoming necessary. The next five years were wholly taken up with the gigantic labour of producing the succeeding vols. Vols. II. and III. appeared in 1787, and vols. IV., V., and VI. in 1788. (i. e. six years later, of a disease the existence of which he had hidden from his friends. G.'s *Decline and Fall* has borne the critical judgment of more than a century and a half without losing its place as one of the foremost historical works of all time. It is unsurpassed for its comprehensiveness, its wealth of information, general accuracy and well-weighed decisions, together with its stately diction and charm of narration. Innumerable details have

been made to yield up a 'philosophy of history' in the light of which characters, events, and conditions account for each other. The treatment varies according to necessity—here complicated details are analysed to their foundation and their underlying philosophy is extracted, there this philosophy is used to shed light on a period which, by its means, may be swept over rapidly; hampering details are cast aside, and the general trend of events stands out clearly. Defects there are, both of style and of judgment—gallicisms creep in easily, the stateliness sometimes becomes monotonous rhythm, the remarkable clearness occasionally fails. Worst of all, the calm judgment is sometimes obscured where G.'s prejudices and preferences are involved. Religion had no interest for him, and the famous fifteenth and sixteenth chapters would no doubt have been more acceptable to the intellect had he not offended the feelings by disobeying his own 'great law of impartiality' and let his love for Rome lead him into sarcasm in dealing with the early Christianity which he makes responsible for her downfall. His other works include *Mémoires littéraires de la Grande Bretagne* (with Deyverdun, 2 vols., 1767, 1768); *Critical Observations on the Sixth Book of the Æneid* (1770); *Vindication* (1779); *Antiquities of the House of Brunswick*, ed. by Lord Sheffield (1814); and *Memoirs of my Life and Writings*, ed. by Lord Sheffield, 2 vols. (1827). See Sir S. Walpole, *Essays and Biographies*, 1907; J. Smith, *Junius Unveiled*, 1909; E. Clodd, *Gibbon and Christianity*, 1916; L. Strachey, *Portraits in Miniature*, 1931; and E. Hutton *The Conversion of Edward Gibbon*, 1932; also lives by H. H. Milman, 1839; G. Birkbeck Hill, 1900; D. M. Low, 1937; and G. M. Young, 1948.

Gibbon (*Hylobates*), the smallest of the anthropoid apes, rarely exceeding 3 ft. in height, is found principally in the Malay peninsula. The species include the hoolock (*H. hoolock*), a native of Assam, the

Choromandus, Harlan's G. (*H. concolor*) from Borneo, the white-handed G. (*H. lar*), a native of Malacca and Siam, and the Siamang (*H. syndactylus*). This last, found in Sumatra, is the largest of the group, black in colour with a large laryngeal pouch. The Gs. are noted for their agility in climbing, their slim contour and length of arm contributing to this facility. Their loud voices and howling cries resound through the woods, particularly in early morning. They are gregarious, very intelligent, and easily tamed when young. See ANTHROPOID APES.

Gibbons, Grinling (1648-1721), celebrated wood-carver and sculptor, b. at Rotterdam. He was brought to the notice of Charles II. by Evelyn, the diarist, and became master carver in wood to the Crown until the time of George I. Many of the carvings in Windsor, Kensington, and Whitehall are by him. He carried out commissions for Sir Christopher Wren, including the choir stalls of St. Paul's and woodwork in Trinity College, Cambridge. Chatsworth, Southwick, and Petworth (q.v.) were all beautified by his art. In sculpture he was scarcely less successful, as is evidenced by his monument to Newton in Westminster Abbey and the bronze statue of James II. in Whitehall. The ceiling of a room at Petworth is considered to be one of his masterpieces. He also designed the base of Charles I.'s statue at Charing Cross and that of Charles II. at the Royal Exchange. In 1931 four statues, representing St. John, St. Peter, St. Paul, and the Church, in College Garden, Westminster, were identified as his work. G. was one of the most skilful craftsmen who has ever worked in this country, but some deny his claims to be considered a great artist, and consider his art to be 'still-life sculpture applied to the wall rather than carved decoration of the interior architecture' (Margaret Whinney). This may be exemplified by the complex carving of flowers and fruits at Hampton Court. Though Evelyn introduced G. to Sir Christopher Wren, and on his behalf 'bespoke His Majesty for his work at Windsor which Mr. May the architect there is going to alter and repair,' it was in fact in his association with Hugh May rather than with Wren that G. was to create the style by which he is remembered. It is not improbable that the first introduction to May had come through Lely, the painter, for it is certain that Lely, May, and G., with the help of Verrio, the II. decorative painter, were responsible for the new baroque tendency which appeared in Eng. decoration in the late seventeenth century. Great changes were introduced by G. and May at Cassiobury Park (now destroyed) and at Windsor. The architectural decoration of the rooms largely disappeared; instead of the pilasters are pendants of fruit and flowers, and the overmantel becomes a series of small mouldings below a painting, which is also framed by naturalistic carving. It is surmised that G. was not quite so fitted to carry out commissions in sculpture, because he subsequently employed a series of

Flemish collaborators. Among his works in sculpture of the eighties the monument to Viscount Camden at Eaton is of no great merit; but the statue of Charles II. at Chelsea Hospital, and that of James II. (mentioned above) in Rom. armour, which stands in front of the National Gallery, are both fine pieces of sculpture. His great commission at this period was the altar for James II.'s Rom. chapel in Whitehall Palace, in which G. was assisted by the Flemish artist Artus Quellin. The finest work reputed to be by G. in St. Paul's Cathedral lies in the choir stalls and the great organ case, made during 1696 and 1697. The decorations in limewood with trumpets, scrolls, and flowers above the stalls and the boys supporting the bishop's mitre and the pollicen in her plecty are all evidently characteristic of the work of G. rather than of his collaborators. See H. A. Tipping, *Grinling Gibbons and the Woodwork of his Age*, 1914, and A. E. Bullock, *Grinling Gibbons and his Contemporaries*, 1914.

Gibbons, Orlando (1593-1623), Eng. musician and a celebrated composer of church music, b. at Cambridge. He took the degree of Mus. Doc. at Oxford in 1622, and was made organist of Westminster Abbey in the following year. He d. suddenly at Canterbury while waiting to take part in Charles I.'s marriage service, for which he had composed the music. Orlando G. marks the apotheosis of the auct. Eng. musical art and with him the old church school of England may be said to cease. His compositions are still in frequent use in the church services to-day. The most famous are *Morning and Evening Service* in F; anthems; *Hosanna*, *O Clap your Hands*, and *God is gone up*; madrigals; *The Silver Swan* and *Dainty Sweet Bird*. He also composed some beautiful chamber music. See E. H. Fellowes, *O. Gibbons*, 1925.

Gibbs, Josiah Willard (1837-1903), Amer. physicist, b. at New Haven, Connecticut. From 1871 prof. of mathematical physics at Yale Univ. Although his scientific papers were not numerous all were important. His fame was made by a paper, pub. in the *Transactions of the Connecticut Academy*, 1875-78, and entitled 'On the Equilibrium of Heterogeneous Substances,' which led to the estab. of the 'phase rule' of chemical equilibrium and change. Other papers: *Graphical Methods in the Thermo-Dynamics of Fluids* (1873); *Methods of Geometrical Representation of the Thermo-Dynamic Properties of Substances by Means of Surfaces* (1873); and treatises on the electro-magnetic theory of light (1882-83) and on vapour densities. See W. L. Miller, *Method of Willard Gibbs in Thermo-dynamics*, 1925.

Gibelin, see BERT, JIBRIN.

Gibello, Mount, see ERNA.

Gibeon, ant. city of Palestine, 5 m. N.W. of Jerusalem. The vil. of El-Jib now occupies the site, which is a solitary hill overlooking a corn valley. It is now chiefly remarkable for its springs, but in biblical hist. it is famous as the scene of the combat between the fighters of David and

those of Iabbosheth (2 Sam. ii. 12-32), of the murder of Amasa by Joab (*ibid.* xx. 8-10), and especially of the bloody battle in which Joshua overcame the five kings of the Amorites who were besieging the town because the inhabitants had made a treacherous covenant with the enemy of all the Canaanites. The Gibeonites had previously been brought into bondage by Joshua, that is, made 'hewers of wood and drawers of water unto all the congregation,' because they had won from him a truce by deceit and trickery (Joshua ix., x.).

Gibraltar (Moorish *Gebel-al-Tarik*, or *Jebel-el-Tarik*), Brit. strongly fortified town and promontory in extreme S. of Andalusia, Spain, forming the E. horn of the bay of Algeiras or G., N. of the strait of G. connecting the Atlantic and the Mediterranean Sea. G., as *Mons Calpe*, and *Mt. Atala* (Apes' Hill) on the African coast opposite, were known to the ancients as the famous 'pillars of Hercules,' and considered by them to be the W. extremity of the world. The great promontory, of brownish-grey limestone or marble, is connected with the mainland by an isthmus of sand. It is shaped like an enormous lion, 3 m. long, averaging 1 m. broad, reaching a width of over 1400 ft. above sea level, except on the W., where it slopes more gently to the sea. Though barren in appearance its vegetation includes capers, asparagus cacti, and aloes, and its fauna partridges, woodcocks, pigeons, rabbits, and small monkeys (Barbary apes), the only native monkeys of Europe. There are numerous caverns and galleries cut into the rock, the largest being St. Michael's, with a hall 230 ft. long. G. is in fact a labyrinth of tunnels, an underground city divided into many self-contained parts, and till tunneling goes on to accommodate great power plants, hospitals, laundries, bakeries, kitchens, ammunition stores, stores, gun emplacements, and living accommodation for thousands of men. The narrow ledges bristle with wireless masts and radar equipment. The Sp. lines are near the point of junction of the rock of G. and the mainland, the space between being called neutral ground. On the flat isthmus joining the rock to Spain is the aerodrome, extended into Algeiras Bay. The fine harbour has two moles, 1100 and 700 yds. long. There are a lighthouse and an important wireless station situated by Europa Point on the S. The town has two main divisions, N. town and S. town, while the part on which the lighthouse is situated is styled Europa. In the town, however, are sometimes tawdry shops, and restaurants. Alameda Park is a moderate-sized garden in the central part of G., and the governor's house on the 'convent' is situated a mile away in the main street. There is an admiral's residence, an official house called The Mount on the Europa Road, half a mile S. of the gardens. The naval hospital is a mile away (but was closed for ten years or more). The theatre is half a mile N. of the gardens. There are also the exchange building and the barracks. G. is the see of an Anglican and a Roman Catholic bishop. The Anglican cathedral or church

of the Holy Trinity is in the Moorish style. There are also Protestant and Roman Catholic churches, Jewish synagogues, public schools, and libraries. A crown colony of Great Britain controlled by a governor, G. is of extreme importance as a coaling station and for its control of the Mediterranean Sea. It has been a free port since 1704, but, for revenue purposes, there are import duties on malt liquors, wine and spirits, tobacco, motor spirit, and perfume. Industries are of no importance, but there is a fair transit trade at the port and G. is becoming a popular tourist centre. There is cable communication with the Continent, Tangier, the Mediterranean E. ports, and England. The fortress was taken, A.D. 711, by the Saracen chief, Tarik ibn Ziad. The Moors finally ceded it to Spain, 1462. After 1510 it was extensively fortified by Charles V. In 1704 it was captured by the Eng. and Dutch under Rooke. It was subsequently often besieged by the Spaniards, notably 1779-81, when it was gallantly defended by Hothfield against the united Fr. and Sp. It was ceded to Great Britain by the treaty of Utrecht in 1713, renewed by the treaty of Versailles in 1763. Since 1897 a new mole and enclosed deep harbour has been built at the N. end. In the Second World War, as in the First World War, G. was of paramount importance as a pivotal point of Britain's sea lines; for a successful thrust either at G. or at Suez or at both together would have meant her expulsion from the Mediterranean and jeopardised her hold on the Middle E. On the other hand it may be that the Nazis in the Second World War hesitated to attack Spain for fear of dispersing their own resources over too extended an area without appreciably increasing them; besides which Spain would have been of little practical aid against G. Laing in 1942, with Italy in the war, it was questioned by many in Britain whether Malta could be held and whether it should even be attempted to be held. This was the school of thought which for some years had argued that, in case of war with Italy, it would be wisest to abandon the Mediterranean and to be content with sealing it at both ends through control of G. and Suez; and the arguments for this course had been reinforced by the collapse of France. Fortunately other counsels prevailed—strengthened by the amazingly successful defence of Malta. Again, in the late autumn of 1942 the Brit. command of the straits of G. prevented any serious interference with the Anglo-Amier. expedition to N. Africa, whether by Axis submarines or by air patrols, when passing through the straits. Naturally, the bottle-neck at the straits invited a U-boat concentration in the surrounding area, but the most efficient organization for patrol and protection which was rendered possible by the very fact of holding G., kept losses down to a low level in the first six months of 1943, when 11,000,000 gross tons of shipping was escorted by the R.N. into the ports of N. Africa. There was always a danger that the Ger. reply to the allied

invasion of N. Africa would be an invasion of Spain and the occupation of bases dominating the straits without opposition from Gen. Franco. But before the end of 1942 there were signs that doubts were beginning to influence the mind of Gen. Franco, for a move towards a firmer neutrality might be seen in overtures to Portugal for the formation of an Iberian bloc. The fixed civilian pop. was estimated in 1947 to be 21,200. The military pop. is about 3000; the naval pop. is approximately 550. The settled pop. are chiefly descendants of Sp. and It. settlers. See 'Mémorial de Elliot' in Green's *Siege of Gibraltar*, 1784; J. Drinkwater, *History of the Siege of Gibraltar*, 1883; A. M.

Collier's Weekly, in which appeared the famous 'Education of Mr. Pipp,' G. essayed portraiture in oils, but eventually returned to his designs in pen and ink.

Gibson, Edmund (1689-1748), Eng. divine, who in 1692 brought out an improved Eng. trans. of Camden's *Britannica*. His great work was *Codex juris ecclesiastici Anglicani* (1713), written to plead the privileges of the Convocation.

Gibson, Edward, see AHBORNE, BARON.

Gibson, John (1790-1866), Welsh sculptor, b. at Gylln, near Conway, son of a market gardener. For some years he worked in the studio of Canova, and later became for a time the pupil of the Dano

GIBRALTAR

E.N.A.

Monti, *Historia de Gibraltar*, 1851; F. Sayer, *History of Gibraltar*, 1862; J. Mann, *History of Gibraltar*, 1870; H. Field, *Gibraltar*, 1889; E. R. Kingdon, *Gibraltar under Moor, Spaniard, and Briton*, 1938; G. T. Garratt, *Gibraltar and the Mediterranean*, 1939; Stetson Conn, *Gibraltar in British Diplomacy in the Eighteenth Century*, 1942; and R. Henry, *Journey to Gibraltar*, 1943.

Gibraltar, Strait of (anc. Fretum Herculeum), entrance from the Atlantic to the Mediterranean, having a length of 50 m. and a breadth varying from 9 to 23 m. It is flanked on the N. by Spain, on the S. by Morocco in Africa.

Gibson, Charles Dana (1867-1914), Amer. artist, b. at Roxbury, Massachusetts, son of Charles de Wolf G. Attended for one year the schools of the Art Students' League in New York, and first drew for the comic weekly *Life*. It was his portrayal of the Amer. girl, especially of an idealised type, in which health, refinement, and extreme dignity were suggested, that estab. his name and made magazines vie with one another for his drawings of what came to be known as the G. girl. After having made a fortune by contributing to

Thorwaldsen. But the old Gk. sculptors were his true masters, and their influence is reflected in his works. Thus it was Gk. mythology which supplied him with his subjects, 'Bacchante and Faun,' 'Amazon thrown from her horse,' 'Proserpine,' 'Sappho and Psyche,' etc. It was the knowledge that Pheidias and Praxiteles had coloured their statuary that suggested to him the tinting of his 'Venus' (1851) and other of his works, a process which was naturally regarded as a daring innovation. It was moreover in classical garb (the Rom. toga) that he insisted on representing Peel, whose fine statue now adorns Westminster Abbey, and Huskisson, whose colossal marble figure now stands in the cemetery of Liverpool. But the above are merely external illustrations of his paganism in art. In his *bass-reliefs*, such as 'Hours leading the Horses of the Sun,' he shows the truly Gk. appreciation for the serenity and natural limits of the plastic art. Among his many imposing monumental works may be mentioned the group of Queen Victoria with Clemency and Justice in the Houses of Parliament. See T. Matthews, *J. Gibson*, 1911.

Gibson, Wilfrid Wilson (b. 1878), Brit. poet. Was for a time a social worker in the E. end of London, and during the First World War he served in the ranks. These experiences form the background of much of his work. Most of his poems — notably the seventeen dramatic pieces which make up *Daily Bread* (1910) and the work *Livelihood* (1917) — present the normal toiling life of man in our modern industrial world. The talk and thoughts of the factory folk are modulated into verse, in which the figures are significant rather than symbolical, and in which the poignant experience, when it finds a place, is uttered in the heroic and non-sentimental strain. There is nearly always a story even in his shortest pieces, and the story is generally full of interest. G. is one of the so-called neo-Georgians, who, as has been well said, did at least stir the public to read poetry before the First World War came to throw men back on the elemental emotions, which can be expressed only in poetry. Though he chooses unlovely themes, the ugliness of the hand-to-mouth existence, he is certainly the 'laureate of modern industrialism' (A. C. Ward) who sings of a man-made hell of machines and creatures of the machines in verse which creates the illusion of the glare of furnaces and the grime and murk of industry. Some of the most striking of his individual pieces are *Kindlesyke*, *Fluann Isle*, and *The Ice-cart*. His poems include, besides those mentioned, *Stonefolds* (1907); *Fires* (1912); *Thoroughfares* (1914); *Borderlands* (1914); *Battle* (1915); *Friends* (1916); *Whin* (1918); *Home* (1920); *Neighbours* (1920); *I Heard a Sailor* (1925); *Collected Poems, 1905-25* (1926); *The Golden Room* (1928); *Hazards* (1930); *Highland Dawn* (1932); *Fuel* (1931); *Coming and Going* (1938); *The Alert* (1941); *Challenge* (1942); *The Searchlights* (1943); and *The Outpost* (1944). See also E. M. (Sir Edward) Marsh (ed.), *Georgian Poetry, 1911-12*.

Giddings, Joshua Reed (1795-1864), Amer. statesman, sat from 1838 to 1859 in the national House of Representatives, first as a Whig, later as a Free-soiler, and eventually as a Republican. The abolition of slavery was very materially assisted by his able and outspoken speeches. When the slaves of the *Creole* slew their captain and claimed their liberty (1841) he courageously asserted that in 'resuming their natural rights to liberty' they 'violated no law of the U.S.A.' In 1842, when Congress passed a vote of censure on him, he resigned his seat, but his immediate re-election proved that the public fully recognised the value of his disinterested and splendid work.

Gide, André Paul Guillaume (b. 1869), Fr. novelist and critic, b. in Paris. Educated at École Alsacienne and Lycée Henri IV. At one time conducted *La Nouvelle Revue Française*. His outstanding work is *Les Faux-Monnayeurs* (1925), his one roman, which marks the climax of the Proust period; but it is a barely readable work evidently aimed at the 'counterfeit' imitations of Proust, and the writing soon afterwards of *Le Journal*

des faux-monnayeurs (1926) admits, by implication, that the former work was a failure. A great Fr. writer, G. began in a vein of turgid romanticism veiled as symbolism; but *Le Voyage d'Urtien* (1893), *Les Nourritures terrestres* (1897), and *L'Immoraliste* (1902) would have been ignored but for the soundness of their ideas and sentiment and for the promise which was to develop much later in *Se le grain ne meurt* (1921). *Les Caves du Vatican* (1914) is a fantastic tale which seems to exploit the moral theory of acts without motive, a paradox exemplified also in the work *L'Acte gratuit* (a tale of homicide without reason), the former of which, says Prof. Denis Saurat, would have been a masterpiece had it been possible not to take it seriously. A remarkably different outlook seems to pervade his two delightful travel books, *Voyage au Congo* (1928) and *Retour du Tchad* (1929), books completely antithetical to the spirit which seems to inform his 'motiveless' stories. The substance of G.'s writings is, all through, his own self, a moi which has not achieved any cohesion and yet up to a point seems to reflect everybody's outlook. What he seems to be driving at in his more complex works is that sincerity is the prime virtue but consists in having no fixed beliefs. But above all G. is a supreme stylist, as may be seen in his autobiographical *Si le grain ne meurt* and his *Journal* (1939) and the two African travel books, and many Fr. critics hold that he is the greatest modern writer of Fr., not excepting even Paul Valéry. His Journal will probably remain his most read work. Some of the numerous themes which recur most frequently in it include his home at Cuverville, travel, piano-playing, Racine, Dostoevsky, homosexuality, his wife, the Gospels, the devil, Browning, insomnia, temptation, the problem of style, animals, Pascal, health, Conrad, the Catholic Church, children, and Boscuet. Even so summary a list serves to afford some indication of G.'s main preoccupations. It also indicates the peculiar rhythm of his existence, in perpetual oscillation between discipline and anarchy, between classicism and revolt, between austerity and sensuality. What is significant in G. and emphasises his originality as a writer is that he has no wish to suppress any of these extremes, nor to decide between the alternatives suggested to him by his own nature. He is equally attracted by heaven and hell, and is disposed to think that the kingdom of God partakes of both, particularly because, as the Gospel text teaches which he quotes so often, that kingdom is within you. His other works include *Les Cahiers d'André Walter* (1891); *Les Poésies d'André Walter* (1892); *La Tentative Amoureuse* (1893); *Paludes* (1895); *Le Prométhée mal enchaîné* and *Philoctète* (1899); *Lettres d'Angle, 1898-99* (1900); *Le Roi Candaulé* (drama) (1901); *Saül* (drama) and *Préludes* (1903); *Amyntas* (1908); *Le Retour de l'enfant prodigue* (1907); *Dostoevsky d'après sa correspondance* (1908); *La Porte étroite* (1909); *Oscar Wilde* (1910); *Nouveaux Préludes* and *Isabelle* (1911);

Bethsabé (1912); *La Symphonie pastorale* (1919); *Corydon* (1920); *Ninquin et lui* (1922); *Incendences* (1924); *Caractères* (1925); *Dindiki and Faits divers* (1928). See S. Braak, *A. Gide et l'âme moderne*, 1923; C. du Bos, *Le Dialogue avec André Gide*, 1929; R. Fernandez, *André Gide*, 1931; L. Pierre-Quint, *André Gide: sa vie, son œuvre*, 1932; Klaus Mann, *André Gide and the Crisis of Modern Thought*, 1945; and *The Journals of André Gide*, trans. by Justin O'Brien, vol. 1., 1889-1913, 1947; vol. II., 1911-1927, 1948.

Gide, Charles (1847-1932), Fr. political economist; b. at Uzès (Gard). Prof. at univ. of Paris, 1898-1920. Early became attached to Christian Socialist movement. Works include *Principes d'économie politique* (1884); *La Coopération* (1900); *Histoire des doctrines économiques* (with Charles Rist) (1909); *Principes notions d'économie politique* (1921); and *La Coopération à les colonies communistes et Coopératives* (1930).

Gideon, warrior judge of Israel, won the title of Jerubbabai ('Let Baal plead') for destroying the heathen god's altar at Ophrah, his bp., and seems in his youth to have tried to rouse the people from their idolatry and sloth. But his great achievement was to overwhelm the Midianites at the bloody battle near Mt. Gilboa. These people were continually making inroads for rapine, and G. believed that Jehovah had directly inspired him to lead the chosen people against them. The fruits of this struggle were a peace of forty years. The higher biblical criticism has revealed the fact that the G. story is inconsistent, and probably a coloured and dramatic version of what actually occurred.

Gielgud, Arthur John (b. 1904), Eng. actor, b. in London, April 14. His father, Frank G., was a member of a Polish family which had settled in England some years previously. On his mother's side he is connected with the celebrated theatrical family the Terrys (q.v.). His mother was a daughter of Kate Terry and a niece of Ellen Terry. G. was educated at Westminster School, and deciding on a stage career he then studied at Lady Benson's school, gaining from there a scholarship to the Royal Academy of Dramatic Art. His first appearance on the stage was in 1921 at the Old Vic Theatre as the herald in *Henry V.* For the next few years he played a great variety of roles in a succession of plays. Early in 1928 he visited New York, playing at the Madison Theatre in *The Patriot*, in which he took the part of the Grand Duke Alexander. In 1929 he was again with the Old Vic Company, playing a number of Shakespearean roles, including Hamlet and Macbeth. The following year he played Hamlet at the Queen's Theatre and also John Worthing in Wilde's *The Importance of Being Earnest*. With these two roles he assured his reputation as one of the leading actors in the country. He then scored a big success with his production of *Richard of Bordeaux*, in which he played the title role. The play ran for two years. In 1934 he

again played Hamlet in his own production, which was marked by a very successful run. Two years later he continued his success in Hamlet during a second run in New York. In 1939 he was at the Lyceum Theatre, also as Hamlet, which he played with the Old Vic Company at Elsinore on the outbreak of war. During the war years he toured in plays for the army and the R.A.F. in the United Kingdom, Malta, and Gibraltar. In London he produced Barrie's *Dear Brutus*, in which he played Will Dearth (1941). In 1944 he formed his own company for a season of repertory at the Haymarket Theatre, playing Hamlet, Valentine in *Lore for Lore*, Oberon in *Midsummer Night's Dream*, and Ferdinand in *The Duchess of Malfi*. In 1945 he travelled in Burma, playing in Hamlet and Coward's *Blue Spirit*. He has also appeared in films, notably in *The Good Companions* (1932) and as Disraeli in *The Prime Minister* (1940). An autobiography of his early years is contained in *Early Stages* (1939, 1949).

Gien, tn. of the dept. of Loiret, on the R. Loire, France. It has porcelain manufs. The tn. was severely damaged in the Second World War. Pop. 8,290.

Giesebrecht, Friedrich Wilhelm Benjamin von (1811-89), Ger. historian, held the chair of hist. both at Königsberg (appointed 1857) and at Munich (1862), and left behind him a long series of historical works. Of these the most valuable and exhaustive is his *Geschichte der deutschen Kaiserzeit* (1855-94), which treats of no events later than 1811. A trans. of Gregory of Tours (1851), *Deutsche Helden* (1851), and *Arnold von Brescia* (1873) are his publs. See Lord Acton, *English Historical Review*, vol. v., 1890.

Gieseler, Johann Karl Ludwig (1793-1854), Ger. writer on church hist., graduated in philosophy from Halle in 1817. In 1819 he was appointed to the chair of theology at Bonn as the result of his *Entstehung und die frühesten Schicksale der schriftlichen Evangelien*, wherein he disproved the existence of a primitive written gospel. In 1831 he accepted a similar position at Göttingen. His *magnum opus* is his *Lehrbuch der Kirchengeschichte* (5 vols., 1821-57). In this work he gives the world the benefit of his profound learning and carefully sifted information, and may not unfairly be associated with Neander, though he could not grasp with the same intensity the fullness of the spiritual life of Christian churches.

Giessen, tn. of Hesse, Germany, 16 m. S. by W. of Marburg, connected by rail with Kassel, Koblenz, and Cologne. Situated amid picturesque surroundings at the confluence of the Lahn and Wieseck, it has a univ. (founded in 1607), whose chemical laboratory was the scene of the valuable researches of Liebig (1824-52); and has manufs. of woollen and cotton goods, leather, tobacco, machinery, etc. Pop. 36,000.

Giffard, Godfrey (c. 1235-1302), bishop of Worcester and chancellor of England, son of Hugh G., of Boynton, Wiltshire, a

royal justice, and younger brother of Walter G. (*q.v.*), to whom he owed advancement. Became canon of Wells and rector of Mells; archdeacon of Barnstaple (1265-67). Walter, becoming chancellor, made Godfrey chancellor of the Exchequer, 1266. The same year Godfrey succeeded to the chancellorship of England, archdeacon of York and rector of Adlington (1267); became bishop of Worcester (1268), and soon afterwards resigned chancellorship, though still often employed on state business.

Giffard, Hardinge Stanley, *see* HALESBURY, EARL OF.

Giffard, Walter (d. 1279), archbishop of York; *b.* probably before 1233, elder brother of Godfrey G. (*q.v.*). Became canon and archdeacon of Wells. Bishop of Bath and Wells, 1261. Made chancellor of England after battle of Evesham. Pope Clement IV. appointed him archbishop of York, 1266, and he resigned chancellorship. G. received great seal on death of Henry III., was principal of the three governing England till new king's arrival (1271), and one of the guardians of England during Edward I.'s absence in 1275.

Giffen, Sir Robert (1831-1910), Brit. statistician and writer on finance. From 1876 dates his association with the Board of Trade, where he served as chief statistician, assistant secretary (1882), and controller-general (1892-97). His chief publs. were *Essays on Finance* (1879, 1881); *The Growth of Capital* (1890); and *Economic Inquiries and Studies* (1904).

Gifford, William (1757-1826), Eng. political writer and man of letters. Early left an orphan, he was rescued from a 'state of savage melancholy' by Cookley, a local surgeon, who sent him to school and afterwards to Oxford. His ability and sad story persuaded Lord Grosvenor to appoint him tutor to his son and to afford G. his home as an asylum (1782). From this time forth G. devoted himself to writing. His *Bariad* (1794) and *Harriad* (1795) were powerful satires directed against the Della Crucians of Florence, and the ineptitudes and corruption of modern dramas respectively. In politics he was an enthusiastic admirer of Pitt, a good hater of the Fr., and a bitter opponent of Radical principles. Among his illustrious associates were Pitt, Canning, Keble, and the marquess of Wellesley. G. was the first editor of the *Quarterly Review*, with which he was connected from 1809 to 1821, but though by his vigorous political partisanship he secured for it an ever-increasing circulation, he nevertheless blackened its pages with a cruel and prejudiced attack on Keats's *Jennydion* and many similar onslaughts on the writings of Shelley, Lamb, Hazlitt, and others. *See* R. B. Clark, *W. Gifford, Tory Satirist, Critic, and Editor*, 1930; also Hazlitt's open letter to him, and his short autobiography (1827).

Gift, transfer of property without valuable consideration (*q.v.*) to a person who accepts the property either by himself or through his trustee. To constitute a G. there must be both a complete

transfer and an intention to give. As to what amounts to the former, much depends on the nature of the property. Such a movable chattel as a bicycle would require no more than delivery accompanied, as the law says, by *verba de presenti doni* (i.e. by words indicating that a G. is made). The transfer need not, however, be to the person intended to be benefited, but may be to a trustee for the benefit of the donee. A donee is not bound to accept a G., but if the G. be made by deed it vests in the donee without acceptance until he repudiates it. A promise to make a G. in the future gives no right whatever. An infant may accept a G. and repudiate it on attaining twenty-one. A *donatio mortis causa* is a G. made by a man in contemplation of his death from an existing illness. Following the principles of the civil law (*q.v.*), the law is that a 'death-bed G.' is made only on condition that the thing shall be returned if the donor recovers, and that it is revoked by the predecease of the donee. A *donatio mortis causa* is ineffectual without delivery, either to the donee or someone on his behalf. It appears to be settled law that bank shares, railway stock, consols, and building society shares cannot be the subject of a *donatio mortis causa*, and cheques given must be cashed or negotiated before the donor dies. Delivery of the key of a safe would be effectual to pass securities in the safe.

Gifu, tn. of Japan, manufacturing silk and paper goods, near Lake Biwa, on the Central Railway in the *ken* or gov. of Central Nippon of which it is the cap. Pop. 15,000.

Giga, more commonly called **Gigue**, was originally always a sprightly dance measure in 3/4 time, being often introduced into the suites of Bach and other old master. It has also been used by Bach and Handel to finish a suite, and then simple time is sometimes found. 'Jig' as in Irish jig, is another form of it.

Giggleswick, par. and vil. in the W. Riding of Yorkshire, 16 m. N.W. of Skipton; known chiefly for its public school, founded in 1512. Pop. 800.

Gigli, Beniamino *ib.* 1890, It. operatic tenor, *b.* and educated at Recanati, his father, a shoemaker, being the sacristan of the cath. ch. there. At the age of seven he joined the cathedral choir. He failed to secure admission to the Schola Cantorum of the Sistine Chapel, but won a scholarship to what is now the Conservatorio di S. Cecilia, and studied music at the conservatory in Rome under Prof. Enrico Ronali. He made his debut on the operatic stage at Ravenna, near Venice, in 1914 in the part of Ezio in Ponchielli's *La Gioconda*. He then toured the chief It. cities and also sang in Paris, Berlin, Madrid, and elsewhere in Europe. In Monte Carlo in 1917 he created the part of Ruggiero in Puccini's *Bohème*. He also sang at the Scala in Milan, where he estab. his reputation as one of the best tenors of the day. In 1920 he went to New York as a member of the Metropolitan Opera Company, and made his debut there on Nov. 17 of that

year as Faust in a revival of Boito's *Meistersinger*. He remained with the Metropolitan Opera until 1932 singing in it and it opera among his outstanding roles being that of Mefisto in *Le Roi Lear* and of Walter in Citalani's *Forley*. He has also sung at Covent Garden and in opera houses of Budapest, Vienna

GILA MONSTER

Hamburg, Munich and Zurich. As a concert artist he has given recitals in most of the large cities of Europe, the U.S.A. and America.

Gijon, on the bay of Biscay, 11 mi. S.W. of Oviedo in the prov. of Oviedo, N. Spain. When in 1851 the town was connected by rail with Langreo, the great coal mining centre, and with Avilés and Oviedo, the foundation of its present commercial prosperity was laid. Its exports, including iron, copper, fish and agricultural produce, amount to about £120,000 annually. Its imports, which consist chiefly of machinery, timber and foodstuffs, amount to about £60,000. Moreover G. has its own blast furnaces, glass, tobacco and china factories and petroleum refineries. Besides the finest harbour between Santander and Liverpool, Charles V. made the first quay (1574) and since his day it has been many times reconstructed. The old town is perched on the promontory of Santa Catalina, the modern portion covering the shore between Cayas Torres and San Lorenzo. The bull ring, in the latter quarter, accommodates 12,000 spectators. Pop. 57,000.

Gila Monster, popular name for the poisonous lizard called *Heloderma suspectum*, which frequents the sandy wastes of Arizona, Texas and New Mexico. Its colouring is brilliant orange and black and its victims are chiefly birds and small animals.

Gilbert, Sir Alfred (1851-1934), Brit. sculptor and goldsmith, studied under Cavalier at the École des Beaux Arts in Paris and also in the studio of Sir John Boehm, P.A. At Rome and Florence he was an enthusiastic admirer of the masterpieces in the galleries of sculpture, and his admiration is reflected in his 'Mother and Child' and 'Percuss Arming,' which were

assuredly inspired by Renaissance work. His 'Icarus' attracted much attention in the Royal Academy Exhibition of 1884, but of his work known to the general public the most highly appreciated is the Shaftesbury memorial fountain (1903) (1885) in Piccadilly, London. G. also executed the statue of Queen Victoria at Winchester (1898), the memorial to the duke of Clarence, and fine busts of G. I. Watts, Sir Henry Tate and many others. Received Brit. Sculptors' Society gold medal 1906. See Sir J. Hutton *Life and Work of Alfred Gilbert* 1903 and Isabel McAlister *Alfred Gilbert* 1929.

Gilbert, Cass (1859-1934), Amer. architect b. at Zanesville, Ohio, son of Gen. Samuel Augustus C. Educated in common school, Zanesville, St. Paul and Massachusetts Institute of Technology, B.S. (1881) of Univ. of Michigan and Oberlin and Middlebury Colleges. Began practice in 1883. Is noted for his skyscrapers, especially the Woolworth Building, New York (see ARCHITECTURE). He is architect of the Capitol and other buildings at St. Paul, Essex Co. Court House, Newark, New Jersey, Agric. Building, Omaha Exposition 1891, U.S. Custom House, New York, Festival Hall, St. Louis Exposition, Central Public Library, St. Louis, Detroit Public Library, general plans of Univ. of Minnesota, Univ. of Iowa, and completion of Arkansas Capitol at Little Rock, U.S.A., Treasury Annex, Washington, D.C., W. Virginia

SIR HUMPHREY GILBERT

State Capitol, U.S.A., Chamber of Commerce. Appointed by President Roosevelt, chairman of Council of Fine Arts by President Taft, member of the Commission of Fine Arts, reappointed by President Wilson, President Amer. Institute of Architects 1908-9, president National Academy of Design, 1920-27. See also ARCHITECTURE.

Gilbert, Sir Humphrey (c. 1539-83), Eng. navigator, was educated at Eton and

Oxford, and had served as a soldier in Ireland and the Netherlands, been in Parliament, and pub. his famous *Discourse on a North-West Passage to India* (1570) before he finally obtained his much-coveted patent from the queen to 'discover and possess' remote 'heathen lands not actually possessed of any Christian prince or people.' The immediate result of this charter was the fruitless expedition of 1578-79, when Raleigh sailed in his company. In 1583 he fitted out another fleet, formally occupied Newfoundland, where he landed in Elizabeth's name, and having planted the first Eng. colony, was on his way home when the little frigate, the *Squirrel*, in which he insisted on sailing, capsized, and the *Golden Hind* was left to carry home the tidings of their leader's untimely death. See life by D. B. Childsey, 1932.

Gilbert, Sir John (1817-97), Eng. painter, sketched and drew from his earliest childhood, and seems chiefly to have been his own teacher, for his only lessons in art were received from Lance, the fruit painter. He exhibited at the Royal Academy from 1838, beginning with the 'Portrait of a Gentleman,' and continuing, except between 1851 and '567, till his death to exhibit there a number of his best paintings, such as 'Don Quixote's First interview with the Duke and Duchess' (1842), 'Holbein painting the Portrait of Anne Boleyn' (1842); 'Charles-magne visiting the Schools' (1846); 'Rembrandt' (1867); and 'Naseby' (1873), this being one of the most splendid of his designs. Two hundred and seventy of his water-colours were hung from 1852 onward in the gallery of the Old Water Colour Society, of which he became president in 1871. The success moreover of the *Illustrated London News* is said to have been due not a little to his engravings. Nearly all his subjects are historical, and a breadth of style, a vigour of conception, and a rich and harmonious coloration characterise his work. A few of his other works are 'Don Quixote and Sancho Panza' (1841); 'Richard II. resigning his Crown' (at Liverpool); and 'Morning of Agincourt.'

Gilbert, Sir John Thomas (1829-98), founder of the Public Record Office in Dublin, was for many years (1855-89) in charge of the library of the Royal Irish Academy, an office which he found very congenial, as it gave him every facility for satisfying his passion for hist. and antiquities. He ed. the civic records of his bp., Dublin, as far back as 1730, and was the author of *Historical Essays on Ireland* (1851); *History of Dublin* (1854-59); and *Contemporary History of Affairs in Ireland, 1641-1832* (1880). See life by his wife, 1905.

Gilbert, William (c. 1540-1603), father of the science of magnetism, studied in Cambridge and Italy, and about 1573 was admitted to the College of Physicians in London. Queen Elizabeth made him her physician-in-ordinary, but his fame rests on a far more substantial basis than royal favour, for in 1600 he pub. his exhaustive and original treatise on magnetism, viz. *De magne, magneticisque corporibus, et*

de magno magne tellure, a work which earned him the admiration of Galileo and an encomium from Erasmus containing the words (he is) 'great to a degree that is enviable.' In his realisation of the affinity and essential difference of magnetism and electricity, and of the communicability of telluric magnetism, in his fine conception of the whole earth as a great magnet influencing the direction of the magnetic needle N. and S., and his invention of terms 'electric emanations' and 'electric attractions,' etc., he may be said to have estab. all the 'fundamental facts' of his science. See the Eng. trans. of *De Magne* by S. P. Thompson, 1900.

Gilbert, Sir William Schwenck (1836-1911), Eng. humorist and playwright, was the son of a novelist, and a descendant of Sir Humphrey I., the explorer. His schooling was received in Boulogne and Ealing, and in 1856 he graduated from King's College as a B.A. of the univ. of London. For four years (1857-61) he led a clerk's life in the education dept. of the Privy Council, but finding such an existence too slow decided to follow law, and was called to the Bar in 1864. From this time onward his time was largely occupied with all manner of literary activities, though he found time to serve as magistrate for Middlesex (1891), and to hold a captaincy in the volunteers. For many years after 1861 G. was a popular contributor of comic verse and illustrations, signed 'Bab,' to *Fun*, and his *Bab Ballads* which appeared in 1869, were merely a collection of his contributions. These lyrics, together with *More Bab Ballads* and *Songs of a Savoyard*, are full of splendid nonsense and of graceful whimsicalities. For some time G. acted as dramatic critic for the *Illustrated Times*, and it was his work on this paper which turned his attention to the stage. From 1866, the year of his success with a burlesque entitled *Dulcamara*, he continued to write original plays, among them being a clever fairy play entitled *The Palace of Truth* (1870); *Pygmalion and Galatea*, a mythological comedy (1871); *Sweethearts* (1874); and *Dan'l Druce* (1876). *Fogarty's Fairy and other Stories* is the best collection of his tales, most of which first appeared in magazine form. His famous partnership with Sir Arthur Sullivan dates from 1871. At first at the Royalty, and later at the Savoy, under the management of Richard D'Oyly Carte, there appeared in rapid succession a series of delightful operas, of which G. was the librettist, the most popular of them being *H.M.S. Pinafore* (1878); *The Pirates of Penzance* (1880); *Patience* (1881); *Iolanthe* (1882); *The Mikado* (perhaps the masterpiece, 1885); *Ruddigore* (1887); *The Gondoliers* (1889); and *The Yeoman of the Guard* (1888), the last-named undoubtedly containing some episodes of true poetry. These operas are ones and all animated by a rich vein of humor which consists in 'a logical topsy-turveydoni,' and of sly hits at the follies and foibles of the day, the satire being of such a disarming urbanity as to be free from all the odium which usually attaches itself to satirists. See

Edith A. Brown, W. S. Gilbert, 1907, and F. Cellier and C. Bridgeman, *Gilbert and Sullivan and their Operas*, 1914.

Gilbert and Ellice Islands, Brit. colony on the W. Pacific, comprising some three main groups of is. scattered in the form roughly of a triangle, the approximate geographical positions of whose vertices are N. (Gilbert Is.) 30° N., 173° E.; E. (Phoenix Is.) 4° S., 171° W.; S. (Ellice Is.) 11° S., 179° E. The colony comprises the Gilbert Is. proper; the Ellice Is.; Ocean Is.; the Phoenix group; and, away to the E., and immediately to the S. of Hawaii, the three detached is. of Washington, Fanning, and Christmas. The colony was built up gradually between 1877 and 1937; while, since 1939, two of the atolls of the Phoenix group (pop. 850), Canton and Enderbury, have formed an Anglo-Amer. condominium, the value of the r. being enhanced in these days of trans-Pacific air travel. With the sole exception of Ocean Is. all the is. are coral atolls, which explains their relatively tiny land area of 400 sq. m. in relation to the vast area of sea over which the groups are scattered (2,000,000 sq. m.). Christmas Is. occupies about half the land area. Ocean Is., or Banaba, lying about 250 m. from the Gilbert group proper (1500 ar.), is the headquarters of the gov. and the site of the Brit. Phosphate Commission. It is 280 ft. high and covered with vegetation (pop. 280). The total pop. of the G. and E. I. is only 36,000 and consists of Micronesians and Polynesians. The pop. of the Gilbert Is. in 1945 was 28,100; that of the Ellice Is., 3500. The Gilbertese are Micronesians, as are the Ocean Islanders, while the Ellice Islanders are Polynesians. The Gilbertese are inclined to be reserved, but the Ellice Islanders are probably the most vivacious of all Polynesians. Life is very austere on these is., for, apart from the coco-nut and pandanus, nothing grows easily, though a coarse tuber, the 'bubai' (*Xanthosoma sagittifolium*), is cultivated in rock and pits. Politically the Gilbertese and Ellice Islanders are remarkably advanced for primitive peoples, having evolved for themselves a sound form of self-government, with native magistrates and headmen (*kaibure* in Gilbertese and *fupule* in Ellice). There are also in each is. a chief *kaibure*, a native scribe, and a local police force. Each council or 'native gov.' makes its own local regulations subject to the approval of the district officer (Brit.) and enforces the Brit. laws of the colony administered by the local courts before they are sent to the high commissioner for enactment as ordinances. Formerly in the Gilbert Is. there were some northerly is. which were outside this politic. system. They were Little Makin and Butritai or Great Makin, where reigned a dynasty of high chiefs. A vivid description of the bloody rule of the last kings of the Makinis is given in R. L. Stevenson's *In the South Seas*, as also a graphic picture of the King Tem Binoka, of Abemama Is. who Stevenson lived for some time. It is surmised that the first white man to sight the Gilberts

was Mendana when he discovered the Solomon Is. (q.v.). But the official discoverers of the G. and E. I. were various Brit. naval officers who sailed these waters between 1764 and 1924. Among them were Capt. Gilbert and Marshall, after whom groups of is. are named. One is. of the Gilberts was named after Commodore Byron, who discovered the is. in 1765. Unfortunately the impact of the white man on the life of the islanders was often disastrous; the friendly and tractable Ellice islanders in particular fell an easy prey to the sordid 'blackbirders,' who snatched them away to toil and perish in the plantations of Mexico and Guatemala, while the white man's diseases thus introduced took terrible toll of those whom the kidnappers had left behind. At this early period some of the atolls were controlled by wandering white sailors and traders, others by missionaries; some by the 'native gov.s.' and high chiefs. Hence to evolve order out of this chaos the two groups were brought in 1877 under the jurisdiction of the high commissioner for the W. Pacific. Subsequently they became a separate entity by the proclamation of a Brit. protectorate over the Gilbert Is. at Abemama, May 1892, and over the Ellice Is. four months later. The protectorate was extended to Ocean Is. in 1900. So acceptable did Brit. rule prove to the natives that it was not long before the 'native gov.s.' expressed the wish to be formally incorporated in the Brit. Empire. The G. and E. groups of is. were annexed in 1915 and with Ocean, Fanning and Washington Is. were constituted into the G. and E. I. colony in 1916. Christmas Is. was included in 1919 and the Phoenix group in 1937. The pop. of the whole colony is steadily increasing and it was to meet a deteriorating economic situation that the Phoenix Is., previously only intermittently inhabited though claimed by Britain, were formally incorporated in the colony. On them numbers of Gilbertese have been successfully settled. Both the Gilbertese and the Ellice islanders are gifted and artistic people, who find their highest form of self-expression in dancing. They are Christians and literate, and their vil. churches are often of impressive dimensions. See Sir H. Luke, *Britain and the South Seas*, 1915.

Gilbey, Sir Walter, Bart. (1831-1911), wine merchant, b. at Bishop's Stortford, Hertfordshire. He volunteered for civilian service in the Crimea, and after his return founded the well-known firm of wine merchants, W. and A. Gilbey. His spare time was devoted to the improvement of the breeds of Eng. horses, on which subject he wrote some standard works. He was president of the Royal Agric. Society in 1895. His writings include *History of the Great Horse or War Horse* (1888); *Ponies Past and Present* (1900); *Horse Breeding in England and India* (1901); *Modern Carriages* (1904); *Farm Stock One Hundred Years Ago* (1910) etc., and a vol. on agriculture from George III. to George V., *The Royal Family and Farming* (1911).

Gil Blas, see under **LE SAGE, ALAIN** **RUNE**.

Gilboa (corruption probably of Heb. *Gib'ath habba'al*, hill of Baal), chain of hills in Palestine between the plains of Esdraelon and the valley of the Jordan, now called Jebel Fukua. Famous for being the scene of the death of King Saul and his three sons after the Philistines had defeated them.

Gild, see **GUILD**.

Gildas, or **Gildus** (c. 516-70), early Eng. historian about whom little is known. He was surnamed Sapiens and also Badonicus from the battle of Mt. Badon, fought between the Saxons and the Britons. Our sole knowledge of him, during the fifth century is derived from his treatise, *De excidio Britanniae*, pub. by Polydore Vergil in 1525 and trans. into Eng. by Habington (1638).

Gilder, **Richard Watson** (1811-1909), Amer. poet and editor, b. at Bordentown, New Jersey. He served as a private during the civil war. Entering journalism he founded the *Newark Register* with Newton Crane, becoming subsequently assistant editor of *Scribner's Monthly* and editor-in-chief of the *Century Magazine* after Dr. Holland (1903). He was one of the founders of the International Copyright League, and took an active interest in all public affairs. Chief works: *The New Day* (1875); *Lyrics*, *The Celestial Passion*, *The Great Remembrance*, *Two Worlds* (collected in *Five Books of Songs*, 1894); *Poems and Inscriptions*, *Letters and Speeches*, of A. Lincoln (1901); *In the Heights* (1905); and *Collected Poems* (1908).

Gilding, art of covering surfaces with gold by mechanical or chemical means for ornamental purposes. According to Herodotus and Pliny the custom was in use among the anc. Egyptians and also the Romans, after the siege of Carthage. The thickness of the gold leaf they employed accounts for the comparatively solid traces extant. The art is seen to perfection in the native processes still pursued in India. It in modern days is widely employed. The various processes used are as follows: (1) Leaf-gilding in which pieces of gold leaf are applied to the surfaces by hand and with adhesives. This is the method employed in church and interior decoration, and also by the shop-fitter, picture-frame maker, and the book-binder, though the latter uses heat or pressure, or both, as well. (2) The application of finely divided gold powder instead of leaf is used extensively in the decoration of glass, pottery, and porcelain. (3) Chemical or electro-chemical deposition. In this process the plating is effected by depositing the gold from solution by means of the electric current generated by dynamo or battery. The articles to be gilded are first washed free from grease, those of Britannia metal, tin, zinc, lead, or pewter being given a thin preliminary film of copper or brass before immersion in the gold solution. This may be prepared in two ways: (1) Electrodes composed of gold sheets are hung by means of platinum wires in a hot solution of potassium cyanide and connected up to

a special dynamo or battery. (2) By dissolving the cyanides of gold and potassium in distilled water. The articles are hung in this solution or, if of small size, are supported in a perforated stoneware carrier. The anode is formed by a gold plate larger in area than the surface of the articles to be plated. The latter are connected with the negative pole of the battery or dynamo. The plating solution is frequently agitated while the process is being carried out and is kept at a temp. of about 110° F. It is probable that some of the new methods used in coating metals, such as the Sherardizing process, may be successfully applied to G.

Gilda, see **GUILDS**.

Gilead ('hard' or 'rugged'), fertile mountainous tract of country traversed by deep ravines, situated in Palestine to the E. of the Jordan. It is bounded on the N. by the R. Yarmak (Heronax) and on the S. by the Arnon. The tribal land of Gad also seems to have formed part of it. Jephthah and Elijah belonged to this beautiful country. Josephus sometimes mentions it as divided into small provinces, called after the caps. estab. by Gk. colonists in the time of the Seleucids. The chief tns. of G. were Jabesh, Mizpeh, Jazer, Penuel, Succoth, Ramoth-Gilead, Mahanaim, and later Pella and Gerasa. See L. Oliphant, *The Land of Gilead*, 1880.

Giles, St. (Lat. *Apollinus*), high born Athenian of holy life, who lived towards the close of the seventh century. His festival falls on Sept. 1. In the Middle Ages he was regarded as the special patron of lepers, beggars, and cripples, and his name still survives in the names of some well-known churches. See Rembray, St. Giles, 1884.

Giles, or **Gilles de Colonne**, see **COLONNE**. **Giles**, Ernest (1839-97), Australian explorer, b. at Bristol, and educated at Christ's Hospital, London. He went to Australia at an early age, and in 1872 made an expedition into the interior, which resulted in the discovery of Lake Amadous. He crossed from Adelaide to Perth about the parallel of 30° S. lat. (1874-76), and recrossed the country between the 24th and 25th parallels, the journey being undertaken on camels. G. proved the interior W. of 132° E. long. to be waste scrub and desert. He pub. *Geographical Travels in Central Australia* (Melbourne) (1871); *The Journal of a Forgotten Expedition* (Adelaide) (1880); and *Australia Price Traversed* (1889).

Gilgal, name given to sev. places which are mentioned in the O.T. as being in Palestine. One is mentioned in Joshua iv. 19 as being about 3 m. E. of Jericho. Another place of similar name was to be found in Mt. Ephraim, N. of Bethel, and a third S.E. of Cesarea, known as G. of the Goin. In Samaria there was another situated near Shechem, and a second near Jericho is mentioned as one of the sacred places in the time of Samuel.

Gilgamesh Epic, old Babylonian epic, the fragmentary remains of which were found inscribed on twelve tablets in the library of Assur-bani-pal at Nineveh. It tells of the adventures of G., who was ruler

of Erech and Enkidu. Resembles the story of Nimrod.

Gilgit, or **Gilgit**, Brit. agency situated in the N.W. of Kashmir. It is the name both of a tn. and dist., and includes Chitral, G., and part of the Indus. It has been the centre of a Brit. agency since 1889. The tn. is situated nearly 5000 ft. above sea level. Area of dist. 30,000 sq. m.

Gill, Arthur Eric Rowton Peter Joseph (1882-1940), Eng. sculptor and typographer, b. at Brighton, son of Rev. A. T. Gill, a minister of the countess of Huntingdon's Connection, who afterwards joined the Church of England at Chichester. G. was educated at the Preparatory School, Brighton, and, from 1897, at the Chichester Art School. Pupil to Douglas Caroe, the architect, 1889-1903, but preferred letter-carving, which led him on the one hand to sculpture and on the other to the designing of type-faces (notably of the fount known as G. sans-serif). He became an agnostic and later a Socialist. In 1910 he began carving the human figure in stone, and he was encouraged by the approval of Augustus John and by the patronage of Count Kessler. A belief that absolute truth must be ascertainable led him to join the Church of Rome in Feb. 1913, in which year he was commissioned to execute the Stations of the Cross in Westminster Cathedral. After the First World War he carved 'Christ Driving the Moneylenders Out of the Temple' and it was placed as a war memorial at the main entrance to Leeds Univ. Other examples of his work are to be seen at Broadcasting House, at Jesus College, Cambridge, in the Tate Gallery, and in the Victoria and Albert Museum. During the latter part of his life he was a partner in a printing business which specialised in hand-setting. He designed the George VI. series of postage stamps. Though his exquisite carvings are notable for their simplicity of design and boldness of execution, they are often done in that over-conscious defiance of convention which was first made famous by Epstein. G.'s pub. works include *Typography* (1931); *Clothes* (1931); *Work and Leisure* (1931); *Money and Morals* (1934); *Art in a Changing Civilisation* (1934); *Clothing Without Cloth* (1934); *Necessity and Relief* (1937); *Work and Property* (1938); and *Sacred and Secular* (1940). See also ILLUSTRATION.

Gill, Sir David (1813-1914), Brit. astronomer. Accompanied Lord Lindsay's expedition to Indian Ocean. Official astronomer, Cape of Good Hope, 1879-1898; improved observatories and did geodetic work in S. Africa. Made catalogue of stars of S. hemisphere. President Brit. Association, 1907-8.

Gilles de Rais, see Ritz.

Gillespie, Thomas (1708-74), Scottish divine, b. at Clearburn in Midlothian. He was received into the Presbyterian Church and became minister at Carnock, Fife. He was deposed by the General Assembly in 1752 for what they called contumacy. Attempts were made to get him reinstated, but he refused to re-enter the church

unless they altered their policy. Finally he formed the Relief Church, which was to relieve worshippers from the discipline of the church courts. This body finally amalgamated with the United Presbyterian Church. He pub. *An Essay on the Continuation of Immediate Revelation . . . in the Christian Church* (1771) and *A Treatise on Temptation* (1774).

Gillingham: 1. Municipal bor. of Kent, situated on the Medway, near the tn. of Chatham. The main industries of the tn. are brick and cement manufs., whilst the tn. has also a large torpedo factory. Pop. 62,000. 2. Tn. of Dorsetshire, a few miles N.W. of Shaftesbury. Pop. 3500.

Gillman, Frederick John (1866-1949), Eng. hymn-writer, b. at Devizes, Wiltshire. He was a member of the Adult School movement and the Society of Friends, and was a leading member of the committee which compiled, in association with Sir Walford Davies, the *Fellowship Hymnbook*, pub. in 1909.

Gillray, James (1757-1815), Eng. caricaturist, b. at Chelsea, being the son of a trooper. Successively a letter-engraver and an actor, he became a caricaturist after studying the works of Hogarth. Before 1790 he had estab. himself as one of the most successful of Eng. caricaturists. His caricatures were good-humoured and topical, being aimed principally at Napoleon and the Fr., and also at the leading politicians in England. In a broad way he caricatured the follies and vices of the day. In particular he satirised George III. and his court. See also UNDER CARICATURE. See life by J. Wright, 1851.

Gills, or **Branchia**, respiratory organs of aquatic animals, consist of delicate expansions of skin through which the oxygen is taken into the blood and carbonic acid emitted. Invertebrates generally respire through the skin, and their G. are merely slight expansions of the body wall; many Echinodermata have their respiratory organs attached to their feet or tentacles, or connected with the thin filaments which float from the head; some of the lower crustaceans, e.g. *Phyllopora* and *Branchiopoda*, also breathe through their feet or through respiratory filaments, as in the case of the lobster. *Limulus*, the king-crab, is characterised by a series of broad, flat sacs called 'gill books,' which are borne on the abdominal appendages. The lamellibranchiate molluscs usually carry their G. in the form of ciliated plates on each side of the body. In fishes the G. are generally composed of triangular, membranous folds of skin which are supported by the branchial arch, and lie on each side of the gullet. G. are not found in any order higher than the amphibians and in certain cases, e.g. the frog, they are replaced by lungs in later life.

Gilly, industrial tn. in Hainaut, Belgium, just outside the city of Charleroi. There are important coal-mines here. Chief industries are iron and copper foundries, glass, chain, bolt, and cable works, boiler construction, brewing, and distilling. Pop. 24,200.

Gillyflower, term applied to sev. very

different plants, but is most often used to indicate *Cheiranthus Cheiri*, the wall-flower. *Dianthus carophyllus*, the pink, and *Matthiola incana*, the stock, are also called by this name.

Gilman, Daniel Colt (1831-1908), Amer. educationist, b. at Norwich, Connecticut. At the Sheffield Scientific School of Yale Univ. he was prof. of political and physical geography. He had an almost revolutionary influence on Amer. educational methods. In 1872 he became president of the univ. of California, and two years later he became the first president of the Johns Hopkins Univ. He became the president of the Carnegie Institution at Washington in 1901. Amongst his publs. were *University Problems in the U.S.*; *James Munroe*; and *The Launching of a University*. See life by F. Franklin, 1910.

Gilman, Harold (1876-1919), Eng. painter. Early education, Oxford and Slade School. In Spain studied Velasquez, and worked out a technique of delicate colour modulations. Became associated with Sickert and his Saturday afternoon receptions at 19 Fitzroy Street, London, of which Frank Hunter has said: 'Sickert was *chef d'œuvre*'. Round him gathered gifted equals and juniors - Augustus John, Wyndham Lewis, and Henry Lamb were frequenters. 'Spencer Gore was his chief of staff, with Harold Gilman as an exceedingly able but sometimes difficult-to-manage aide-de-camp.' Uncompromisingly faithful to Impressionist technique, G. became first president of the London group, and later a chief spirit in the Camden Tn. group (1911). Lived two years in Letchworth, where his style underwent a change, and he left his subdued painting behind. A fellow worker of the Camden Tn. group, W. Ratcliffe, tells that it was due to the influence of Spencer Gore, who used no medium whatever for his paint, that G. abandoned his thin pigments. A realist absolutely, G. liked painting domestic things, things that went on in the house. Like Gauguin and all the Impressionists, if he saw green in a face, he would put it in strongly green, letting the crude colours balance one another. He did many portraits of his mother, an example being among the purchases of the Chantrey bequest. Other outstanding works are a beautiful snow piece done at Letchworth, 'Children,' the luminous 'Washing Day,' the rich 'Yellow Hat,' landscapes, and 'Hampstead Road' (1914). His last and perhaps greatest picture, 'Halifax Harbour, Canada' (6 ft. by 4 ft.), was finished Oct. 1918, and is at Ottawa. As stated in *The Times* when G.'s work was exhibited at the Lefevre Gallery in 1918, he 'was endowed with real originality of vision, as well as an obvious and professional mastery of his medium.' G. lived his art. See K. Rutter, *Art in My Time*, 1933, and G. Ginner, 'The Camden Town Group' in *The Studio*, Nov. 1945.

Gilpin, Bernard (1517-83), Eng. clergyman, known usually as the 'Apothecary of the North,' b. at Kentmere Hall, Westmorland. He was educated at Queen's Col-

lege, Oxford. After accepting a vicarage for a short time, he travelled in France, and studied at Louvain and Paris. On his return he was made archdeacon of Durham. His fearlessness and outspokenness gained for him many enemies, but he was ultimately appointed rector of the par. of Houghton-le-Spring. He was offered the bishopric of Carlisle, but preferred to remain in his own par. Here his influence for good was enormous. He did much for education, and built and endowed a grammar school. Spent much of his time in the wilds of Cumberland and Northumberland, on what were called missionary journeys.

Gilyaks, Gee-laks, or Ghillaks, aboriginal race in Siberia. Their country extended from Tamborst or Glin, some 350 m. S. of Nikolayevsk, to the coast near the mouth of the Amur, as well as over the N. half of the Is. of Sakhalin. Réclus, who called them 'Giliaks' or 'Kilé,' holds the view that they were 'related to those mysterious Ainos who are the object of so much discussion among ethnologists.' He that as it may, much light was thrown on their curious superstitions and primitive habits by Henry Lansdell, the famous missionary, who journeyed through Siberia in 1878. Lansdell regarded the race as the most thoroughly heathen in Siberia and he indicated in his *Through Siberia* that though there was trade between Europeans and the G., very little was known of them. As a matter of fact they were a fast disappearing race even when Lansdell visited them. Women occupied a low position among the G., who, like the neighbouring Goli, were polygamists, and, according to Jap. records as quoted by Ravenstein, polyandry also prevailed. In stature these aborigines were diminutive, usually below rather than above 5 ft. Their skin was tawny, like the Chinese; hair black and not thick. They subsisted entirely on fish. Extremely superstitious, the G. believed in wooden idols and charms as antidotes to disease. Their idols were in the form of the tiger, bear, etc., which animals were closely connected with their superstition, if not their religion. The 'shamans' or priests, who might be male or female, were regarded as powerful mediators between the people and the evil spirits. Consult also P. M. Collins, *Siberia to Japan*, 1866, and the same author's *A Voyage down the Amoor*, 1860.

Gin, or Geneva, spirit distilled from malt, or from unmalted barley or other grain, and afterwards rectified and flavoured very slightly with oil of turpentine or juniper. It contains from 40 to 50 per cent of alcohol. Sweetened G. or Old Tom is made by adding the right proportion of sugar to the ordinary spirit. Hollands (i.e. Schiedam, or schnapps), is a variety made at and around Schiedam in Holland, from rye meal and malt, and is flavoured with juniper berries. The word G. is a shortened form of Geneva, so called by confusion with the Swiss town, but is really a corruption of the O.F. *genêvre*, meaning 'juniper,' from the Lat. *juniperus*. G. is often adulterated with potato spirit, nutmeg, caraway, capsicums, etc.

Ginatilan, tn. on the S.W. coast of Cebu, Philippine Is., 65 m. S.W. of Cebu. Cotton, tobacco, sugar-cane, rice, etc., are grown. Pop. 12,000.

Ginchy, Fr. vil. 7 m. E. of Albert, which was the scene of many engagements in the battles of the Somme in 1916. In 1928 a Brit. war memorial to the Guards was erected there.

Gindely, Anton (1829-92), Austrian historian, b. in Prague, where he received his education. In 1862 he was appointed prof. of hist. at the univ. there, and not long afterwards archivist to the kingdom of Bohemia. His works include *Geschichte des dreissigjährigen Krieges* (1869-80); *Rudolf II und seine Zeit* (1862-65); and *Geschichte der Gegenreformation in Böhmen* (1894).

Ginger (*Zingiber*), E. Indian plant belonging to the genus of Zingiberaceae, which has been cultivated from the earliest times in the E. Indies. It grows in damp, moist places in various parts of tropical Africa, and is cultivated particularly in Jamaica, where many varieties are dealt in commerce. The cultivation is quite simple. When the rootstock is taken up, on the withering of the stems, it is prepared for the market by scalding, or by scraping and washing, the first method yielding black G., the second white G. G. is put to many uses; medicinally as a stimulant and carminative, as a condiment or preservative, and sometimes, when green and mixed with other herbs, as a salad.

Ginkgo, Jap. name for a genus of deciduous coniferous plants consisting of a single species, *G. biloba*, the maidenhair tree, which bears large, yellow, edible fruit and delicate foliage. The Jap. hold the tree as sacred and plant it round their temples.

Ginguene, Pierre Louis (1718-1816), Fr. man of letters, b. at Rennes in Brittany and educated at a Jesuit college there. In 1777 he composed a comic opera, *Le petit Pompon*. In 1791 he pub. *Lettres sur les confessions de J. J. Rousseau*, in which he defended the life and principles of that author. He spent the principles of justice and liberty at the beginning of the Fr. Revolution in his paper, *La Feuille rousseauiste*, and this led to his imprisonment during the Terror, only escaping with his life on the downfall of Robespierre. (A. a. abest work in his *Histoire littéraire de l'Italie* (1811-35).)

Ginkell, Godart, see ATHLONE, EARL OF.

Ginosa, in Italy, a com. of Naples, situated in the prov. of Otranto. Pop. 10,000.

Ginsburg, Christian David (1831-1914), Heb. scholar, b. at Warsaw, Poland. He was educated at the Rabbinic College in his native city, and afterwards pursued the study of the Heb. scriptures, with special regard to the Megilloth, in England. His first treatise was that of the *Song of Songs*, and this he followed up with a trans. of *Ecclesiastes*. In 1870 he was appointed a member of the committee for the revision of the Eng. version of the O.T. His *magnum opus* was the *Massarah*, pub. in three vols. Later pub. were *The Text of the Hebrew Bible in Abbreviations*

(1903) and *Facsimiles of Manuscripts of the Hebrew Bible* (1905). He also contributed many articles to the *Ency. Brit.*

Ginseng, or *Aralia quinquefolia*, species of Araliaceae, well known on account of its doubtful medicinal properties. The root is used by the Chinese as a tonic and stimulant.

Gioberiti, Vincenzo (1801-52), It. philosopher, publicist, and statesman, b. in Turin. He was educated for the priesthood and ordained in 1825, and was subsequently appointed prof. of theology in the univ. of his native city. In 1833, the period of rising political agitation, G., who was chaplain to the king, Charles Albert, was dismissed from court and imprisoned on an accusation of promoting the liberal movement. He then went to Paris and Brussels at the latter city spending eleven years as tutor in an academy. During this time he wrote many works of philosophical importance, formulating his theory of platonic idealism tinged with pantheism. His political ideal was a confederated Italy, with the pope at the head and the king of Sardinia as military guardian. His chief works are *Il Gesù moderno*, an exposure of the Jesuits which precipitated the transfer of rule from clerical to civil hands; *Del primato morale e civile*, identifying religion with civilization and reaching the conclusion that the church is the axis on which the well-being of human life turns; *Prolegomena*, on the same theme but less emphatic; *La Teoria del sovrannaturale*, on the reality of revelation and a future life; and *Introduzione allo studio della filosofia* on method and terminology in philosophy; and *Nuovo prospetto delle scienze economiche*. See Massari, *Vita de V. Gioberiti*, who has ed. his entire writings. See also G. Gentile, *Prophets of the Italian Rising* (n. it.), Florence, 1921.

Gioconda, La (Fr. *La Joconde*), famous portrait of Mona (Madonna) Lisa, 'with the ineffable smile,' wife of Francesco del G. (1468-1488), painted in Florence by his friend Leonardo da Vinci (c. 1502). It is said that he worked on it for four years, and even then considered it unfinished, surrounding her with all kinds of amusements to keep the divine smile upon her lips. The beautiful canvas was acquired by Francis I. for the Louvre. It was stolen from there in 1912 but subsequently recovered. There has naturally been many copies, and it was even claimed, but on insufficient evidence, that the Louvre treasure was not the original. Vasari, Michelet, Théophile Gautier, Gustavo Planché, and George Sand wrote enthusiastically about the picture.

Giocondo, Fra Giovanni (1450-1515), It. architect, engineer, and antiquary, b. at Verona. He became a Franciscan friar and went to Rome to study archaeology, where he made a wonderful collection of over 2000 ant. inscriptions. He was the architect of King Ferdinand of Naples, and later of Charles VIII. of France. He is said to be the designer of the Hôtel Dieu, Pont Notre Dame, and Chambré do Complex. G. was also learned in philosophy and classical literature, and

wrote notes on *Cæsar's Commentaries*. See studies by F. Fiocco, 1916, and G. Badego, 1917.

Gioja, Melchiorre (1767-1829), It. writer on philosophy and political economy, b. at Piacenza. At Milan he was appointed by the Fr. Gov. director of the statistical bureau. G. was one of the first investigators to apply statistics to questions of public morality and political economy. *Filosofia della statistica*, G.'s latest work, contains briefly his ideas on human life, and affords the best insight into his aims and methods. He also wrote *Del merito e delle recompense* (1818), a large treatise giving a systematic description of social ethics from the utilitarian standpoint, and *Nuovo Prospetto delle scienze economiche* (1815-17), containing much valuable information. This last may be considered the best and most original treatment of the div. of labour since Adam Smith's *Wealth of Nations*.

Giolitti, Giovanni (1842-1928), It. statesman, b. at Mondovì in the prov. of Cuneo. He received his education at Turin, and after a rapid career in the financial administration, he was appointed councillor of state and elected to Parliament in 1882. He became minister of the treasury in 1889 and minister of finance in 1890, but he was soon compelled to resign this position on account of his policy of extreme economy. Two years later he became president of the ministry, and during his tenure of office succeeded in introducing many needed reforms in favour of the lower classes. In 1901 he was minister of the interior and in 1906 Premier. Was pro-Ger. in the First World War and a pacifist. Italy having decided to join the Entente nations, G. was replaced in power by Baron Sonnino, and thereafter formulated a new programme of Socialism. In his paper, the *Stampa*, he laid down a vast plan of social, economic, and political reforms, including the abolition of secret diplomacy. He, however, never returned to office. In the plenitude of his power he had been virtually dictator of Italy and was a statesman of undoubted abilities. His autobiography *Memorie della mia vita* was pub. in 1922. See B. Crowe, *History of Contemporary Italy, 1871-1915*, and Count Storza, *Makers of Modern Europe*, 1930.

Gioia, see **DAGU**.

Giordani, Pietro (1774-1848), It. author, b. at Piacenza. His writings are numerous, the most valuable being the collection of letters, *Epistolario*, pub. with the *Opere*. He also wrote various critical essays, political pamphlets, eulogies, and memorial addresses. In his youth G. joined the Benedictine Order, but in 1808 he left it to become secretary of the Academy of Bologna. This office, however, he was obliged to give up in 1815 on account of his Liberal political views, and from that date till his death he continued to fight for the cause of liberty, being remembered as a great patriot as well as a noted writer. G. is considered as one of the greatest classical scholars of his day. See G. Romagnoli, *Della vita e delle opere di Pietro*

Giordani, 1868; also lives by C. Viani, 1920, and G. Leopardi, 1937.

Giordano, Luca (1632-1703), It. painter, b. in Naples. The first rudiments of drawing he acquired from his father, Antonio G., who was, however, an indifferent painter. He painted with great facility at a very early age, and at the age of thirteen he was placed under the instruction of Ribera. His father later took him to Rome, where he studied under Pietro da Cortona and copied many of the great master's pictures. He also visited Venice and studied the works of Paul Veronese and Titian. G. painted a great number of pictures, which may be seen in the chief galleries of Europe. One of the most famous is 'Christ expelling the Traders from the Temple' in the church of the *Pedri Girolamini* in Naples. Others of note are 'The Judgment of Paris', in Berlin, and 'Christ with the Doctors in the Temple', in Rome. See W. Rolfs, *Geschichte der Malerei Naples*, 1910, and studies by E. Petraccone, 1919, and A. de Rinaldis, 1922.

Giordano, Umberto (1867-1948), It. operatic composer, b. at Foggia, son of an artisan and educated at the Conservatoire, Naples. His first opera, *Marina*, was written while he was still a student, and his next, *Malà Pàla*, was written in 1892. He was a popular composer in the tradition of romantic realism that was the vogue at the end of the last century and most of his themes were melodramatic. His best known opera is *Andrea Chenier* (1896), which, however, suffered by comparison with the work of his contemporaries, Mascagni, whom he somewhat resembles, and Puccini. It was last performed at Covent Garden in 1930. His *Edora* (1898), composed to Sardou's text of the same name written for Sarah Bernhardt, enjoyed some success. He was still writing operas as late as 1928 when *Il Re*, founded on a fabl, was produced to celebrate the reopening of La Scala. D. at Milan.

Giorgio, Francesco (1439-1502), It. architect, sculptor, engineer, painter, and bronze-caster, b. at Siena. He is prominent among the artists of the Renaissance on account of his great versatility; but he principally devoted himself to engineering and military architecture, his services being constantly in demand by the Sienese Republic. His prin. authentic picture is that of the Madonna and Child enthroned in the church of Siena, though there are many others in the different galleries of Europe attributed to him.

Giorgione da Castelfranco (1477-1511), one of the chief Venetian painters of the High Renaissance, whose real name was Giorgio Barbarelli, Giorgione (the George) being applied to him on account of his ability. He was b. at Castelfranco, but we have very meagre information as to the facts of his life. He appears to have been of humble origin, and was brought up at Venice, where he seems to have served his apprenticeship under Giovanni Bellini, and it was at Venice that he became famous. In 1500, at the early age of twenty-three, he was chosen to

paint portraits of the Doge Agostino Barbarigo and the condottiere Consalvo Ferrante. He decorated the façades of about half a dozen palaces in Venice, which have long since been defaced, the most important being that of the Fondaco dei Tedeschi (1508). All accounts of his life represent it as being a person of great social charm, a musician, and a romantic and ardent lover; he is said indeed to have died in consequence of a love affair. It has been said that G.'s position in Venetian arts was similar to that of Leonardo in Florentine art. Quite 150 paintings are attributed to him in the

W. I. Mansell

GIOTTONO
Self-portrait.

European galleries, but only a few are of undoubted authenticity, notably 'Madonna enthroned between Saints Liberale and Francis,' in the cathedral of Castelfranco; 'La Famiglia di Giotto,' in Venice; 'Three Eastern Sages,' in Vienna; 'The Three Ages of Man,' in Florence; and 'The Sleeping Venus,' in Dresden. G. d. at Venice at the zenith of his popularity. See studies by L. Justi, 1926, and Sir M. Conway, 1929.

Giotto (Tommaso di Stefano) (1267-37), It. painter of the school of Giotto, surnamed G. because he imitated the manner of Giotto, his great predecessor. He decorated the Vatican Palace at Rome, and he painted numerous frescoes and oil pictures, many of which are extant. The following are attributed to him: 'Deposition,' in the Uffizi; 'Crucifixion' and 'Adoration' in the Srozzini Chapel at Santa Maria Novella; and the 'Legend of Constantine and Pope Sylvester' at Santa

Croce in Florence. See G. Vasari, *Lives of the Painters*, etc.

Giotto (Ambrogio di Bondone), It. painter, architect, and sculptor, b. in Florence, probably in 1266 or 1267. There are but few known facts about his life, but he was the son of a peasant landowner, it is generally agreed, who, though of no large possessions, was of reputable descent. From G.'s works it is evident that he was a pupil of the Rom. school, developing its early Christian and classic side. His earliest works are to be found in the church of St. Francis at Assisi. Here is his series of the 'Life of Christ' and the 'Allegories of St. Francis.' In 1298 G. painted the altar-piece of St. Peter's at Rome and designed the 'Navicella' in mosaic—Christ saving St. Peter from the waves. This is still to be seen in the vestibule of St. Peter's. The series of frescoes with which G. decorated the walls of the chapel built in Padua in honour of the Virgin brings us to the greatest of his undestroyed enterprises. These frescoes were painted in 1303, and illustrate the life of Christ and the life of the Virgin in thirty-eight scenes. In these G. reaches the height of his genius. G. next returned to Florence and Assisi, where he painted the four famous allegorical frescoes in the vault of the church: 'The Marriage of St. Francis with Poverty,' 'The Triumph of Charity,' 'The Triumph of Obedience,' and 'The Glorification of St. Francis.' Though perhaps hardly of the first rank, G. was an architect and his masterpiece of design, the Campanile, known as G.'s Tower was begun in 1334, when he was made chief architect of the Florentine cathedral. Though unfinished at his death, the Campanile was carried out according to G.'s plan in every detail. Its reliefs and statues are among the finest works of It. Gothic sculpture. The art of painting, as re-created by G., was carried on by his pupils and successors throughout Italy, with but little change or development, for nearly a hundred years. G. d. in 1336. See biographical studies by I. B. Supino, 1920; C. Garra, 1925; E. Cecchi, 1937; and T. Hefner, 1911.

Giovanni de' Medici, see LEO (popes), Leo X.

Gipping, see ORWELL.

Gippsland, in Australia, the S.E. dist. of Victoria, named after Sir George Gipps, governor of New S. Wales from 1838 to 1846. It has an area of nearly 14,000 sq. m., and though mountainous in the N.E. is of a more agric. nature in the S.W., where farming and cattle-grazing are carried on. Its chief mineral wealth consists of gold, silver, copper, lead, coal, etc.

Gipsies, see GYPSIES.

Giraffe, also known as **Camelopard**, tallest of all mammals. *Giraffa*, the Sp. name, is derived from the Arabic *zaraf*, whilst the classic term *camelopard* probably came into use when these animals were introduced into the Rom. amphitheatre from N. Africa. This name has

now more or less fallen into disuse. The G. constitutes a distinct family of ruminants, containing one species only. It is a native of Africa, and is found S. of the Sahara, generally in herds of from five to forty. The chief characteristic of the animal is the enormous length of the neck and limbs, and the long, tufted tail. Its tongue is also remarkable for its great length, combined with elasticity and power. The head is furnished with two protuberances between the ears, commonly described as horns. The G. is an inoffensive animal and usually seeks safety by flight, not being easily overtaken even by a fleet horse. When fighting it kicks

GIRAFFE

swiftly with its hind legs and can make a stout resistance, being capable of even keeping off a lion. Persecution has of late years much reduced the number of Gs., and led to their extermination from many districts. Gs. were first brought to the Zoological Gardens in London in the year 1836, and since then many specimens have been acquired which have bred in the Gardens. The G., however, is rather a delicate animal, and needs care in captivity. These animals are essentially inhab. of open country. Gs. are able to browse on tall trees with the greatest of ease by reason of their long necks and flexible tongues, and they are capable of going for a long time without water and seldom feed on grass. In their native state in Africa, when standing among the mimosa-trees, they can often hardly be detected, as they harmonise so completely with their surroundings. See also under CAMELOPARDALS.

Giraldi, Giglio Gregorio, or Lilius Gregorius (1479-1552), It. poet and archaeologist, b. at Ferrara. In 1507-8 he was at

Milan, studying Gk. Thence he went to Modena, and became tutor to a son of Count Nicolo Rangone—Ercole, afterwards cardinal. He went with his pupil to Rome, and became protonotary apostolic. His library was destroyed in the sack of Rome, 1527. He was an elegant Lat. poet, and systematised classical mythology.

Giraldi, Giovanni Battista (1504-73), It. author, b. at Ferrara, son of Christoforo G. Became prof. of medicine and philosophy at the univ. of Ferrara, 1525. Obtained chair of belles-lettres in succession to Celio Calcagnini, 1537. About 1542 became secretary of state under Ercole d'Este II.; was continued in that employ under Alfonso II. As a member of the Accademia delle Affinità he took the surname of Cinzio, and is commonly known by this assumed name, which, anglicised, is Cinthio. Wrote nine tragedies, the best known of which is *l'Orbecche* (1541). *Gli Hecatommiti* (or 'A Hundred Novels') (1565) is a famous vol. of tales. Shakespeare borrowed from this source his plots in *Measure for Measure* and *Othello*, though in the latter play he profoundly modified the relations of Othello and Iago and introduced two new characters in Roderigo and Emilia.

Giraldus Cambrensis (c. 1146-c. 1220), medieval historian and ecclesiastic, also called Gerald de Barri, of Eng. descent. Under the influence of his uncle, bishop of St. David's, he took holy orders about 1172, and soon afterwards became arch-deacon of Brecknock. This position he filled for four years, and then retired to the univ. of Paris, where he resumed the study of law and theology. In 1181 he returned to England, was made one of the king's chaplains, and accompanied Prince John on his voyage to Ireland. See *Itinerary* (Everyman's Library), 1908.

Girardin, Emile de (1806-81), Fr. politician, journalist, and legislator, the illegitimate son of Alexandre, comte de G. (d. 1855). His idea of a halfpenny newspaper was carried out in 1836, when he founded the *Presse*, a jour. of Conservative and Royalist tendencies. Attacks on this led to the quarrel and duel in which G. killed Armand Carrel, editor of the *National*. Till the revolution of 1848 G. was occupied with politics, gradually becoming a decided Republican. In 1866 he left the *Presse* to direct the *Liberté*, in which he wrote vehemently against Prussia and voted for war (1870). His works (apart from journalism) include *La Fille du millionnaire* (comedy, 1858); *Le Supplice d'une femme* (with Dumas fils, 1865); *De la presse périodique au XIXe siècle* (1837); *De la liberté de la presse et du journalisme* (1842). His first wife was Delphine Gay (1804-55), who wrote 'Lettres parisiennes,' under the pseudonym 'Vicomte de Lannay,' in the *Presse* (1836-47). See his *Collected Works*, 1860-61; G. d'Helly, *Mme de Girardin*, 1868; Saint-Amant, *Mme de Girardin*, 1874; and lives by M. Reclus, 1934, and P. Simiure, 1934; also J. Morienval, *Les Créateurs de la grande presse en France*, 1934, and G. Weill, *Le Journal*, 1934.

Girardon, François (1628-1715), Fr. sculptor, sent by Séguier first to Anguier's studio, and then to Rome. On his return he obtained a position at court, decorating the palaces at Versailles and Trianon under Lebrun's direction. Admitted to the Academy of Painting and Sculpture in 1657 he became prof. in 1659. Chief among his works is 'Tombeau du Richelieu' at the Sorbonne. Others are the white marble medallion of Louis XIV., presented to his native Troyes (1690); equestrian statue of Louis XIV. in Place Vendôme (1699); 'L'Illiver' and 'L'Eulèvement de Proserpine' at Versailles. G. was a friend of Condé, Boileau, Racine, and La Fontaine. He married Catherine Duchemin (d. 1693). See life by P. Francart, 1929.

Giraud, Count Giovanni (1776-1834), It. comic writer of Fr. descent. His first work, *L'Onesta non si vince*, appeared in 1798. He wrote also comedies (4 vols., 1808), somewhat resembling Goldoni's, the most popular being *L'Ugo nell'Imbarazzo* (*La Précepteur dans l'embarras*, 1807). His *l'entro domestico*, 1816-25, was a collection of plays for children, partly in imitation of Berquin's works (1719-91). He raised a squadron of cavalry (c. 1798) to defend Pope Pius VI. against the Fr. G. became director of all the theatres in Italy (1813-31), but ruined himself by speculation.

Giraud, Henri (1879-1949), Fr. soldier, b. in Paris, of Alsatian descent, and educated at St. Cyr. A captain of the Zouaves in the First World War, he was wounded at the battle of Guise and, left on the field for dead, was taken prisoner by the Gers. A few weeks later he escaped from a hospital in Germany and, through his skill with horses, successfully posed as a bus conductor and circus hand, and so made his way into Holland. At the armistice he was a major with four bars to his Croix de Guerre, and chief of staff of the Moroccan Div. Between the two world wars he saw service in the Ruff campaign and, in 1939, was military governor of Metz. On the outbreak of war he was given command of an army in Holland, but was again captured by the Gers., who, mindful of previous experience, kept him under vigilant surveillance at Koningsloot. But again, after casual devising, G. escaped and, despite the offer of a large reward for his recapture, reached unoccupied France (April 1942). To Pétain he pledged himself not to join de Gaulle, but he refused to give any promise not to take up arms against the Gers. Having, however, decided to serve with the armies of Gen. Eisenhower, he escaped from France by boarding a Brit. submarine at the narrow risk of being drowned and, on the day of the allied landing in N. Africa, broadcast an announcement that he had assumed the command of the Fr. forces there, thus associating himself with Adm. Darlan (q.v.). After the murder of Darlan he was unanimously chosen by the Fr. Council to be high commissioner in Fr. N. Africa, as well as commander-in-chief. At meetings with de Gaulle it was agreed to set up a

committee for National Liberation under the joint chairmanship of both generals, but this arrangement was abandoned after the creation of the provisional Consultative Assembly had brought about considerable changes in the membership of the committee. In the spring of 1944, however, his post of commander-in-chief was abolished—nominally because the Fr. forces were assigned to various allied commands, but actually because the men of the *maquis* or resistance movement distrusted him as a representative of the *ancien régime*. He rejected the offer of the post of inspector-general of the Fr. Armies. His last order of the day as commander ended with what, in the circumstances, were peculiarly poignant words: 'There is only one voice, that of France. Men may go, France remains.' G. was one of the most distinguished Fr. soldiers of his day, and regarded as a leading strategist. He was awarded the Médaille Militaire in 1919, shortly before his death.

Girba, see JERBA.

Girder, beam of metal or wood intended to be supported at either end, and to carry a vertical load between the ends. A G. spans the distance from wall to wall and supports a super-structure, such as the pathway of a bridge, a floor, etc. Gs. either extend over one or more intermediate supports, or are supported only at the two ends. In the latter case they are called simple Gs.; in the former, continuous. The upper and lower flanges of a G. are connected by a solid web, or by an open framework of diagonal and vertical members. Gs. naturally differ according to the purpose for which they are required. A sandwich G. is one which is composed of two wooden beams, with an iron flitch plate between, all bolted together. Again, a box G. is one in which the flanges are connected by two web plates, so that a cross-section of the G. is box-like in form. Gs. are mainly used in connection with bridges (commonly being of steel, which has almost entirely replaced cast iron and wrought iron), of which they form the prin. component parts, and they are employed generally to form the horizontal weight-bearing members in steel and iron structures of every kind. G. bridges are generally used for short spans, seldom exceeding 100 ft. In plate-G. bridges the Gs. have solid webs composed of steel plates, and of recent years longer Gs. have come to be constructed. The longest ones are those of the viaduct on the Riverside Drive in New York, erected in 1900, the span being 126 ft. A more extensive adoption of plate-Gs., together with new designs and details, has arisen in consequence of the large amount of new construction and corresponding increase in the weight of rolling-stock in recent years.

Girgeh, Gurga, or Jirgeh, prov. and tn. of Upper Egypt. Area about 675 sq. m. Cap. of prov., Suhag. Pop. 1,288,400. The tn. is on the Nile's l.b., and on the railway from Cairo to Assuan, 60 m. from the ruins of Thebes. It is the seat of a Coptic bishop, has a Lat. monastery, and

a gov. cotton factory. Most of the inhab. are Christians. Pop. 31,900.

Girgenti: 1. Prov. of Sicily, on S.W. coast. It is hilly, but produces cereals, fruits, olive-oil, sulphur, salt, and fish. Area 1172 sq. m. Pop. 435,000. 2. Cap. of above and episcopal see, on an eminence overlooking the sea near the site of anct. Agrigentum, on S. coast, about 60 m. from Palermo. Porto Empedocle, its port, is protected by a mole built on the ruins of an anct. temple. Officially the port includes Licata and Siculiana, and these are the chief tns. in Italy for exporting sulphur. Remains of Agrigentum (fl. 560-406 B.C.) are to the E. of the modern tn. There are interesting medieval buildings, gates, and churches, notably the cathedral (fourteenth century). The library was founded by Bishop Lucchesi, 1765. The Saracens took it from the Gks., 828, and in 1086 Roger I. took it from them and founded a bishopric. In the fighting of 1943 the frescoes of S. Gerlando Cathedral, the convent of the Santo Spirito, and the museum all suffered damage from bombardment, but the Gk. and Rom. ruins of the great temples were unscathed. Pop. 31,000.

Girg, son of Bunai, associated with Eochia in the government of the Pictish kingdom, A.D. 878-90. Hero of numerous stories of more or less apocryphal character. Said to have liberated his country from the Dan. invaders, to have overrun Lothian, and to have subjugated Ireland. In consideration of the privileges he conferred on the monks of St. Andrews, he has been styled the liberator of the Scottish Church.

Girl Guides. This movement was founded in 1910 by Lord Baden-Powell as a parallel organisation to the Boy Scouts. The Brit. headquarters are at 17-19 Buckingham Palace Road, London, S.W.1, and there are training centres for guiders in various parts of the country.

THE GIRL GUIDE
BADGE

In 1948 the total membership in Great Britain and E. Ireland was 445,000, and the world membership in thirty-one countries throughout the world was 2,500,000. The president of the Brit. Girl Guides Association is the Princess Royal, and Princess Elizabeth is chief ranger of the Brit. Empire. Lady Baden-Powell is the world

chief guide. Guiding provides a progressive training for girls between the ages of 7½ and 21, as Brownies (7½-11), Guides (11-16), and Rangers (16-21). The adult leaders are known as guiders and commissioners, and the cadet section is responsible for training girls between the ages of 16 and 21 as potential guiders. The extension section provides Ranger and Guide companies and Brownie packs for physically and mentally handicapped children, and the auxiliary section caters for those in homes and schools for girls taken from undesirable surroundings.

Lone companies are formed for girls who are unable to join ordinary companies owing to their work or where they live. The aim of the Guide movement is to give individual character training through healthy, happy, and adventurous activities; training them in habits of observation, self-reliance, and thoughtfulness for others, teaching them services of value to the public, handicrafts useful to themselves, and promoting their physical, mental, and spiritual development. Special emphasis is laid on camping and other outdoor activities. Membership is open to every girl, irrespective of colour, class, or creed, who is willing to subscribe to the basic principles of the movement, and to keep the promises made at her enrolment. See Sir R. Baden Powell, *Girl Guiding*, 1921; Ann Kindersley (editor) *The Guiding Book*, 1922; and J. Potts, *Girl Guide Badges*, 1924.

Girnār, sacred mt. in the feudatory state of Palitana, India, S.W. of the peninsula of Kathiawar, 230 m. from Bombay. There are sev. Jain temples, and at the base valleys, gorges, and slopes covered with jungle. Altitude 3500 ft.

Girodet-Trionon, Anne Louis Girodet de Roussy (c. 1767-1821), Fr. painter, pupil of Languin and David. He won the Grand Prix de Rome with 'Joseph vendu par ses frères' (1789). He travelled in Italy and France, and was awarded the Légion d'Honneur, 1816. His works include 'Danaë' (1798); 'The Seasons' (1799); 'Ossian and his Warriors'; 'Scene du Deluge' (1806); 'Sommell d'Endymion' (1792); 'L'Inhumation de d'Atala' (1808) (the last two both in Louvre); 'Portrait of Napoleon I.'; and 'Aurora' (1806, Leipzig Museum). See M. Coupin (editor), *Euvres posthumes*, 1829, and life by P. A. Leroy, 1892.

Gironde, maritime dept. of S.W. France, near the G. estuary, formed by the confluence of the Garonne and Dordogne, bordering the bay of Biscay. It comprises part of anct. Guienne, is fertile in the E., but belongs to the region of the Landes on W. coast, being separated from the sea by sand-dunes, 35 to 300 ft. high, extending for 75 m. The dist. is particularly famous for wine (especially claret). The two chief dists. are 'region girondine', above Bordeaux, and Médoc below Bordeaux. The three great vineyards are Château-Margaux, Château-Lafite, and Château-Latour. Turpentine, pitch, and charcoal are obtained from the pine plantations on the coast (*landaise*). Grain, vegetables, fruit, salt, sugar, tobacco, candles, etc., are produced. There are five arrons.: Bordeaux (cap.), Blaye, Lesparre, Libourne, and Langon. In the Second World War operations were carried out in the spring of 1945 by Fr. forces against the Ger. pocket which had continued to hold out at the mouth of the G. Extensive air operations supported the offensive. Those operations against the G. enclave—for the rest of France had long been liberated—were launched on April 14. Long isolated and now demoralised by the allied successes on the main fronts, the Ger. defenders were incapable of any extended resistance, and

the final elimination of the enemy in the area was achieved with the reduction of the is. of Oléron on May 1. Area about 4140 sq. m. Pop. 858,000.

Girondists (Fr. *Girondins*), moderate Republican party amongst the great political parties of the Fr. Revolution, which played a distinguished part in the Legislative Assembly (1791-92) and the Convention. The dept. of Gironde sent up as its representatives the earliest leaders of this party, hence the name. In the legislative assembly the G. held the most commanding position, being the leaders of the progressive or revolutionary party, and they were distinguished by such men as Vergniaud, Gaudet, Isnard, and Brissot, the last named, though perhaps not so distinguished an orator as his co-workers, being a noted statesman. Early in 1792 Louis XVI. was obliged to form a Girondist ministry with Roland and Dumouriez as its chiefs. It was, however, short-lived, and on its close dissensions broke out between the G. and the more extreme members of the assembly. After the National Convention the G. tried to save the king's life but were unsuccessful, and the last effort of the party was an ineffectual attempt to impeach Marat, who, however, overthrew and arrested many of their number. From 1793 may be dated the fall of the G. See A. de Lamartine, *Histoire des Girondins*, 1847; J. Jaurès, *Histoire socialiste de la Révolution française*, 1923; and A. Mathiez, *Girondistes et Montagnards*, 1930.

Girouard, Désiré (1836-1911), Canadian judge and legal writer; b. July 7 at St. Timothee, Quebec Prov.; graduated from McGill Univ.; practised at the Montreal Bar, 1860-95. He was a member of the dominion Parliament for J. Cartier, 1878-1895, carrying the Deceased Wife's Sister Bill, 1882. Judge of the Supreme Court of Canada from 1895. He became deputy governor-general of Canada, 1910. One of the founders of the *Revue critique*. His publs. include *Lake St. Louis: Old and New* (1893; supplement, 1903) and *La Salle* (1894), as well as a number of legal treatises and sev. works on the hist. of the G. family.

Girtin, Thomas (1775-1802), Eng. painter and etcher. He was apprenticed to a mezzotint engraver and soon estab. a reputation by his engravings. He practically estab., however, the modern school of water-colour painters. From 1794 to his death he exhibited at the Academy. See L. Binyon, *Thomas Girtin*, 1900.

Girton College, college of Cambridge Univ., for women. The original college was opened at Benslow House, Hitchin, on Oct. 16, 1869, under the name of the College for Women. The present site in the par. of Girton, 2 m. W. of Cambridge, was purchased in 1872 and the college was then renamed G. C., the removal to the new building taking place in Oct. 1873. Ordinances of 1923 admitted members of the college to univ. lectures and laboratories and to the univ. library; and under the univ. statutes of 1926 members of the college became eligible for all univ.

teaching offices, and for membership of faculties and boards of faculties. Its royal charter was granted in 1924. Entrance scholarships and exhibitions are awarded on the results of a school examination held jointly with Nownham College. Scholarships are of a minimum value of £30, with a possible increase up to £100 for a major, or £50 for a minor, scholarship. Exhibitions are of a minimum value of £15, with a possible increase up to £30. There are also a number of foundation scholarships founded between 1876 and 1943, besides two musical scholarships, and ten studentships and graduate scholarships.

Girvan, tn. and par. of Ayrshire, Scotland, about 20 m. from the co. tn. of Ayr. It is a well-known health resort, and is noted also for its herring fisheries. Pop. 6700.

Gisborne, tn. in the N. Is. of New Zealand. It is the trade centre and port of the rich agric. and pastoral dist. of Poverty Bay. A sunny climate and up-to-date recreational facilities make G. one of the most attractive holiday resorts. It has daily communication with other parts of New Zealand by rail, road, and air. G. is renowned as the first landing place in New Zealand of Capt. Cook (Oct. 1769). Pop. 16,200.

Gisors, Fr. tn., dept. Eure, situated some 30 m. E.S.E. of Rouen; it was originally a Norman tn. of some importance. The castle was partly built by Henry II. of England and the tn. still retains many fine old buildings. It suffered some damage in the Second World War. It manufs. nowadays lace, linen, and leather. Pop. 5800.

Gissing, George R. Bert (1857-1903), Eng. novelist and miscellaneous writer, b. at Wakefield, Yorkshire; studied at Owens College, Manchester. Of a curiously 'unpractical' temperament, he led a chequered and usually unhappy career. Beginning as a clerk in Liverpool, he next went to America, returning to Europe in 1877 to study at Jena. He returned to England in 1878 and eked out the livelihood gained from his novels by taking pupils. About 1886 he took a long-projected tour to Rome and Greece. He had made an unhappy marriage in America, and his first wife being dead, he married again, equally unhappily, in 1890. In 1897 he again visited Italy, with H. G. Wells, and in 1901 was obliged by his health to settle in the S. of France, where he d. His work is marked by sombre power. Most of his novels deal realistically with suburban life, and certainly portray more of the sordid than the joyous aspects of existence. They are nevertheless inspired by a deeply moral ideal. His works include *Workers in the Dawn* (1880, showing the results of his study in Germany); *The Unclassed* (1884, new ed. 1895); *Isabel Clarendon* (1886); *Demos* (1886); and *Thyrza* (1887)—all written from the point of view of a social outlaw—and *A Life's Morning* (1888, his most cheerful novel); *The Vether World* (1889, a gloomy description of semi-starvation); *The Emancipated* (1890); *New Grub Street*

(1891, a study of the effects of want on literary powers); *Born in Exile* (1892, an introspective soul-autobiography); *Denzil Quarrier* (1892, new ed. 1907); *The Odd Women* (1892-93, new ed. 1907); *In the Year of Jubilee* (1894); *Kee's Ransom* (1895); *The Whirlpool* (1897); *Human Odds and Ends* (1897); *Charles Dickens: a Critical Essay* (1898); *The Town Traveller* (1898); *The Crown of Life* (1899); *Our Friend the Charlatan* (1901); *By the Ionian Sea* (1901); *The Private Papers of Henry Ryecroft* (1903, largely autobiographical); *Will Warburton* (pub. in 1905); and the unfinished *Veranilda*. See Morley Roberts, *The Private Life of Henry Mailland*, 1912, and *The Letters of George Gissing*, 1927; S. Alden, *George Gissing: Humanist*, 1922; R. C. McKay, *George Gissing and his Critics*, Frank Swinnerton, 1933. See also lives by F. Swinnerton, 1913; E. Gissing, 1927; G. Roberts, 1930; and S. V. Gapp, 1936.

Giuliano della Rovere, see JULIUS (popes), Julius II.

Giuliani, Giambattista (1818-84), It. philologist, b. near Asti in Piedmont, and devoted the greater part of his life to Dante. He became prof. of moral philosophy at Genoa, and ultimately succeeded to the chair of rhetoric in the same tn. He removed later to Florence. His chief works are *Le Norme di Commentare la Divina Commedia* (1856), and *La Villa Nuova e il Canzoniere di Dante* (1863).

Giugliano, It. tn. in Campania, 6 m. to the N.W. of Naples. Pop. 17,000.

Giulianova, coast tn. of Teramo, Italy. It is linked by rail with tn. of Teramo. In the Second World War the fine Romanesque church of St. Maria was ruined.

Giulio Romano (Giulio Pippi de' Gianuzzi) (1525-1546), It. painter and architect, b. at Rome; studied under Raphael, assisting him in sev. works, including 'Benefactors of the Church,' in the Incendio del Borgo, and the 'Apparition of the Cross,' in the Vatican. This last was one of a series in the Hall of Constantine, with the completion of which he was entrusted on Raphael's death. He succeeded Raphael as head of the Rom. school of painting. Among his early architectural works is the Villa Madama, with its fresco of Polyphemos. In 1521 Federico Gonzaga, duke of Mantua, invited him to undertake numerous renovations and decorations in that city. Here he drained the marshes and made provision against periodic floods; restored the palazzo del Tò, the cathedral, a ducal palace at Manturolo and numerous minor buildings, and did much pictorial work, including the 'History of Troy,' 'Psyche,' 'Icarus,' and 'The Titans.' Later he designed the façade to the church of St. Petronio at Bologna. Among his other works as a painter are 'The Martyrdom of St. Stephen' (Genoa), 'Holy Family' (Dresden), 'Mary and Jesus' (Louvre, Paris), and 'Madonna della Gatta' (Naples). His style is distinguished by freedom and animation. See lives by D'Arco, 1842; J. P. Richter, 1928, and G. Vasari, *Lives of the Painters* (Eng. trans. by J. Foster, 1850).

Giura, see GRAYES.

Giurgevo, or Giurgiu, tn. of Rumania in

Wallachia, on the l. b. of the Danube, opposite Rustchuk, 40 m. S.W. of Bucharest. The tn. was founded by the Genoese in the fourteenth century, was destroyed by the Russians in 1829, and recaptured by the Turks in 1854. It has a large trade in petroleum, salt, and grain, and is the headquarters of commerce between Rumania and Bulgaria. There are also large saw-mills. Oil wells at G. were bombed by the Allies on June 23, 1914, and the place fell to the Russians soon in their offensive in Aug. Pop. 24,000.

Giusti, Giuseppe (1809-50), It. satirical poet, b. near Florence, and early began a brilliant series of poems denouncing the enemies of Italy and her own internal vices. In 1818 he became a member of the Tuscan Chamber of Deputies. Among his friends were Capponi, Manzoni, and D'Azeglio. He was actively sympathetic with the liberation movement, but his temperament inclined him to moderate liberalism, and he was considered by some of his countrymen, e.g. the 'Young Italy' party, to be a reactionary. His poems include *La Chiavolteria* (The Guillotine, 1833), written while he was still a student; *Il Des Ira* (1835), on the death of the Emperor Francis I.; *Lo Stivale* (1836); *Il Bruidisi di Girilla* (1840); *Gli Umanitari*; *Il Papato di Prete Pero*; *Gingillino*; and *Santi* (1846). See monographs by Susan Horner, 1864; G. Florent, 1877; and Leonardis, 1887. The Amer. writer W. D. Howells trans. Giusti in *Modern Italian Poets*, 1887.

Givenchy, or Givenchy-lez-La Bassée, vil. in the dept. of Pas-de-Calais, France, 2 m. W. of La Bassée, which was the scene of severe fighting in the First World War. In the battle of the Lys (1918), April 1918, the G. sector was the key to the whole situation on the S. front of the Ger. attack, and the position there had become especially critical by reason of the withdrawal of the Portuguese from the battle, thereby leaving the 5th Brit. Div. unsupported. This famous div. held an organised line of 11,000 yards, and this successful defence undoubtedly saved Bethune. Earlier in the war G. was occupied by Indian troops, who were heavily attacked by the Gers. in Dec. 1914. There was also fighting at G. in 1915 during the battle of Loos (q.v.). Pop. 1100. See G. A. B. Dewar, *Sir Douglas Haig's Command*, 1922.

Givet, tn. of France, in the Ardennes, it stands on the Meuse and the Canal de l'Est, 10 m. N.E. of Mézières, and near the Belgian frontier. It is a busy manufacturing and trading centre with metallurgical and other factories. There are blue marble quarries near by. An old citadel, built by Charles V. on a height above the tn., is the only remnant of its ant. fortifications. Pop. 6800.

Givors, Fr. tn., dept. of the Rhone, situated 11 m. S.W. of Lyons on the r. b. of the Rhone. It manufs. iron, bottles, and glass, and is also a centre of the coal-mining industry. Pop. 13,200.

Giza (Gizeh): 1. Prov. of Upper Egypt. Area about 400 sq. m., with a pop. of

832,400. 2. Tn. situated on the l. b. of the Nile, some 3 m. S. of Cairo. It is near the Pyramids, which are about 5 m. to the W. The Sphinx and the ruins of Memphis are also in the immediate neighbourhood. An electric railway runs to both of these and also to the Pyramids. The Egyptological museum which used to be here is now removed to Cairo. The Nile is crossed at this point by a bridge. Pop. 66,000.

Gjellerup, Karl Adolf (1857-1919), Dan. author, b. at Røhøfte, Zealand. His works are varied; including poetry, fiction, dramas (in which he was least successful), and criticism. Among them are *En Idealist* (1879), written under the pseudonym of 'Epigonos'; *Det Uge Denmark* (1880); *Germanaernes Læring* (1882) all three novels; *Rødtjørn* (1882), a collection of poems showing his radical tendencies; *Aander og Tider* (1882), addressed to Darwin; *Brynhild* (1884), a tragedy; *Landvænet* (1885), a series of reflections; four dramas, viz. *Saint Just* (1886); *Thamgris* (1887); *Jen Arkadisch Legende* (1887); *Hagbard og Signe* (1888); *Romulus* (1889), a novel; *Richard Wagner i hans Hovedværk Nibelungens Ring* (1890); *Herman Vandel* (1891), a tragedy; and *Minna* (1898), a novel. He gained a Nobel prize, 1916 17.

Glinokaster, see ARGYROCASTRO.

Glaber, Raoul or Rodolphe (d. 1030), Fr. historian and monk of Cluny, b. at Auxerre. His *Historia*, in five books, extending from 900 to 1046, was first pub. by P. Pithou in 1596.

Glabric, Achilus, see ACILIUS GLABRIO.

Glance Bay, seaport of Cape Breton Is., situated on the N.E. coast of Nova Scotia, and the most easterly port of Canada (excluding Newfoundland). It is the centre of the richest coal-mining area in Canada, and is also an iron-mining dist. It is a good harbour and there is deep-sea fishing. There is an airport about 3 m. from the tn. There are twelve churches, thirteen schools, and two hospitals. The tn. owns the electric light and water systems. A Marconi wireless station for the transmission of transatlantic messages has been erected here. Pop. 28,000.

Glacial, or Pleistocene, Period (Gk. *pleistos*, most, and *aios*, new), or Ice Age, the name usually given in geology to the latest div. of time immediately preceding historic time - and following upon the Neocene period. The terms Earlier Post-tertiary or Quaternary era are also used with the same meaning. Glacial period and Pleistocene period are practically synonymous as regards N. and temperate regions, the former referring rather to the climatic characteristics of the age, the latter to its form of life. The chief peculiarity of the time was the marked fall of temp., and the G. conditions of N. Europe and America were similar to those of the polar region of the present day. Great mt. glaciers and ice-fields appear to have formed and gradually advanced southwards, filling the riv. and lake basins, and submerging mts. and lowlands alike. Many geologists believe in sev. great submergences during the G. period. Only

in the nineteenth century was much attention given to the subject. The three chief stages in our knowledge of G. formations and causes are sometimes known as the diluvial hypothesis, the drift hypothesis (started by Lyell), and the ice-sheet hypothesis.

An enormous mass of ice covered Canada and N.E. U.S.A., reaching E. to the Atlantic, and S. even below the region of the Great Lakes and New York. The White Mts., Catskills, and Adirondacks, as well as the Rockies on the W. and the Sierra Nevadas, all show signs of former G. activity, while the glaciers of Alaska and Brit. Columbia were so vast as to form almost a single continuous field. In the old world the ice-sheet spread from Scandinavia to N. Germany, blocking up the Baltic Sea, and northward to Great Britain, across the North Sea, finally reaching to Ireland and the Atlantic. Rocks found in the fen dist. and off Flamborough Head remain as proof of the spread of the ice to the Brit. Isles from Norway before its final melting. The thickness of the sheet has been estimated at some 5000 ft. On the Continent the area covered was about 800,000 sq. m., sev. times larger than the Greenland ice-cap. Small glaciers and snow-fields extended as far S. as the Carpathians and Alps, and to the ranges and Central Plateau of France. The general tendency of all these ice-masses was to move downwards, and from the Scottish Highlands they diverged in both directions, W. and E. to the Outer Hebrides from Ross and Inverness, and to the North Sea from Moray and Aberdeen. The flow eastward was checked by the great Scandinavian sheet which pressed upon the Yorkshire coast and finally forced the Scottish ice N.W. to the Atlantic by way of Galloway and the Orkneys. Part of it also flowed down the Clyde valley, reaching N. Ireland, S. Wales, and the Eng. Midlands, where boulders of Ailsa Craig granite have been found. The present Alpine glaciers are merely humble remains of the mighty ice-sheet which once covered all Switzerland. The former existence of glaciers is proved partly by certain deposits and partly by the peculiar character and formation of the surrounding country. The deposits consist of moraine materials, erratics, marine, fresh-water, and terrestrial accumulations, the most important substance being boulder-clay or 'till.' This is an unstratified clay full of ice-worn stones and boulders, supposed to have been formed under glacier ice. There are often sev. distinct layers of boulder-clay, separated by 'interglacial beds.' The lowest and oldest layer covers a vast area, extending S. to the Bristol Channel and Thames valley in England, and to the foot of the Harz Mts. in Germany. Similar deposits are met with in Switzerland and the Alpine regions, the Apennines, the Corsican Mts., the Sp. Sierras, the Pyrenees, the mt. ranges of France and Germany, and the Carpathians. The rock surfaces beneath are smoothed and striated, or scratched and crushed. Other characteristic deposits are erratics,

askers, or kames, Glants' Kettles, and asks with Arctic marine shells (especially in Scotland and Prussia). There are numerous lakes in glaciated regions, the streams have exceedingly irregular courses, and relatively there is little continuity of slope. Many of the lakes of N. Europe and America originated in the G. period, and those of pre-G. origin were considerably expanded. Lake basins were scooped out by erosion, and the ice-sheet by obstructing valleys in its retreat formed temporary lakes. One such temporary basin spread from N. Minnesota and N. Dakota far into Canada. The lochs of Scotland and the fiords of Norway were very probably largely produced by the erosive action of ice. The soil of glaciated regions is not derived from the disintegration and decomposition of the rock below, but from material or 'drift' carried down from elsewhere. This, unlike alluvium, has some boulders of great size, and its materials are not generally rounded and sorted, but rather of rough, uneven surface, with numerous knolls and undrained hollows. Evidence of former glacial conditions has been found also in the Caucasus, Asia Minor, India (Asia Proper), parts of Africa and S. America, and in New Zealand.

The changes of climate during the G. period were accompanied by migrations of the fauna and flora of the Arctic and temperate zones. As the temp. fell, animals and plants moved from the polar to the tropical regions, returning poleward again with the rise of temp., or seeking refuge on the mt. tops. Thus the climatic changes saw a series of corresponding variations of life forms in the different regions.

Terminal moraines (1200 to 2000 ft. high) of glaciers are to be seen in a great amphitheatre round Iveron the Piedmont plains. The plains of France, Italy, Spain, S. Russia, and England S. of the Thames were not covered by any entire ice-sheet, but were frost-bound during a great part of the year. A detailed study of G. deposits tends to show that the ice must have advanced and retreated again more than once. The exact number and extent of these fluctuations is still a matter for discussion, and different views are held. Some geologists believe in as many as five epochs of glaciation with four interglacial intervals, others only in one.

The true causes of the cold climate of the Ice Age are still much discussed, and many different theories are held. These can only be mentioned briefly here. Some believe it to have been the result of astronomical changes (James Croll and Prof. Ball among others); others of terrestrial changes. Another theory ascribes it to variations in the quantity of heat radiated by the sun, supposing the latter to be a variable star. Changes of level of land and sea, perhaps accompanied by a diversion of the Gulf Stream across the Isthmus of Central America to the Pacific or by submergence of the Panama Isthmus, have also been suggested. One widely spread explanation is based on the relative positions of the earth and the

sun at distant periods of time. The eccentricity of the earth's orbit is subject to gradual and irregular variations. With a maximum of eccentricity the earth is 14,000,000 m. nearer the sun during perihelion than in aphelion, the difference in the amount of heat received from the sun being about one-fifth. See also GEOLOGY and GLACIERS.

For detailed study of the subject see Sir C. Lyell, *Geological Evidences of the Antiquity of Man*, 1863; J. Geikie, *The Great Ice Age and its relation to the Antiquity of Man*, 1874, and *Earth Sculpture*, 1898; W. B. Dawkins, *Early Man in Britain*, 1880; J. Croll, *Climate and Time in their Geological Relations*, 1885; A. Heim and A. Penck, *On the District of the Ancient Glaciers of the Isar and Linth*, 1886; Sir H. Howarth, *The Mammoth and the Flood*, 1887, *The Glacial Nightmare and the Flood* (i., ii.), 1893, and *Ice and Water* (i., ii.), 1905; Sir R. Ball, *The Cause of the Ice Age*, 1891; W. Wright and T. Chamberlin in *The American Journal of Science*, 1892-93; H. C. Lewis, *Papers and Notes on the Glacial Geology of Great Britain and Ireland*, 1891; A. Penck and E. Bruckner, *Die Alpen in Eiszeitalter*, 1901-6; F. Smith, *The Stone Age in N. Britain and Ireland*, 1909; A. P. Coleman, *The Age, Recent and Ancient*, 1926; K. Mason, *Glaciers of Karakoram*, 1930; R. A. Daly, *Changing World of Ice Age*, 1935; and R. F. Flint, *Glacial Geology and the Pleistocene Epoch*, 1947. See also writings of J. Schuchzer, Kuhn, H. B. de Saussure, J. von Charpentier, A. Agassiz, and J. Ramsay. For further references to literature see A. Geikie, *Text-book of Geology*, ii. (4th edn.), 1904, and T. Chamberlin and R. Salisbury, *Geology* (iii.), 1906.

Glaciers (Fr. *glacier*; Ger. *Gletscher*), name given to rivers of snow compacted by pressure into ice. This mass of ice has its origin in the hollows of mts. where perpetual snow accumulates; it moves slowly from higher to lower levels, making its way down towards the lower valleys, where it gradually melts. Not infrequently it reaches the borders of cultivation and has been known even to sweep away villages in their course. A glacier moves at the rate of 18 to 24 in. in a space of twenty-four hours. It is steep and inaccessible at its lower end, but the middle part of its course is more level, though it becomes steeper again towards its source. The ice of which G. are composed differs from that produced by the freezing of still water, being composed of numerous thin layers, more brittle and less transparent than ordinary ice. A glacier usually descends into a valley, far below the limit of perpetual snow, and ends amidst a wilderness of stones borne down upon its surface, the earthy, rocky rubbish being termed a moraine. In tropical and temperate climates G. are found only upon the higher parts of lofty mts., but at the poles great ice, and whole continents are partially and sometimes entirely covered by them. G. have many features in common with rivers. They have regular drainage areas from which they draw

their supplies, they carry along with them in their course rocks, sand, earth, gravel, etc., they reach the ocean in the forms of ice or water, and they convey their burdens of earthy matter to the sea, their influence upon marine deposits being very considerable. The distribution of G. is very extensive. They are to be found in Greenland, which is almost an entire sheet of ice in N. America in Alaska and dotted along the Pacific coast. They also occur in Europe, Norway among the Pyrenees and along the Alps and traces of their presence in past geologic ages are generally appearing over the larger part of N. America and all N. Europe. The unexplored Antarctic continent is to all appearance covered by one huge ice sheet over 10,000 ft thick. Of the 11,000 G. in the Alps perhaps the most remarkable is the lower glacier of the Aar. It has been estimated to have a depth of about 1510 ft and is one of the most remarkably even and accessible G. in all Switzerland. The slope of its surface is in many places only 4° . Such level and easily crossed spaces are also found about the middle regions of the Mer de Glace and in the lower glacier of Grindelwald and it is in such portions of a glacier that internal cascades or *moulins* occur. They arise from the surface water being collected into a considerable mass by a long course over its unbroken surface and then hurled with force into the first rivulet with. A channel is kept open by the descending cascade which at length loses the form of a fissure taking on that of an open shaft sometimes of enormous depth. The middle region of the great G. of the Alps extends from the level of about 6000 to 8000 ft above the sea. Beyond 8000 ft the snow line is reached. Fresh snow annually disappears from the glacier proper and where it ceases entirely to melt it naturally becomes incorporated with the glacier. Everywhere below this region therefore the glacier *melts*, but here it *forms*. In this snowy region is known as *névé* in G. as *Lirn*.

As ascended, the glacier gradually changes from the state of ice to the state of snow. The outer layers are nearly pure snow, but the deeper ones have more consistency and break into large fragments, which at Chamonix, are called *seracs*. The ice of the glacier proper has a very peculiar structure quite distinct from the stratification of the snow on the *névé*. It has a remarkable veined or ribboned appearance explained by Prof. Forbes as being the result of internal forces by which one portion of ice is dragged past another in a manner so gradual as not necessarily to produce large fissures in the ice but effecting a general bruise over a considerable space of the moving body.

The delicate veins seen in the G. have their course in a parallel direction to that of the sliding effort. One portion of the ice over another. Forbes described a glacier as 'an imperfect fluid or viscous body which is urged down slopes of a certain inclination by the mutual pressure of its parts,' but this 'plastic theory' has been objected to, in that ice is by its

nature a brittle solid and not sensibly possessed of any viscous or plastic quality. One of the most important contributions to the solution of this problem was made by Prof. James Thompson, when he predicted that the freezing-point of ice must be lowered by pressure, and in this manner explaining the 'viscous' theory of Forbes. But in spite of the observations made by these two men and by Tyndall and others the real cause of glacier motion cannot yet be considered as satisfactorily solved.

D. McIntosh

SERACS IN A GLACIER IN THE DAUBHINI ALPS

Moraines previously referred to are one of the most remarkable phenomena connected with the work of G. They are accumulations of stones and detritus either piled up on the sides of the glacier or scattered along their surface, and have been detached from the sides of the valley or ravine forming the bed of the glacier by the action of ice.

The fissures or crevasses by which G. are traversed present another phenomenon. They are frequently over 100 ft in depth and often covered with snow, thus adding considerably to the beauty and wonder of Alpine scenery, though they are, at the same time exceedingly dangerous to travellers. G. abound in Switzerland the Tyrol, Piedmont and Savoy, but it is chiefly in the chain of Monte Rosa that they are exhibited in their greatest sublimity.

Gravel cones are occasionally seen on the surface of G., and these are closely connected in origin with the *moulins* already referred to. The glacier of Aar

has examples of these singular cones, but they are comparatively rare on most others.

Glacier tables are another striking phenomenon produced by a similar protective action of large stones, which have become detached from the moraines and lie on the surface of the ice, giving it the appearance of a table. See also DEPOSITION.

Glacis, open space of ground round a fortress, sloping gently down from the covered way to the country. The insurgents are obliged to pass over it in approaching the fort, and thus expose themselves to open fire from the defenders.

Gladbach, or **Bergisch-Gladbach**, tn. in the Rhineland, Germany, about 9 m. E.N.E. of Cologne. Chief industries include iron, steel, and zinc works, paper and paper-mâché works. Coal is worked. Pop. 20,400.

Gladbach, **München-Gladbach**, or **Mönchen-Gladbach**, manufacturing tn. 16 m. W. of Düsseldorf, Rhineland, Germany. It has a fine Gothic church, the crypt of which dates from the eighth century. The building sustained some damage during the fighting of 1915. G. was the centre of the Rhinish cotton industry; there were many dyeing, calico-printing, weaving, and spinning works. The tn. grew up round the Benedictine abbey founded in the eighth century and dissolved in 1802. In the Second World War it was the first considerable industrial tn. to be captured by the Allies in their advance to the Rhine. The Amer. First Army secured communications between G. and Aachen early in Feb. 1945. Towards the end of the month that army pushed towards Cologne, while the forces of the Amer. Ninth Army were directed towards G. and Grovenbroich. By March 1 both tns. had fallen to the Amer. Pop. 126,000.

Gladbeck, tn. in the prov. of Westphalia, Germany, about 8 m. N.N.W. of Essen. The chief industries before the Second World War were the manuf. of cement and coal-mining. Pop. 61,200.

Gladiators, professional swordsmen who in ancient times fought to provide public entertainment. The custom of gladiatorial fights is supposed to have come from the E. and to have been borrowed by Rome from the Etruscans. Its origin is probably to be found in the practice of honouring heroes who had d. in battle by sacrificing the lives of captives. The practice spread to the funerals of all important men, the sacrifice being rendered more interesting to the spectators by the captives killing each other,

and it later still became an independent form of public amusement. The first gladiatorial fight in Rome of which we have knowledge took place in 204 B.C., being arranged by Marcus and Decimus Brutus for their father's funeral. In 217 B.C. Scipio Africanus arranged an exhibition at New Carthage; in 207 B.C. twenty-four pairs of G. fought in the Forum; while Julius Caesar, Titus, and Trajan all gave huge gladiatorial shows. Augustus made some attempt to limit the number of such exhibitions, but they had become so popular that this was impossible. They were unsuccessfully prohibited by Constantine in A.D. 325, and finally abolished by Theodoric (A.D. 500). The G. were either slaves, prisoners, or criminals, who were bought and trained for the business, or freemen of the lowest class who fought for hire. They were sworn to fight to the death and any show of cowardice was punished with death by torture. The defeat of one of the combatants was marked by a cry of 'Iabet!' from the spectators, who then decided his fate, turning their thumbs downward; if they wished him to be killed by the victor. The victor was rewarded with a branch of palm and sometimes received his freedom. There were sev. types of G., such as the *andabate*, who fought blindfolded; the *armillones*, who fought with sword and shield; the *retarii*, who had, as weapons, a net and a three-pronged lance; and the *Thraeces*, who used a short sword and a round buckler. They were occasionally mounted. Discharged G. were known as *rudarii*, from the *rudis*, or wooden sword, with which they were presented. The practice of gladiatorial fights never found much favour in Greece.

Gladiolus, name of a genus of Iridaceæ, which comprises many beautiful species, sev. of which are European. *G. communis*, the foxglove sword-lily, is frequently introduced into Eng. gardens; *G. cardinalis*, the red sword-lily, and *G. gandavensis*, a hybrid form, are natives of the Cape. There are numerous new hybrids, and the species *Branchiocyensis*, *Lemoinei*, and *Primulinus* give gardeners an ample choice.

Gladstone, **Herbert John**, first Viscount (1854-1930), Brit. administrator: youngest son of Wm. Ewart G., educated at Eton and Univ. College, Oxford. He was private secretary to his father, 1880, in which year he entered the House of Commons. In 1891-95 he was chief commissioner of works, and from 1899 to 1905 chief whip to the Liberal party. He became home secretary in 1905 and held that position until 1909. In the following year he was appointed first governor-general of S. Africa. He wrote *W. E. Gladstone* (1918) and *After Thirty Years* (1928).

Gladstone, **John Hall** (1827-1902), Eng. scientist, b. at Hackney; educated at Univ. College, London, and at Gießen. From 1874 to 1877 he was Fulcrum prof. of chem. at the Royal Institution; in 1871 became first president of the Physical Society. His pub. works include *Life of*

Michael Faraday (1872), written from close personal knowledge; *Miracles as Credentials of Revelation* (1873); and *Chemistry of Secondary Batteries* (1883).

Gladstone, William Ewart (1809-98), Brit. statesman, b. on Dec. 29 at Liverpool, the fourth son of John G., a Liverpool merchant of Scottish descent, a member of the family of Gladstones of Lanarkshire. His father sat in Parliament from 1818 to 1827, and was created a baronet in 1846. He was educated at Eton and Christ Church, Oxford. At Eton he was contemporary with a number of brilliant young men, and he took an energetic part in the debates of the Eton Society to which he was elected a member in 1825. He was also co-founder of the *Eton Miscellany*, which he ed. during his last two terms. At Oxford he took a double first in classics and mathematics. While an undergraduate his political and theological interests began to show themselves. He founded an Essay Society, and in 1830 became president of the Oxford Union. He frequently took part in the debates on political subjects. He defended Catholic Emancipation and attacked the Reform Bill in a speech so magnificent that Charles Wordsworth, with whom he read classics, ventured a prophecy that he would become Prime Minister. G. now wished to take holy orders, but his father insisted that he should enter Parliament. John G. had influence with Peel, and his son was, at the instance of the duke of Newcastle, returned (Dec. 1832) to the first Reform Parliament as one of the members for Newark. He sat in the House of Commons until his retirement in 1895, except in 1846, when he was secretary of state for the colonies. G. made his maiden speech on June 3, 1833, and this was favourably received. In this speech he advocated the abolition of slavery in Brit. dominions, and at the same time defended his father from a charge of cruelty to the slaves working on his estate in Demarara. When at the end of the next year Peel became Prime Minister, he appointed G. as junior lord of the treasury, a nomination due to John G.'s connection with Peel rather than to the young man's ability, of which as yet he had given no remarkable proof. He was promoted under-secretary of state for war and the colonies in Jan. 1835, but the ministry went out in the following April. Being out of office G. devoted himself to his favourite studies. Stimulated by the Oxford Movement with which he was sympathetic, both from conviction and through his friendship with Manning, then still a minister in the Church of England, he pub. in 1838 his famous book, *The State in its Relations with the Church*. It was an immediate sensation and aroused considerable controversy. Macaulay in the course of a critical review referred to its author as 'the hope of the stern, unbending Tories.' In the winter of 1838-1839 G. was in Rome. There he became engaged to Miss Catherine Glynne, daughter of Sir Stephen Henry Glynne of Hawarden, Flintshire, and in her issue heir to her brother, Sir Stephen

Glynne, ninth and last baronet. The marriage took place at Hawarden on July 25, 1839. In the general election of 1841 G. was again returned for Newark. Peel formed his second administration, in which G. was vice-president of the board of trade. G. was committed to protection and drafted the revised tariff of 1842. He now showed his consummate mastery of financial and commercial matters. Two years later he became president of the board of trade and entered the Cabinet. Peel's policy of placating the Irish Catholics by increasing the grant to the Catholic training college of Maynooth presented G. with a difficult decision. He wished to support the measure, but felt he could not do so as a member of the gov. because it ran counter to the principle he had expressed in his book. As a private member he considered he was free to change his opinions. He resigned, and his action was widely and wrongly construed as a piece of unnecessary 'political prudery.' In Dec. 1845 he returned to office as colonial secretary under Peel. Peel had been converted to free trade as being in his opinion the only means of averting famine in Ireland. His repeal of the Corn Laws caused a violent split in the Tory party. G.'s increasing mastery of financial affairs also led him to free trade. As a result of his adherence to Peel he gave up his seat for Newark, in which he had been the nominee of the duke of Newcastle, an unyielding protectionist. Thus during his colonial secretaryship he was not in Parliament. In the general election of 1847, however, he was returned for the univ. of Oxford. Peel d. in 1850, leaving a small 'third party' within the Tory ranks. G. remained a Peelite, and the leadership of the Tory party passed him by. In the period which followed his attention was turned to foreign affairs. He crossed swords with Palmerston, the foreign secretary, who nearly precipitated a European war in defence of Don Pacifico, a Maltese and a Brit. subject who had suffered at the hands of the Greek Gov. G. now, as in the future, stood for moral right in dealings with other countries. A visit to Naples in the autumn of 1850 led him to take up the cause of the oppressed subjects of the Neapolitan Gov. His letter of April 7, 1851, to Lord Aberdeen on this subject made him an international figure. In domestic policy he again came to the fore with his masterly impromptu speech, denouncing the budget introduced by Disraeli, then chancellor of the exchequer. This contributed to the fall of Lord Derby's gov. Lord Aberdeen succeeded him with a coalition of Whigs and Peelites. G. became chancellor of the exchequer, and his great speech on the introduction of his first budget on April 18, 1853, established his reputation as a financier beyond question. When Lord Aberdeen went out of office on the question of the mismanagement of the Crimean war, the Whig and Peelite partnership continued under Palmerston, with G. again as chancellor. The gov. was pledged to withstand the move for a select committee to inquire into the conduct of the Crimean war.

Palmerston gave way, however, and the Peelite members including G., resigned (Feb. 1855). There followed for G. a period of political independence, which in the eyes of many appeared to jeopardise his political future, but was in reality a time of growth confirming his leanings towards Liberal principles. Lord Derby, who succeeded Palmerston in 1858, attempted to bring G. into the gov. but he declined a position which would have made him a colleague of Disraeli then chancellor and leader of the House of Commons. In that year he went, at the request of Sir Edward Bulwer Lytton then secretary for the colonies on a special mission to the Ionian Is. but could not

WILLIAM EWART GLADSTONE

stem the agitation for incorporation with the kingdom of Greece. When Palmerston returned to power in 1859 G. accepted office as chancellor of the exchequer and this finally marked his adherence to the Liberal party. He continued as chancellor under Lord Russell with whom he was as much in sympathy as he was at odds with Lord Palmerston. In the general election of 1865 he lost his seat for Oxford, his tenure having become increasingly uncertain as his conversion to Liberalism became confirmed. His severance from Oxford was a matter of great personal regret for him. He stood for Salisbury and was narrowly elected. On the death of Palmerston Lord Russell became Prime Minister. G. was again chancellor but with the added responsibility of being leader of the House. The gov. fell however on the issue of the Reform Bill. In rejecting this measure Parliament was out of touch with the people and G. in defeat became a popular hero. His prestige did not suffer when the Tory administration which followed in 1866 introduced a Reform Bill similar in scope

to his own. The Bill as finally passed owed much to the amendments which G. had forced upon it. On the retirement of Lord Russell in 1867, G. succeeded to the leadership of the Liberal party. The following year the retirement of Lord Derby made Disraeli Prime Minister, and thus the two great protagonists became the leaders of their respective parties. By the end of the year Disraeli's gov. resigned. The Liberals won the ensuing election on the issue of the disestablishment of the Irish Church. G. defeated in S. Lancashire was returned for Greenwich. On Dec. 9, 1869, he became Prime Minister for the first time. He remained in office until 1874. The disestablishment of the Irish Church, the Irish Land Act, the Education Act introducing compulsory national elementary education, and the Ballot Act were among the great domestic measures of his gov. while his handling of the Alabama case (*qv*) was an example of his insistence on moral right rather than force in international affairs. G. failed however with the Irish Univ. Bill (1873), a measure dear to his heart in his efforts to compose the differences of Protestant and Catholic in the service of higher education. G. resigned, but resumed office as no alternative gov. offered. The administration was however less active and in Jan. 1874 G. announced the dissolution of Parliament. In the general election the Liberals were to their surprise defeated. G. himself only narrowly retaining his seat for Greenwich. He felt his work was done and in the belief that early retirement from politics was beneficial for the country he announced a decision which he had long meditated: his resignation from the leadership of the Liberal party. He devoted himself to his theological studies and it so happened at this time that the welfare of the church was in his view threatened by the Public Worship Regulation Bill sponsored by Archbishop Tait the object of which was to abolish ritual. G. felt it compelled to come out publicly in favour of "moderate ritual." His article on ritual and ritualism appeared in the *Contemporary Review* in Oct. 1874. The controversy led him at length into an attack on Roman Catholicism and to the outcry then raised he replied in the pamphlet *The Italian Dictatorship or bearing on Civil Allegiance*. His full return to public life came as the result of his vigorous denunciation of the atrocities perpetrated by the Ottoman Empire upon the Bulgarians. He was thus in direct conflict with Disraeli's pro-Turkish policy. He was also opposed to Disraeli's imperialism which resulted in the Afghan war of 1879-79. G. aroused the conscience of the country, and the Conservatives were defeated in the elections of 1880. Lord Hartington, the Liberal leader retired in G.'s favour. G.'s second administration lasted from June 1880 to June 1885—a turbulent five years which frustrated the Liberal policy of "peace, retrenchment and reform." G.'s sympathy for a people struggling for independence persuaded him to treat with the Boers who had defeated the Brit. at

Majuba, and the first Boer war was concluded (March 1881) by the Boers being granted independence under British suzerainty. In Irish affairs circumstances impelled G. unwillingly towards coercion. Parnell was himself arrested. G.'s Land Act (1881) failed to pacify the country. Parnell was released on condition of co-operation but any good which may have come from this abrupt change of policy, which caused dissension in the Liberal ranks, was destroyed by the assassination of Lord Cavendish (q.v.), the newly appointed Irish secretary. Liberal principles were further compromised by the aggressive action in Egypt where the Khedive who was without popular support, was restored by British arms at the battle of Tel el Kebir. Then followed the rising of the Mahdi in the Sudan the surrender of the Sudan and the death of Gen. Gordon (q.v.). The circumstances of this event excited popular feeling at home against the gov., and G.'s popularity declined. In domestic legislation however, he was more successful and he introduced several Irish measures and extended the franchise to agricultural labourers and others. Owing to a defeat in the House of Commons G. resigned in 1885 but returned to office for the third time in the following year. He now introduced his long cherished measure for Home Rule for Ireland. His own party split on the issue. The Liberal Unionists as the Liberal opponents of Home Rule were called, who included Lord Hartington and Joseph Chamberlain voted with the Conservatives and the Bill was thrown out on the second reading. An appeal to the country brought the combined Conservatives and Liberal Unionists a majority and Lord Salisbury's gov. lasted until 1892. Then G.'s vigorous and successful Midlothian campaign brought him back to power for the fourth time he became Prime Minister. He was now in his eighty-third year. The strain of public life was beginning to tell on his magnificent physique but he was determined to devote his last years to bringing the Home Rule question to a successful issue. In this he was disappointed. His second Home Rule Bill was put before Parliament in Feb. 1893 and after much controversy was passed by the House of Commons in Sept. It was then rejected by the Lords by an overwhelming majority. This was a bitter blow. He did not dissolve Parliament however. He continued in office but with the defeat of his hopes he did not wish for much longer to bear his official responsibilities. He made his last speech in the House of Commons in support of the Parish Councils Bill on March 1, 1894 in which oration he bequeathed to his followers the task of destroying the vestiges of the House of Lords. Two days later he resigned the office of Prime Minister in which he was succeeded by Lord Rosebery. He did not again attend the House of Commons, but he retained his seat until the dissolution on July 8, 1895. He had suffered from falling eyesight, but an operation for cataract restored his vision soon after his retirement. This enabled

him to devote his time to a study of Bishop Butler, whose works he ed. He also pub. *Studies subsidiary to the Works of Bishop Butler*. The Armenian massacres of 1895 and 1897 moved him so deeply that he again appeared to speak in public with something of his old vigour of denunciation. Illness now, however, began to make itself felt. A visit to Cannes failed to fortify him, and he returned to Hawarden where it had long been his wish to end his days. This was in March 1898. His health declined rapidly and on May 11, Ascension Day, he died. The nation went into mourning and many thousands attended the funeral which took place in Westminster Abbey where he is buried. His wife who survived him by two years also lies there. G. was one of the world's statesmen of his century. As he said of himself his name stood in Europe as a symbol of the policy of peace, moderation and non-aggression. Stern in principle, actuated always by a sense of moral right, he believed it was his duty as the leader of a great democracy to understand the will of the people and to fulfil it. Gifted with a deep sonorous voice and fine delivery he was a magnificent orator. His budget speeches in particular were masterly for their lucidity and grasp of fact. Parliament gave him the occasion for the exercise of his great gifts and he in turn during an age of great parliamentary orators enhanced the reputation of Parliament his service in this respect exceeding that of any other statesman of the century. As a financier he takes his place as a lineal descendant of Walpole, Pitt and Peel. He was one of the best chancellors of the exchequer that England has ever boasted. Many of his taxes were at the time almost as a matter of course utterly opposed but time has shown the wisdom of most of those he introduced. Taxes and convictions placed him through much of his career in political antagonism to Disraeli for whose abilities, cleverness and wit he nevertheless had a great admiration. Courageous patient and resourceful himself he could admire these qualities in his opponent. The long political opposition also helped to bring out the fire of his personality and him took away from the studiousness which was a retiring nature might have imposed on him and made him a more warmly popular figure than he might otherwise have become. In addition to his arduous public duties G. was an indefatigable writer devoting as much time as he could give to theological and literary studies. He was also a voluminous diarist. Besides the writings already mentioned he pub. *Church Principles considered in their Results* (1840), *Remarks on Recent Commercial Legislation* (1845) and *The Inexpugnable Rule of Holy Scriptures* (1890) while his *Studies on Homer and the Homeric Age* (1858) and *Homeric Synchronism* (1876) were the results of a lifelong study. In his final retirement he also showed his versatility by publishing a rhymed version of the *Odes of Horace* (1894). The official life is by Lord Morley, 1903. Other biographies have been written by G. W. E. Russell,

1891; Sir Edward Hamilton, 1898; Herbert Paul, 1901; and Osbert Burdett, 1927. See also D. C. Lathbury, *The Religious Life of Gladstone* 1910; Mary Drew, *Catherine Gladstone*, 1919; and Viscount Gladstone, *After Thirty Years*, 1928.

Glaisher, James (1809-1903), Eng. meteorologist, b. in London, worked from 1833 to 1836 at Cambridge Observatory. From 1840 to 1874 he superintended the meteorological dept. of the Royal Observatory. He founded the Royal Meteorological Society, and in the course of investigations into atmospheric humidity, etc., during 1862-66, he reached a height of 7 m. in a balloon. Among his works are *Hygrometric Tables* (1847); *Meteorology of England* (1860); *Scientific Experiments in Balloons* (1863); *Travels in the Air* (1870); *Crystals of Snow* (1872); and rev. trans.

Glamis, vil. of Angus, Scotland, 12 m. N. of Dundee. Near it is G. Castle, the seat of the earl of Strathmore, which has a famous traditional history. It is first mentioned in actual records in the thirteenth century, but Shakespeare, in *Macbeth*, makes it the site of the murder of Malcolm II. in 1034. It is the paternal home of Queen Elizabeth, wife of King George VI. Pop. 1200.

Glamorganshire, most S. co. of Wales, being bounded on the S. and S.W. by the Bristol Channel, on the N. by Brecknockshire, on the E. by Monmouthshire, and on the W. by Carmarthenshire. Area 555 sq. m. The coast to the W. is indented by Swansea Bay, beyond which is the Gower Peninsula. The N. part of the co. is rugged and mountainous, the highest peak being Llangeinor (1839 ft.). These hills are the source of the R. Taff. Ely, Neath, Tawe, Rhymney, and Llwchwr, which flow into the Bristol Channel, and to the S. of them is a large and fertile plain, with a mild climate, containing many richly wooded valleys, one of which, the vale of Glamorgan, is known as the garden of Wales. The industrial prosperity is due to the presence of abundant mineral wealth. Coal is mined at Merthyr Tydvil, Aberdare, Pontypridd, Rhymney Valley, Neath Valley, and Rhondda Valley; there are large blast furnaces at Cardiff, Swansea, Aberavon, Dowlais, Briton Ferry, Port Talbot, Landore, and Merthyr Tydvil; copper, lead, and tin smelting is carried on at Swansea, Neath, and Aberavon, and zinc and nickel are manufactured. Anthracite, coking-coal, ironstone, and limestone are also mined. The co. tu. is Cardiff, and Barry, Swansea, and Port Talbot are flourishing seaports. The co. has seven parl. representatives (Aberavon, Caerphilly, Gower, Llandaff and Barry, Neath, Ogmores, and Pontypridd); besides three for Cardiff bor., two each for Rhondda and Swansea bors., one each for Aberdare and Merthyr Tydvil. Pop. 1,226,000.

Gland. The term G. in its widest sense implies a complex of secreting epithelial cells which form the walls of cavities that are quite distinct from the lymph and blood vessels, and in which the secretion collects. The goblet cells in the lining of

the intestine, secreting mucus, are unicellular Gs. All Gs. present internally a large secreting surface obtained in an immense variety of forms. In all, however, the essentials are an internal cavity or blind canal, a layer of secreting cells, and an enveloping network of capillary blood vessels. The specific characteristics and differences in the secretions depend not on any external and mechanical change, nor upon the anatomical form of the G., but solely upon the specific character of the epithelium which invests the internal secreting ducts. The actual secretory cells vary in appearance according to their previous degree of activity. If the cells have been at rest for some time, they contain very many granules which distend the cells. After continued activity the cells are shrunken in size, and their

DIAGRAMMATIC REPRESENTATION OF GLAND FORMS

A, simple tubular gland—large intestine; B, coiled simple tubular gland—sweat gland; C, branched compound tubular gland—pyloric glands of stomach; D, E, simple sacular or acinous glands (see INTESTINES), F, compound racemose or sacular gland—pancreas.

contained protoplasm is clearer. Gs. are classified according to their functions as excretory or secretory, lubricatory or digestive. They may also be arranged in groups dependent on their origin as (a) from ectoderm, e.g. sweat and mammary Gs. In some animals specially adapted Gs. occur, as scent, spinning, adhesive, poison Gs., etc.; (b) from mesoderm, e.g. those of kidneys; (c) from endoderm, e.g. those connected with the main part of the alimentary canal. A common form of classification is into types as (a) tubular, simple in large intestine, compound as in pyloric Gs. of stomach; (b) alveolar or sacular, where the secretory portion is much enlarged. These may be much complicated, as in a compound alveolar G. of the pancreas, where there is a growth of still smaller saccular diverticuli growing from the main sacculi. In general the branches of Gs. do not unite, but in one instance, the liver, this does occur, and in this case a reticulated compound G. is produced. The transplantation of the glands of one living organism to another was first attempted by Dr. Serge Voronoff (q.v.) in 1913 at the physiological station of the Collège de France. He proved that by grafting the sex glands (testes) of a young animal (such as a rat, ram, or bull) upon an animal of the same species showing senility he could

rejuvenate his patient and prolong its life. Later by grafting the Gs. (testes) of monkeys upon human beings it was claimed that he renewed in many human subjects their youthful mentality, physical and sexual condition. Dr. Voronoff also grafted the thyroid G. of monkeys in 1913 upon children showing signs of cretinism, and, the cerebral cells of the experimental subjects becoming stimulated by the internal secretion (hormone) of the G., normality was in many cases achieved. In the Brit. character there is a marked repugnance to such forms of grafting, and the operations are not performed in England. The sex Gs. (testes) in the male, ovaries in the female) and the thyroid previously mentioned are examples of ductless Gs. (g.r.) or endocrine organs, which pour their secretion, in the form of a hormone, directly into the blood stream, not into a duct. Other ductless Gs. are the pituitary (attached to the brain) and the adrenals, or suprarenals (g.r.) adjoining the kidneys. Lymph Gs. occur at intervals along the lymphatic vessels (e.g. in the groin and the armpit). See also BIOCHEMISTRY. See N. Haire, *Rejuvenation*, 1924, and Dr. S. Voronoff, *The Conquest of Life*, trans. by G. Glibler Rambaud, 1928.

Gland, in botany, an organ which produces more or less peculiar substances termed secretory by a process known as secretion. The secretum may collect in a cavity, or it may be thrown out at the surface (excreted). Solid Gs. occur in the leaves of many saxifrages and crassulaceae, where chalk is excreted; in many flowers as nectaries, when nectar is the secretum. Hollow Gs. are spaces surrounded by secreting cells, and the secretum may be mucilage, gum, ethereal oil, resin, etc., such as is found in many conifers, oranges, lemons, etc. The milky juice, known as latex, which is found in the dandelion, greater celandine, poppies, etc., is the secretum of Gs. Water-excreting Gs. (hydathodes) occur on some leaves, and digestive Gs. are found in the leaves of the sundew and other insectivorous plants.

Glanders, contagious disease of horses, asses, and mules communicated to man, to whom it is extremely fatal. It is caused by the *Bacillus mallei*, which is expelled in the discharge from the animal's mouth or nostril. It may affect the eye, mouth, nose, or any scratch, crack, or sore with which it comes in contact, and thus enter the blood stream, where in the course of a week or two it produces symptoms. When weakness sets in the lungs are involved, and there are pains in the joints, with fever, thirst, hot skin, and other symptoms of infection of the whole body. When the disease has lasted for some time, the skin becomes affected, when pimples, pustules, and ulcers form. This form or stage of the disease is known as farcy. There is a popular tradition that if there are only internal general symptoms to which the term G. is applied, or if the skin alone is infected, which, as already stated, is described as farcy, either may be recovered from, but when both conditions are

present the result is fatal; but seeing that the two conditions are nearly always present together sooner or later, the prospect of recovery has no connection with the nature of the symptoms that are first seen. As the disease is a distinctly rare one, it is more often feared than seen. It can only be definitely excluded from a person who has been exposed to infection when symptoms fail to develop, and when examination of the discharge reveals the absence of the bacillus. Inoculation by vaccines is the only treatment that offers any prospect of success. G. is apt to be confused with smallpox, pyemia, and other forms of blood-poisoning, pneumonia, rheumatism, and various fevers. It is frequently extremely difficult to diagnose the presence of the disease in stables, where half the animals may die before it is even suspected, and the new arrivals have already become affected. Every inducement should be given to owners, by offers of compensation, to report all suspected cases at the earliest opportunity, so that the disease may be stamped out as soon as possible. A preparation by the name of mallein can be obtained from the bacilli and used to diagnose the disease, in the same way as tuberculin is employed to detect tuberculosis.

Glanvill, Joseph (1636-80), Eng. ecclesiastic, b. at Plymouth and graduated at Oxford. In 1660 he became rector of a church at Wimbush in Essex, and six years later of the abbey church at Bath, and in 1672 was made chaplain in ordinary to Charles II. He was totally opposed to the Aristotelian doctrines. His best-known work is *The Vanity of Dogmatising* (1661), on a passage in which book Matthew Arnold founded his poem, *The Scholar-Gipsy*. Among his other works are *Lux Orientalis* (1662); *Philosophical Considerations touching Witches and Witchcraft* (1666); and *The Ways of Happiness* (1670). See F. Greenslet, *Joseph Glanvill*, 1900; and H. S. and I. L. L. Redgrove, *Joseph Glanvill and Psysical Research*, 1921.

Glanvill, Ranulf de (d. 1190), chief justiciar of England during the reign of Henry II. succeeding de Lucy in 1180. He was b. in Suffolk, near Saxmundham, and about the year 1175 he was successful over the Scottish troops under William the Lion. He eventually joined the Crusaders under Richard I., and was killed at Acre. A great lawyer, his chief work was *Tractatus de Legibus et Consuetudinibus Anglie* (c. 1181), an ed. of which was issued by Sir Travers Twiss (1892). In fourteen books, it is valuable as the earliest treatise on the laws of England, and is comparable in its scope to the work of Bracton, though G.'s task was the more difficult in that old local customs, now feudal principles and habits of action, and a good deal of Roman law—then lately made known to England—were in a still earlier stage of being fused into our common law. The trans. of J. Heames (1812) has been ed. also by J. Philipps (1827-28) and G. E. Woodbine (1932).

Glaphthorne, Henry (1610-after 1643),

Eng. dramatist. Practically nothing is known of his life, but that he was a friend of Lovelace. Most of his works seem to have been written between 1639 and 1643. Among them are *Argalus and Parthenia* (1639); *The Tragedy of Albertus Wallenstein* (1639); *The Hollander* (1640); *Wit in a Constable* (1640); *The Ladies' Privilege* (1640). He also wrote a poem, *Whitehall* (1643). His collected works were ed. by R. H. Shepherd (1874).

Glarus, or **Glaris**: 1. Swiss canton, having an area of 261 sq. m. This canton, which contains part of the valley of the Linth, is a mountainous one, its highest point being Mt. Todt (11,887 ft.). The land is mostly pastoral, and some cotton is manufactured. It is specially noted, however, for the manuf. of a green cheese known as *Schabziger*. Pop. 34,700. 2. Cap. of above canton. It is a modern tn., and from 1506 to 1516 Zwingli was the priest here. Pop. 5200.

Glas, John (1693-1773), founder of the *Hasslerite*, was b. at Auchtarmuchty in Fifeshire. In 1719 he became minister of Tealing, where he formed the sect which bears his name. It was on account of his book *The Testimony of the King of Martyrs concerning his Kingdom* (1727) that he was suspended by the General Assembly. In this book he disagreed with national establs. in religion, and advocated the principle of independence as being nearer to the teaching of Christ. He was afterwards joined by Robert Sandeman, who became his son-in-law and gave his name to sects in other places who were known as Sandemanians. His works were pub. in 5 vols (1782-83). *An Account of the Life and Character of John Glas* was pub. in Edinburgh in 1813. See also GLASSITES.

Glasgow, Ellen (1874-1915). Amer. novelist, b. Richmond, Virginia. She has written many pieces of fiction dealing mainly with her native state. But she differs from most S. writers in not taking the super-romantic pose about her section. If occasionally she is given to melodrama, at the same time she sees her people with very clear eyes and does not spare them her satire about some of their pretensions. Among her books are *The Love of the People* (1900), *The Battle Ground* (1902); *The Wheel of Life* (1906); *Twelve Law* (1908); *Life and Gabriella* (1916); *Barren Ground* (1925); *They Stopped at Folly* (1929); *The Sheltered Life* (1932); *Fein of Iron* (1935); *In Our Life* (1911); and *A Certain Measure: an Interpretation of Prose Fiction* (1913).

Glasgow (from Celtic *Gleschu*, afterwards *Glasghu*, dear green spot-*glas*, green; *ghu*, dear), a co. of a city and port, and is situated in the co. of Lanark, Scotland. The see of a Rom. Catholic archbishop. It lies on both sides of the R. Clyde, which is shut in by the surrounding hills, but the city extends beyond these for a considerable distance. G. can boast of having some of the finest buildings in Scotland. Many of them are decorated with the finest marble. They are situated chiefly in the commercial centre of the city. George Square is the prominent square in G. and has been called

the 'Valhalla of Glasgow' because of the many beautiful statues which adorn it. The Cenotaph to the fallen of the two world wars occupies a prominent place in the square. The municipal buildings stand on the E. side of George Square; they were erected in 1889 at a cost of nearly 2000,000. They are built in the Venetian Renaissance style and were modelled upon the plans of a young architect, Wm. Young. Besides consisting of an entrance hall, marble staircase, banquetting hall, and council chamber, these municipal buildings include sev. apartments for the accommodation of the municipal staff. The General Post Office occupies the S. side of the square, and on the W. is the Italianate building, Merchants' House of G. Notable buildings of G. include the cathedral, univ., art galleries, Kelvin Hall, Provand's Lordship (the oldest dwelling-house in the tn.), Tolbooth Steeple, Royal Exchange, and Stock Exchange. The Royal Exchange, which is in Queen Street, has a news-room furnished with Corinthian pillars supporting a richly decorated roof. David Hamilton is the architect, a G. native, who also designed the Western Club House, as well as other public buildings. The prin. streets run for the most part from E. to W. and are parallel with the riv. The houses are largely built of freestone. The names of the chief streets are Buchanan Street, containing the Stock Exchange and some of the finest shops; Sauchiehall Street, in which the Fine Art Gallery and the old Art Gallery are to be found; and Argyll Street, which is the busiest commercial thoroughfare, and which leads to Trongate, the oldest portion of the city. The other chief shopping streets are Union Street, Gordon Street, and Renfield Street. The Trongate steeple, a relic of mediævalism, is to be seen at the E. end of Trongate, and a little further on the cross and city hall are approached.

The cathedral is situated N.E. of the city on a height overlooking the Molendun stream. St. Kentigern, called also St. Mungo, founded a bishopric on the banks of this stream about 560, after which period hist. is silent for a space of five centuries. The see was restored by David, prince of Cumberland, in 1115, and his preceptor John Achaus, bishop of G., laid the foundations of a cathedral in 1133 (consecrated in 1136), which was, however, replaced by the present construction by Bishop Jocelyn in 1175. It was left to Bishop Bondington to complete the main part of the building, the cost of which was borne by Comyn, lord of Kilbride, and his lady, during the reign of Alexander II. The memory of these four persons is perpetuated by carved bosses of their heads, which are to be found in the vaulting of the Lower Church. In the fifteenth century, Bishop Blackader raised the beautiful rood screen, together with the unfinished S. transept, which was built over the anc. burying ground consecrated by St. Ninian in A.D. 399. Under the central vaulting of the Lower Church or Lough Kirk St. Mungo is buried,

and his well is still to be seen near by. Of the twelve pre-Reformation cathedrals in Scotland St Mungo and St Magnus in the Orkneys were the only ones to escape destruction during the Reformation in the sixteenth century. The cathedral is in an excellent state of preservation. Its style of architecture is Early Eng, and it is built in the form of a Lat cross with imperfect transepts. Originally it consisted of three churches one of which is its famous crypt with its pillars and

It contains a large library of 250,000 vols. Its museum was founded in memory of the celebrated Dr Wm Hunter of London in 1783 who bequeathed his splendid collection of coins medals etc to the principal and profs. The museum contains a remarkable collection of anatomical preparations zoological and mineral specimens MSS books and pictures. The univ also owns an observatory and botanical garden. The students reside outside the college and those in the

GLASGOW CATHEDRAL THE CRYPT

Dux Engraving Co

The crypt was originally a separate church the Lady Kirk. In the centre of the picture is St Murg's tomb

pointed arches. The crypt was then called Lady Kirk. The windows of the cathedral are of stained glass some of which were manufactured in Munich whilst those in the crypts and chapter house were executed by various Brit and foreign artists.

The univ of G occupies a prominent position, standing on the top of Gilmore hill just above Kelvingrove Park. It was designed by Sir Gullielm Scott and erected in 1871. The old univ was founded in 1461 (under a bull of Pope Nicholas V) by Bishop Turnbull on a different site from that occupied by the present buildings. The modern univ presents a striking contrast to its predecessor. It is built in imitation of the Early Eng style of architecture intermixed with Scots or domestic style of more recent times. It is capped by a central tower 150 ft high

faculty of Arts wear scarlet gowns. The usual univ degrees such as M A B Sc, M D LL D DD etc, are accorded. A railway now stands upon the ground occupied by the old univ which was built in High Street and which became enriched in 1473 by four ac of land and extra buildings the gift of Sir James Hamilton of Cadzow. It was decided it should be rebuilt in 1860, accordingly three estates were bought up both by the gov authorities and by public subscription. These estates were the Gilmorehill estate the Down Hill and the Clayslaps properties, the purchase was effected in 1861, and the foundation stone was laid in 1868. Over 1000 day students attend classes at the univ in arts engineering, law, medicine science and theology. The Royal Technical College, which is affiliated to the univ, is the oldest foun-

dition of its kind in the world. It instructs annually 1000 day and 3000 evening students, and, in affiliated classes, 4500 evening students.

There are other important colleges and institutions in G., amongst which may be mentioned Queen Margaret College for women, the School of Art, the G. and W. of Scotland Commercial College, and the Scottish National Academy of Music. The corporation, through its education dept., provides education in its 285 day schools for about (1948) 165,000 young people (aged three to eighteen). Over 25,000 young men and women study technical and commercial subjects at the evening continuation classes. The Stow College has been organised to provide trade and technical instruction. Notable schools for boys are G. High School, a medieval foundation, and G. Academy (founded 1815). G.'s art galleries in Kelvingrove Park take the place of the McEellan Galleries, which with their pictures were acquired by G. in 1856. Kelvingrove Gallery was first opened as part of the 1901 International Exhibition, and officially opened as an art gallery and museum in 1902. The architectural design is founded on seventeenth-century classic Renaissance, but modified in view of a design reflecting the period of its erection. The building cost approximately £250,000. Of first importance among its contents is G.'s famous art collection. In its representation of European painting from the fifteenth century onwards the G. Art Gallery is superior to all other municipal collections, and sev. great additions have been made during the past decade. Associated with the art galleries, and housed in them, is a museum comprising sections devoted to archaeology, geology, natural hist., ethnology, and technology. In archaeology the section showing prehistoric relics is of direct local interest, and embodies a replica of a burial site found at Mt. Vernon on the E. boundary of the city. The natural hist. section, much damaged during the air raid of 1941, is being rebuilt on the most modern lines. The shipbuilding section, which also suffered considerable war damage, contains much to attract both expert and layman. Fortunately the Spencer collection of early ship models, as well as irreplaceable later models of historical interest, were saved. The Scott collection of arms and armour ranks high in comparison with similar collections throughout the Continent; fortunately this collection too escaped all damage in the air raids. A recent gift by Sir Wm. Burrell includes a collection of pictures, tapestries, porcelain, bronzes, etc. renowned throughout the world. Near the art galleries stands the Kelvin Hall, a 1927 addition to the buildings and institutions controlled by the municipal authorities. The site was formerly occupied by the old Bunhouse building which was burnt down in 1925. The hall is the ann. venue of the city's exhibitions, fairs, carnivals, etc.

The G. Corporation Libraries Dept. embraces twenty-nine estab. The head-

quarters are at the Mitchell library, which has more than 500,000 vols. available for reference. Stirling's library and Elder Park library also have important reference collections. Other libraries include the Commercial library, Gorbals Dist. library (containing representative collections of books in twenty-five foreign languages), Elder Park and Townhead libraries, with special collections of books and periodicals for the use of blind readers.

The Scottish Orchestra in G., where Sir J. Barbirolli first won fame, has been known for nearly half a century. In drama G. is ahead of all other Scottish cities, the Citizens' Theatre being one of the chief creative dramatic centres. Also famous are the G. Unity Theatre, and the G. Orpheus Choir, whose conductor is Sir Hugh Robertson.

G. has maintained the reputation of the Clyde as the greatest shipbuilding riv. in the world. Innumerable ships of all classes have been built on the Clyde, including the world's largest and fastest liners *Queen Mary* and *Queen Elizabeth*; a 220,000,000 feet for the Canadian Pacific Steamships Ltd., and the most powerful battleship ever built, H.M.S. *Vanguard*. G. engineers built the first air-ship to cross the Atlantic, and also the Forth bridge and London Tower bridge. While the heavier industries of shipbuilding and engineering have been predominant, the Clyde area has also developed many of the lighter forms of industry. Its textiles, carpets, threads, sewing machines, and food products are known all over the world. During recent years a number of new industries have been estab. in the Clyde area, including the manuf. of motor trailers; electric welding machinery; electrodes; electric lamps, batteries, and electric household appliances (vacuum cleaners, fires, and cookers); silk and artificial silk garments; seamless containers; safety-razor blades; and motor service equipment. Among the newer products which are being manufactured by firms already estab. in the dist. are mechanical loaders and shovels, synthetic resin gears and insulated cloth, machines for bottle-making and labelling, gravel and sand washing, and the mechanical packing of food-stuffs, glass silk for heat insulation and sound deadening.

The Broomielaw is the name given to G. harbour, and being over 400 ft. wide, and at least 1½ m. long, it is able to accommodate vessels of every description. The eighteen m. of riv. running from Albert bridge in the centre of G. harbour, highest point of the riv. now navigable by sea-going vessels, and Port G., are all administered by the Clyde Navigation Trustees, though G. harbour itself has a frontage of 4½ m. of this length. The riv., originally a fordable salmon riv., has been successfully straightened and deepened in such a manner that the scour of the tides keeps the channel clear of itself and comparatively little dredging is required. The rise and fall of the tide at G. bridge varies between 10 ft. 9 in., and 12 ft. 6 in. The R. Clyde is spanned by many bridges.

The Dalmarnock bridge was erected in 1891; the Rutherglen bridge was reconstructed in 1896. St. Andrew's suspension bridge spans the riv. from the Green to Hutcheson Tn., a dist. also approached by the Albert bridge. The Victoria bridge, built of granite, replaces the old bridge constructed by Bishop Rae in the middle of the fourteenth century. The most important of all the bridges, the G. or Broomielaw bridge, composed of granite, is a continuation of Jamaica Street; this was reconstructed in 1899, but it proved inadequate for the constantly increasing traffic, and the George V. bridge was opened a short distance downstream in 1927. In 1914 further dock accommodation was required and construction was begun on land acquired by the trust between Shieldhall and Renfrew. It is connected by rail and a road joining the new trunk road of the G. corporation scheme. In the year 1948, the last full year of normal working, 13,917 coastwise vessels of over 5,000,000 tons used the port of G., while 1510 foreign vessels, totalling 8,600,000 tons, entered the port. The tonnage of vessels using the port was 10,536,714. Over 3,697,000 tons of goods were imported, and almost 2,000,000 tons of goods were exported. There are 12½ m. of quays in G. harbour, including six tidal dock systems.

There are four large open spaces in G., one in each quarter of the city. The Green lies towards the E. and covers 140 ac., Queen's Park lies to the S. and comprises 100 ac., Kelvingrove Park is in the W. quarter and contains about 40 ac., whilst the Alexandra Park in the N.E. consists of 85 ac. In the S. also are the Bellahouston and Linn Parks. Altogether the G. corporation owns 88 public parks and 601 open spaces and children's playgrounds. The city also possesses fine botanic gardens, containing the Kibble Crystal Art Palace, a large glass structure for popular entertainments. Hampden Club, the ground of Queen's Park Football Club, can accommodate 150,000 spectators. In 1889 an Act was passed placing the entire city of G., with its surrounding dists., in the co. of Lanark. Two years later six suburban burghs and sev. suburban dists. were added, thus increasing the area of 6111 ac. to a total of 11,861 ac. The extreme length of G. in its entirety from N. to S. and from E. to W. is computed to cover 39,725 ac. G. is under the control of the lord provost, magistrates, and tn. council of the city. There are 114 popularly elected members of the tn. council and there are also two ex-officio members, the dean of guild—head of the Merchant's House—and the deacon-convent—head of the Incorporated Trades. The tn. councillors elect from their own number the lord provost, twenty bailies, the river bailie and the river bailie depute. The work of the corporation has been a stupendous achievement, and all sorts of measures and schemes have been successfully carried through under its jurisdiction. All the water supplies, gas, and electricity, tramways, and municipal tenements, as also the meat,

catne, fish, fruit, vegetable, and cheese markets are owned by the corporation. In 1914 Loch Katrine was raised 5 ft., and connected by tunnel with Loch Arklet, providing storage for 2,050,000,000 gallons of water. Additional works increased the city's water supply by 10,000,000 gallons per day. Gasworks were opened at Govan in 1921 and an electric generating station at Dalmarnock Bridge in 1920. The total length of tramway track is 208.82 m., covering 134.77 m. of streets and roads. Great reforms have been effected in the system of drainage. In 1897 the total area of G. was divided into three sections, each distinct, for the disposal of its own sewage. After the First World War unemployment and housing conditions were very bad and led to a strike, so that in 1925 a rent commission had to be appointed. With the increase in trade, in sanitary improvements, and in the extension of the city's boundaries, G. is only second in importance to the Brit. tn. and seaport, Liverpool. At Bellahouston Park, a great empire exhibition, covering 150 ac., was held in 1938. In the Second World War G. and the Clyde-side sustained sev. severe enemy air raids, especially on March 13 and 14, 1941, when 1000 persons were killed, and much damage was done to business premises, dwelling houses, tenement buildings and flats, and industrial buildings, though the raiders conspicuously failed to destroy docks or shipyards. Probably the raiders deliberately aimed at homes, for in G. and Clyde-side on those two nights, when incendiaries descended in masses, 40,000 houses were damaged, some of G.'s great tenement blocks being among the buildings most severely hit. G. returns fifteen members to Parliament. Pop. has grown enormously of late years, being (estimated 1947) 1,128,500. See G. K. re-Todd, *The Story of Glasgow*, 1911; *History of Glasgow*, 1931; W. F. MacArthur, *History of Port Glasgow*, 1932; and A. Macgill, *Glasgow: its Rise and Progress*, 1935.

Glasgow. Brit. light cruiser (4800 tons). At the outbreak of the First World War this ship formed part of Adm. Craddock's squadron, which fought against the Ger. Adm. von Spee's squadron at the battle of Coronel (q.v.), Nov. 1, 1914. During the battle she was particularly engaged by two Ger. cruisers, *Leipzig* and *Dresden* and, though hit sev. times, escaped being sunk. She joined Adm. Sturdee's squadron, which avenged the Coronel defeat at the battle of the Falkland Is. (q.v.) on Dec. 8, 1914, and was one of the ships sent in pursuit of the Gers. in the early stages of the battle, and also later on. She was responsible for sinking the *Leipzig*.

Glasgow Academy was founded in 1845. Since 1920 it has been controlled by the Academical War Memorial Trust. There is a preparatory school of some 270 boys, and an upper school of 500, mainly day-boys.

'Glasgow Herald,' one of the two most influential existing Scottish daily newspapers. It was founded in 1770 as a weekly paper called the *Glasgow Advertiser*

but three years later the name was changed to the *Glasgow Herald and Advertiser*. In 1805 it was again changed to the *G. H.*, its then editor or conductor and part-proprietor being Samuel Hunter, a qualified surgeon and a man of many parts, who devoted himself to the service of the paper for thirty-four years. In 1859 it became a daily penny paper. It opened later in Edinburgh, where it is now pub. simultaneously with the Glasgow issue, as a reply to the opening by the *Scotsman*, an Edinburgh paper, in Glasgow, and it is now connected by private wire by day and night with its London offices. It has long been distinguished by its daily light literary column. Many eminent Scottish writers have been either its editors or contributors to its columns. George Outram, the advocate and writer of *Lyrics, Legal and Miscellaneous*, succeeded Hunter as editor in 1837.

Glasgow School, group of painters living in Glasgow, Scotland, at the turn of the century, including amongst others Sir David Cameron and Sir John Lavery. See D. Martin, *The Glasgow School of Painting*, 1902.

Glasnevin, vil. in co. Dublin, Eire, 1½ m. N. of Dublin. Bur. famous Irishmen are buried in its cemetery. There are also botanical gardens and an agric. college. Pop. 3000.

Glaspell, Susan (b. 1882), Amer. novelist and dramatist, b. at Davenport, Iowa. Her play, *Hisson's House* (1930), won the Pulitzer prize. Her novels include *The Glory of the Conquered* (1909); *Fidelity* (1915); *The Road to the Temple* (1926); and *The Morning is Near Us* (1940).

Glass, term which covers a wide range of substances which differ widely in chemical composition and physical properties, but which possess the essential characteristic of having cooled from a state of fusion to become solid without crystallisation. G. at room temp. can be regarded as a liquid which is of such a high viscosity that it behaves as a rigid elastic solid. Many Gs. when maintained at a suitable high temp. for sufficient time will devitrify, that is to say that some of the components crystallise out, the crystals causing opacity. Most commercial Gs. can be regarded as mixtures of silicates, but borate and phosphate glasses are made for special purposes. Window and plate G. are usually made by fusing silica (sand), sodium carbonate (soda ash), or sodium sulphate (salt cake), and calcium carbonate (limestone); magnesium carbonate is often added in combination with calcium carbonate as dolomite. Flint G. which is used widely for cut crystal glassware is made from sand, potassium carbonate (pearlash), potassium nitrate (saltpetre), and red lead; and heat-resisting G. from sand, boric acid or borax, soda ash, and hydrated alumina. Many chemical substances are used as constituents of Gs. for optical purposes, where it is necessary to produce Gs. with precisely defined optical characteristics of refractive index and dispersion. Coloured Gs. are produced by the addition of metallic oxides to a colourless base G. Thus ferrous iron

gives bluish green, cupric oxide blue green, oxidised manganese violet-red shades, cuprous oxide and colloidal gold ruby colours, cobalt oxide blue. Opal G. is obtained by the addition of calcium and sodium fluorides or by tin and arsenic or calcium phosphate. Compounds of about thirty-five of the chemical elements are in use for glass-making at the present time. Great care is exercised in selecting the raw materials, since their purity and often their degree of subdivision will affect the quality of the ultimate product. The choice of sand is most important as all natural sands contain iron which imparts a green colour to the resultant G. The iron impurity must be as low as possible, but in certain types of glassware, the green colour can be neutralised by oxidising the iron to the ferric state, giving a yellow coloration, and then by superimposing a complementary colour. This process is known as decolorising and common decolorisers are manganese or selenium, both of which colour the glass pink.

History of Glass Manufacture.—The earliest specimens of glassware seem to have been made in Egypt, though the anc. Assyrians were also expert in glass-making. There is a whole series of Assyrian clay tablets (from the library of King Assurbanipal, seventh century B.C.), dealing with glass-making, in the Brit. Museum. It was, however, not until Graeco-Rom. times that any considerable development of the industry took place. The Romans greatly developed the industry, and were acquainted with the arts of G.-blowing and sheet-making. From the eleventh to the sixteenth century Venice was the home of the art of making beautiful vessels of glassware, and towards the end of this period there were produced objects of art which have never been excelled and, in the opinion of many, not even equalled. The manu. of G. gradually spread over Europe, and from comparatively early time G. has been made in England. Venetian G. was made in London in the sixteenth century, and from that time onwards G. of all kinds has been made, but it was perhaps in the eighteenth century that Eng. work stood pre-eminent. That this was so was chiefly due to the fact that the Eng. flint G. was greatly superior in brilliancy to the Bohemian product and lent itself especially to the art of cutting. In America much fine G. was made by the Ger. emigrant Heinrich Wilhelm Stiegel about the middle of the eighteenth century. Great progress has been made of recent years in the manu. of many varieties of G. specially adapted for optical purposes.

Manufacture.—The melting of G. from the raw materials is carried out either in a tank furnace or in individual crucibles or pots in a pot furnace. Tank furnaces are used for large-scale commercial production largely by automatic processes where a continuous supply of G. is required for delivery to the fabricating machinery. Pot furnaces are used for the production of smaller quantities of G. for hand manu. and melting is intermittent.

Tank Furnaces.—A tank furnace consists of a large bath, the bottom and side walls of which are built of refractory clay blocks previously fired to a high temp. (see fig. for cross-section of tank). The bath may be as large as 100 ft. by 35 ft. by 5 ft., but tanks of smaller size are in general use. The bath is covered by an arched roof or crown constructed of silica brick which will withstand the high temps. at which the G. is melted. The tank is

CROSS-SECTION OF REVERSIBLE REGENERATIVE GLASS TANK FURNACE

A, refractory tank blocks, B, furnace crown, C, crown insulation; D, inlet port for mixed gas and air; E, exit port for waste gases; F, air regenerators; G, gas regenerators. The direction of the gases is reversed periodically so that the incoming gases are preheated by the heat transferred to the regenerators by the outgoing waste gases.

usually heated by producer gas or fuel oil and air, but other fuels are used, e.g. natural gas, particularly in America. In the case of gas firing the gas and air inlets or ports are located round the sides of the tank above the G. level and prior to introduction into the furnace the gas and air are preheated by passing through the hot waste gas flues; both the regenerative and recuperative principles are used for this preheating and the fuel efficiency of the furnace is thereby increased. The end of the furnace at which the raw materials are introduced is known as the melting end, and the temp. increases from this point for some distance along the tank and then decreases towards the working end, the point at which the G. is removed for fabrication.

Pot Furnaces. A pot furnace is a large enclosure usually circular in shape and containing a number of pots arranged around the circumference. Access to the pots is arranged through working holes around the side of the furnace. The gas is introduced through an inlet at the centre of the furnace floor.

The Melting of the Glass.—The batch from which the G. is melted consists of a mixture of raw materials or 'frit' mixed with a proportion of broken G. or 'cullet.' The mixture is introduced either into the melting end of the tank or into the pot at temps. varying from 1300 to

1600° C., depending on the kind of G. Many reactions occur between the raw materials as they melt and large quantities of gas are evolved. The molten mixture reaches a stage at which it consists of a viscous mass full of bubbles which eventually rise to the surface and escape. The process of removing the bubbles is known as 'fining.' In the case of the tank furnace there is a continuous change from the raw material at the melting end to the refined G. at the working end, the temps. at points along the tank being controlled so that the G. passes through the correct temp. cycle for the melting and fining processes. The production is thus a continuous one, with continuous filling at the melting end and continuous extraction from the working end. In the case of pot melting the cycle of operations from filling to working is controlled by varying the temp. of the furnace, and when refined the contents of the pot are removed for fabrication.

Methods of Fabrication.—There are four main methods of fabricating the G.: (1) by blowing, (2) by pressing, (3) by pouring, rolling, or drawing, (4) by allowing the G. to cool in the pot—a method peculiar to optical G. manuf. Although the first three methods were originally evolved by hand manipulation, and as such are still used at present, automatic methods have been developed for large-scale production.

1. **Blown Glass.** The process of blowing was invented by the Romans early in the Christian era and the methods employed to-day are still closely similar. The blowing pipe or 'iron,' which consists of a tube about 5 ft. long, is dipped into the molten G. which is 'gathered' by rotating the pipe. After removal from the furnace the rotation is continued so that the symmetrical form of the molten G. is maintained. The shape of the G. gathering can be modified by manipulation of the pipe either by spinning it about its own axis or by swinging it in its own plane, and by such methods the blower can work the G. into the approximate shape of the final article. The G. may now be transferred to a mould and blowing is continued until the article fills the mould. The G. is then broken away from the pipe and further processing is required to finish off the broken edge. This process is used largely for hollow vessels, but the manuf. of bottles and electric-light bulbs is carried out largely by automatic methods, the machines imitating the actions of the G. blower. However in the automatic blowing process a preforming operation is often carried out in which a hollow vessel is first formed by means of a plunger operating in a mould called the parison mould. The hollow vessel or parison thus forms the basis for the subsequent blowing operation in the final mould, the transfer from the parison mould to the final mould being carried out automatically. The production of crystal glassware is also carried out by blowing, except that considerable hand manipulation with a few simple tools is carried out to fashion the vessel while it is attached to the pipe. The flint G. used for this type of glass-

ware enables the manipulation to be carried out over a wide range of temp. Window G. was originally produced by blowing. In the Bohemian process rev. gatherings are necessary to give the mass of G. required, and the gathering is rotated in an open mould to form a neck for the subsequent blowing of a hollow cylinder. By alternate blowing and reheating of the gathering remote from the pipe, and by swinging in a pit, a cylinder about 5 ft. long is formed. The closed end of the cylinder is opened with shears and the cylinder is spun in a furnace until the end is uniform with the remainder of the cylinder. The cylinder is then detached from the pipe with a cold iron and the end from which the pipe was detached is removed to give a cylinder of uniform diameter. The cylinder is split longitudinally with a diamond and is opened out and subsequently flattened by reheating and rubbing down on to a flat surface. In the older crown process a large sphere is blown from the gathering and an iron rod or 'pundy' is attached to the sphere diametrically opposite the pipe which is now detached leaving a circular hole. The open-ended sphere is now reheated and spun on a circular disk is formed. The point at which the pundy is detached from the disk yields the 'bullion,' which is a characteristic feature of windows glazed with G. made by the crown process. These processes of making sheet window G. have now been superseded by the rolling and drawing processes described below. G. tubing is made by a combined blowing and drawing method. The gathering is first shaped to form a short thick-walled cylinder and a pundy is attached to the end of the cylinder away from the blowing pipe. Then as the blower blows into the cylinder the second man pulls the pundy away, elongating the cylinder and thus decreasing the wall thickness. The rate of draw determines the diameter and wall thickness of the tubing. Again the method of hand manuf. has largely been copied for machine production, although various methods are employed for producing the initial thick-walled cylinder mechanically.

2. *Pressed Glass.* In the pressing process the G. is gathered on the gathering iron and is then dropped into a heated metal mould. A plunger is brought into the mould and the molten G. is squeezed between mould and plunger until it is rigid. The G. therefore takes up the shape of the mould and plunger. This method is capable of adaptation to mechanical methods. The G. leaves the furnace along a channel known as a feeder and flows through an orifice where the required mass is cut by shears and drops by gravity into the mould. A number of moulds are arranged around the circumference of a rotating horizontal table, and after one mould receives its G. it moves on to receive the plunger and at the same time the next mould moves into place to receive G. The pressing method is used largely for domestic hollow-ware, signalling lenses, motor headlamp lenses, and articles of a similar kind.

3. *Pouring, Rolling, and Drawing.* The processes of pouring, rolling, or drawing are used for producing G. in sheet form, and the bulk of the G. produced by such methods is used for window glazing. The earliest methods of making plate G. were by the method of pouring or casting. The contents of a pot were poured on to a flat table and were rolled into sheets varying in thickness from $\frac{1}{2}$ to 1 inch.

Chambers Brothers Ltd.

CASTING AND ROLLING

The manufacture of coloured optical filter glass.

Guides moving in front of the roller determined the width of the sheet. Owing to the fact that the G. had been in contact with the table and roller, the surfaces were such that clear vision was obscured. The first improvement on this method was the Blicheroux process in which the G. is poured from the pot behind a pair of rollers from which it passes on to a moving table, the speed of the table being synchronised with that of the rollers. This produces a much smoother sheet than the original process. After cooling the sheet is transferred to a large circular table on which it is held by plaster of Paris. The table is rotated and two circular rotating disks are lowered into contact with the G. The G. surface is first ground by feeding coarse sand and water on to the surface, and this is followed by finer grades of sand until a finely ground surface is obtained. The process is repeated, using felt polishers and rouge to give a polished surface. The Blicheroux process is still employed for plate G. manuf., particularly where very large sheets or special thicknesses are required. However, for mass production of polished plate G., a continuous rolling process, using tank-molten G., is used. The molten G. emerges from the working end of the tank over a weir and passes through a pair of water-cooled rollers from which it cools and passes through the annealing

lehrs. Sheets are cut to size from the continuously moving ribbon and these are transferred to tables for grinding and polishing. The grinding and polishing process is also continuous, the G. passing through a series of grinders each of which uses a slightly less coarse abrasive. The continuous process of rolling is also used for the production of figured and wired G. For the production of figured G., that is G. with a formal pattern impressed upon it, the rollers are machined to the appropriate pattern and the G. takes up that pattern as it passes through them. Wire-netting is often introduced at the point before the G. passes through the rollers and such G. is used largely for glazing factory roofs where some reinforcement is necessary to hold the G. together in case of cracking. For the production of clear sheet window G. it is necessary that the sheet should be formed with a smooth, clear surface, and it is therefore essential that it should not come into contact with either metal rollers or a metal table. The process usually employed in this case is known as the Fourcault process. The molten G. issues from a slot in a fireclay float or debiteuse which is depressed into the G. surface in the making end of the tank. Molten G. wells up through the slot and the stream is drawn away as a sheet by means of a series of rollers above the debiteuse in a vertical tower. These rollers only come into contact with the surface of the sheet after the G. is rigid and do not therefore distort the G. surface.

4. *Optical Glass.* Optical G. requires the most particular attention, because it is essential that it should be homogeneous and should not absorb light. It is therefore necessary to use the finest raw materials, and the essential quality of homogeneity is attained by stirring the G. in the melt in a state after melting and firing has been completed. After stirring the pot is removed from the furnace and is transferred to another furnace for slow cooling. When cold the crucible is removed, broken, and the fragments removed from the G. or broken into smaller lumps. The product is carefully examined for flaws, and any pieces with marked defects are rejected. The accepted G. is once more heated to the softening point, moulded into the required shapes, and then subjected to a prolonged process of cooling. Further close examination reveals a large percentage of defective pieces, so that it is not surprising that the price of good optical G. is high. Optical Gs. are required to fulfil in greater or less degree the following demands. They must be homogeneous, transparent, free from colour, and internal strain, stable to atmospheric influences, of a certain degree of hardness to resist scratching, and possess specified refractive and dispersive powers.

Annealing of Glass.—Annealing of G. is necessary after fabrication in order to avoid stresses which will occur if the G. is cooled too quickly. The stresses arise from the fact that during cooling temp. differences must exist across any piece of

G. and therefore the G. will contract to different degrees at different points. So long as the G. is in a plastic condition it can adjust itself to these differences, but once any part of it has become rigid permanent stresses will appear when the G. has reached a uniform temp. There is always a tendency for the stresses to be relieved and if sufficiently high the stress release will occur by breakage. High stresses are often put into G. by controlled heat treatment, the outer surface of the G. being heated to redness and then being cooled rapidly either by air blast or by immersion in oil. This treatment has the effect of imposing high compressive stresses on the surface and, as G. usually falls under tension, has the effect of increasing the strength of the G. Such G. is known as toughened G., and if breakage occurs it fractures into tiny fragments which avoid risk of injury.

Safety Glass.—In addition to the reinforced wired G. mentioned earlier, safety G. consisting of alternate laminations of G. and transparent cellulose or cellulose derivative is made under the name of Triplex G. In manufacture the composite sheets are cemented together and are subjected to high pressure in a hydraulic press.

Coloured Glasses.—Coloured Gs. are made for various purposes. Coloured decorative glassware has been made from the earliest times, but nowadays many coloured Gs. are made for the specific purpose of confining the light they transmit to definite regions of the spectrum, being opaque to other regions. Thus ultra violet transmitting and infra red transmitting Gs. are available which absorb practically the whole of the visible spectrum. A wide range of Gs. is available which transmit only certain portions of the visible spectrum and these Gs. have wide applications in photography and in physical and chemical apparatus. A filter G. has been developed during the last few years which absorbs infra red rays while transmitting a high proportion of the visible spectrum. Such a G. is very valuable in projection apparatus, where it is necessary to prevent heat from the projection lamp reaching the lantern slide or film while the visible light remains unchanged in intensity and colour.

Fibreglass.—In recent years considerable progress has been made in drawing G. into fine fibres and subsequently spinning the fibres into threads which can be woven into cloth. This material has excellent electrical, heat, and sound insulating properties and has a wide variety of uses. Owing to the fact that it is stable up to the softening point of the G., it can be used at temps. at which other insulating materials fail. In addition to cloth, tapes, and sleeving for wires, this material is available in various forms for placing round steam pipes and also for placing between walls for heat and sound insulation.

Glass-crab, name given to *Phyllosoma*, the young form of *Palaemon*, a genus of edible crustaceans found in the Mediterranean.

Glasse, Hannah, Eng. writer on cookery of the eighteenth century. She was a

London habit-maker, and a Rom. Catholic. She became bankrupt in 1754, and d. before 1770. Her most famous work was *The Art of Cookery* (1747), and she also wrote *The Compleat Confectioner* (about 1769) and *The Servant's Directory* (1770). She did not write 'First catch your hare,' but did write 'Take your hare when it is cased' (i.e. skinned).

Glass Eye, see under HORSE (DISEASES).

Glassites, Scottish religious sect, founded by John Glas or Glasco (1695-1773) (q.v.). He was a Scottish divine, b. at Auchtermuchty, Fifeshire, who, in 1719, obtained the charge of Tealing in Forfarshire. Owing to the views which he promulgated here he was removed from the ministry in 1730, but in 1739 he was restored by the General Assembly to the position of 'a minister of Jesus Christ,' being still forbidden to assume the title of 'a minister of the Kirk of Scotland.' The sect which he formed, also known as the Sandemanians, from Robert Sandeman (1718-71), a disciple of Glas, practised community of property, abstinence from certain kinds of flesh food, the weekly celebration of communion, and the holding of 'love feasts.' It detached itself from the Presbyterian body to join the Independents.

Glass-snake, name applied to all individuals of the genus *Ophisaurus*, family Anguillidae; they are serpent-like lizards about 3 ft. long, with rudimentary limbs and an elongated, brittle tail. *O. ventralis* is common in N. America, and in many ways resembles the Brit. slow-worm; it lives on snails, worms, insects, etc., and spends much of its time underground. *O. gracilis* inhabits the E. Himalayas and Burma. *Pseudopus*, an allied genus, is found in S. Europe.

Glass, Stained, see STAINED GLASS.

Glasswort, the popular name for *Salicornia herbacea*, a species of leafless herbs belonging to the family Chenopodiaceae. Also called marsh samphire, crab-grass, etc. It grows on the seashore and in salt marshes. It is widespread in S. Europe and N. Africa. There are two Brit. species, *S. herbacea* (crab-grass) and *S. radicans*. Soda can be obtained from G. by burning, and was, formerly, often obtained in this way for the manuf. of glass and soap.

Glastonbury. This tn. was once an is., but now forms a peninsula, as it is surrounded on three sides by the Lt. Brue. It was originally called the Is. of Avalon or Apples, and is one of the most picturesque spots in Somersetshire. It has many interesting historical features. G. is famed for its abbey, which dates back to the year 708, when it was built by the Saxon, Ina, in place of the Brit. monastery founded about 601. The abbey is a ruin, and includes different periods of architecture. The ruins of the church, St. Joseph's Chapel, and the Abbot's Kitchen, are the only surviving buildings. St. Joseph's Chapel is the finest portion of the ruins and points to the Transition period of the twelfth century. It is remarkable for its crypt, which was not inserted beneath it until the fifteenth century. There is a legend that Joseph of Arimathea came

over to G. and founded a church there; moreover, he is stated to have planted a graft from the Sacred Thorn there. G. Tor is a hill upon which the last abbot of G. suffered capital punishment for 'divers and sundry treasons,' 1539: it is the property of the National Trust. A lake-vil. was discovered in G. in 1892, pointing to the existence of Celtic tribes. Other features of interest are the market cross and St. George's Inn. Pop. 4600. See A. G. Chant, *The Legend of Glastonbury*, 1949.

Glatz (Polish Kłodzko), fort. tn. in Silesia, Poland (formerly of Prussia), on R. Neisse, near the Bohemian border, and 58 m. S.W. of Breslau. Before the Second World War it was strongly defended by two citadels, one on an eminence of 200 ft., and has had an adventurous hist. It is noted for manufs. of hardware, machinery, furniture, and spirits. The tn. fell to Konev's Russian forces in 1945. Pop. 19,200.

Glauber, Johann Rudolf (1601-68), Ger. chemist, b. in Karlstadt, Franconia. He is chiefly famous for his discovery of G.'s salt (q.v.), which he prepared, in 1658, and identified with a natural mineral salt found in waters throughout Europe, and having a medicinal value. He also produced hydrochloric acid from oil of vitriol and salt. He was an alchemist and a voluminous writer. His *Opera Omnia* (Amsterdam), 1661, were trans. into Eng. in 1689.

Glauber's Salt, or **Sodium Sulphate** ($\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$), is prepared by heating salt with sulphuric acid and crystallising the residue from water, from which it separates as colourless prisms having ten molecules of water of crystallisation, which are lost on prolonged exposure to the air. G. S. has a cooling, bitter, and saltish taste, is a mild laxative and diuretic, and is present in the waters of Karlsbad, Chltenham, etc.

Glauchau, tn. of Germany, in Saxony, situated in the circle G., on the Zwickauer Mulde, 8 m. N.N.E. of Zwickau, and 36 m. S.S.E. of Leipzig. Before the Second World War it was a busy industrial centre; the chief manufs. were cloth and woollen goods, paper, beer, etc. There were also calico-printing factories, dyo works, saw and flour mills, iron works, etc. In the Second World War, the tn. fell to the Allies in the closing days of the war. Pop. 28,000.

Glaucoma (Gk. γλαυκος, bluish green), disease of the eyeball characterised by an increase of pressure of the fluids within it. This pressure or tension causes the crystalline lens to assume a greenish-grey or bluish-green hue. The condition is in part mechanical, in part congestive, and results from the iris's outer margin being pushed against the cornea. G. occurs mostly at or after middle life, leading to increasing loss of sight, unless remedied in time by an operation upon the iris or sclerotic. It may, however, be necessary to remove the damaged eye, in order to preserve the vision of the unaffected one.

Glaucouite, hydrated silicate of iron and potassium found in the muds deposited

at the bottom of the sea. The various colours of these deposits are probably due to the presence of G., which is itself green. G. occurs in masses of minute crystals; these masses are often rounded, and it is believed that they represent casts of the shells of Foraminifera which after dissolution of the shell are liberated. It is possible that such casts have been broken down into fine particles which are transported by currents and so distributed amongst the different deposits. G. is found rarely in the oldest rocks, but more plentifully in the Secondary and Tertiary formations.

Glaucus, name given to a genus of nudibranchiate gastropods found in the Atlantic and Pacific Oceans: they have long, slender, slug-like bodies, with three pairs of lateral outgrowths, and the heads are furnished with tentacles. They are of a greenish-blue colour, whence their name.

Glaucus. In Gk. mythology: 1. Builder and steersman of the *Argo*, who escaped unwounded from Jason's fight with the Tyrrhenians, but sank to the bottom of the sea and became an ocean divinity, often surnamed Pontius. 2. Charitoer, the son of Sisyphus, king of Corinth, and Merope, daughter of Atlas, often surnamed Potnieus. He wished to enrage Aphrodite by the exceeding swiftness of his mares, and the goddess inspired them with such fury that they tore him to pieces. 3. Lycian prince, son of Hippolochus and grandson of Bellerophon, who was an ally of Priam against the Gks. in the Trojan war. He had a famous conversation with Diomed, and exchanged his own golden armour for Diomed's iron suit. He was killed by Ajax. 4. Son of Minos II. and Pasiphae, who was smothered in a tub of honey, but restored to life by Polydus, the soothsayer.

Glazebrook, Sir Richard Tetley (1854-1935), physicist. Educated Liverpool College; Trinity College, Cambridge (scholar) — 5th wrangler 1876; Fellow 1877. Principal, Univ. College, Liverpool, 1898-99. Director, National Physical Laboratory, 1899-1919. Prof. of aviation and director of dept. of aeronautics, Imperial College of Technology, 1920-23. Chairman of the Advisory Committee for Aeronautics from its formation in 1909, and also, until 1933, of the Aeronautical Research Committee which succeeded it in 1920. Albert medallist, Royal Society of Arts. With Dr. (later Sir) Napier Shaw, he took a leading part while at the Cavendish Laboratory in organising the teaching of practical physics. He also did valuable work on questions relating to the determination of the fundamental electrical units. Wrote *Science and Industry* (1917). Editor of the *Dictionary of Applied Physics* (1922-23).

Glazing is the art of fixing glass into supporting frames, e.g. windows, doors, roofs. The glazier of the less specialised type may cut the glass himself, but more frequently G. and glass-cutting are two entirely separate crafts. The actual fixing agent employed is putty. This is a mixture of whiting (calcium carbonate, CaCO_3) and 'bollo' linseed oil (i.e. linseed

oil previously heated to about 150°C . with litharge, lead acetate, or some similar drier). On exposure to the air the putty hardens and thus keeps the glass in position. In G., the putty is usually spread by hand, the glass placed in position and held by nails, and the putty then trimmed with a putty knife. Putty is not generally used for indoor G., appropriate wooden beadings serving the purpose both efficiently and more elegantly. Frames or sashes for holding the glass are made of wood or metal; of the latter material lead is used for small lights, chiefly for decorative purposes. The small pieces of glass are placed in the lead framework, and the edges of the lead are then pressed over. Much so-called leaded glass consists of large panes on to which a sham framework of lead has been cemented. Various kinds of glass are used for particular types of G.: thus for glass roofs and skylights wired glass, i.e. glass with wire-netting in it, is commonly employed, while safety glass (q.v. under GLASS) finds wide application in motor vehicles, etc.

Glazunov, Alexander Constantinovich (1865-1935), Russian composer b. at St. Petersburg. After being taught music at home as a child he studied with Rimsky-Korsakov. He composed his first symphony before he was eighteen, and his success decided his future career. He went to Germany, where he became acquainted with Liszt, and under his advice he devoted himself to composition. In 1889 his second symphony and his symphonic poem *Stenka Razin* appeared. These were followed by numerous compositions, including symphonies, overtures, marches, chamber music, songs, etc., and music for the ballets *Raymonda*, *Les Saisons*, and *Ruse d'amour*. He was appointed director of the St. Petersburg Conservatoire in 1905, but wrote little after that to augment his earlier output. He left Russia in 1928, and settled in Paris.

Glebe Land: 1. In eccles. law is the land which belongs to a church as its dowry. Every church is entitled of common right to house and glebe, and formerly no church could be regularly consecrated without such house and land. Where an incumbent before his death has manured and sown G. L. at his own cost with corn or any other grain, he is entitled to dispose, by his will, of all the profits accruing from the crops sown by him. Where the total income of the incumbent of a united benefice appears to be more than sufficient for his due maintenance, the whole or some specified part of the G. Ls. may be given as a perpetual endowment for the support of any adjoining poor benefice. G. L. generally speaking is exempt from tithe consistently with the canon law maxim, that the church shall not pay tithes to the church. The exemption does not, however, extend to the lessee of the vicar. Sales of G. Ls. may be effected by incumbents under the Glebe Lands Act, 1888, with the approval of the Ministry of Agriculture. 2. In the civil law (q.v.) G. L. denotes the soil of an inheritance, and the serfs of the glebe were said to be *glebae*

adscripti or attached to the soil. See Sir R. J. Phillimore, *Ecclesiastical Law of England* (2nd ed.), 1895, and L. A. Goodove, *Real Property*.

Glee, in music, a vocal composition in at least three parts, each taken by only one voice, and consisting of two or more contrasted movements. The subject may be of any type, and a (1. is sung unaccompanied, usually by male voices. It is distinguished from a madrigal by having no contrapuntal harmony, and from a part-song by the independence of its parts. It is entirely Eng. in origin and cultivation, and its best period was during 1760-1830, the most famous composers of Gs. being Dr. Arne, Samuel Webb, Richard Stevens, and John Wall Callcott.

Gleig, George Robert (1796-1888), Scottish author, b. at Stirling. Entered the army, and served in the Peninsular war (1813), and in America (1814). In 1820 he took orders; became chaplain of Chelsea Hospital, 1831; chaplain-general of the forces, 1844; and inspector-general of military schools, 1846. He was a most voluminous writer and his works include *The Subaltern*, 1826, his best-known novel, founded on incidents in the Peninsular war; *The Campaign in Orleans* (1821); *Chelsea Pensioners* (1829); *History of India* (1830-35); *Lives of Military Commanders* (1831); *The Hussar* (1837); *The Story of the Peninsular War* (1839); and *Lives of Warren Hastings* (1811); *Clive* (1848); and *Wellington* (1862). See W. Maquh, *A Gallery of Illustrious Literary Characters*, 1873.

Gleim, Johann Wilhelm Ludwig (1719-1803), Ger. poet, b. at Ermsleben, near Halberstadt. He gave great encouragement and assistance to the young and ambitious poets of his day, and on this account earned for himself the name of 'Father G.' His efforts, however, in this direction were not of a sufficiently judicious and discriminating nature. He wrote a good deal of moderate poetry, his patriotic *Preussische Krugkinder von einem Grenadier* (1758) displaying considerable force of expression and genuine sentiment. His other works consist chiefly of odes and, in the style of Horace and Anacreon, songs and rhymed tables, etc. His collected works were pub. in 8 vols. (1811-11). See lives by W. Körte, and R. Weinmann, 1920.

Gleiwitz (Polish Gliwice), tn. of Poland, in the former Prussian prov. of Silesia (Upper), situated 24 m. N.E. of Ratibor, on the railway between Oppeln and Cracow. It is the centre of the mining industry of Upper Silesia, and is noted for the manuf. of woollens; it has glass works, and an iron foundry, and meal mills. It fell to Marshal Konev's forces in the early part of 1945. Pop. (1939) 112,000.

Glen, William (1789-1826), Scottish poet, b. in Glasgow. He was the son of a merchant, and first took to trade and farming, but he soon gave these up and pub. a book of poems in 1815. He is remembered for his popular song, *Wae's me for Prince Charlie*.

Glendalmond, Perthshire, Scotland. The name given to the valley of the R. Al-

mond, the finest part being called Sma' Glen. It is one of the most picturesque valleys of Scotland. An important Episcopalian institution is situated here, about 10 m. N. of Perth, called Trinity College, founded in 1841 with the idea of raising a Scottish Episcopalian public school on the model of the great Eng. ones. Gladstone was the main initiator of the project.

'Glenart Castle', Brit. hospital ship which was torpedoed and sunk on Feb. 26, 1918, by a Ger. submarine in the Bristol Channel regardless of the fact that the boat was showing the Red Cross and, in all respects, conforming to the requirements of The Hague Convention as to hospital ships. Only 38 persons out of 200 were saved.

Glencairn, Earls of. This title was first borne by Alexander Cunningham of Kilmaurs, Ayrshire, who was created earl (1488), and d. shortly afterwards. It is taken from a par. of Dumfriesshire, Scotland. Among the more famous earls were: *William*, fourth earl (d. 1547), who supported Henry VIII.'s Scottish policy and opposed the duke of Albany. He joined Angus and Lennox (1524) to place their young king under control of a council of regency. He was defeated (1541) at Glasgow Muir by Arran. See Sadler, *State Papers*, and Douglas, *Scott Peersage*, i. 633-36.

Alexander, fifth earl (d. 1571), third son of preceding, supported Knox and the reformation in Scotland, and composed a satirical poem against the Grey Friars, who had persecuted G. Buchanan.

William, ninth earl (c. 1610-64), organised the Highland rising of 1653, but was defeated at Dunkeld, 1654. He warmly supported Charles II., becoming lord chancellor of Scotland on the Restoration.

James, fourteenth earl (1719-91), was a friend of Burns. The title became extinct with *John*, fifteenth earl, 1796.

Glencoe: 1. Wild, gloomy valley of Argyllshire, Scotland, near the head of Loch Leven, extending from Balla Mullish E. for 10 m. The mts. rise perpendicularly on either side (3000-3800 ft.). The bed is swept by Ossian's 'dark torrent of Gona' (R. Coe), which enters Loch Leven. The pass is noted for the treacherous massacre of the MacDonalds in Feb., 1692, brought about by Dalrymple and Capt. Campbell. See Lord Macaulay, *History of England* 1649-61. 2. Hamlet of N. Natal, S. Africa, on the railway from Ladysmith to Dundee.

Glen Cove, tn. of New York, U.S.A., in Nassau co., on the Hempstead and G. branch of the Long Is. Railway. There are flour mills and a starch factory. Pop. 11,430.

Glendalough, mt. glen of Ireland, situated 10 m. N.W. by W. of Wicklow, and 8 m. from Rathdrum station. It is watered by the stream Gleneau, a trib. of the Avonmore, and is famous for its picturesque beauty. The ruins of an anct. city, which, from the sixth century to 1211, was a bishop's see, are situated here; chief among them are the 'Seven Churches,' one of which was the anct.

cathedral. Most of the churches were founded by St. Kevin.

Glendower, Owen (Owain ab Gruffydd) (c. 1359-1416), famous Welsh chieftain claiming descent from Llewelyn and the ruling princes of Wales, an opponent of the Eng. in Henry IV.'s reign. He had been patronised by Richard II., but was at first a follower of Henry IV. until local troubles made him rebel. He laid claim to the crown of Wales (1402), and refusing a definite engagement, checked two Eng. expeditions by wearing out the king's forces among his mt. fastnesses. G. defeated the Eng. near Knighton, 1402. On the third Eng. march to Wales, he retired to the mts. With Mortimer and Hotspur he formed a conspiracy against Henry, but was defeated at Shrewsbury (1403). He also allied with Scotland, Ireland, and Charles VI. of France. In 1405 he was defeated by Henry, Prince of Wales, but remained hostile to the end of his days. He was the last champion of Welsh independence against the Eng. kings. See T. Thomas, *Memoirs of Glendower*, 1822; J. H. Wylie, *History of England under Henry IV.*, 1881-91; A. G. Bradley, *Owen Glyndwr*, 1904; and Sir H. Ellis, *Original Letters Illustrative of English History*, 1925-16. See also Shakespeare's *Henry IV.*; the *Retrospective Review*, xlii., 1826, the works of Iolo Goch and Lewis Glyn Cothi, and the bibliography compiled by D. R. Phillips, 1915.

Gleneagles, picturesque glen in S. Perthshire, Scotland, about a mile S. of Crieff, through which flows the Ruthven. Agricola is supposed to have passed through it when marching on Ardoch. It has excellent golf links.

Glenelg, tn. and watering-place of S. Australia, situated in Adelaide co. on the W. coast of Holdfast Bay, and 5 m. S.W. of Adelaide. Here in 1836 S. Australia was formally proclaimed to be a Brit. colony. It is connected with Adelaide by two lines of railway. Pop. 4000.

Glenfinnan, hamlet and glen in Inverness-shire, Scotland, on Loch Shiel, 18 m. W. of Fort William. A tower marks the place where the Young Pretender raised his standard in 1745.

Glengariff, vill. of Co. Cork, Eire, 8 m. N.W. of Bantry. It is a favoured beauty spot, standing at the head of a harbour of the same name, an island-studded arm of Bantry Bay.

Glengarry, valley of the Garry, in Inverness-shire, Scotland. A picturesque wooded vale, it was the property of the Macdonells and gives its name to the Highland bonnet or cap.

Glenlivet, valley of Bantffshire, Scotland through which runs the Livet. It is some 20 m. S.W. of Huntly and is noted for its whisky.

Glenmore, or the Great Glen, valley of Scotland which stretches for more than 60 m. across the central part of the country, from the N.E. at Inverness to the S.W. at Fort William. The Caledonian Canal, which was constructed by connecting the lochs Ness, Olch, and Lochie, flows through the glen.

Glenroy, narrow glen, 14 m. long in the Lochaber dist. of Inverness-shire, Scotland. The Roy flows through the valley which is remarkable for having in each side three regular and distinctly formed terraces, the margins of a former loch.

Glens Falls, city of New York state, U.S.A., in Warren co., 55 m. N. of Troy, situated on the Hudson R. and connected with Champlain Canal. It has a descent of about 50 ft. between cliffs of black marble. There are valuable quarries and Portland cement works. The tn. possesses a Crandall free library, state armoury, hospital, etc. It is an old Quaker settlement of about 1763. During the Revolution of 1780 it was burned to the ground, but was rebuilt. Pop. 20,000.

Glenilt, glen in N. Perthshire, Scotland, watered by the Tilt. It extends from Blair Atholl for a distance of 13 m. At its upper part it is hemmed in by high mts., and numerous torrents flow down their slopes through the glen. The rock formation here is geologically interesting; white, grey, and green marble have been quarried.

Gliding, art of flying in an aeroplane, without the use of engines of power, by taking advantage of the natural currents of air and the law of gravitation. The first principle involved in this kind of flight is that by the skilful arrangement of planes on a flying machine its fall can be retarded in such a way as to make the fall itself a means of propelling the aeroplane over a long distance. The plane, with power behind it, can also take advantage of the law of gravitation in this manner. But whereas the power machine can elevate the front of its planes and, by driving against the wind, climb to a desired height, the machine without power must find other means. Here, use is made of the second principle, which is based on the fact that the air currents in passing over uneven or hilly ground follow the contour of the land over which they pass, and though, in relation to these currents, an aeroplane may be falling all the time, the breeze that blows up the side of a long and fairly steep hill actually lifts to a greater height any plane floating with it. Skilful manipulation of the plane enables the glider to take advantage of these two principles to cover long distances. By alternately 'soaring,' or making use of the lift of these upward currents and 'gliding,' or using the pull of gravitation as a means to cover distance, the airman can now remain in the air for an almost indefinite period. The art of G. was an important part of the development of flying, and continues to afford useful information. Long before the progress of the motor car turned the attention of inventors and engineers to the possible uses of very powerful engines in very small compass, experiments were being made in heavier-than-air flying machines, which, starting from high ground, should fly a long distance before landing. Among the most successful pioneers in this form of experiment were the two brothers Lilienthal, Chanute and Montgomery, whose experiments gradually led to the adoption of the

flying machine, which has become more or less standardised. Gliders, or motorless aircraft, towed by other aircraft, and used to carry 'airborne' troops and stores, were much developed in the Second World War. The Brit. 8-ton Hamilcar glider (designed in 1941) which was used with great success by the Army Air Corps in the invasion of Europe in 1944, was then the largest wooden aircraft in the world. It had a wing-span of 110 ft. The fuselage formed a cabin which was nearly 26 ft. long, 8 ft. wide and 7½ ft. high. It could transport a Tetrarch Mk. IV. tank with crew, a T19 Locust tank, a 17-pounder anti-tank gun, a tractor and angle-dozer (used in acrodromic construction), main portions of a bulldozer, 2 armoured Scout cars, a self-propelled Bofors-gun, and a variety of other loads. It required a four-engined bomber to serve as its tug, Handley-Page Halifaxes being used for the purpose. When fully loaded this transport glider weighed 36,000 lb., or 16 tons, and the glider-tug combination could cruise at 150 m.p.h. The Gers. used the 'Gotha' (Go 242 glider in the N. African campaigns, but in size this transport craft was completely dwarfed by the Hamilcar. The Gers. also produced, but did not bring into service, a glider for photographic reconnaissance, launched from a Dornier bomber at about 30,000 ft. A rocket motor then took it to 75,000 ft. until its fuel failed, when it became a glider and accomplished its mission thereafter in a glide. The pilot could jettison the nose part with himself inside, and descend by parachute.

G. became very popular in Germany after the First World War. It also took root in England, where many amateur G. clubs were formed. A Brit. G. Association was also estab., which is now affiliated to the Royal Aero Club. Notable G. records are those of Fl./Lt. R. C. S. Forbes (194 m. in 6 hrs. 7 min.) and F. O. G. Archibald (194 m. in 5 hrs. 12 min.) at Pussburg, Germany (lieut. zone of occupation) in 1948, and Philip Willis, Hatfield to Truro, May 1, 1949. See T. Horsley, *Soaring Flight*, 1945, and A. C. Douglas, *Gliding and Advanced Soaring*, 1947. See also HORSLEY GLENN.

Glinka, Mikhail Ivanovich (1804-57), Russian composer; b. at Novospaskoi, of noble family. Chief operas, *A Life for the Tsar* (1836) and *Russian and Ludmilla* (1842). The latter work is based on Pushkin's poem. In these works G. liberated Russian music from its over-zealous imitation of W. opera and thereby laid the foundations of a really national opera.

Glilwice, see GLIWITZ.

Globe, tn. of Arizona, U.S.A. situated in Gila co., of which it is the cap., and 30 m. N. of Tucson. It is the centre of a copper mining dist., and stands third in the U.S.A. for production. Gold, silver, asbestos, quicksilver, and coal are also found. Pop. 7000.

Globe-fish, marine fish of the diodontidae and tetrodontidae families. They are so named because of their power of distending the gullet with air, and thus

assuming an almost globular form. Most of the species are found in tropical and sub-tropical seas, where they feed on corals, molluscs, and crustaceans, for which their hard, beak-like snouts are peculiarly adapted. Some of them are highly poisonous, and most of them are armed with spines of differing shape and size; they vary in size from a few inches to two feet, and are nearly always brilliantly coloured. *Tetodon* and *Diodon* are the best-known genera. *D. hystrix*, the sea hedgehog, being the largest of all the species.

Globe Flower or Golden Ball, popular names of the genus *Trollius*, perennial erect plants of the order Ranunculaceae. The best-known Brit. species is *T. europaeus*, which has pale yellow globular flowers.

Globes, spherical maps representing the appearance of the heavens or the earth. A terrestrial globe naturally conveys a far more accurate impression of the relative areas of land and water and of the true position of any one place with regard to another than can possibly be given by a flat projection, where angles and distances are of necessity distorted. A globe reproduces in miniature the spherical shape of the earth, only that no account is taken of the flattening at the poles. It is constructed as follows: Layers of paper are pasted on to a wooden or iron matrix. At the poles are metal meridian circles through which pass the ends of the central axis round which the globe is made to revolve. The meridians and parallels are drawn on a composition of whiting, glue, and oil with which the sphere has been coated. Great care is needed to attach the gores or segments (from twelve to twenty-four in number) on which the map is already printed, to the globe. Formerly the preparation of a globe was a laborious process, as it was painted by hand or else engraved on copper. For schools and libraries a globe is made to rotate round its own axis in a somewhat larger metal meridian, which in its turn is fitted into a horizontal wooden ring fastened to a stand. The gores, it should be added, are now prepared on strictly mathematical principles. A normal globe has a diameter of 12 or 18 in. At the Paris Exhibition of 1889 an interesting globe was on view, which was an exact model of the earth, only a million times smaller. Thus the equator measured 40 metres, which represented 40,000 kilometres, the actual circumference of a great circle. Such a sphere would make the calculation of distances an easy matter. Sometimes a globe is embossed to show the highlands and lowlands. Compound G. are also made, the celestial globe being of glass and enclosing the terrestrial. Accessories, such as a flexible quadrant to measure distance between any two places, a compass usually put below the sphere, and an hour-circle round the N. pole, are indispensable if the globe is to be used for solving geographical and astronomical problems. On the celestial sphere the stars are drawn as it is calculated they would appear if looked at from the centre

of that sphere, the relative positions and distances of the stellar bodies being exactly the same as they appear in the actual heavens.

Celestial G. seem to have been made first. Thus they were understood in the days of the Venerable Bede, and some were contrived by Gerbert of Aurillac (929). The oldest of the Arabian celestial spheres is now in the Florence museum, and another, dated about 1225, can still be seen at Velletri. A certain scientist of China, Ho-shing-tien, devised such a sphere as early as 450, whilst to turn to Gk. civilisation the celestial sphere of Hipparchus (c. 150 B.C.) was still on view in the great library of Alexandria in Ptolemy's day. In the Naples Museum is one which is believed to be as old as the fourth century B.C. The Laon and Nuremberg terrestrial G. are contemporary with Columbus, who was certainly familiar with similar maps (c. 1492), and there exist reliable illustrations of the terrestrial sphere of Crates of Mallus (d. 145 B.C.), dividing the earth, by an equatorial and a meridional ocean into four quarters, thus anticipating the discovery of the Americas and Australia.

'Globe, The' (or more fully, 'The Globe and Traveller'), started in 1803 as a six-penny paper by a syndicate of publishers primarily with the object of securing to themselves an advertising medium. Its first editor was George Lane, and other prominent members of its staff or contributors from time to time were James Bacon (subsequently Vice-Chancellor Sir James Bacon); R. H. Barham, author of *Ingoldsby Legends*; Thomas Love Peacock, satiric novelist, poet, and official of the E. India Company; and Frédéric Bastiat, the Fr. economist. In 1842 it took over its old rival the *Courier*. Later, at the ebb of its fortunes, it was changed into a Conservative paper, its new proprietors, including Sir Stafford Northcote, lowering the price to one penny. Afterwards it became the property of one of its editors, Capt. (subsequently Sir George) Armstrong. In 1907 it was sold to Sir Hildebrand Harmsworth. After a somewhat lively career, the paper came to an end soon after the First World War.

Globe Theatre. In the year 1868 this theatre was opened in London, the first production being one of H. J. Byron's pieces, entitled *Cyril's Success*. There was also a theatre of the same name which stood on Bank-side and was famous in Elizabethan times where the works of Shakespeare and his contemporaries were represented. Every kind of dramatic entertainment was produced at the G. T. of 1868, from tragedy to farce. Pinero wrote a comedietta, produced there in 1877, and in the following year were seen J. L. Toole's *Trying a Magistrate*, and another play by H. Byron called *A Fool and his Money*. In the early eighties such well-known writers as Jerome K. Jerome, Sydney Grundy, and Robert Buchanan had productions running. In 1897 Sir John Hare took possession of the theatre, and during his tenancy as many as twelve different plays by well-known

authors were produced. *The Three Musketeers* was given in 1898, and the following year Sir A. Pinero's *Gay Lord Quex*, in which Sir John Hare scored such a success in the title role. The G. T. now stands in a fine position in Shaftesbury Avenue, W.C., and its approximate seating capacity is 1000 people. It is one of the largest of the W.-end theatres. Later plays produced there were *Fallen Angels*, by Noel Coward (1925), *Trelawny of the Wells* (1926), *Canaries Sometimes Sing*, by F. Lonsdale (1928), *The Improper Duchess*, by J. B. Fagan (1931), *For Services Rendered*, by Somerset Maugham, (1932), *Robert's Wife*, by St. J. Ervino (1937), *The Morning Star*, by Emyln Williams (1941), and *While the Sun Shines*, by Terence Rattigan (1943-46).

Globigerina, name given to a genus of foraminiferous rhizopods, whose shells are found in great abundance on the floor of the ocean, particularly in warm seas. They are of a pelagic, limy formation, having many chambers covered with pores, out of which streams protoplasm. As they die, their shells sink to the bottom and form the calcareous deposit known as the G. ooze.

Globular Clusters, dense groups of stars at great distances. Some sixty are known and each contains thousands of stars. They are believed to be outside our galaxy and to form isolated stellar systems comparable to ours. The best known is that in the constellation Hercules.

Globular Projection, see PROJECTION.

Globularia, genus of the order Salicnaceae. They are perennial herbs or shrubs and are cultivated in rock-gardens. The flowers, which are globular, are blue or white.

Glogau, or Grossglogau, tn. and fortress of Poland in Upper Silesia (formerly of Prussia) on the l. b. of the R. Oder, 32 m. from Liegnitz. Its cathedral, on an is. in the Oder, is connected with the tn. by a wooden bridge. Fortified since about 1000, it has withstood sev. sieges. It is noted for manufs. of sugar, starch, pottery, and agric. machines; and its book trade was celebrated. The tn. was taken by the Russian forces on April 1, 1915.

Gloss (Gk. *γλῶσσα*, tongue, language), or Glose. Originally an explanation of merely verbal difficulties in a literary work (such as words taken directly from a foreign tongue, provincialisms, obsolete and technical terms, dialect words, or those used by the author with some exceptional meaning), inserted between the lines or written in the margin beside the passage. The earliest Gs. (Gk., Lat., and Heb. MSS.) were interlinear, later they became marginal, and finally developed into a running commentary on the whole book. (*Glosse* came to be applied to similar explanatory renderings of words or passages in any dictionary or annotated work, hence our word 'glossary'. In a sinister sense G. may mean a sophistical interpretation. Collections of Gs. (*glossaria*) were very common in the Alexandrian period (fourth century B.C.). Among the chief Gk. *glossatores* are Philetas of Cos (third century B.C.)

Zenodotus, Aristophanes of Byzantium, Arietarchus, Apion, Hesychius of Alexandria (fourth century A.D.), Photius (ninth century), Suidas (tenth century), Zonaras (twelfth century), Favorinus, a Benedictine (d. 1537). Most of the Rabbinical writers have done for the Heb. text what these did for early Gk. texts. The chief glossators or glossarians of the Lat. Vulgate are Walafrid Strabo (ninth century), author of the *Glossa Ordinaria*, and Anselm of Laon (c. 1050-1117), author of the *Glossa Interlinearis*, printed in the Vulgate ed. of 1480. A collection of Gs. illustrating the language of scripture was the *Glossa Sacrae Hesychie* . . . of Ernesti (1785-86). In Rom. Law G. means an explanation, not merely of one word, but of the whole intent of the law. The medieval commentators on the texts of civil and canon law were called glossators, the best known being Iracunus (twelfth century), and Accursius (thirteenth century), whose Gs. on the sixth-century Justinian code (*Corpus Juris Glossatum*) ranked almost as high as the code itself. The first glossarium to canon law was that of J. Soneca (Teutonicus), 1212, printed in connection with the *Decretum Gratiani*.¹ Similar collections were made later of the decretals of Gregory IX., the *Liber Sextus*, the *Clementines*, and the *Extravagantes*. The *Glossarium ad Scriptores Mediae et Infimae Latinitatis* of C. du R. Du Cange (6 vols.), 1733-36, and P. Carpentier's *Supplement* (4 vols.), 1766, are very famous. Seven vols. of the *Corpus Glossariorum Latinarum* of G. Goetz appeared between 1888 and 1907. Gs. on the works of more modern writers are T. Tyrwhitt, *Glossary to Chaucer*, 1775; H. Nares, *Glossary to Shakespeare and his Contemporaries* (new ed.), 1888; and W. W. Skeat, *A Glossary of Tudor and Stuart Words*, 1914.

Glossop, John Collings-Taswell (1868-1931), Eng. vice-admiral. Served in the Australian Navy in the early part of the First World War. He was in command of the Australian cruiser *Sydney* when she sank the Ger. raider *Emden* in Nov. 1914.

Glossop, manufacturing tn. in Derbyshire, England, near the Peak. Noted for paper mills, cotton and calico printing. Pop. 20,528.

Glottis, see LARYNX.

Gloucester, Arthur Cayley Headlam, Bishop of, see HEADLAM.

Gloucester, Dukes and Earls of. The earldom of G. was first conferred on Robert (d. 1147), who won the battle of Lincoln for his sister Matilda against Stephen. In the Clare family, Richard (1222-62) was seventh earl, and fought on the side of the barons under Henry III. till he finally quarrelled with Simon de Montfort. His son Gilbert (1213-95) was eighth earl, surnamed the 'Red.' He fought with de Montfort at Lewes (1264), but against him at Evesham (1265) for Prince Edward. He was regent during Edward I.'s absence from England. Gilbert, ninth earl (1291-1314), fell at Bannockburn. Thomas of Woodstock (1355-97), youngest son of Edward III.,

was made duke of G. by Richard II., 1385. From 1386-89 he was virtual ruler of England. He was put to death at Calais by order of Richard II. on a charge of treason. Humphrey (1391-1447), known as the good Duke Humphrey, was youngest son of Henry IV., brother of Henry V., with whom he fought at Agincourt (1415). He was Protector during the minority of Henry VI. (see K. H. Vickers's life, 1907). He invaded Flanders, 1436; lost his influence over Henry VI. upon the conviction of his wife, formerly Eleanor Cobham, for witchcraft, 1441, and, at the instigation of Suffolk, was arrested, 1447, and d. a few days later. He was a munificent patron of literature and the Church. Richard, son of the duke of York and brother of Edward IV., became Richard III. (1483-85). The last but one to bear the title was Frederick Wm. (duke of G. and Edinburgh, 1776-1834), nephew of George III. The present holder of the title is Henry Wm. Frederick, third son of George V. He was b. March 31, 1900. Known as Prince Henry until 1928, when he was created a duke. He entered the Kings Royal Rifle Corps in 1919 but later joined the cavalry. Married, 1935, Lady Alice Scott, daughter of the seventh earl of Buccleuch. Promoted major-general in 1937. Governor-general of the Commonwealth of Australia, 1915-47. Now general and air chief marshal; colonel of the Scots Guards; master of the Corporation of Trinity House.

Gloucester, Robert of. 1. Early Eng. writer (fl. thirteenth century), probably a monk of G. Abbey. He wrote in verse a *Chronicle of England* from the earliest times down to the reign of Henry III. See selections from his *Chronicle* in G. Sampson's *Cambridge Book of Prose and Verse*, 1921. See also W. Ellmer, *Über die Quellen der Reimchronik Roberts von Gloucester*, 1886; the Rolls Series ed. of the *Chronicle*, ed. Aldis Wright (2 vols.), 1887; and B. D. Brown, *Robert of Gloucester and Life of Kenein*, 1926. 2. Illegitimate son of Henry I., earl of G. (d. 1147), b. in Normandy. He was made earl about 1121, and in 1139 headed a rebellion in the W. of England, supporting the claim to the throne of Matilda and her son Henry against that of Stephen. His efforts were unsuccessful. Robert was a great patron of letters.

Gloucester: 1. Cap. of Gloucestershire, England, an inland port, city, and co. bor. of note. It is built on a slight declivity, sloping towards the Severn, and is sheltered by the Cotswold and Malvern Hills. Its prin. building is the cathedral, the foundation of which dates from the eleventh century, but which has been restored since 1873. It was at one time a monastery church. G. has sev. schools, three endowed anct. ones, and sev. modern. It is governed by a mayor, aldermen, and burgesses. Its chief manufs. are air-raft, railway engines, agric. implements, cutlery, etc., and it exports, iron, coal, bricks, pottery, salt, malt, and agric. products, carrying on a large trade with the Baltic and other foreign ports. It also has fine ship-

building yards, foundries, marble and slate works. The salmon fisheries in the Severn are valuable. G. returns one member to the House of Commons. Pop. 61,700. 2. In Massachusetts, U.S.A., a city and port of entry of Essex co., 32 m. N.W. of Boston. It was founded in 1623, chiefly by settlers from G. in England whence it derived its name. In 1642 it was incorporated as a tn., and in 1871 became a city. It is governed by a mayor, elected annually. The oldest Universalist church in the U.S.A. is situated in G., founded in 1770. From the beautiful

British Railways

THE FIFTEENTH-CENTURY TOWER
OF GLOUCESTER CATHEDRAL

dark granite quarried in the neighbourhood the Woolworth Building, New York, and some gov. offices are built. G. is noted as being one of the most important fishing ports and markets in the world, 6000 men being engaged in the trade. The prin. catches are herring, cod, mackerel, and halibut. G. also has large manufs. of oil, shoes, machinery, cigars, twine, etc. Pop. 21,000, which increases by summer holiday traffic. 3. A city in Camden co., New Jersey, U.S.A., on the Delaware R. It was incorporated in 1868, and is governed by a mayor, elected every two years, and by a unicameral council. It is connected with Philadelphia by ferry. The manufs. include cottons, calico prints, woollen yarns, Welsbach lights, and boats. It has a shipyard. Pop. 13,800.

Gloucestershire, co. of England in the 1st. Midlands, bounded by Worcestersh. and Warwickshire on the N., by

Oxfordshire on the E., by Wiltshire and Somersetshire on the S., and by Monmouthshire and Herefordshire on the W. Its area is 1258 sq. m. The co. is irregular in outline, but is marked into three distinct physical divs., viz. the hills, the vale, and the forest. The E. part of the co. lies among the uplands of the Cotswold Hills; the W. part overlooks the rich valley of the lower Severn, known as the Vale; and the beautiful and historic Forest of Dean lies between the Wye and the Severn. The greater part of the total area is under cultivation; the vale dist. is particularly adapted for pasturage, and the moist climate is favourable to the growth of root crops, wheat being the chief grain raised. The cattle are mostly shorthorns, reared for both distant markets and dairy purposes, G. being famous as a dairy co. It is the vale dist. which produces the celebrated double Gloucester cheeses, and it has long been celebrated for its cheese and butter. From its orchards large quantities of cider are obtained; the apple and pear orchards attached to nearly every farm are quite a feature of the co. Sheep-farming is carried on largely in the Cotswold (q.v.) dist., and this has led to the manuf. of woollen cloth, the kind principally manufactured being broadcloth, made in all shades of colour. Stroud is the chief centre for a number of manufacturing vls. Machinery, tools, paper, furniture, pottery, and glass are produced. Ironstone, clay, limestone, and sandstone are worked, and the Forest of Dean has some iron deposits and important coalfields.

G. is served by two railway systems, the main line of the W. Region of Brit. Railways serving Bristol from London. The coalfields of the Forest of Dean are served by sev. branch lines. G. is in the Oxford circuit and assizes are held at Gloucester, the co. tn. It is principally in the diocese of Gloucester and has four parl. divs. It contains the parl. bors. of Cheltenham and Gloucester and six bor. constituencies of Bristol. (See Victoria Co. Lists, *Gloucestershire*.) Chief antiquities of the co. are the celebrated cathedrals of Gloucester and Bristol, the famous abbey church of Tewkesbury, and the church of Cirencester. Most of the old mkt. tns. have fine par. churches, those in Cleveo and Cheltenham being of special interest by reason of the pre-Norman work they retain.

As already shown, the physical characteristics of the three natural divs. of G. have given rise to a special industry in each. The woollen trade of the big tns. has been gradually absorbed by the hill dist.; and in the prosperous Stroud valley silk-weaving was introduced in the seventeenth century. During that century and the next numerous minor industries sprang up, including flax-growing and the manuf. of lace, rope, sailcloth, stockings, etc. The abundance of clay and building-stone in G., too, has given rise to the manuf. of tiles, bricks, and pottery. Colostine (q.v.) is found near Gloucester hamlet.

As regards geological formations, no co. in England has a greater variety. Gneissic

rocks are found at the S. end of the Malvern Hills, and the oldest stratified rocks of the co. are to be found in a patch of greenstone at Damory, Charsfield, and Woodford. A series of sandy shales and sandstones is quarried at Dymock, and the Old Red Sandstone occurs in sev. places in the Bristol coalfield. The Penarth series consists of grey marls and black paper shales, containing much pyrites and a celebrated bone bed, the Cotnam landscape marble, and the White Lias limestone. The co. has no higher Secondary or Tertiary rocks, but is represented by the Quaternary series. Dover's Hill, a spur of the Cotswolds between Chipping Campden and Weston-sub-Edge commands extensive views over the vale of Evesham. This vantage-ground was bought, largely by public subscription, during 1928 and 1929. Land was also bought in 1933 though funds provided by the Pilgrim Trust, to preserve the surroundings of the church of Chipping Campden and Old Campden House. Pop. 874,700. See W. Jones (editor), *Transactions of the Bristol and Gloucestershire Archaeological Society*, 1900; A. Hissing, *Footpath-way in Gloucestershire*, 1924; G. B. Grundy, *Saxon Charters and Field Names of Gloucestershire*, 1935-36; K. Haro, *Gloucestershire*, 1948; and H. Stratton David, *Batsford's Little Guide to Gloucestershire*, 1949.

Gloucestershire Regiment. Formerly 28th and 61st Foot. The 28th was raised in 1694, and took part in Marlborough's campaigns, and was at the battle of Fontenoy (1746). Thence it went to America on service. As 'The Old Braggs' and 'The Slashers' it gained great renown in the eighteenth century. At Alexandria in 1801 it gained the unique distinction of being permitted to wear a badge at the back of the head-dresses as well as in the front. This was in commemoration of the fact that it was attacked by Napoleon's Invincible Legion both in the front and the rear but defeated the legion with great loss. A few years later it was with Wellington in the Peninsula and at Waterloo. The 61st was raised in 1755, and saw service in the W. Indies, Malda, Peninsula, and the Indian Mutiny. These two regiments were linked in 1851 to form the G. R., which fought in the S. African war, 1899-1902. During the First World War it raised twenty-four battalions, which served in France, Flanders, Italy, Macedonia, Gallipoli, Egypt, Mesopotamia, and Persia. In the Second World War the G. R. fought in N.W. Europe and in the Far E. Took part, in Feb. 1915, in the heavy fighting on the Canadian Army's front at the Sierfried and Maas R. defences. Other units of the regiment formed part of the 49th Div., captured Nispen in Belgium on Oct. 26, 1914, and, with the Essex Regiment, won the bridgehead over the R. Mark (Nov. 1914).

Glove (O.E. *glof*), covering for the hand, usually with a separate sheath for each finger. The use of Gs. was apparently known in the earliest times, and references are made to it in classical hist. In the eighth and ninth centuries the use of Gs.

was almost universal among the Gers. and Scandinavians, though usually of the fingerless kind; but there is no evidence to prove that Gs. were in use in England till the thirteenth century. They were then first worn by ladies as ornaments, sometimes being made of linen and reaching almost to the shoulder. It was Queen Elizabeth who set the fashion of wearing them richly embroidered and bejewelled. During the Middle Ages the G. obtained a special significance in the symbolic sense, the custom of offering a folded G. as a gage for waging one's law coming into use. Associated with this custom was the use of the G. in a wager of battle, when it was thrown down by the defendant and picked up by the accuser, in open court, signifying a challenge and its acceptance. The manu. of Gs. was not introduced into Great Britain till the tenth or eleventh century. A speciality of the Eng. manu. is the so-called 'dog-skin' G., made from the skin of the Cape sheep. The chief seat of the leather-G. manu. is at Worcester, though they are also made to a considerable extent at Ludlow, Yeovil, and Woodstock, and they are distinguished for their durability. An immense number of Gs., especially of the kid variety, are made in France, where they are noted for their elegance and neatness. Dmn. ladies' Gs. are also famous. The manu. is also carried on in Brussels and Berlin; and in the U.S.A. many grades and varieties are made in the large manufacturing cities.

Glover, Richard (1712-85), Eng. poet, son of a London merchant, educated at Chesham, Surrey. He was M.P. for Weymouth, 1762-8. He wrote some verses in praise of Sir I. Newton (1728), and his blank verse epic, *Leonidas*, appeared in 1737 (extended to 12 vols. by 1770). The *Athenaid* (a sequel, 30 vols.) was pub. posthumously in 1788. His works are mostly forgotten now. Others were the tragedies *Roadside* (1753); *Medea* (1761); *Jason* (1799); and the *Ballad of Admiral Hosier's Ghost* (1726), intended to excite the Eng. against Spain. G.'s diary was pub. in 1813. See A. Chalmers, *Works of the English Poets* (vol. xvii.), 1810; J. G. Schauf, *Richard Glover, Leben und Werke*, 1900.

Gloversville, city of Fulton co., New York state, U.S.A., 43 m. N.W. of Albany. Noted for the manu. of gloves and mittens and glove and shoe leather. Pop. 23,000.

Glow-worm, name applied to various luminous beetles of the sub-family Lampyridae. There are about 300 species. They are nocturnal in habit, and found chiefly in warm countries. The phosphorescent structure is on the abdomen, and the lights apparently serve as love-signals between the sexes, to light the path of the beetle and frighten off foes. The most common European variety is the *Lampyrus noctiluca*. The female is usually wingless; the males, eggs, larvae, and pupae are all luminous. In this variety alone the female's light is more brilliant than the male's. Other species are *Lampyrus splendida*, the W. Indian

Photuris and *Pygolampis*, Amer. *Pyraclomena*, *Pyrocælia*, *Luciola*, *Lamprocera*, and *Photus pyralis*. See FIREFLY, PHOSPHORESCENCE

GROW WORM

A fema B larva C eggs D male

Gloxinia, bulbous plants of the order Gesneriaceæ. All species are indigenous to tropical America. They are very popular in Britain, being one of the handsomest of stove and greenhouse (heated) plants. They are usually propagated from seeds, which, if sown in spring or about the second week in March will bloom in autumn. Tubers can be flowered at almost any season five to six months from planting. Many cultivated varieties have been derived from *G. speciosa*. The large trumpet-shaped flowers borne singly on strong stems rise above the large ovate leaves. They are tubular with wide, richly coloured inner speckled marbled blotched, or whole colour.

Glubb, John Bagot (b. 1897), Iraq soldier. After service in the First World War he was political officer in Iraq working among Arab tribes on the Saudi Arabian frontier. In 1932 he was transferred to Timor and put in command of the Arab Legion. His name will always be associated with the formation of the 'desert patrol' and system of forts on the Transjordan-Egypt border. During the Iraqi campaign of 1941 (see under IRAQ) he was attached to the Transjordan frontier force and took part in the operations in the Hail area, and, in the Syrian campaign later in the year, he took part in the operations in N.E. Africa and at Palmyra. Known among the Arabs as Abou Il muk or 'Father of the Jaw'. He wrote *The Story of the Arab Legion* (1948).

Glubozyce (Ger. Leobschutz), tn in the prov. of Polish Silesia, on the Zinna, 19 m. N.W. of Ratibor. Pop. 13,300.

Glucinum, see BERYLLIUM.

Gluck, Christoph Willibald (1714-87), operatic composer, may be credited with having rescued opera from the degeneracy to which it had sunk under the influence of the early eighteenth century Italian school, who wrote purely for the display of vocal technique—thereby preparing the way for its subsequent development by Wagner. G. was the first composer to study the deeper æsthetic possibilities of opera as an art form. His ideals, like those of his successor Wagner, were framed on the lines of the Greek drama, and aimed at making music the expression of sincere passions and profound sentiments. The music of his reformed operas is an application of these ideals; it is subservient to the libretto, and psychological in a manner that would now be deemed superficial, although at the time it was in unheeded innovation and the orchestration represents with noble breadth and dignity of style and austere simplicity of colouring the emotional depths of the poetry. Further the overtures are synoptic programmes of the operas. G.'s early efforts were all in the Italian style, *Orfeo* being the first of very successful series in Milan, Venice and Lurein (1741-5). He then came to England, but was overshadowed by Handel who was then at the zenith of his popularity, and failed to win recognition. It was in Vienna that his first significant opera *Orfeo* (1761) was produced, meeting with great and immediate success. In this work, which may be regarded as the germ of the modern music drama, are seen the more or less tentative ideas which found mature expression in *Alceste* (1763), *Iphigénie en Tauride* (1774), *Armida* (1777), *Iphigénie en Aulide* (1779). This latter being the weapon which gave G. victory over Piccini, the rival composer of the Italian school in the quarrel melted between them by the Paris courtiers under Marie Antoinette and Mme du Barry respectively, and finally *Choer d'Arceise* (1779).

Glucose, see DEXTROSE.

Glue (O.E. *glu* 'bird lime'), impure gelatine which is used for its adhesive properties. It is made from the refuse of tanneries such as parings of hides, ears and tails of oxen and sheep, and from the skins of calves, cats, dogs, rabbits, hares, and other animals, though oxen and sheep are preferred. The hide is washed in tanks of lime water or soda solution for two or three weeks until the hair is removed. The gelatinous substance is obtained by melting the hide in an open boiler. The gluestock is then boiled in water, the quality of the G. depending on the amount of water used. Any stock left after the contents of the boiler have been passed through a clarifying vat is reboiled with a fresh quantity of water to make an inferior quality of G. The gelatinous fluid is placed in wooden congealing boxes until it is solidified into a firm jelly, when it is removed, cut up into slices by a wire or a wet knife, and dried in the open air on netting stretched over frames. The cakes should be carefully watched, as changes in the weather

may bring about partial or total decomposition of the G. The drying is finished indoors by currents of air. The cakes are redipped in water and allowed to dry again, which gives them a bright, polished appearance. A very fine quality of G. is made in Scotland. There are various other kinds of G., e.g. bone G., made from bones, fresh or boiled, and fish G., made from the skins of fish. Marine G. is a cementing composition, made of a solution of indiarubber and coal-tar naphtha, powdered with shellac. It is often used instead of tar.

Synthetic resin glues are of four main types. Those made from (1) phenolic and other heat-setting resins, used where speed and waterproofness is necessary for gluing wood; (2) vinyl and other heat-softened resins, mainly used on leather, rexine, and transparent film materials, though they have a great variety of uses both in emulsion and solution form, and also as hot melts; (3) cellulose derivatives, used for making transparent bags, window cartons, etc.; (4) synthetic rubbers and other miscellaneous resins: these have specialised uses on metals and other impervious surfaces.

Glutathione, see *as* - HOPKINS, SIR FREDERICK GOWLAND.

Gluten, one of the most important constituents of wheat flour, is obtained from it by kneading a paste of the flour under water in a linen bag, until no further milkiness is produced. The grey, tenacious, tasteless substance remaining consists mainly of G., which may be separated into vegetable fibrin, which is soluble, and gliadin, which is insoluble in alcohol. Oats, rye, and barley scarcely contain any G., whereas the proportion in wheat varies from 10 per cent in cold to 15 per cent in hot climates. It has a high food value, and contains from 15 to 18 per cent of nitrogen in addition to carbon, hydrogen, oxygen, and sulphur. G. plays an important part in the manuf. of bread by preventing the escape of carbon dioxide from the dough, thus rendering wheat bread lighter than that prepared from rye and other flours.

Glutton, or **Wolverine** (*Gulo luscus*). The former name is somewhat of a misnomer, since the animal is no greedier than are the other species of the same genus. It belongs to the weasel family and has most of the characteristics of that family. It resembles somewhat the European badger, being from 2 to 3 ft. long, plus a bushy tail of about 8 in. It has blackish-brown fur, with a broad band of chestnut fur running along each side of it. It exists in both hemispheres, but is found principally in the Arctic regions of N. America, especially in Alaska and round the Mackenzie R. The flesh is useless, but the furs are made into hearth- and carriage-rugs.

Glycas, **Michael**, Byzantine historian. The date of his birth and the period during which he wrote are very obscure, but he was noted amongst the historians of the E. Empire for the terseness and clarity of his style. Some letters which are supposed to have been written by him to Constantine still exist, though their

authorship is dubious. His best known work is *Βιβλος Χρονική*, which treats of the hist. of the world from the creation to the death of Alexius I., Comnenus.

Glycerine, more correctly called **Glycerol**, or, in chemical terminology, **Trihydroxypropane** ($C_3H_8(OH)_3$), is an essential component of the fats and oils of both vegetable and animal origin. These fats and oils are mixtures of the glyceryl esters of the fatty acids, and on treatment with hydrolysing agents (e.g. alkalis, superheated steam, etc.) they are split into either G. and the alkali salt of the acids, or G. and the free fatty acids. A similar decomposition is effected in the intestine, the G. and fatty acids being absorbed separately and again reconverted into fats. The prin. sources of G. are stearin (the main constituent of the harder fats such as beef and mutton tallow), palmitin, present in palm oil and other oils, and olein, which is found in the soft fats and oils, including lard. G. is prepared almost entirely as a by-product in soap manuf. The fat is treated with alkalis, and the soap (i.e. the alkali salt of the fatty acid) is salted out; in the residual lye is found all or most of the G. present in the original substance. This lye is filtered from impurities, concentrated *in vacuo*, and then distilled under reduced pressure. Chemically pure G. is obtained by diluting the crude product with water and removing by distillation the acid products that pass over at 100–110°C. The temp. is gradually raised to 170°, when the G. distils over. G. is a colourless, viscid liquid with a sweet taste which crystallises at low temps. sp. gr. 1.260, boiling point 290° with decomposition. On rapid heating it loses water with the formation of acrolein. G. is used in enormous quantities for the preparation of nitro-G. and explosives related to the latter, e.g. dynamite. It is also employed to a large extent in dyeing, calico-printing and dressing, in the manuf. of leather, and in pharmacy and medicine generally. Because of its non-drying and antiseptic properties it is used as a lubricant for watches, etc., and since it does not freeze when mixed with water it forms a valuable filling for gas meters and motor-car radiators.

Glyccol, or **Glycine**, is aminoacetic acid (CH_2NH_2COOH), a sweet, crystalline body (melting point 232°C.), and was first obtained from the products of the action of sulphuric acid on glue, but is more conveniently prepared by the action of ammonia on monochloroacetic acid. It forms compounds with both acids and bases.

Glycogen, or **Animal Starch** ($C_6H_{10}O_5$)_n, discovered by Bernard in 1857, is found in the livers of animals, where it is probably stored as a reserve material. It is a white tasteless powder, giving a red colour with iodine, and is converted by ferments into maltose and by acids into glucose. *Fait de foie gras* and oysters contain a considerable amount of G.

Glycol, or **Ethylene Alcohol** (CH_2OHCH_2OH), first and best known of the series of dihydric aliphatic alcohols.

It is prepared from ethylene dibromide by boiling with potassium carbonate solution, and is a sweet syrupy hygroscopic liquid, boiling at 197° C., and freezing to a crystalline solid at -17° C. It is used in the manufacture of high explosives.

Glycon of Athens, Gk. sculptor of uncertain period, famous for the colossal statue of the Farnese Hercules found in the baths of Caracalla in 1540, with the inscription 'Glycon the Athenian made it' engraved on the rock supporting it. The statue was probably executed in the first or second century of the Rom. Empire.

Glycosmis, name of a genus of rutaceous plants indigenous to the tropics. It contains six species, of which *G. citrifolia*, the Jamaica orange, is the best known.

Glycosuria. The literal definition of this word is sweet urine, and it is used to designate a state in which chemical tests show sugar to be present in the urine. G. is of common occurrence, and may be due to excessive consumption of sugar or inability of the individual to utilise the sugar and starch in food. It is often associated with mental trouble, disease of the brain, liver, or kidney. The severity of G. is estimated by the amount of sugar excreted, and the presence or absence of increased thirst. The condition is not infrequently found on examination and should be looked upon as an indication of the necessity of regulating the diet. This should be done by diminishing the amount of articles of diet containing sugar and starch, that is flour and generally vegetables grown underground. Saccharine should be taken instead of sugar in beverages, such as tea and coffee, and other articles of diet. The significance of G. consists in the fact that it may be an early symptom of the disease known as diabetes.

Glydyrs, rocky abrupt mass of mts. (Glydyr Fach and Glydyr Fawr) set in the middle of the most beautiful scenery of N. Wales. Starting at Pen-y-Pass they go down the flank of the Snowdon valley to Capel Cmg. On their N. side they are precipitous and more interesting to the rock-climber. There is some grass and heather, and about 3000 sheep graze on them, but mostly the G. are utter rock. 'Piles of boulders, cliffs of glacier-scarred rock, rising ridge upon ridge, until you reach that incredible climax on the top of the Little Glydyr. . . . It is as if the Glydyr did once have a beautifully peaked top, and then some great explosion blew the peak to pieces,' leaving 'pile upon pile of great rock slabs, great monoliths of rock that would do credit to Stonehenge, slab upon slab, all balanced precariously' (E. Firkbank). Lyn Casg Fraith, 'a very small lake, lies just below the Little Glydyr. The famous Llanberis Pass runs from Snowdon in the direction of these hills, Idwall Lake, and other fascinating spots, are within easy range.'

Glyn, Elinor (1865-1913), Canadian novelist, youngest daughter of Douglas Sutherland, a brilliant Toronto engineer who d. of typhoid while at work on the Mont Cenis tunnel. She spent part of her youth in Canada, her grandmother, a true survivor of the *ancien régime*, exerting a

strong influence on her upbringing. Her husband, Clayton G., she describes as 'instinctively the perfect grand seigneur,' and she modelled her fictional heroes upon his kind. Novels flowed from her pen for thirty years. Her earliest was *The Visits of Elizabeth* (1900)—said to have been built up on her diary—which at once made her name. The best known, however, was *Three Weeks* (1907) and the best designed *The Career of Katherine Bush* (1917). Beneath her air of extreme sophistication and the cultivation of the *risqué*, she was at heart a romantic, and her novels which, judged by contemporary standards of reticence, seemed daring, served but to point the way to writers of far wider and ampler licence.

Glyncorwg, urb. dist. of Glamorgan-shire, situated 8 m. W.S.W. of Aberdare. It has coal- and iron-mines. Pop. about 10,000.

Glyndebourne Festival Theatre, founded in 1931 by John Christie on his estate at Glyndebourne, near Lewes, Sussex. Opera performances of a high standard are given, notably of Mozart. The theatre is made accessible to London opera-goers by a special train service.

Glyptodon (Gk. γλυπτός, carved, and ὄδων, tooth), name of a genus of fossil Dasypodidae or armadillos, found in the post-tertiary deposit of S. America. They are characterised by their great size and by thick, solid carapaces, which in some cases are nearly 6 ft. long; the head is sheathed in bony plates, so also is the long tail. *G. clavipes* and *G. reticulatus* are the best known species.

Gmelin, name of a distinguished family of Ger. scientists:

Johann Georg G. (1709-55), b. at Tübingen. In 1749 he was appointed prof. of botany and chem. at Tübingen. He pub. *Flora Sibirica* (1717-19) and *Reise durch Sibirien* (1751-52).

Samuel Gottlieb G. (1711-71), nephew of Johann Georg G., b. at Tübingen, and appointed prof. of botany in St. Petersburg in 1767. He wrote *Historia Fucorum* (1768).

Johann Friedrich G. (1748-1804), nephew of Johann Georg G., who pub. a botanical dictionary entitled *Onomatologia Botanica completa* (1771-77).

Leopold G. (1788-1853), chemist, son of Johann Friedrich G., b. at Göttingen. He studied medicine at Göttingen and Tübingen, and taught chem. at Heidelberg. He was the discoverer of red potassium prussiate and he wrote many scientific works, amongst which is *Handbuch der Chemie* (1817-19); this was trans. into Eng., 1848.

Christian Gottlob G. (1702-1860), nephew of Samuel Gottlieb G., was prof. of chem. at Tübingen, and was also the discoverer of an artificial process for the manufacture of ultramarine.

Gmünd, tn. of Germany in Württemberg-Baden. It is situated on the Rhine, 28 m. N.E. of Stuttgart. It manufactures woollens and cottons, jewellery, trinkets, etc. Hops and fruit are grown in the neighbourhood. There is a noted pilgrimage chapel in the vicinity. Pop. 59,100.

Gnat, genus of small dipterous flies of the family Culicidae, very common in marshy districts. There are nine Brit. species, the *Culex pipiens* being the common G. Mosquitoes are included in the family, but are larger in size and bite more effectively.

Gneiss, **August Wilhelm Anton, Graf Neithardt von** (1760-1831), Prussian general, b. at Schildau, near Torgau, in Prussian Saxony. After studying for two years (1777-79) at the Erfurt Univ., he joined an Austrian regiment. In 1782-1786 he fought among the Ger. auxiliary troops on the side of England in the Amer. War of Independence. On his return he became a lieutenant in the Prussian infantry, and served in Poland (1793-94). He fought at Saalfeld and at Jena in 1806, and defended Colberg in the following year. His gallantry was formally recognised, and he received the order *pour le mérite*. During the War of Liberation he fought with distinction at Leipzig in 1813, and still further increased his military reputation on Blücher's staff during the Waterloo campaign of 1815. In 1831 he was appointed a field marshal of the Prussian Army and put down the rebellion in Poland, but he fell a victim to cholera and d. at Posen in Aug. of that year. See lives by G. Berz and H. Delbrück (1861-1886), and W. von Unger, 1911.

'**Gneiss**, **one of the five Ger. cruisers of Adm. von Spee's** squadron at the battle of Coronel (q.v.). A 'pocket battleship,' built on Hitler's accession to power, was given the same name. In the Second World War it was bombed in Kiel harbour by the R.A.F. in 1940. In Brest harbour it was bombed on many occasions by allied aircraft, but on Feb. 11-12, 1942, together with the *Scharnhorst* (q.v.) and *Prinz Eugen* (q.v.), succeeded in escaping to Germany, where, however, it was soon put out of action. See under NAVAL OPERATIONS IN SECOND WORLD WAR.

Gneiss, name given to a family of metamorphic rocks which contain essentially the same mineral elements as granite, that is, felspar, quartz, and mica, but differ in the foliated arrangement of their constituents. The minerals alternate in light and dark layers, which are sometimes so distinct as to give the appearance of stratification. There are many varieties of forms, from the true granite to the schistose condition; in *hornblende* (i.e. hornblende takes the place of, or is associated with, mica; in *graphite* (i.e. it is graphite that takes the place of mica. In some varieties the felspar occurs in large distinct crystals, or kernel-like masses forming *porphyritic* G. Some Gs. are undoubtedly of eruptive origin and others have resulted from the metamorphism of sediments; they are the most widely distributed of metamorphic rocks and are found in almost all parts of the world.

Gneiss Islands, see HUMBOLDT.

Gneist, Heinrich Rudolf Hermann Friedrich von (1816-95), Ger. jurist, b. in Berlin. He studied at Berlin Univ., where he took his degree of *doctor juris* in 1838. In 1841 he was appointed assessor to the

Kammergericht, or supreme court, and rose to be an assistant judge. In 1844 he became extraordinary prof. of Rom. law at Berlin, and retired from his judicial life in 1850 in order to devote himself to teaching and to politics. He sat in the Prussian Lower House among the National Liberals, and from 1858 to 1893 sat in the Abgeordnetenhaus, or House of Deputies of the Prussian Landtag. He wrote voluminously on political subjects and on constitutional law. His works, many of which have been trans. into Eng., include *Die formellen Verträge des heutigen römischen Obligationen-Rechtes* (1845); *Adel und Ritterschaft in England* (1853); *Das heutige englische Verfassungs- und Verwaltungsrecht* (1857-63); *Budget und Gesetz nach dem constitutionellen Staatsrecht Englands* (1867); *Zur Verwaltungsreform in Preussen* (1880); *Englische Verfassungsgeschichte* (1882); *Das englische Parlament* (1886); and *Die verfassungsmässige Stellung des preussischen Gesamtministeriums* (1895). See lives by O. Gierke, 1895, and E. Schiffer, 1920.

Gnidus, see CNIDUS.

Gniezno, **tn.** in the prov. of Poznan, Poland. It has a fine Catholic cathedral in the Gothic style, dating from 965, in which the Polish kings were crowned till 1320. It was rebuilt in 1760-90. The tn. numbers among its industries linen and cloth weaving, brewing, and distilling. The archiepiscopal see was founded by the Emperor Otto III. in 1000. The tn. came under the rule of Prussia in 1815. Came under independent Polish government by peace treaty, 1919. Pop. 30,000.

Gnome (Gk. γνῶμη, an opinion), maxim or proverb. The Gnomic poets of Greece (γνῶμικοί) flourished in the sixth century B.C.; wrote sententious and pithy maxims in the elegiac distich, and included among their number Theognis of Megara, Solon, Simonides of Amorgos, Xenophanes, and Euanes. The Gnomic spirit is prevalent in a great deal of oriental literature, and was popular among the early Germanic peoples. A fair number of O.E. proverbial sayings, strung somewhat inconsequently together, may be found in the Exeter Book and in the Cambridge Cotton MS. and are known as Gnomie verses. Francis Quarles (1592-1644), who directly imitated the Gk. Gnomie writers in his *Qualtrains* (pub. 1574), is one of the latest writers to use this particular form.

Gnomes (Fr. *gnomes*, Ger. *Gnomen*), in folklore, are spirits of the earth and mt., who are supposed to conceal treasure in their subterranean dwellings. The word is supposed to have originated with Paracelsus, who uses it as synonymous with *Pygmæi*, and derives it from Gk. γνῶμη, intelligence. They are of both sexes. The male gnome is generally represented as a tiny, semi-deformed, bearded creature, clothed in a tight, brown tunic with a peaky hood. They are impish and mischievous, but not malignant sprites. It is probable that the fanciful idea of G. really originated among Teutonic tribes of normal stature with regard to some dwarfish neighbours. The

aborigines of Transylvania were a swarthy race, largely inhabiting caves, and the suggestion is that they may have given rise to the imaginative superstitions with regard to G. and such faeries. The Transylvanian gypsies fear an 'earthman' whom they call *phurush*, and who is supposed to steal unbaptised children.

Gnomonics, see HOROLOGY, *Sun-dials*.

Gnosticism (Gk. γνῶσις, knowledge), widespread spiritual movement which existed before Christianity, and was a kind of religious philosophy which attempted to interpret paganism and Judaism by revealing the deeper knowledge of God which lay in the creeds but which only the initiates (Gnostics) came to perceive and understand. This same spirit of seeking a higher and secret knowledge attacked Christianity in its turn, and so there were Christian Gnostics. For them γνῶσις meant a secret and higher interpretation of the gospels, distinct from the ordinary beliefs (moris) of the Christian. They claimed that they had received their revelation by a secret tradition, through the disciples, from Jesus Christ Himself, and jealously guarded their knowledge from the uninitiated. They set aside the realistic eschatology of the early Christian Church. As in so many mystic religions, G. is individualistic. The ultimate object was the salvation of the human soul, redeemed from matter by religious knowledge, and not, as in Christian doctrine, by the death of the Saviour. Sacraments of water, fire, food, etc., formed a significant part of the religion. Their teaching was an amalgamation of diverse points from later Gk. philosophies and oriental religions. The Divine Demiurgus, the Creator of the world and the Law-Giver of the O.T., was distinguished from God, the Supreme Being. They believed that all things emanated from the Divine First Cause; that God is separated from man by a hierarchy of aeons (or spirits) and by companies of demons and deities, the highest duty of man being to unite himself with the First Source of Spirit through gnosis. The soul, on its passage to God, must overcome the intervening gulf by means of secret formulas and symbols (see Lipsius, 'Gnosticismus,' article in Ersch and Gruber's *Encyclopädie*, republished in a revised form with the title *Der Gnosticismus; sein Wesen, Ursprung und Entwicklung*, 1860.) They distinguished Jesus-Christ, as the final and perfect Aeon between man and God, from the visible manifestation of Himself on earth. His life was regarded as a real human life, with which He deliberately associated Himself, or as a 'psychical' creation. The Gnostics divided men into three grades, the *Pneumatic* (πνευματικοί), or 'spiritual'; the *Psychic* (ψυχικοί), or 'soulish'; and the *Hylic* or 'material' (σωματικοί), which last are doomed to perish. They laid great stress on asceticism or denial of the sensuous world, among early Christians, which with them was developed into extremes of self-abnegation or of libertinism, the latter being advocated by the Marcionians and

Carpocratians. The teaching of Gnostics varied enormously with the *milieu*, pagan, Jewish, or Christian, in which they worked, but the claim that G. was of divine origin, handed down through a chain of initiated disciples, was common; also the hatred for the material world as necessarily evil, and the preoccupation with salvation through acquiring the γνῶσις of the privileged few. The two leading Christian Gnostics were Basilides and Valentine, both in the second century A.D., both founders of schools of G. There is a warning in 1 Tim. vi. 20 against a 'false knowledge,' and it has been suggested that this passage refers to some kind of Gnostic speculation which was troubling the early Christians. The only complete Gnostic work that has come down to us is the *Pistis Sophia*, an Egyptian work of the third century, an ed. of which was pub. by Schwartz and Petermann in 1853. Fragments exist of the works of Bardesanes, a Syrian poet (fl. A.D. 220), and there are certain Gnostic Acts, bearing the names of Peter, John, Andrew, and Thomas. Tatian's *Diatessaron* was used as late as the fifth century in the Syrian Church. The works of the Gnostics, Basilides (*Ercegetica* and, perhaps, a *Gospel of Truth*) and Valentino (*Psalmes, Homilies, and Letters*), have been lost. The chief authorities on G. are Justin, Irenaeus, Tertullian, and Epiphanius. See A. J. Matter, *Histoire critique du Gnosticisme* (2 vols.), 2nd ed., 1843; A. von Harnack, *Zur Quellenscheidung der Geschichte des Gnosticismus*, 1873; C. Kling, *The Gnostics and their Remains*, 1887; H. L. Mansel, *The Gnostic Heresies of the First and Second Centuries*, 1875; G. R. Mead's trans. of *Pistis Sophia*, 1890; W. Bousset, *Hauptproben der Gnosis*, 1907; L. Duchesne, *History of the Early Church* (trans.) vol. I, 1911; F. C. Burkitt, *The Church and Gnosis*, 1932; and H. Leisegang, *Die Gnosis*, 1932. The chief attacks upon G. have been collected by Coxo in *Ante-Nicene Fathers* (10 vols.), 1885-96.

Gnosus, see GNOSTUS.

Gnu, or Wildebeest (*Catoblepas*, or *Connochætes Gnu*), name of two species of antelope. The S. African G. is black in colour with a white tail, and presents a curious mixture of a buffalo, antelope, and horse. Both sexes have horns, which are cylindrical and curve upwards. The brindled G. or blue wildebeest (*Connochætes taurinus* or *Catoblepas gorgon*) occurs in Bechuanaland, where it is called *kokon*. The G. is a fast runner and in its wild state is very fierce, but may be tamed to do the work of oxen if captured when young.

Gôa: 1. G. ter., a Portuguese settlement on the W. coast of India. It consists of G., containing the cap. Pangim, or Nova G., on the Malabar coast; Damao, on the coast about 100 m. N. of Bombay; and Diu, a small is. about 140 m. W. of Damao. It is divided into two portions known as the Velhas Conquistas (Old Conquests, taken early in the sixteenth century) and the Novas Conquistas (New Conquests). It is a hilly region, some of the peaks of the W. Ghats rising

to 4000 ft. The country is intersected by many short but navigable rivs., the largest being the Mandair and the Juari. One of the chief industries is agriculture, mangoes, bananas, coco-nuts, areca nuts, palm, and spices being among its products. There are a number of salt works both at G. and Damão and manganese deposits were found in 1906. The chief exports are coco-nuts, fish, spice, salt, and copra. The harbour is good and a breakwater and quay have been added recently. It is connected by rail with India. The prov. is ruled by a governor-general, assisted by a general council and three subordinate councils. Area 1400 sq. m. Pop. 621,100. 2. Tn. founded by Albuquerque in 1511 on the is. of G. It is famous for its beautiful examples of Portuguese architecture. Among its buildings are a majestic cathedral, the church of Dom Jesus (1594-1603), a perfect example of Renaissance style, containing the tomb of St. Francis Xavier, and the chapel of St. Catherine (1551). Pangim was formerly a suburb of the old city. It was made the cap. of Portuguese India in 1843. Pop. 10,000. See J. Saldanha, *Historia de Goa*, 1926.

Goagira, *comuna* of Colombia S. America. It is a peninsula on the N.W. shore of the gulf of Maracibo, with an area of 4700 sq. m. It became part of the republic of Colombia in 1891. Cap. Puerto Estrella. Pop. 53,800.

GNU

Goalanda, mrlt. tn. of Bengal, India, situated at the confluence of the Ganges and the Brahmaputra. It is the terminus of the E. Bengal Railway and has a busy riv. trade. There are important engineering works. Pop. (estimated) 20,000.

Goalsara, dist. in W. Assam. Fertile but hot and unhealthy. Cap. G., on the Brahmaputra, 85 mi. E.N.E. of Rungpor. Pop. about 12,000.

Goat, ruminant quadrupeds of the genus *Capra*, forming, with sheep, the 'caprine' section of the Bovidae family. Most Gs., both male and female, have horns and beards, usually more pronounced in the

male (called the 'billy'), which is characterised by a strong offensive smell, especially during the rutting season. This fact has given rise to the erroneous impression amongst many people that all Gs. have an unpleasant odour. Gs. belong entirely to the old world, but many types have been introduced into Canada and the Americas. They are essentially mt.-loving animals and sure-footed nimble climbers. In their natural state they are chiefly found in small herds in the mt. regions of Europe and Asia. Two species exist in N. Africa and one in S. India, but they are not commonly found below the Himalayas. Remains discovered in the Indian pliocene deposits include those of a hornless kind, the *Bucapra daviesi*. They feed chiefly on the shoots and leaves of shrubs and trees, and not so much on grass as sheep do. Autumn is the breeding season, the female (usually called the 'nanny') coming into season in Sept. and thereafter at three-weekly intervals until early spring. The kids are usually produced in the spring, commonly two at a birth, the gestation period being about twenty-one weeks. The numerous varieties of wild G. (*Capra hircus*) fall into three groups: the European (see illustration), with up-standing ears, the E., with lop ears or Rom. nose, such as the Nubian, and the smaller wool-bearing breeds, such as the Angora. The varieties include the ibex of the Alps, Himalayas, and Arabia; the bezoar G. or paseng (pas-ang), probably the parent of the common domestic G.; the tur of the Caucasus; the markhor of the Himalayas; the Sp. G.; and the tahr or G.-antelope (*Hemitragus*). The paseng (*Capra aegagrus*) is the wild G. mentioned by Homer in connection with Crete and the Cyclops. Gs. are useful for their milk (from which cheese is often made), for their skins (which make good leather), and for their meat. Certain breeds are also useful for their wool, in particular the Angora (mohair) and the Kashmiri. The two chief varieties of Kashmiri Gs. (variety *laniger*) are the 'chappoo' and the more common 'changra' which abound chiefly in Tibet and Bokhara. The Angora breed has been introduced into S. Africa, Australia, and U.S.A. The member G. from Asia Minor and Tartary, distinguished by its drooping ears, is also bred for its wool. G. keeping has been practised since earliest times, and the Egyptians, Gks., and Romans were familiar with the domestic G., which was probably introduced into Britain by the Phœnicians, although it has never gained the footing in Britain as in other parts of Europe and elsewhere. The milk of the hardy Eng. G. is poor in quality and it has therefore been crossed with other breeds of better yield, a very popular cross being the Anglo-Nubian. Other favoured breeds are the Brit. Alpine, Toggenburg, and Saanen. The milk is chalky white and has no characteristic flavour, provided that the animal is healthy and is kept in hygienic conditions. Gs. can be stall-fed, tethered, or, in uninhabited dists., allowed free range, but for good milk production their diet should include concentrates and

grain, preferably oats. The kids mature very young and will mate at six months, but to produce a good milker a kid dropped in the spring should not be mated until the autumn of the following year. Hornless types have been bred, and the milking strain of some Gs. has been improved to such an extent that they will yield for two seasons, the usual lactation period being ten to eleven months. The Brit. G. Society has done much to improve the strain of the domestic G., which has gained considerable popularity during the last decade, and similar work has been done by the Amer. Milk G. Record Association and by the Canadian G. Society.

Gs. offer a profitable investment to the small holder, yielding up to a gallon or more of milk a day. Domestically Gs. make interesting pets, but on account of their keen intelligence and innate mischievousness they are usually tethered. G's milk is much richer than that of cows, containing about double the amount of butterfat and as Gs. never contract tuberculosis the milk needs no pasteurisation. It is thus a safe and valuable human food and is highly recommended for babies and invalids by the medical profession. Consult the pubs. of the Brit. G. Society, Schruener, *The Angora Goat*, 1918; C. J. Davis, *Goat Keeping for Milk Production*, 1920 and H. S. Holmes Pegler, *The Book of the Goat*, 1911.

Goatsbeard, Purple, see **SALSIFY**.

Goat-moth (*Cotesia bignoniella*), large moth, measuring about 3 in. across the wings, common in Europe and W. Asia. It is yellowish-grey or brown in colour, with irregular markings of white and black on the upper wings. The pupa is enclosed in a tough cocoon of chips, from which the moth emerges. When the moth is frightened it emits a disagreeable odour like that of a he-goat, whence its name.

Goatsucker, name given to *Caprimulgus europaeus*, the common nightjar, a picarian

(see **PICARIE**) bird belonging to the family Caprimulgidae. It is so called because of an ancient and widespread belief that it sucks the milk of goats and other animals, infecting them with disease; this tradition probably originated from the nightjar's habit of seeking insects on pasture-grounds. Other names for this bird are fern-owl, dor-hawk, and night-hawk. It is common in the Brit. Isles during the middle of summer, and is found in various parts of Europe, Asia, and America.

Gobanium, see **ABERG VIKENNY**.

Gobbo, see **OCHRA**.

Gobelin, name of a noted Fr. family of dyers. Gilles and Jean G. estab. dye-works at Faubourg St. Marcel, on the Bièvre, about the middle of the fifteenth century. The business flourished, and before long a tapestry manufactory was added to the estab. The beautiful tapestries produced by this firm became celebrated and in 1662 the works were purchased by Colbert for Louis XVI. Le Brun and other famous painters executed the designs for the royal tapestries. The looms were not worked during the revolution, but towards the end of the nineteenth century a fresh impetus was given to the industry, and a second state-supported estab. was opened at Beauvais. See E. Gerspach, *La Manufacture nationale des Gobelins*, 1892.

Gobi, Desert of (Mongolian, desert), enormous desert region of China, Central Asia, its exact limits being still somewhat undefined. The Chinese call it Shamo, Shabo (sea or riv. of sand), or Hanhai. It stretches from the Pamirs to the Khungan Mts., which separate it from Manchuria on the E., China Proper bounds it on the S., and Mongolia on the N. The W. part between the Yarkand (Tarim) and Lob Nor is called the Takla Makan desert, and E. of Lob Nor comes the 'Great' G. Other parts with special names are the Ordos G. (N. loop of Ilwang-ho), Gaihin G. (N.W. of Ordos), Alashan or Lian G. (W. of Ordos), Gashun G. (W. of oases from Nganshan to Barkul). The surface is in some parts composed of masses of loamy, coarse, shifting sands, in others of rocky masses and mt. heights. The great plateau is from 3000 to 5000 ft. high. In the E. there is some vegetation, and regular caravan routes cross the desert, the chief being that between Kiakhta and Peking, via Urga and Kalgan. Nomad Buddhist tribes live in the interior, but all permanent settlements are towards the N. Remains of buried habitations and tns. have been found in the sandy parts. The streams appear to have no outlet to the sea, the most important being the Tarim. The total area is about 300,000 sq. m., average breadth 400 m. Information has been obtained from the explorations of Ney Elias, Przhevalski (Prjevalski), Kozlov, Grun-Griffatio, Kobovrocky, Bogdanovich, Plovatov, Dr. Sven Hedin, and Dr. Stein. Early explorers were Marco Polo (1254-1324), the Jesuit (seventeenth century), the Spaniard Ysbrand Ides (seventeenth century), and Lorenz Lange (eighteenth century). See N. M.

Przevalski, *Mongolia*, 1876, and *From Kulja across the Tian-shan to Lop Nor*, 1879 (both trans. by E. Delmar Morgan); Sir F. E. Younghusband, *The Heart of a Continent: Travels in Manchuria, 1884-94*, 1896; Sven Hedin, *Through Asia*, 1898; *Central Asia and Tibet*, 1903; and *Scientific Results of a Journey in Central Asia, 1892-1902, 1904-7*; D. Lattimore, *Desert Road to Turkestan*, 1928; M. Chahle and F. French, *The Gobi Desert*, 1944; and P. T. Etherlon, *Across the Great Deserts*, 1948.

Gobineau, Joseph Arthur, comte de (1816-82), Fr. diplomatist and writer, b. at Ville d'Avray, Seine-et-Oise. Son of a retired officer. Worked for a time, first with a Paris gas company and then with the post office dept. Then wrote for Parisian journals, attracting the attention of do Tocqueville who, as foreign minister, made G. chief of his secretariat. From 1849 G. filled various posts in the diplomatic service in Berne, Persia, Greece, Brazil, and Sweden, but retired in 1876 embittered because none of the great prizes in the service had fallen to him. His fame rests on his writings. For years he was unread in his own country, while in Germany he was the subject of an ardent cult. He wrote a hist. of the Persians and an account of the tenets of Babism (see BAHAI); also a long poem *Anadis* and some novels, including *Scaramouche* and *L'Abbaye de Typhaines*. Some of his best writing is to be found in his *Souvenirs de voyage* and *Nouvelles Asiatiques*, books of exotic short stories. Probably his masterpiece is *La Renaissance*, a series of dialogues in which the masters of the 19th century discuss art, letters, statesmanship, and life's lessons. But the work which gave him his chief vogue in Germany is his pseudo-scientific book extolling the Nordic races, entitled *The Inequality of Human Races* (1854, 1884). This won him the friendship of Wagner and Nietzsche and profoundly influenced both men. Through his literary descendants G. was one of the founders of the pan-Germ. school of the early twentieth century. His work, together with that of Lapouge and Houston Stewart Chamberlain, supplied the pseudo-scientific foundation for Hitler's 'Aryan paragraph' and persecution of the Jews as a non-Aryan race. In keeping with his theories was his best known novel, *Les Pléiades* (1874). See R. Dreyfus, *La Vie et les prophéties du comte de Gobineau*, 1905, and life by H. Streutz, 1928.

Gobio (Gk. *κοβίος*, small fish), generic name of certain teleostean fishes belonging to the Cyprinidae and commonly called gudgeon (q.v.).

Goblin (Fr. *gobelin*; Low. Lat. *gobulus*), friendly but mischievous and impish sprite; corresponding to the Ger. *Kobold*, domestic fairy. It is also called hobgoblin, and is supposed to haunt dark corners, for which reason it is used to frighten children.

Gobo, Jap. name for *Arctium Lappa*, the burdock (q.v.).

Goby or **Gobius** (Gk. *κοβίός*, small fish), family of carnivorous fish of the sub-order

Gobiodea, allied to the blenny. Sev. species are found on Brit. coasts, but most species inhabit brackish pools. Chief characteristic is the production of the ventral fins into a sucker-like disk, by means of which they attach themselves to rocks. *G. niger* and *G. ruhenaparr* are common Brit. species. They are found in most tropical and temperate seas and in length vary from half an inch—in the case of one species in the Philippines, ranking as one of the smallest of all vertebrates—to three feet.

Goch, tn. of Germany, in the Rhineland, 8 m. S. of Cleves (Kleve). During the Middle Ages it was noted for its linen, and in recent times for manufs. of brushes, plush, cigars, and margarine. During the Allies' operations early in 1945 to reach the Rhine, particularly fierce resistance was encountered on the S. side of the Reichswald near G. The Kalkar-G. road was crossed on Feb. 16, although Ger. forces of the First Parachute Army continued to resist strongly in the G. sector. The tn. itself, severely damaged, fell to Scottish and Welsh troops on Feb. 21. Pop. about 11,000.

God, see DEISM.

Godalming, municipal bor. in the Guildford parl. div. of Surrey, England, on the r. b. of the Wey. The famous public school of Charterhouse, founded in 1611, was transferred from London to G. in 1872. The manufs. of the tn. include paper, hosiery, and leather. Basing Bridges, 1½ m. from G.—really one bridge divided into two parts—over the Wey, date from the time of King John. The bridges and their approaches, with a sum for maintenance, were presented to the public by the Old Guildford Society in 1901. Pop. 10,000.

Godard, Benjamin Louis Paul (1849-1895), Fr. composer, b. in Paris. He studied at the Conservatoire, and shared with M. Théodore Dubois the prize of the Paris musical competition of 1878 with his dramatic cantata *Le Tasse*. He composed a number of popular songs, such as *Chanson de Florian*, *Ninon*, *Je ne reux pas d'autres choses*; four operas, *Pedro de Zalamea* (1884), *Jocelyn* (1888), *Dante* (1890), *La Vrandière* (left unfinished); the *Symphonie légendaire*, and the *Symphonie gothique*, and a large quantity of piano and violin pieces and various orchestral works.

Godavari: 1. Dist. of India in the prov. of Madras. In 1907-8 it was transferred to Kistna dist., its present area being 5634 sq. m. It is watered by the G. R. and its trib., the Sabari, and across the N.E. portion of the dist. lies a range of the E. Ghats. The timber from the forests is of great value and graphite is mined. The cigars known as *lunkas* are manufactured from tobacco grown on the *lunkas* or is. of the R. G. Sugar, oil-seeds, and rice are also cultivated. The chief tn. is Coranada, the old cap. being Rajahmundry. The main line of the E. Coast Railway traverses the dist., a branch running to Cocanada. Pop. 1,500,000. 2. Riv. rising 50 m. from the Indian Ocean, and, dowing across the Deccan from the

W. to the E. Ghata, empties itself into the bay of Bengal. Its total length is 900 m. It is regarded as a sacred riv. and the festival of Pushkaram takes place on its banks at Rajshumundry once in twelve years. There is a dam constructed by Sir Arthur Cotton at Dowlaish-weram, from which three main canals are drawn off. By this means the entire delta is utilised for perennial crops. In 1920 nearly a million ac. were irrigated by this system. Two further canals have also been made and there is a large reservoir at Lake Beale.

Godfroy, Frédéric Eugène (1826-97), Fr. literary historian, b. in Paris. He compiled the *Dictionnaire de l'ancienne langue française et tous ses dialectes du IX^{ème} au XV^{ème} siècle* (10 vols., 1880-1903), which involved a stupendous amount of laborious research and is a standard reference book. Another important work of his is a *Histoire de la littérature française depuis le XV^{ème} siècle jusqu'à nos jours* (9 vols.), 1859-81.

Goderich, Viscount, see **RIPON, EARL OF**.

Godesberg, tn. in the Rhineland, Germany, situated on the l. b. of the Rhine, opposite Königswinter, 4 m. S. of Bonn. Its popularity as a summer resort is largely due to its hydropathic estab. and mineral springs, but it is also a pretty tn. with a picturesque castle in ruins. It was at G. that Neville Chamberlain, the Brit. Prime Minister, flew to visit Hitler during the latter's menacing agitation against Czechoslovakia. The visit was on Sept. 24, 1938, and six days later it was followed by the Munich Pact (q.v.). Pop. 20,000.

Godet, Frédéric (1812-1900), Swiss Protestant theologian, b. at Neuchâtel. In 1873 he left the state church and became one of the founders of the free evangelical church of Neuchâtel, and till 1877 was its theological prof. G. was a great scholar, and his commentaries are among the most noteworthy pub. during the last century. Besides his commentaries on the Gospel of St. John (2 vols., 1863-65, Eng. trans. 1877); St. Luke (2 vols., 1871; Eng. trans. 1875); the Epistle to the Romans (2 vols., 1879-80; Eng. trans. 1880); and Corinthians (2 vols., 1886-87; Eng. trans. 1886), he pub. *Études bibliques* (1873-74), *Introduction au Nouveau Testament* (1893), etc. His son, Philippe Ernest (1850-1922), was a poet and historian of literature.

Godetia, genus of plants sometimes included with the evening primrose, which it resembles, in the genus *Eriogonum*, of the order Onagraceae. There are now a score of species, indigenous to W. America. Popular in Britain as hardy annuals, which can be flowered outdoor from May to Nov. or in cool greenhouses at any time. Colours are mainly pinks to reds, and pinks to purples and white.

Godfather and Godmother, see **SPONSORS**.

Godfrey, Sir Dan (1868-1939), Eng. conductor, b. in London, son of Dan G., a military bandmaster and grandson of Charles G., bandmaster to the Coldstream Guards (1825-63). He was educated at

King's College School and in Germany. Studied music in London under Lazarus and Alfred Caldicott, and also military band orchestration under John Hartman. Toured S. Africa 1891 for the Standard Opera Company; musical adviser to Olympia Ltd., 1893; and appointed resident musical adviser and director of music at Bournemouth, 1894. The corporation of that tn. took over control of music in 1896 when 'Dan G.'s Band' was converted into the Bournemouth Municipal Orchestra, the first of its kind estab. in England. Through G. thousands of people received their first introduction to classical music. By the long and consistent support given to native composers he did much towards building up the modern renaissance of music in England. His services to Brit. music were rewarded with a knighthood in 1922. On his retirement in 1934 he had conducted some 2000 symphony concerts. Pub. his *Memories and Music* (1924).

Godfrey of Bouillon (c. 1060-1100), leader of the first crusade, the second son of Eustace II., count of Boulogne. He was b. at Baily in Belgian Brabant, and served in the train of the Emperor Henry IV. He fought with conspicuous gallantry at the siege of Rome (1084) and was rewarded with the duchy of Lower Lorraine. In 1096, with his brothers Eustace and Baldwin, he rode to Constantinople and paid homage to Alexius in 1097. Two years later he led the march to Jerusalem, and was elected its ruler on July 22. In Aug. of the same year he defeated the sultan of Egypt on the plain of Ascalon, and after a year spent in organising he d. See *De Hody, Godfrey de Bouillon*, 1859, and Frobose, *Gottfried von Bouillon*, 1879.

Godhra, tn. of Bombay, India, in the dist. of Panch Mahals, 50 m. N.E. of Baroda. The prin. trade is timber, obtained from the surrounding jungle. Pop. 27,000.

Goding, tn. of Czechoslovakia in Moravia, situated on the R. March, 22 m. N.E. of Nikolsburg. Formerly an Austrian tn. There is a royal castle. The prin. manufs. are glass, sugar, and tobacco. Pop. 12,000.

Godiva, Lady, wife of Leofric, earl of Mercia and lord of Coventry. According to legendary hist. she released the town-folk of Coventry from the heavy taxation imposed by her husband by riding through the tn. clothed only in her long hair. In St. Michael's Church there is a stained-glass window commemorating her magnanimous action, and in a niche is an effigy of Peeping Tom, who was said to have been struck blind as he peeped at her behind his shutters. The G. procession which was included in Coventry fair from May 1678 ceased in 1826.

Godless Five Year Plan, see **FIVE YEAR PLAN**.

Godmanchester (anct. *Darolipona*), municipal bor. and mrkt. tn. of Huntingdonshire, England, on the Ouse, 1 m. S.E. of Huntingdon. An anct. tn. with an agric. trade and flour mills. Noted for its milk cheeses. Pop. 2000.

Godolphin, Sidney Godolphin, earl of (1645-1712), Eng. politician, b. at G. Hall, near Helston, Cornwall. He became attached to the court as a page in 1664, being promoted to a groom of the bed-chamber in 1672. He accompanied Sir W. G. on an embassy to Spain (1668) and in 1678 was sent as envoy-extraordinary to the Netherlands to negotiate between the prince of Orange and the duke of York. In the following year he sat among the Commons and was appointed a commissioner of the Treasury. He became first commissioner in 1684, when he was raised to the peerage. On the accession of James II. G. was appointed chamberlain to the queen, but he returned to the Treasury in 1686, and supported his sovereign at the revolution. William III., however, retained him in office until

SIDNEY, EARL OF GODOLPHIN

1696, when with other Tories he was obliged to retire before the Whig party. In 1700 he was once more reinstated, and on the accession of Anne in 1702 became lord high treasurer, an office which he held till 1710, when Anne, under the influence of Harley and Mrs. Masham, began to view him with disfavour. He and Marlborough effected the dismissal of Harley, but a few months later G. was himself summarily dismissed by the queen. He d. at Marlborough's seat, Holford House, near St. Albans. He was a wise and cautious administrator, and by his masterly control over the finances did much to secure the success of Marlborough's famous continental campaigns. See the life by the Hon. Hugh Elliot, 1888.

Godowsky, Leopold (1870-1939), Polish composer and pianist, b. at Vilna. Studied pianoforte in Vilna, and at the age of nine appeared in public. After a tour of Russia and Poland studied from 1881 to 1884 under Ernst Rudorff in Berlin. Studied under Saint-Saëns, 1887-1890. From 1890 to 1900 teacher and concert pianist in U.S.A.; then for many years in Berlin, and in 1909 director of Klaviermeisterschule, Vienna. Works: studies in Chopin's *Études* (1904); *Sym-*

phonic Melamorphoses of Themes of Johann Strauss, Walzermasken, etc.

Godoy y Alcazaga, Lucila, see **MISTRAL, GABRIELA**.

Godoy y Alvarez de Faria, Manuel de, Duke of Alcudia (1767-1851), Sp. statesman, b. at Badajoz. While serving in the royal guards he became the favourite of Maria Luisa, wife of the future king, Charles IV., and after that prince came to the throne G. rapidly attained influence and position, being made duke of Alcudia in 1791 and, from 1792 to 1797, minister of state. He played a conspicuous part in the affairs of Spain during the Fr. Revolution and the Empire. He declared war on France (1792-95) but was defeated and negotiated the treaty of Basel (1795), for which he was granted the title of 'Prince of the Peace,' though the treaty was concluded in opposition to the general wish of the Sp. people. Restored to power again in 1801, he was compelled by Napoleon to lead Spain in an attack on Portugal; he aided France in the war with England (1801-5), but incurred great unpopularity on account of his arbitrary conduct and, above all, for the defeat of the Sp. fleet at Trafalgar. He was then imprisoned by the king and was forced to flee from Spain in 1808, being helped to escape by Napoleon. Lived in Rome and Madrid (1808-51). His *Memoirs* (pub. in Eng.) were pub. in 1836. See T. Hardy, *The Dynasts* (Part II.) 1906.

'God Save the King' (or Queen), Eng. national anthem, of uncertain origin and authorship, first performed in 1740, to celebrate the capture of Porto Bello, S. America, by Vernon. It is usually attributed to Henry Carey (1696-1743), or to John Bull (1563-1628), who wrote an 'ayre' very similar to the present tune, which is in two sections of six bars and eight bars. The tune was adopted in France in 1776, and has been used as the Dan., Prussian, and Ger. national air. Beethoven introduced it into his *Battle Symphony*, and Weber used it in *The Amer. national air My Country, 'tis of thee* (written by Dr. Smith, 1843, is sung to the same tune, as is the Swiss *Hail Du, mein Vaterland*. In Germany it is sung to *Heil dir im Siegerkranz*! The old Lat. hymn, *O Deus Optime* (probably written about 1688), was set to Bull's 'ayre,' and had words very similar to the present Eng. version. It is sung on all ceremonial occasions throughout the Brit. Empire. Words and music first appeared in *Harmonia Anglicana* (1742) and in the *Gentleman's Magazine* (1745). See Clarke, *Account of the National Anthem*, 1822; W. Chappell, *Collection of National Airs*, 1838-40; and W. H. Cummings, *God Save the King*, 1902.

Godstone, rural par. in Surrey between Reigate and Caterham. Pop. 24,000.

God's Truce name given to a means of promoting peace devised by the Church, when, after the fall of Charlemagne's empire, the right of private war and vengeance (as practised by early Teutonic races) threatened to become a source of anarchy instead of a rough and ready form of justice, in the ninth and tenth centuries.

There was a mutual agreement on the part of the barons and nobles of certain dists. to abstain from war between fixed days, and respect the rights of all following purely peaceful callings, such as priests, travellers, or tillers of the soil. Originating in St. France at the synod of Tuluges in Roussillon, 1027, the custom spread to Germany, Italy, Spain, and England. The chief stipulations were: (1) the keeping of peace from Wednesday evening to Monday morning; (2) during Advent and Lent; and (3) on the prin. saints' days and holy days. Breaking of the *tréuga Dei* was punishable by fines, banishment, and excommunication. The council of Clermont confirmed the truce (1095) under Urban II. The Emperor Henry III. (1017-56) adopted it as imperial law. It fell into disuse in the thirteenth century. See E. Semichon, *La Paix et la trêve de Dieu* (2nd ed.), 1869.

Godunov, or Gudunoff, Boris, see **BORIS, FEDOROVICH GODUNOV**.

Godwin, or Godwine (c. 990-1053), earl of the W. Saxons, or Wessex, a great Eng. noble, one of Canute's most powerful supporters by 1020. He helped to place Edward the Confessor on the throne of England (1042), and headed the national party against the Norman favourites. His daughter Edith married the king, and his son Harold was the last native Eng. king (killed at Hastings, 1066). The Norman party grew powerful, and G.'s influence waned, partly owing to the crimes of his son, Sweyn. Outlawed in 1051 he fled to Flanders, but returned next year and was welcomed by the people, forcing Edward to restore him to his old position. See A. E. Freeman, *The Norman Conquest*, I. and II., 1870-79; J. Green, *The Conquest of England*, 1893; and Saxo, *Historia Danica* (ed. 1644).

Godwin, Francis (1562-1633), son of the bishop of Bath and Wells, b. in Northamptonshire. He graduated at Oxford in 1580, and then took orders, being made sub-dean of Exeter in 1587, and bishop of Llandaff four years later. He is chiefly remembered by his fanciful story, *The Man in the Moon*, which undoubtedly had an influence on Swift's *Gulliver's Travels*. Cyrano de Bergerac imitated and trans. G.'s work into Fr. G. also wrote *Rerum Anglicarum Annales*, 1616.

Godwin, Mary Wollstonecraft (1759-97), Eng. writer of Irish descent and pioneer of the Women's Rights movement. She had to earn her living by teaching (1778-88), and then worked for Johnson, the publisher, as reader and translator. While thus engaged she met Paine, Priestley, and Fusch. (Going to Paris she collected materials for her never-finished *Historical and Moral View of the French Revolution* (l., 1794), and there met Capt. Imlay, who soon deserted her. She married Wm. G. in 1797, dying at the birth of their daughter (see **SURLEY, MARY WOLLSTONECRAFT**). In 1851 her remains and those of her husband were removed from Old St. Pancras churchyard to Bournemouth. A portrait of Mary Wollstonecraft, by Opie, is in the National Portrait Gallery. Mrs. Opie's *Adeline*

Mowbray (1804) was founded on the outlines of Mary's life. Her works include *Thoughts on the Education of Daughters* (1787); *Original Stories from Real Life* (1789); *Answer to Burke's Reflections on the French Revolution*; *Original Stories for Children* (1791); *Vindication of the Rights of Women* (1792); *Posthumous Works*, 1798, including 'The Wrongs of Women, or Maria, a Fragment' and 'Letters to Imlay' (new ed. with memoir by G. Paul, 1870). See memoirs by Wm. Godwin, 1798; E. Pennell, 1885 (Eminent Women series); E. Rauschenbusch-Clough, 1898; *A Defense of the Character and Conduct of the late M. W. Godwin* (anon.), 1803; and M. Linford, *Mary Wollstonecraft*, 1924.

WILLIAM GODWIN

Godwin, William (1756-1836), Eng. novelist and miscellaneous writer. He was a dissenting minister, preaching at Ware and Stowmarket in 1777-82. His faith being shaken by the study of Fr. philosophers, he gave himself up to a literary career. He wrote *Life of Chatham* (1783) and *Sketches of History in Six Sermons* (1781), but his first important work was *Enquiry Concerning Political Justice* (1793). In this he revealed himself as a sympathiser with the Fr. Revolution, and representative of Eng. Radicalism. G. taught that government is not an end in itself and that man's true growth is towards emancipation from it. He perceived the evil of collectivism. He relied upon and defended the integrity of the human personality. Agnostic, he attacked organised religion, rejected the hope of immortality, and regarded Christianity as harmful because it diverted men's thought from their potentialities in the world to their expectations of another. He married Mary Wollstonecraft in 1797, though both disregarded the importance of a legal tie except for the sake of the children. G.'s views, however,

became modified in later life. He knew many celebrated people of the day, such as John Southey, Coleridge, Lamb, and Shelley (who married his daughter Mary, 1816). His works include *The Adventures of Caleb Williams* (1794), *St Leon* (1799), *Fables* (1805) and other children's stories under the name of Bulfinch, *Mundville* (1817), *History of the Commonwealth of England* (1821-25), and *Thoughts on Man* (1831). See W. Hazlitt, *The Spirit of the Age* (1825), Sir J. Stephen, *English Thought in the 18th Century* 1876, and *Hours in a Library* 1832. (Kegan Paul, William Godwin, his Friends and Contemporaries 1876. H. Foussin, *William Godwin* 1913. J. K. Brown, *Life of Godwin* 1926, and C. Woodcock, *William Godwin* 1916.)

Godwin-Austen, Henry Haversham (1831-1923) Eng. surveyor. He joined the army in 1851 doing survey work in India after 1857 making many remarkable ascents in the Himalayas. In 1862 he ascended Mt. Dhaulagiri, the second highest mt. in the world in the Mustang range, Himalayas, near Karakoram Pass (8,200 ft.). Everest in Nepal (29,002 ft.) was named after him 1885. He discovered many glaciers in China, the Himalayas, and near by. His works include *On Land and Fresh Water*, *Wonders of India* (1882-83) and *Theanna of India* (with Dr. Blandford) (1908).

Godwit, or Limosa genus of wading birds of the snipe family (Scolopacidae) much resembling sandpipers. They have very long bills slightly upcurved, long slender legs, with a great part of the tibia bare of feathers, and the claw of the third toe comb-like. Live species of this genus *Limosa* are known, all frequenters of marshes, especially by the seashore. They inhabit the Arctic and temperate regions of the N. hemisphere chiefly, but migrate southwards in the summer as far as N. Africa, S. America and even New Zealand. As birds of passage, the black-tailed G. (*L. belya*) and the bar-tailed G. (*L. lapponica*) are found in Britain. The former at one time used to breed in England. The females are larger than the males. Other species are the marbled and the Hudsonian G. (*L. fedoa*) and *L. helmas tica*, or marlin G. Gs. are valued as a table delicacy, and sent from Holland to London.

Goebbels, Paul Joseph (1897-1945) Ger. politician. B. at Rheydt Rhineland of peasant stock, he succeeded through scholarships and hard work in providing himself with a first rate education and studied at sev. univs. graduating Ph.D. at Heidelberg in 1920. Was for some time a struggling journalist and an equally unsuccessful dramatist, which latter fact may explain his bitterness towards the Jews for whom plays by Jewish dramatists were accepted, his were rejected. In 1922 he became a most efficient propagandist of National Socialism and in 1926, after successful campaigns in the Rhineland and the Ruhr, he was made party leader, or *Gauleiter* for Berlin. In 1927 he founded the Berlin daily paper

Der Angriff, which he ed. His newspaper was as ruthless and as active as his shock troops. Its campaigns employed any lie or distortion of facts to suit the purpose of the moment. Libel actions failed to suppress either the pub. or its editor. In 1928 he was elected to the Reichstag and in the following year he was made chief of party propaganda and in 1933, minister of propaganda and popular enlightenment in Hitler's gov. Zealous as any fanatic it was he who canonised Horst Wessel and other Nazi 'heroes and martyrs'. In his capacity of minister of propaganda his

JOSEPH GOEBBELS

L.V. 4

cynical ingenuity matched his entire want of moral scruple. The press, literature, the cinema, theatres, music, and every other cultural field came under his control and each and all were subordinated to the task of popularising Nazi policies and explaining away the deficiencies of its rule. Germany probably owed her initial political successes in the 'war of nerves' as much to his propagandist machine as to any other agency. Later he held the rank of *Reichsleiter* in the party and was made president of the *Reichskulturkammer*. Married the divorced wife of a wealthy Jew named Friedländer, to whom her former husband was forced by the Nazis to leave 500,000 marks, by the aid of which G. acquired as residence the castle of Schwanauwerder. An unhappy perverted man leading a notoriously dissolute life, he yet often posed for pictures designed to show him as a family man.

leading power in the Nazi hierarchy, he realised, in the last days of the Russian siege of Berlin, that he would eventually be tried as a war criminal, and chose to escape his inevitable doom by taking his own life and those of all his family. See L. Lochner (ed.), *The Goebbels Diaries*, 1948; and life by C. Riees, 1949.

Goeben, August Karl von (1816-80), Prussian general, b. at Stade, Hanover; son of Maj. Wilhelm von G. Became lieutenant of infantry. In Carlist adventure in Spain, 1835-40. In 1860 under O'Donnell in Morocco. In Prussian wars against Denmark (1864) and Austria (1866). In Franco-Prussian war commanded 8th Army Corps; at Saarbrücken, Gravelotte, and Metz; commanded N. of France campaign that ended in victory of St. Quentin, Jan. 19, 1871. He commanded 8th Army Corps at Koblenz till his death there, Nov. 13.

'Goeben' and 'Breslau.' The. These two ships, which during the earlier part of the First World War eluded the vigilance of the Brit. Navy and got into Turkish waters, were nominally bought from the Ger. Gov. by Turkey as 'compensation' for the action of the Brit. Gov. in taking over three other ships which at the time were being built in Eng. shipyards to the order of the Turkish Gov. As a fact, Ger. crews remained in charge of the ships. There is no doubt that their acquisition by Turkey was so material an accession to that country's feeble naval strength that it was one of the factors which decided the Porte to enter the conflict at that particular time. The Turkish Gov. had ordered three warships to be built, *Resciadié*, *Sultan Osmanli*, and *Fethé*. Whatever the cost, Turkey was resolved to have a fleet superior to that of Greece, and the Turkish people were united in a common sentiment of revenge. But on the outbreak of the First World War, and while Turkey was still neutral, the Brit. Gov., exercising the well-established right of pre-emption, took over the Turkish ships. The *G.* and *B.* were then in the Mediterranean, and, escaping the Brit. squadron under Adm. Troubridge, came out of their refuge at Messina on Aug. 7, 1915, and afterwards made a dramatic reappearance before Constantinople on Aug. 11. The plot was a clever one. Germany 'generously' offered her two ships to Turkey by way of compensation for England's 'theft.' The Brit. Gov. contended that legally the two battleships should be dismantled and the crews interned. Eventually the Brit. Gov. agreed to the Porte's wishes that the crews should remain on board until the Turkish crews, which had come to England to sail the ships in commission to Turkey, should have returned. But when these crews did reach Turkey it was too late, for the *Gers.*, abetted by Enver Bey, had carried through their intrigue, with the result that Adm. Limpas and his Brit. officers had to leave the ships and Turkish officers came aboard. The Brit. Admiralty held an exhaustive inquiry on the escape of the two ships, with the result that Rear-Adm. Troubridge applied for trial by court

martial. The finding of the court martial was an honourable acquittal for Troubridge. The *G.* was a 28-knot boat, as against the 20-knot speed of Troubridge's armoured cruisers, and her guns had a range of 18,000 yds. as against 14,000-15,000. Hence the *G.* could have steamed round Troubridge's squadron and sunk each boat in detail. After the war the *G.* was renamed *Famiz*, mounting ten 11-in. guns and four torpedo tubes.

Goedeke, Karl (1814-87), Ger. literary historian, b. at Cello. He was educated at Göttingen, and eventually became prof. of hist. there. His prin. work is *Grundriss zur Geschichte der deutschen Dichtung* (1859-1929), and his biography of Goethe is also well known. He was a remarkably prolific author, and wrote sev. novels and a drama entitled *König Kodrus, eine Missgeburt der Zeit* (1839), besides much critical and biographical literature. Besides those mentioned, his publs. include *Deutschlands Dichter von 1813 bis 1813* (1844); *Elf Bücher deutscher Dichtung von Sebastian Brant bis auf die Gegenwart* (1849); and *Deutsche Dichtung im Mittelalter* (1855-51).

Goeje, Michael Jan de (1836-1900), Dutch Arabic scholar; educated at Leyden under Dozy. In 1866 he was appointed to the chair of Arabic at Leyden. He issued an ed. of *Tабари* (1879-92), and wrote vols. iii.-v. of *Catalogus codicum orientalium bibliothecae Lugduno-Batavae* (1865-73). Among his other works are *Mémoires d'histoire et de la géographie orientale* (1862-1866); *Edrisi's Description de l'Afrique et de l'Espagne* (with Dozy) (1866); *Liber expugnacionis regionum, auctore al-Beladrosi* (1866); *Fragmenta historicorum Arabicorum* (1869-71); *Bibliotheca geographorum Arabicorum* (1870-92); *Discus Poëtae Moslim ibn-al-Walid* (1875); and *Selections from the Annals of Tabar* (Semitic Library) (1902). He also wrote for the *Encyc. Brit.*

Goering, Hermann Wilhelm (1893-1946), Ger. field marshal and politician, b. at Rosenheim, Bavaria. In the First World War he was successively pilot, squadron-leader, and finally commander of the famous Richthofen 'air circus.' After the war, which he left as a captain, he served in civil aviation in Sweden, married his first wife, a wealthy Swedish woman, Karin von Fock, and was engaged in the aero-engine industry in Germany. He led a drifting life at this time, turning his back on the new democratic Germany. In 1922 became an active supporter of the new National Socialist party. Took part in Hitler's abortive Munich *putsch* in 1923 and, again, after the collapse of Hitler's party, became an exiled drifter. Took to drugs and was certified as a morphine addict, spending some time in a mental hospital in Sweden. In 1926 he returned to Germany, where Hitler's party was beginning to gain influence. In return for the promise of large contracts he secured the support of important industrial concerns and, by plotting and intrigue, became, in 1928, one of the Nazi party's representatives in the Reichstag, and, in 1933, after Hitler's coup, Prime Minister

of Prussia and minister of the interior. In this latter capacity he reorganised the police and the internal administration in accordance with Nazi ideas. He is thought to have played a part in the staging of the Reichstag fire of Feb. 1933. In 1934 he was Prime Minister of the Reich and promoted to the rank of general, and in the meanwhile had made himself minister of aviation. It was now that he began secretly to lay the foundations of Ger. air power. He started the Air Sports League, outwardly one of the youth organisations that were so popular in Germany, but in 1935 the members of the league were being supplied with uniforms. He then turned to economics and was appointed commissioner of the 'four-year plan,' gradually ousting Dr. Hjalmar Schacht, representative of conservative business interests, and became virtual economic dictator of Germany. In 1938 he received the rank of field marshal. Was Hitler's right-hand man in expropriating the Jews in that year. Co-operated with Hitler in finally extinguishing all 'left' tendencies in the Nazi movement, and, indeed, was designated as Hitler's successor in the event of the latter's death.

In 1937 he became Reich minister for foreign affairs. The documents in the Nuremberg trial reveal the prominent part he took at this time in securing, through the puppet Ger. chancellor in Austria, Seyss Inquart, the ruin of the Schuschnigg Gov. in Vienna in the interests of the 'freedom' of the Austrian people. The share he had in preparing a desperate war of aggression is established beyond all doubt by these documents. Among them were the minutes of a conference of Oct. 14, 1938, a fortnight after the Munich Pact was signed, between G. and his economic planning staff. They show the extraordinary economic situation in which G. then found himself, and the long black shadow this situation was casting ahead at a time when, on the basis of the pact, all should have been concord. From the evidence in the trial it was proved that G. was at great pains to justify the seizure of Czechoslovakia, especially as Mussolini was by no means enthusiastic over the move. Yet G. could adduce no better reason than the desire to eliminate the Czechoslovak forces: 'The heavy armament of Czechoslovakia,' he said at a conference on April 15, 1939, with Mussolini, 'shows in any case how dangerous that country could have been, even after Munich, in the event of a serious conflict. Because of Germany's action the situation of both Axis (g.v.) countries was ameliorated, among other reasons because of the great armament potential of Czechoslovakia. This contributes towards a considerable strengthening of the Axis against the western powers, and much else to the like purport, all providing its own commentary on Ger. aggressive intentions behind the façade of Munich. G. gambled even on the *Luftwaffe*, which was by no means so strong as to justify universal aggression; the document 'Case Green' has his directive: 'By means of simulated activities on as many peacetime aero-

dromes as possible, and on other aerodromes known to the enemy, further by installing new dummy aerodromes, and by distributing our own forces in small units over a wide area, we intend to create a deceptive impression of great fighting strength and so split up the enemy's combat forces.' Thus there was always an 'enemy' even in days when no war clouds should have threatened the peace of Europe. In his defence at Nuremberg G. concluded his examination-in-chief with words which he impudently attributed to Mr. Churchill: 'In a struggle for life and death there is no legality,' words which aptly sum up the man G. and everything he stood for, as seen in an address that lasted for twelve hours and in which all his powers of persuasion were concentrated on maintaining that, given the inevitability of war, any measure was justified in the last resort so long as it redounded to the greatness of the Ger. Reich. That it was precisely this attitude which plunged the world into war had little place in his argument, apart from his redoubled efforts to prove that the Soviet preparations were really responsible for it all.

G. also had a hand in the cold-blooded shooting of nearly fifty officers of the R.A.F. after their mass escape from Stalag Luft III, but he pretended that he had protested to Hitler about it. On the crime of bombing Warsaw, Rotterdam, and Coventry, all ordered by him, he said that Warsaw had refused to surrender and that civilians were resisting in defiance of the rules of international law and that, as to Rotterdam, 'it was in everybody's interest to get the campaign over quickly!' and it was always on this cynical note that G. concluded his amazing arguments. In cross-examination he was challenged over the murder of 4,000,000 persons at Auschwitz (g.v.) concentration camp (g.v.) alone, but whatever he said to establish his 'ignorance' the captured documents showed that, like all the Nazi leaders, he probably knew what was going on in the camps. He was sentenced to death at Nuremberg but had somehow, despite the vigilance of his guards, succeeded in secreting poison (not improbably through his wife) and took his own life rather than face the hangman. In 1935 G. married Frau Emma Sonnemann, a leading Ger. actress, his first wife having d. in 1931. He acquired a sumptuous country seat, which he named Karinhall after his first wife. It was G. who coined the slogan 'Guns for butter' to induce the Ger. people to restrict consumption in order to promote rearmament. G. was interested financially in some of the leading industrial concerns of Germany and would seem to have been extremely wealthy. At Berchtesgaden (g.v.) was found a modest rustic building containing his art loot—jewels, pictures, ceramics, and statuary relics, of which the lowest valuation was 220,000,000.

Goes, Bento de (1562-1607), Jesuit missionary of Portuguese birth, b. in the Azores. In 1603 he was sent on a mission to the Great Mogul, and thence to Cathay.

On his travels he acquired an extensive knowledge of the geography of Asia, ascertaining that Cathay and China were one and the same place. *The Travels of H. de Goes from Lahor to China* is the name of Eng. version of his writings.

Goes, Hugo van der (1420-82), Flemish painter, b. at Ghent. He became known by his picture, 'The Meeting of David and Abigail,' which attracted a good deal of attention. Van Eyck instructed him in the rudiments of oil painting. See J. Destree, *H. van der Goes*, 1914, and Sir M. Conway, *The Van Eycks and their Followers*, 1921.

Goes, fortified tn. of Holland in Zealand, on the is. of S. Beveland. There is a Gothic church (1423) and picturesque tn. hall, restored in 1771. It is the centre of the linen industry; others are brewing, bookbinding, boatbuilding, and the manuf. of cigars. It has a good harbour. Pop. 8000.

Goethals, George Washington (1858-1928), Amer. major-general and engineer, b. at Brooklyn. Taught for a while at West Point; worked at riv. improvements, neighbourhood of Pittsburg; then, as major in regular army, took charge of fortifications at Newport, Rhode Is. Joined the general staff at Washington. In 1907 appointed chief of new organisation of work on Panama Canal, with supreme civil and military power. After opening of canal, May 1914, first civil governor of Canal Zone—resigned 1916 having become major-general 1915. Late in 1917 acting quartermaster-general. In 1918 chief of div. of purchase, storage, and traffic; member of War Industries Board. Retired from service, 1919.

Goethe, Johann Wolfgang von (1749-1832), Ger. poet, dramatist, and philosopher, who 'placed his nation at the head of the intellectual movement of the century' (Scherer). (i. was b. at Frankfurt-on-Main, of an affectionate and joyous mother, who was her son's first playmate and teacher, transmitting to him her love of story-telling and her mirthful disposition, and of a cold, stern, rather pedantic father, whose uprightness and stability of character must have entered in some degree into his son's composition, since (i., 'often erring' as he tells us, always 'found himself' again. The G. family belonged to the well-to-do burgher class, and the poet's whole life was spent in conditions of prosperity and comfort, a circumstance which his detractors use to belittle him, and his admirers (Carlyle, Lewes, and others) to add to his glory, in that he maintained throughout life a high degree of simplicity, even austerity, in material things. In 1765 he entered Leipzig Univ. as a law student. Here he spent three restless years, distinguishing himself, on the one hand, for unusual wisdom and on the other for recklessness, extravagance in thought and behaviour, for waywardness and melancholy, alternating with high spirits. He filled his days with pleasure and some study, came under the influence of the Fr. dramatists at the theatre, began his life-long habit of falling in love, and returned home in

broken health to an angry father with two comedies of his own composition, *Die Laune des Verliebten* (which may be styled 'Lovers Quarrels') and *Die Mitschuldigen* (The Fellow Sinners) (only pub. in 1787). Next he studied at Strassburg for about two years, where he formed a friendship with Herder, who roused in him an overwhelming enthusiasm for Shakespeare and for the old Ger. epics. The result of this was that G. soon became one of the foremost leaders in the *Sturm und Drang* ('Storm and Stress') movement which expressed the reaction against the tyranny of classical and Fr. influence on thought

L. V. A.

JOHANN WOLFGANG VON GOETHE
From the painting by George Dawe, 1819

and literature, and the wish to put away all that was artificial, to return to 'nature' and 'reality.' Lessing had preached this, and the young Romantic school practised it, even to outrageousness at times. G.'s two dramas, *Gotz von Berlichingen* and *Die Leiden des jungen Werthers*, are the direct outcome of this movement. The former was written soon after G. left Strassburg, though not pub. until 1773; *Werther* was pub. in 1774. At Strassburg the poet studied art, gained his degree of *doctor juris*, and wrote some of his most beautiful lyrics under the inspiration of Friederike Brion. His life at Weizlar in 1772, in close friendship with Kestner and his betrothed, Charlotte Buff (Lotte), with whom G. fell in love, creating a situation honourably sustained by all three friends, gave him the inspiration for *Werther*. The romance embodies the actual facts of this experience up to a certain point only, though the description of its effect on Werther's (G.'s) temperament is truer to life. The book caused a tremendous sensation, abroad as well as in Germany.

Carlyle calls it 'the voice of the World's Despair.' G., in whose writings 'the moral lesson is seldom so easily educed as one could wish,' takes, as it were, a text in this case and heads his work with the motto, 'Be a man and follow him not.' G. was now living in Frankfurt, and here his acquaintance was sought by the most notable men of the day in Germany, among others Klopstock, Lavater, Basadow, Jacobi, and the Stolbergs. *Clavigo*, *Stella* (an extravagant comedy for lovers, which suggested to Canning the parody of *The Rovers* or *The Double Arrangement*), *Prometheus*, *Der ewige Jude* (The Wandering Jew) (of which very little remains extant), and *Mahomet* were produced; *Faust* was begun, and immortal lyrics (such as *Neue Liebe neues Leben*, *Heldenrollein*, *Herz mein Herz was soll das geben*) addressed to Fräulein Schonemann (Illl).

In 1775 G. accepted an invitation from Duke Karl August to his court at Weimar. The strong attachment which already existed between the two men was deepened by further intercourse, and Weimar was henceforth the poet's home. He took part in public life, was created *Geheimrat* (Privy Counsellor), then president of the Chamber of Finance, and was ennobled in 1782. His intellectual activities were stimulated by the duke and his wife, the Duchess Luise, and a circle of brilliant friends, including Herder, Musæus, Knebel, Wieland, and Schiller. His love for the Fran Charlotte von Stein, which lasted ten years and inspired further lyrics, dates from 1776. She was a noble-hearted woman, a lady of the court, wife of the master of the horse, and thirty-three years of age, with seven children. G.'s letters to her extend over a period of nearly fifty years. A note in G.'s diary shows that he decided at Weimar to have done with the lawlessness of youth and to start on a course of self-culture; he saw that he had, to use Browning's words, 'Somewhat to cast off, somewhat to become,' or as he himself expressed it later, he resolved to cease doing things by halves and to work out life in its totality, beauty, and goodness, 'Vom Halben zu entwohnen, und im Ganzen, Guten, Schönen, resolut zu leben.' The first sketches for *Iphigenia*, *Tasso*, *Egmont*, and *Wilhelm Meister* were made; *Faust* was continued, and lyrics produced. In 1786 he escaped from the work and festivities of Weimar and went to Italy, where he spent a year and a half, mostly in Rome and Naples. Here he worked at his poems and plays, studied and practised art (Tischbein and Angelika Kauffmann were among his friends), and pursued investigations in science.

This was a period of great development for G., indeed it changed his intellectual standpoint. He outgrew the *Sturm und Drang* phase and worked towards the Gk. ideal of calm and harmony, recasting and publishing (1786) under this new influence *Iphigenia*, in which the rules of classical poetry, cast aside with jubilant satisfaction in his earlier writings, were closely observed. His matchless *Römische Elegien* (1788) on shrine side by side this new spirit and his love for Christiane Vulpius,

who became his wife in 1806. *Tasso* (1790) reflects the conflicts in the author's own mind caused by the various influences he had encountered in his life up to then. In 1794 G. and Schiller, who hitherto had been but mere acquaintances and, in some degree, rivals, entered upon a close and noble friendship which lasted until Schiller's death. Schiller constantly aroused G.'s enthusiasm, and G.'s influence made Schiller a clearer thinker. The two poets started a magazine, *Die Horen*, to try to raise the standard of taste in art and literature; it failed, and the epigrams, called the *Xenien*, the joint work of the two friends, were 'fired off' in revenge against the magazine's enemies. The pub., in 1796, of *Wilhelm Meister's Lehrjahre* (or Apprenticeship) estab. G.'s fame for ever. In this rambling and discursive romance in eight books, G. develops his philosophy of the conduct of life in describing the career of a young Ger. artist at the beginning of the nineteenth century. In the course of the work the weak-willed, dreamy, self-indulgent hero attains power of self-control and a sense of duty. But, as is usual in G.'s writings, there is no direct moral teaching; the work is a picture of 'rich, manifold life brought close to our eyes,' and the picture, being true to life, reflects the laxity of morals in the Germany of the time, and it is drawn without that comment which alone would have satisfied hostile critics. One of the many varied scenes in the vol. is the unforgettable poetic and touching incident of Mignon and the Harper, which has deservedly become universally famous. The valuable criticism on *Hamlet* is also to be found in *Wilhelm Meister*. *Hermann und Dorothea* (1798), written in a spirit of patriotism, is a poem of simple beauty and idyllic charm, with a background of troublous times, the fruits of the Fr. Revolution, towards which G. felt no sympathy. In it the human and tender side of the poet's genius is seen at its best; it is his masterpiece in this kind. G.'s greatest work, *Faust*, occupied him in the intervals of other work for upwards of fifty years: it has been well called 'the companion of his literary life,' and was first pub. as a whole in 1831. It reflects the evolution of the thoughts and character of the man G. from youth to age, and is therefore of unique biographical interest. *Faust*, like G., struggles for perfection, often yields to evil but never comes to love it or to lose his belief in the right and good. His failure in his quest for absolute knowledge leads him to despair, from which he is rescued only by a life of useful labour. This outcome leads us straight to the keynote of the Goethean philosophy - *renunciation* and *resignation*, and to the poet's conviction that 'He only earns his freedom and existence, Who daily conquers them anew' (Bayard Taylor's trans.), in *Faust's* dying words: 'Nur der verdient sich Freiheit wie das Leben, Der täglich sie erobern muss.'

The two parts of *Faust* are as dissimilar as the influences under which they were

written, Part I. being 'romantic' and Part II. 'classical' in form and spirit. The involved symbolism of Part II. is very difficult to comprehend. Both parts rise to the loftiest heights of poetry and art. G.'s achievements in science, optics, botany, anatomy, and mathematics include some useful discoveries and many misconceptions; his discovery of an intermaxillary bone in man was important. His prin. scientific treatises are *Metamorphoses of Plants* and *Farbenlehre*, (Theory of Colour). Many less known works have not been mentioned above. Among them may be mentioned *Die Wahlverwandtschaften* (1809), a story which is sometimes regarded as showing the immoral tendency in G.'s works. In it a married couple are thrown into the constant companionship of two unmarried persons and a cross-attraction ensues like that which is often observed in chemical experiments. The psychological changes by which this result is effected are depicted with great skill. The three ballads, *Der wandelnde Glocke*, *Der Getreue*, and *Der Todtenhans* (1813), written during the height of Napoleon's power, but not impassioned like the songs of Körner nor inspired like the orations of Fichte, for G. had, evidently, little sympathy with the rise of the Ger. people against the dictator. *Westöstlicher Divan* (1814) was an attempt to introduce oriental poetry into Germany, an example which was followed by Heine. In 1797 G. wrote *Die Braut von Korinth*, *Gott und die Bayadère*, *Der Zauberlehrling*—all being pub. in the *Musen Almanach* for 1798—which have affinities with the contemporary works of Schiller. At this time too G. trans. much of the autobiography of Benvenuto Cellini and wrote a number of essays on aesthetics. G.'s life and character are best studied in his works, nearly every one of which presents some aspect of the man as he was when he wrote it. As Carlyle says: 'In Goethe's works . . . we see . . . a mind working itself into clearer and clearer freedom, gaining more and more perfect dominion of its world.' His formal autobiography *Dichtung und Wahrheit* (1811-22), the work of his old age, is inaccurate, not in fact alone, but more seriously, in what Lewes calls 'tone.'

G.'s bp.—the eighteenth-century dwelling which stood in the Hirschgraben in Frankfurt until its destruction in an air raid in March 1944 is (1949) being rebuilt from the stones and rubble. The architects, using many old prints, drawings, and photographs have succeeded in planning the design of every room, stairway, and attic. The adjoining building, which houses the G. Museum and the G. Library of 60,000 books covering the seventeenth and eighteenth centuries, has recently been reopened after extensive repair.

EDITIONS: *Golds von Urhingenen* (1773); *Die Leiden des jungen Werthers* (Sorrow of Werther) (1774); *Iphigenie auf Tauris* (1777); *Edmont* (1788); *Torquato Tasso* (1790); *Wilhelm Meisters Lehrjahre* (1796); *Hermann und Dorothea* (1798); *Poems*, and *Faust*, Part I. (not pub. till 1808); *Die Wahlverwandtschaften* (novel,

1809); *Aus meinem Leben, Dichtung und Wahrheit* (autobiography, 1811, 1812, 1814, and onwards); *Italienische Reise* (Italian Tour) (1816-17); *Westöstlicher Divan* (Lyrics) (1819); *Wilhelm Meisters Wanderjahre* (1821-29); *Trilogie der Leidenschaft* (1822); *Faust*, Part II. (1832); *Dichtung und Wahrheit* (last vol., 1833). G.'s works were collected at Stuttgart in 1806-10; in 1815-22; in 1827-1830; with posthumous works, 1832-42. *Sämtliche Werke* ('Complete Works') in 1868-79, was by Hempel, Berlin. The prodigious Weimar ed. dates from 1887 to 1919. A complete bibliography up to 1910 is in vol. IV. of K. Goedeke's *Grundplan of the History of German Poetry* (Dresden, 1910).

ENGLISH TRANSLATIONS: Most of G.'s works are in Bohn's Standard Library. *Faust* has been trans. by many, including A. G. Latham (Everyman's Library).

BIOGRAPHIES, MANY COMBINED WITH CRITICISM: It is to the credit of Britain that the first adequate biography of G. was by G. H. Lewes, 1855, though there had been a slighter work by J. W. Schafer, 1851; H. Duntzer, 1880 (trans. into Eng., 1883); J. Sime, 1888; O. Browning, 1892; A. Bielchowsky, 1895 (Eng. trans. by W. A. Cooper, 1905-8); H. G. Atkins, 1904; H. S. Chamberlain, 1912; Prof. P. Hume Brown, 1920; E. Ludwig, 1920-21 (trans. by Ethel Mayne, 1928); G. Brandes, 1922; J. G. Robertson, *Goethe and Byron*, 1926; and *Goethe*, 1927; A. Schweitzer, *Goethe* 1939, 1949.

CRITICISM: T. Carlyle (whose powerful praise introduced Eng. readers to G.), 1828-32; R. W. Emerson's essay on 'The Writer Goethe' in his *Representative Men*, 1882; J. R. Seeley, 1894; B. Croce, 1919 (Bari, Eng. trans., 1923); Stowell and Dickinson, 1928; H. W. Newinson, *Goethe, Man and Poet*, 1931; B. Fauley, *Goethe as revealed in his Poetry*, 1932, and *A Study of Goethe*, 1948. See also G.'s *Conversations with Eckermann*, 1836 ff. The Eng. trans. gives an impression of the ability with which G. talked.

Goetz de Berlichingen, see BERLICHINGEN, GOTZ VON.

Goetz, Hermann (1810-76), (Ger. composer, b. at Königsberg (now Kalliningrad). Chiefly remembered for his opera *The Taming of the Shrew* (1874), containing the soprano aria 'Es schweige die Klage' and a septet which is in some sort a counterpart of the *Meistersinger* quintet. The opera has been performed in England, and in Eng. G. also composed a fine second piano Concerto, some instrumental and vocal works, and a good symphony in F major.

Goetze, Sigismund Christian Hubert (1866-1939), Eng. artist, b. in London, educated at Univ. College School and the Slade School of Art. Frequently exhibited at the Royal Academy and at the Paris Salon. His first notable picture was 'Saint Sebastian' (1894), but he was best known for 'He was despised and rejected of Men' (1904). Other examples of his work are 'Ever Open Door' and 'The Greatest of These.' In 1921 he gave to the nation the frescoes he had painted for

the Foreign Office to depict the origin, development, and expansion of the Brit. Empire.

Gog and Magog, names used sev. times in the Bible. In Genesis, M. is spoken of as a son of Japhet; in Ezekiel G. appears as prince of M., an enemy of Israel in the Far N., and in Revelation G. and M. are considered as a comprehensive term for the powers of evil. The names are also given to the two giants in the Guildhall, London. Sev. legends are extant as to their origin, but they seem to have been connected with London hist. since the reign of Henry V. The original figures were burnt in the Great Fire, and the present ones made in 1708.

W. I. Mansell

VINCENT VAN GOGH: A SELF-PORTRAIT, 1888

Gogh, Vincent van (1853-1890), Dutch painter. Son of a clergyman at Groot Zundert, N. Brabant. When about sixteen he entered the employment of Goupil & Company, art dealers, and later was sent to England. Disappointed in love he left Goupil's and became a schoolmaster in England. Returning to Holland he studied theology for a year at Amsterdam, and became a missionary among the Belgian miners. Already an artist G. studied painting at The Hague, and in 1881 joined the Antwerp Academy. His brother, in Paris, introduced him to the impressionists, of which school, or of 'post-impressionism,' G., with Cézanne and Gauguin, was a leader. He painted at St. Rémy and Arles, associated for a while with Gauguin. Still life, portraits, landscapes, are all equally within his splendidly original scope. But, having been a physical and nervous weakling for many years, he spent his latter days in an asylum at Auvers-sur-Oise, and shot himself.

G. was a daring colourist, whose flying brush-strokes live. It is said that, after

a physical effort of painting, into which he had thrown all his powers with almost volcanic or atomic vehemence, he would sometimes fall in an epileptic seizure. Probably every work of his later years is worth close study. At the asylum his portraits of doctors and others, and his self-portraits, were as great as any. The following are a few of his works which have been specially praised: 'The Yellow Chair,' 'Sunflowers,' 'Cypress,' 'Cornfield,' 'Potato Eaters,' 'L'Arlesienne,' 'Berceuse,' 'Restaurant on Montmartre' (at the Luxembourg), 'Mairie au 14 juillet,' 'Ravine,' 'Pine Forest at Sunset.' See G. B. de la Faille, *Catalogue raisonné*, 1930; J. von G. Bonner (editor), *Letters to his Brother* (with memoir), 1927; I. Stone, *Lust for Life* (a novel), 1934; *Van Gogh Paintings* (introduction by G. Reynolds), 1917; and A. Artaud, *Van Gogh, le suicidé de la société*, 1948; also life by L. Piérard, 1925.

Gogo, W. Africa, see **GAO**.

Gogo, port and tn. of Bombay, India, situated in the Ahmedabad dist. There is a safe anchorage for vessels, and the tn. is commercially important. Cotton and salt are the chief products. Pop. 30,000.

Gogol, Nicolai Vasilievitch (1809-52), Russian author, b. at Sorochintsi, Poltava; educated at Niezhin, and in 1829 went to St. Petersburg, where for a short time he was a gov. clerk. He made sev. unsuccessful attempts to gain a footing in literature, but in 1831 produced *Evenings in a Farm near Dikanka*, which became very popular. A second series appeared in 1834. This work is a collection of stories and sketches of sev. types, depicting the life of Little Russia with great truth and vigour. Love of nature and of the supernatural, humour, pathos, and descriptive power are among the attributes of the writer's style. Among the best of the tales are *Taras Bulba* (Eng. trans. 1887), a thrilling account of the Zaporogian Cossacks, *Old-World Gentlefolks*; *How the Two Ivans Quarrelled* (trans. 1945); *Nevskii Prospekt* (1868); and *Alakia Alukievitch's New Cloak* (1835). In 1836 he produced *The Government Inspector* (Eng. trans. 1891 and 1893), a comedy exposing the vices of prov. administrative officials; and in 1837 his best work, *Dead Souls* (Eng. trans. 1886), a strong and gloomy novel dealing with prov. life. During 1836-46 G. lived abroad, mainly in Rome. His collected works and correspondence appeared at Moscow in 6 vols. in 1856-57. See C. E. Turner, *Studies in Russian Literature*, 1883, and V. Nabokov, *Nicolai Gogol*, 1947; also lives by P. Kulsh, 1856, and E. Zabel, 1899.

Gogra, riv. of Oudh, India, rising in the Himalayas. It flows S.E. and enters the Ganges just above Chapra, after a course of 600 m. It is navigable almost to the mts., and at its junction with the Ganges is from 1 to 3 m. wide.

Goidels, one of the primitive races of Britain. They were a Celtic tribe which invaded Neolithic Britain, driving their predecessors into the W. of Ireland. They

were themselves driven out by the Brythons.

Goitre, swelling of the thyroid gland, which is situated in the front of the neck. It is also known as Derbyshire neck. The condition is more prevalent in some countries than others, and occasionally it is so common that practically all the inhab. of a certain locality are affected by it. Sometimes it is specially prevalent in mountainous dists.; at others it appears in lowland ones. As a rule scattered cases are more common in women than in men. The importance of the condition depends upon the fact that the thyroid gland, which is essential to the nourishment of the whole body, is attacked in G., and its functions may be so impaired that the skin, hair, and teeth are affected. The aspect of the patient is characteristically altered; the powers of mind and body are impaired; this weakness gradually increases, and the perceptive powers of hearing and sensation are lessened. This condition is known as myxœdema and in Ger. the term *Struma* is applied to it. This, however, is somewhat rare when the gland has increased in size, as sufficient remains healthy to supply the needs of the body. Apart from the myxœdematous symptoms, the enlargement of G. presses on the windpipe and considerably impedes respiration.

Exophthalmic Goitre.—In this condition in addition to increased size of the thyroid there is exophthalmos, that is protrusion of the eyeballs and rapid action of the heart. At first one or two only of these symptoms may be present. To this extent the condition is the opposite of myxœdematous G., as it is due to an increased action of the thyroid instead of a decrease of activity. Here the mental condition is one of irritability rather than impairment. The condition is frequently first noticed after some severe mental shock. In both conditions if the gland presses on the windpipe surgical measures must be adopted. In the myxœdematous condition the deficient action of the thyroid can be supplemented by taking the thyroid extract of animals, but in restricted amounts for fear of causing rapid action of the heart, as in exophthalmic G. This, however, is not often required in G. itself, because sufficient of the thyroid gland remains in a healthy condition to supply the needs of the body.

Gokhale, Gopal Krishna (1866-1915), Indian political leader; b. at Kolhapur; parents of caste of Chitpavan Brahmins. Graduated Elphinstone College, Bombay; became prof., Fergusson College, Poona, at 260 a year. Joined Congress movement; about 1887, secretary to the Sarva-janik Sabha. In England, 1897, witness before royal commission on Indian expenditure. In 1900 elected to Bombay Legislative Council. Soon afterwards selected by its unofficial members to represent them on Imperial Council. Leader of opposition there; nevertheless on recommendation of Lord Curzon G. became C.I.E., 1904. In 1905 (in which year he was president of Congress) founded Servants of India Society, to prepare India

for self-government. On royal commission on public services in India, 1912. See R. P. Paranjpye, G. K. Gokhale, 1915.

Golaseccia, small vil. on the Ticino R., a few miles from the point where it flows into Lake Maggiore, Italy. It is situated on the site of a famous cemetery of the Iron Age. The first discoveries in this region were made in the early nineteenth century by the Abbé Giani. Castelfranco followed it up in 1874 and pub. accounts which have formed the basis of all later study. The cemetery consists of hundreds of circles made of unworked stones—each circle containing a prehistoric tomb, which itself contained a cinerary urn, and sometimes a vase, weapons, and small objects of iron, amber, glass or bronze.

Golaw, Salomon von, see LOGAU, FRIEDRICH VON.

Golconda, decayed city of India, 7 m. W. of Hyderabad, in the Nizam's dominions. It was once the cap. of a powerful kingdom of G., and still possesses a strong fortress, built on a granite ridge, and now used as a state treasure and prison house. It was at one time famous for diamonds, which were cut and polished here, and for the immense mausoleums of the anct. kings.

Gold (symbol Au, atomic number 79, atomic weight 197.2), metallic element that has been known and valued from the earliest times on account of its occurrence in the free state, the ease with which it can be beaten into articles and ornaments, and its unalterability by water or air. The importance of G. as a metal has certainly not lessened in our day, in fact it is used as the standard for exchange (see BIMETALLISM; CURRENCY). G. is found almost always in the free state, and sometimes in combination with silver, mercury, and tellurium; it is very widely distributed, and in fact there is scarcely a country or deposit in the world which has not been found to contain G. It occurs principally in rock formations, or in alluvial deposits. The latter, which constituted the chief sources of the G. supply until recently, are termed 'placers,' and consist of an accumulation of gravel, sand, and clay, mixed with particles of G. varying from minute grains to nuggets of considerable size, which have been removed from their original habitat by the action of water and redeposited, e.g. in a hollow of a riv.-bed, the G., by reason of its great density, accumulating in places where the current is least. These auriferous deposits may also be covered by more recently distributed material and are then termed 'deep leads' or 'dead rivers.' In Europe the most important alluvial deposits are those in the Urals; in Asia those of Siberia; in Africa those of the Rand. A valuable 'strike' was made at Odendaalsrust in the Orange Free State in March 1946. In America the Californian deposits were the cause of the 'rush' of 1849 and are now practically exhausted; the Klondike dist. in Yukon, Canada, also attracted considerable but short-lived attention. Australia contains the most famous alluvial deposits, which have been marked by the occurrence in

them of nuggets of considerable weight. The largest ever found, the Welcome nugget, discovered in 1858 at Ballarat in Victoria, weighed 183 lb. and was worth £8376. In all cases the recovery of alluvial G. is in principle remarkably simple; the apparatus in which the 'washing' is carried out may be a pan, a cradle, or a tom, whilst for large operations a sluice is used. Where the deposit is not actually near a riv.-bed water is conveyed to it under pressure by means of a pipe line, so that it can be thrown in powerful jets against the banks of gravel, which is thus washed down sluices, the G. being collected as before. Alluvial deposits are now of less importance than the rock deposits in which G. is found. In these the metal occurs in veins, reefs, or conglomerates of quartz and other silicious material in the form of small particles, sometimes embedded in iron pyrites, copper pyrites, or lead ores. The auriferous rock, which is often mined at considerable depths, is first subjected to crushing and then reduced to a very fine powder by stamps, five of which usually go to form a battery. A stream of water is circulated through the mortars, and the fine particles of G. are collected on amalgamated copper plates. The G. amalgam is from time to time removed and the mercury distilled off, leaving the G. behind. The material that escapes still contains some G., and is now concentrated by methods similar to those used in treating alluvial deposits. The concentrates, if free from pyrites, are treated with mercury, the G. being recovered from the amalgam formed. The above method of stamping and amalgamation works satisfactorily with 'free-milling' ores comparatively rich in G., but those ores containing sulphides require chemical treatment to remove the metal from the finely powdered material.

The chlorination process is used for treating concentrates containing sulphides and for recovering the G. that escapes amalgamation. The material is first roasted to remove the sulphur and convert the base metals into oxides. It is then placed in large vats, moistened with water, and treated with chlorine gas, which readily converts the G. into the form of chloride which is washed out, the G. being precipitated in the metallic state by means of ferrous sulphate (copperas).

The cyanide process, introduced on the Rand in 1891, is now almost exclusively used for the recovery of finely divided G. It is extremely simple, and consists of allowing the finely crushed ores, concentrates, or slimes to stand in vats with a dilute solution containing from 0.05 to 0.3 per cent of potassium cyanide. After a day the solution is run off, and the G., which is in solution in the form of a double cyanide with potassium, is precipitated by zinc shaving or by electrolysis, not more than 1½ grains of G. being left in each ton of solution. The metal obtained by any of the above methods is generally alloyed with silver, and contains small quantities of iron, lead, sulphur, etc.

Properties.—G. is a soft yellow metal, which appears red when seen by light many times reflected from its surface. In a finely divided state it appears purple and even black, and when gold-leaf is viewed by transmitted light it appears green. It is a very heavy metal (sp. gr. 19.4), melts at 1067° C., boils at 2610° C., and is volatile at the temp. of the electric arc. It has a specific heat of 0.0316, is a good conductor of heat and electricity, and is quite unaffected by air and most reagents. G. is the most malleable and ductile of metals, and may be beaten out into leaf having the thickness of only $\frac{1}{256}$ th part of an inch; thus one grain of the metal may be made to cover 56 sq. in. of surface, or drawn into a wire 500 ft. long. It has little affinity for other elements, and is easily reduced from its compounds. Most metals when placed in a solution of a G. salt precipitate it, and all its compounds when ignited yield the metal. G. is readily deposited upon other metals by the process of electro-gilding, the most suitable solution being that of the double cyanide of G. and potassium ($\text{Au}(\text{CN})_2\text{KCN}$). In the presence of the two chlorides of tin G. chloride forms a purple compound known to the ancients as purple of Cassius. Colloidal G. may be formed by Bredig's process of striking an arc between G. wires under water, or by reducing solutions of gold with phosphorus, formaldehyde, etc. For the purposes of coinage G. is alloyed with two parts in twenty-four of copper or silver to harden it against the wear and tear of circulation. For use in jewellery various alloys are employed, the 'fineness' being expressed in parts of pure G. In twenty-four; thus 18-carat G. is composed of eighteen parts of the metal alloyed with six parts of copper or silver as the case may be. Silver gives the alloy a paler, copper a redder, colour, than that of the pure metal. The chief alloys used by the jeweller are

Parts pure G.

Red G.	= 75 + 25 parts copper
Dead leaf G.	= 70 + 30 " silver
Green G.	= 75 + 25 " "
Water-green G.	= 60 + 40 " "
Blue G.	= 75 + 25 " iron

The attempt to produce G. from base metals was the age-long goal of alchemy. Such a transmutation was entirely beyond the powers of the alchemists, however, and although modern work on the structure of the atom indicates that the problem is by no means insoluble, it is unlikely to become a commercial proposition, at any rate in the near future.

The world production of G. fluctuates, but in more recent years has ranged from 30,000,000 to 37,000,000 fine oz. The returns pub. in 1939 gave the following totals in fine oz. for pure G.: Transvaal, 11,740,000; U.S.R., 7,700,000; U.S.A. (including Philippines), 4,800,000; Canada, 4,100,000; Australia and New Zealand, 1,900,000; Japan and Korea, 1,380,000; Mexico, 840,000; and S. Rhodesia, 800,000. Later figures are available in

some cases: Transvaal (1944), 12,277,230 fine oz., valued at £103,128,720; U.S.A. (1946), 1,462,354 troy oz., valued at \$51,182,390; Canada (1946), 2,807,643 fine oz., valued at \$103,180,880; Australia (1946), 824,480 fine oz., valued at \$5,873,468; and S. Rhodesia (1916), 544,596 oz., valued at £4,697,526. In 1939 one oz. (troy) weight of G. was worth £3 17s. 10½d. and one oz. of pure G., £4 4s. 11½d. The average market price of pure G. fluctuated with the dollar-sterling exchange, averaging 140s. 9d.

coast is mainly flat and swampy, and a heavy surf makes landing from vessels very difficult. In 1928, however, an excellent harbour was completed at Takoradi, near Sekondi, the only good shelter for large ships between Nigeria and Sierra Leone. There are sev. bold headlands and numerous lagoons. The land is flat for some distance from the sea, but rises towards the interior. The G. C. is rich in minerals and other produce, but cocoa is the mainstay. In 1900 the quantity exported was negligible, whereas

Cadbury Bros Ltd

**A GOLD COAST (ASHANTI) COCOA FARMER AND HIS FAMILY
DRYING COCOA BEANS**

per oz. The price in 1948 was 172s. 3d per fine oz. *See also* BULLION; CURRENCY MONEY.

Gold, Field of the Cloth of, name given to the meeting in June 1520 between Henry VIII. of England and Francis I. of France, near Calais. The proceedings, in which Wolsey took a prominent part, and which resulted in the signing of a treaty between the two kings, were characterised by the utmost splendour and extravagance.

Gold-beating, see GOLD LEAF.

Gold Coast, Brit. crown colony and protectorate in W. Africa, extending for 334 m. along the gulf of Guinea, and bounded on the E. by Togoland, on the W. by the Fr. Ivory Coast, and on the N. by the Fr. Sudan. It includes Ashanti and the dist. known as the N. Pers. The combined area is 78,650 sq. m., that of the G. C. colony alone being 23,490 sq. m. The

by 1938 some 300,000 tons or practically half the entire world supply was produced. This production is entirely in the hands of the African farmers, who receive the advice and help of the Agric. Dept. of the G. C. Gov. The firm of Cadbury's is a household word in the colony—Cadbury Hall and the Hunter Hostel, where young Africans are trained in matters appertaining to agriculture, are both gifts of the company. The low-lying land is very fertile, and palms of various kinds, coffee, cocoa, calabar beans, cereals, groundnuts, ginger, camwood, tobacco, etc., are largely grown. The cultivation of rice and sisal-hemp has been started. Maize has been planted in the old forest land and is the prin. food crop for domestic consumption in the G. C. There are some timber exports, but they are not comparable with the leading exports. The N. border of the high forest is receding,

while within the forest belt further S. extensive areas have been cleared for the cultivation of cacao—the total area cleared has been estimated at 1,000,000 ac. The area of high forest remaining to-day is less than 14,000 sq. m. and it is estimated that nearly 300 sq. m. are destroyed yearly, so that little will survive in forty years' time. In 1926, despite native opposition, a Forestry Bill was passed and became law. It provided that the gov. should constitute forest reserves, but that they should continue to be the property of the 'stools,' but this policy has not been a success. Other forest areas have been denuded to supply the mines with timber. Gold, from the production of which the colony derives its name, and which was mined by the natives before the coming of the Europeans, is found in large quantities, the chief mines being at Tarkwa and Prestea in the S.W. The gold-mines had been famous since the fifteenth century; modern equipment and European methods were introduced in the seventies. But transport facilities did not exist, and transport costs absorbed all profit. A brief boom was followed by a period of stagnation, until the completion of the railway line to Tarkwa in 1901 and to Kumasi in 1903. Diamonds and manganese are also mined. The chief exports are cocoa, palm oil, rubber, palm kernels, mahogany, copra, nuts, ivory, gold dust, diamonds, and manganese. There are some 12,000 cwt. of exports of hides and skins; but as regards livestock in the N. part of the country the control of rinderpest has led to a rapid increase in stock and overgrazing has, in consequence, become a serious problem as elsewhere in Africa.

The climate is hot and dour, and is unhealthy, particularly near the coast. The unhealthiness is, however, rapidly decreasing, owing to the drainage of swamps, improved sanitation, and advances in medical science, and the G. C. now little merits its former title of the White Man's Grave, but no Europeans settle and live there. The chief tns. are Accra, the cap. (pop. 75,000), Cape Coast, Sekondi, Adidah, Tarkwa, Elmina, Kwitta, Saltpond, Winneba, Axim, and Akuse in the G. C. itself, Kumasi and Kumampo in the Ashanti, and Tamale and Navrongo in the N. Ters. Roads, railways, telegraphs, etc., in the colony have been much developed in recent years. In 1930 there were 500 m. of railway, running from Accra and from Sekondi to Kumasi, and from Huni valley to Kade. There are also 6400 m. of motorable roads in the G. C., Ashanti, and the N. Ters., and 6000 m. of telegraphs; and over 11,000 m. of telephone trunks have been estab. There is a wireless station at Takoradi and there are wireless posts for inland communication at Accra, Kumasi, and sev. other tns. A gov. railway runs from Takoradi through Tarkwa to Kumasi and thence to Accra (386 m.), with branches (490 m. altogether). The Awaso line (46 m.), owned and constructed by the Ministry of Aircraft Production for the carriage of bauxite, is also operated: there is an airport at Accra. Sev. of the tns. are lighted

by electricity and have pipe-borne water supplies. Schools, hospitals, and asylums have also been estab. The colony has over 600 schools of approved standard and over 1000 sub-standard and the majority of the schools are managed by churches and missions, with liberal grants in aid by the gov. Attendance is not compulsory nor free. There are also technical schools. Post-secondary education is provided at Achimota College, which was opened in 1925 at a cost of £500,000 and built and endowed by the gov. African children can enter at the kindergarten stage and go through to univ. standard. There are on an average some 500 students at Achimota College. In 1943 a grant of £127,000 was made by the imperial gov. to establish a W. African institute of arts, industries, and social science, in the vicinity of Achimota College.

The government of the G. C. colony is administered by a governor, aided by a nominated executive council, with one unofficial member who was appointed in 1942. There is a legislative council with an 'unofficial' African majority (1946) for the colony, excluding Ashanti and the N. Ters. The administrative service is opened to W. Africans. The mandated ter. of Togoland is also administered by the governor. The G. C. system of native administration has been designed to show the greatest possible respect to the position of the chief as representative of the 'stool'; but this policy in itself forbade the application of that measure of control which made it possible to treat native institutions elsewhere as effective agencies of self-gov. ('indirect rule') and in the wide range of matters outside the sphere of stool interests, administration inevitably tended to take a direct form. In 1927 the gov. accepted a Bill put forward by a number of chiefs and embodied in the Native Administration Ordinance of that year. This ordinance recognised as part of the hierarchy of administration not only the chiefs, but their councils; the paramount chiefs' tribunals received appellate powers and their original powers in civil cases were enhanced. But the most important provision lay in the recognition of the Prov. Council, consisting of the head chiefs of the three provs., as the tribunals for the trial of issues between paramount chiefs, divisional chiefs, and the chiefs of provs. In 1931 an ordinance was passed to enable paramount chiefs to make by-laws establishing native treasuries, but such by-laws have not yet been passed in many states. In religion the people of the G. C. remain for the most part Animists, but there are many Moslems and the number of Christians is increasing. Save where religious ritual has involved human sacrifices, the Brit. Gov. has not interfered with the traditional beliefs of the African peoples. Thus the gov. would intervene in a case of ritual murder, as, for example, in 1945 when a number of men were sentenced to death for the murder of the Akyea Mensah, the Odikro of Apedwa, who was sacrificed to the spirit of the late paramount chief, Nana Sir Ofori Atta.

History.—The Portuguese were the first white settlers in the country; they built a fort in 1482 at St. Jorge de Mina, now known as Elmina. In 1625 the Dutch, who had built some forts in 1598, made a treaty with the Asebu tribe, captured the Portuguese fort and garrison of St. Jago, near Elmina, and when, in 1642, they took Axim, the Portuguese, after a settlement of 160 years, left the G. C. for ever, and for the next 200 years—till 1872—the hist. of the G. C. is the story of the struggle between the Eng. and the Dutch. The dist. was first settled by the Brit. in the seventeenth century, and the trade in gold dust and slaves was very large for some time, being mainly carried on by chartered companies. As early as 1618 James I. granted a charter to a London company of adventurers for 'adventuring in the golden trade of Africa,' and this is reckoned as the date of the foundation of the G. C. colony, making it one of the earliest in the Brit. Empire. About the middle of the seventeenth century Swedes, Danes, and Gers., competing for the trade, put up forts or castles at Sekondi, Shama, and elsewhere, while the Eng. built Cape Coast Castle (1662) and the Danes a fort at Christiansborg (now the residence of the governor of the G. C.) in 1657. In 1665 war broke out with the Dutch over these competing rights and the Dutch seized Cape Coast Castle. But after the peace of Breda a new company, under the patronage of Charles II., built seven more castles along the coast, besides enlarging Cape Coast; and in 1673 these events were celebrated by the coining of 50,000 gold pieces bearing the company's stamp—an elephant; these were called 'guineas,' because they were struck in the gold brought by the company from Guinea. In those days the G. C. was not a colony in the modern sense, and nothing was known of the hinterland except that the prisoner-of-war slaves were brought down from it by the Ashantis to the waiting forts on the coast. So long as slavery existed the Eng. provided a natural market for the slaves; with its abolition the Eng., now desiring only peace for legitimate trade, became the natural enemies of the bellicose Ashantis, and in all there were seven Ashanti wars and two invasions between 1800 and 1900. The last of the chartered companies was dissolved in 1821 when the Crown took possession of the forts and settlements, though previous to this Brit. territorial rights had been conceded by the Ashantis, after the battle of Dodowa (1826), at the end of the first phase in the struggle with them. The gov. then set up a legislative council and an Eng. court and sent out as governor Capt. George Maclean, one of the greatest figures in Eng. colonial hist. and the first European to attempt to understand African tribal law. In 1850 and 1871 the Brit. obtained from Denmark and the Netherlands their possessions in the dist. By a process of absorption the Eng. had become the only Europeans on the coast, but it was only after considerable difficulties that the Eng. power could be

said to be consolidated. In 1873 the gov. appointed Sir Garnet Wolseley as governor and commander-in-chief to deal with the Ashanti invasion of that time. Wolseley's white troops marched northwards by the newly cut road to Prasu, the Ashantis retreating before them; and of 40,000 Ashantis who had marched out from Kumasi only 20,000 returned, and these only returned with the Eng. troops close behind them. This was the first time white soldiers had followed the Ashantis into their own ter. On Feb. 4 the Eng. entered Kumasi and destroyed it. Later the treaty of Fomena was signed by which the G. C. (now separated from Sierra Leone) was declared a colony under Brit. rule and its tribes entirely free from Ashanti dominion. The next twenty-five years were occupied with the gradual subjugation of the Ashantis, the agreement of territorial boundaries with France and Germany—both had begun to penetrate into this part of W. Africa—and the opening up of the gold-fields by Europeans. In 1886, however, another expedition, under Sir Francis Scott, had to march to Kumasi, where Scott demanded from the chiefs payment of the indemnity agreed upon at the treaty of Fomena. Payment was not forthcoming, nor had human sacrifices ceased. Hence next day Prempeh (*q.v.*), the Kumasi chief, and seven other chiefs and the queen-mother, were deported to the Seychelles (*q.v.*). A fort was built at Kumasi to hold a garrison of 300 men. In 1900 Sir F. Hodgson, the governor, visited Kumasi and demanded the surrender of the golden stool, a magic symbol which the Ashantis believed had come from the gods and was in fact the symbol of their tribal confederacy (*see* GOLDEN STOOL). The result was that Hodgson was besieged in the fort and had eventually, together with his retinue and the garrison, to cut a way out to the coast. The chiefs were deposed, but the Brit. prudently refrained from repeating their demand for the golden stool. Since 1901, in which year Ashanti was annexed to the G. C. and the N. Tors. came under Brit. protection, there have been no wars but continued peace and development, for the Brit. Gov. has learnt the danger of ignoring tribal beliefs and has made their recognition and understanding an essential part of the prevailing policy of 'indirect rule.' Since 1900 exports from the G. C. have grown from £885,000 to £9,000,000 in 1935 (cocoa £5,200,000; gold £2,600,000; manganese £500,000; and diamonds £500,000)—an eloquent testimony to the profound change in the conditions prevailing throughout the country. There were serious disturbances in Feb.-March 1948 which arose immediately out of the increased cost of living, due to the general dislocation of world trade. A formidable riot involving some 50,000 people broke out in Accra, attacks being mainly concentrated on shops owned by Syrians, Indians, and Europeans. The police used firearms to stop a procession of 2000 ex-servicemen and others from marching on the governor's official residence at Christiansborg Castle. The

insurrection, exploited by political extremists, assumed a nationalistic and xenophobic character and spread to the schools run by religious communities in Accra. The gov., which was taken aback by the extent of the violence, called in troops and imposed a curfew and press censorship. The disorders spread over the country to Kibi, Koforidua, Akuse, and Suhum, while the situation in Accra was being brought under control. A fortnight after the outbreak in Accra, rioting had practically ceased in all tns. except Kumasi. Some fifteen persons were killed and 115 injured. The activities of political extremists of the United G. C. Convention, which made its first appearance as a political organisation in Aug. 1947, rendered the situation more complex than it would have been had it been due solely to economic causes. According to the governor's report these activities showed links with Communist organisations overseas, and the aims of the convention, while ostensibly the attainment of self-government, were in fact revolutionary, as indicated in a manifesto addressed to the chiefs which was pub. in the press under the title 'The hour of liberation has struck.' Leadership of the convention was dominated by lawyers, many of whom had been trained and resided abroad. Its president, Dr. Danquah, a wealthy timber merchant, had figured in the political life of the G. C. for many years. A commission of inquiry was appointed by the governor to investigate the disturbances and their underlying causes. The commission's report (pub. Aug. 4, 1948) states that the convention, through its working committee, were active in promoting every form of complaint likely to influence an excitable populace with a disproportionate sense of grievance. The report summarises the underlying causes of the disturbances as follows: (Political) the large number of African soldiers returning from service, where they had lived under better conditions, made for a general communicable state of unrest; a feeling of political frustration among the educated Africans, who saw no prospect of ever experiencing political power under existing conditions; a failure of the gov. to realise that, with the spread of liberal ideas, increasing literacy, and a closer contact with political developments in other parts of the world, the star of rule through the chiefs was on the wane; resentment at the growing concentration of certain trades in the hands of foreigners, especially Syrian merchants; (economic) the gov.'s neutrality in the dispute over the high prices of imported goods; the gov.'s acceptance of the scientists' finding that the only cure of swollen shoot disease of cocoa was to cut out diseased trees, and their adoption of that policy, coupled with allegations of improper methods of carrying it out; the degree of control of the Cocoa Marketing Board limiting the powers of the farmers' representatives to control the vast cocoa reserves; (social) the alleged slow development of educational facilities and the almost complete failure to provide any

technical or vocational training; the fear of wholesale alienation of tribal lands, leaving a landless peasantry; inadequacy of the legal powers of government necessary to deal with speeches designed to arouse disorder and violence. Among the recommendations of the commission were proposals for a basis of constitutional reform for a probationary period of ten years, the new constitution of 1946 being described as having been 'outmoded at birth,' and reference was made in the report to an intense suspicion among the people 'that the chiefs are being used by the government as an instrument for the delay if not the suppression of the political aspirations of the people.' The recommendations made by the commission are calculated to develop a pattern of government which will conform in some respects to the government in the United Kingdom. Apart from tns., which will have their tn. councils, the affairs of rural areas in matters of purely local concern will be dealt with by a local authority corresponding in some ways to a rural dist. council. Matters of wider regional concern will be dealt with by a regional council with an administrative structure not unlike a co. council. The legislative body with parl. status will be the U. C. Assembly, functioning with a board of ministers acting as an executive council. The United Kingdom gov., in a statement pub. at the same time as the report, commented that 'a European system cannot be imposed arbitrarily on an African society; readiness to give must be matched by willingness to receive'; and it is suggested that the manner of presentation of some of the commission's proposals might lead to misunderstanding, and that the comments on chiefs did substantially less than justice to the strength of the tradition and custom which a large part of the G. C. still regarded as essential to an ordered society. But the gov. was in agreement with the principles underlying the recommendations for constitutional reform, since they were pledged to assist the people of the G. C. in their progress to self-government as rapidly as conditions permit, though they did not accept the criticisms of the 1946 constitution. While they attach importance to modernising the native authorities and making them fully representative, the gov. regard the chiefs as having an essential part to play, since they are the traditional leaders of the people. It is intended to set up a local representative committee to consider the extent to which the proposals can be accepted. If the proposals are acceptable to local opinion the United Kingdom Gov. would—subject to reservations—be prepared for their early implementation. The United Kingdom gov. also agree with the commission that the membership of the legislative council should be increased, that this body should be presided over by a Speaker, and that the executive council should consist of nine members, of whom four would be *ex officio* members and five Africans. The gov. suggests that there should be three salaried full-time African members, with responsibility for health,

labour, and social welfare, for education, and for communications and works; and they also agree that the executive council would be the body where all major questions of policy would be discussed, and as such the foundation from which a Cabinet would eventually be developed.

Pop. (African), census for 1931: The colony 1,645,140; Ashanti 582,866; N. Ters. 717,283; Brit. sphere of Togoland 275,925; Accra 59,895; Kumasi 36,200; non-African, about 2400, mainly Brit. In March 1942 the pop. was returned at G. C. colony 1,940,789; Ashanti 737,072; N. Ters. 890,170; Togoland 391,473. Total 3,959,510.

Golden Age, phrase applied to the most prosperous and beautiful period of a country's hist., art, literature, etc. The idea originated with the Gks. Hesiod divided the life of a race into five ages, of which the golden, or simple and patriarchal, age was the first. The theory was developed into a regular system of cosmic philosophy, which made Saturn the governing deity of the G. A.

Golden Ball, see GLOBE FLOWER.

Golden Bull, imperial edict issued by the Emperor Charles IV. in 1356, which fixed the law in regard to the imperial elections, and provided that only one member of each electoral house should have a vote. So-called from the gold case enclosing the imperial seal (lat. *bullā*) attached.

Golden Calf, idol made by Aaron from the golden earrings of the Israelites and worshipped by them when Moses was absent on Mt. Sinai (Exod. xxxii). It

is probable that the gold in thin plates covered a core of wood. Moses burnt the G. C. and ground it small, then cast it into the brook and made the people drink the water (Ps. cvi. 19).

Golden Carp, see GOLDFISH.

Golden-crested Wren (*Regulus cristatus*), smallest of European birds, belonging not to the family of the true wrens but to that of the Sylviids. The length of the body is about 3½ in., and the plumage is very beautiful. The back is greenish-yellow, the wings and tail are ash brown, marked with black and white, and the cheeks and throat greyish white, while the crown feathers are elongated into a bright yellow crest. It is found all over Europe, and is not uncommon in Great Britain, particularly frequenting fir woods.

Golden-eye Fly (*Chrysopa pirla*), or Lacewing Fly, common Brit. neuropterous insect. In colour it is pale green, with long antennae, gauzy wings, and bright yellow eyes. The length from the tip of the antennae to the tip of the closed wings is almost 1½ in. The eggs are attached to leaves, etc., by stalks; the larvae are rough and hairy and feed on aphides, and the pupa is enclosed in a white silky cocoon. The name is also applied to an allied species, the *C. vulgaris*.

Golden Fleece, see ARGONAUTS and JASON.

Golden Fleece, Order of the (Fr. *La Toison d'Or*), one of the prime knightly orders of Christendom, belonging to Austria and Spain. It was founded on Jan. 10, 1429, by Philip III (the Good), duke of Burgundy and the Netherlands, at his marriage with Isabella of Portugal at Bruges, and dedicated to the Virgin and St. Andrew. The source of the name is variously given as the story of the Argonauts, the story of Gideon, the wool trade of Flanders, and the golden hair of the duke's mistress, Marie de Rambruge. The order had considerable political influence, having power to censure the grand master, i.e. the sovereign. The grand mastership, which had been filled by the Hapsburg kings of Spain from the loss of the Netherlands till 1700, was claimed in 1713 by the Emperor Charles VI, and the subsequent dispute was tacitly settled by the introduction of the order into both Spain and Austria. See H. H. Kenyon de Settenhove, *La Toison d'Or*, 1907.

Golden Gate, strait of California, U.S.A. It is about 1 m. in width, and connects the San Francisco bay with the Pacific Ocean.

Golden Horn, narrow inlet of the Bosphorus, separating Constantinople (q.v.) from Galata and Pera.

Golden Horn Bay, see PETER THE GREAT GULF.

Golden Legend, medieval collection of lives of the saints, made by a Dominican, Jacobus de Voragine (1230-98), who was for some year, archbishop of Genoa. The collection is in five sections and contains 182 chapters. It was very popular, and was trans. into many European languages. An Eng. trans. by Wm. Caxton appeared in 1483. See the critical ed. by J. G. T. Grässe (Dresden), 1846.

Golden Retriever, see RETRIEVER.
Golden Rod, or *Solidago Virgaurea*, species of Compositae which is found in Britain and is the only Brit. representative of its genus. The leaves of the plant have sometimes been used to make an infusion as a substitute for tea. There are numerous allied species scattered over America, e.g. *S. anadensis*, the Canadian *G. R.*

GOLDFINCH

Golden Rose, emblem wrought of pure gold, which is blessed by the pope on Lentare Sunday, the fourth Sunday in Lent. Occasionally it is sent as a mark of papal favour to some Catholic prince or dignitary, to cities, churches, etc.

'Golden State,' see CALIFORNIA.

Golden Stool, symbol of Ashanti tribal confederacy. It is made of wood but plated and ornamented with gold. It was at first thought by Brit. administrative authorities to be a throne, but researches have shown that it is a sacred object enshrining the spirit of the Ashanti people. After the Ashanti wars and the dissolution of the tribal confederacy when a Brit. protectorate was set up, and the Ashanti chief, Prempeh (q.v.), was exiled, the G. S. disappeared. Hidden the stool was the symbol of the continued but, as it were, underground life of the Ashanti nation under Brit. rule. The Brit., having by 1921 come to realise the veneration in which the stool was held, no longer demanded its production as a throne, and in that year the governor of the Gold Coast explicitly stated that the Brit. made no claim to the stool. The reward for this act of policy came in 1935 when another Prempeh, already king of Kumasi, was formerly installed as king of Ashanti. The G. S. was publicly carried in procession before the Brit. governor at this installation. Thus the famous stool was, in effect, a declaration, significant because of its symbolic form, of the confidence of the whole Ashanti people in the Brit. as guardians and protectors of their national well-being.

Golders Green, a suburb of London, is situated on the E. Brent, 1½ m. N.W. of Hampstead, in the par. of Hendon. Here

is the crematorium for N. London. Also noted for Golders' Hill Park. Pop. 6000.

Goldfinch (*Carduelis elegans*), beautiful Brit. bird belonging to the Fringillidae. It is about 5 in. long, and the plumage of the adult male is a handsome mingling of black, crimson, yellow, and white. Its intelligence and pleasing song make it a favourite cage bird.

Goldfish, or **Golden Carp** (*Carassius auratus*), common fresh-water fish native to China and Japan. In its natural state it is brown in colour, but when domesticated it develops the familiar red-gold tint, and occasionally becomes a complete albino, when it is known as the silver fish. It was introduced into England in 1691, and breeds freely in aquaria or ponds, provided that the water is kept up to a high temp.

Goldie, Sir George Dashwood Taubman (1846-1925), Eng. administrator, b. in the Isle of Man; educated at Woolwich and entered the Royal Engineers. He first visited the Niger country in 1877, and began to work towards adding the dist. to the Brit. Empire. In 1879 he formed the United African Company, which united the Brit. commercial interest of the dist. In 1886 a charter was granted to the company, which became the Royal Niger Company, with Lord Aberdare as governor and G. as vice-governor. G. succeeded Lord Aberdare as governor in 1893. In 1897 he organised and personally conducted a successful expedition against the Muslim tribes of Nupe and Illorin. In 1895 he became president of the Royal Geographical Society. He was made Privy Councillor in 1898. See Lady Dorothy Wellesley, *Sir George Goldie: Founder of Nigeria*, 1934.

Golding, Arthur (c. 1536-c. 1605), Eng. translator, b. in London and served under the protector Somerset and Sir Wm. Cecil. His chief work is a trans. of Ovid, pub. 1565-67. G. wrote an introduction deducing a moral from the tales. His trans. was a great favourite with the Elizabethan writers. He also trans. sev. religious works.

Goldingen, see KUDIGA.

Gold Lace, fabric made of cotton or silk thread covered with fine metal wire, and much used for uniforms, theatrical dresses, etc., and eccles. purposes. The metallic wire employed is made from various substances. In the best qualities pure silver is used, but an alloy of copper and silver is more common, and for very cheap lace copper wire is employed. This wire is annealed and plated and then covered with pure gold leaf, which is made to adhere by heating to red heat in charcoal. In the cheapest varieties the copper wire is electro-plated with silver, and this again electro-plated with gold. The completed wire usually measures 1100 to 1400 yds. to the ounce of metal, and is flattened by steel rollers before being wound over yellow silk or cotton thread by a spinning engine. Much gold thread is manufactured in India.

Gold Leaf, tissue of that metal, beaten out to 2400 in. in thickness. It is beaten out to such a fineness for the purpose of

gilding various surfaces. The art of gold-beating was known to the anc. Egyptians 5000 years ago, and the coffin case of An-Antef, king of Thebes (2000 B.C.), now in the Brit. Museum, is an example of Egyptian gilding that is comparable with the best modern work. It was practised by the potters and decorators of anc. Greece and Rome. In the *Odyssey* Homer describes how cattle were prepared for sacrifice by having their horns gilded with beaten gold. From Pliny the Elder has come down the earliest account of gold-beating, the craft appearing in Rome c. 100 B.C., when the exterior ornaments of the Capitol were gilded, a form of decoration that was soon adopted for other public buildings and villas. A Ger. monk of the twelfth century outlines a process of gold-beating almost identical with that of to-day, and in the days of their prosperity the skilful Florentines were famous for the art. At least seven years of regular practice are necessary to attain moderate efficiency. The gold is alloyed with silver or copper, and is then cast into ingots, about 5 in. by 1 in. by $\frac{1}{4}$ in. thick. Powerful steel rollers flatten the ingots out to a 120-ft. ribbon 1 to $1\frac{1}{4}$ in. wide and $\frac{1}{1000}$ in. thick. The metal is now ready for the gold-beater. After annealing the ribbon is divided into pieces, each weighing about 64 grains, and from this point in its processing, the gold is untouched by hand, being manipulated by boxwood pincers. These pieces are interleaved in a 'cutch,' the interleaving being effected with small sheets of vellum or tough paper about $\frac{1}{4}$ in. square. The cutch or pile is set on a firm marble or granite block supported by a heavy wooden post set in the ground to overcome vibration, and beaten with a seventeen-pound hammer until the gold has spread to the size of the paper screens. The art of beating the cutch consists in striking evenly over the whole square in such a way that the gold will always be even in thickness all over and the gold must extend without distortion of form. Each gold sheet is cut into four with a 'skewing' knife and again interleaved, this time in a 'shoder,' whose leaves are made of gold-beater's skin. The shoder consists of 800 gold-beater's skins about $\frac{1}{4}$ in. square. These skins are taken from the large intestines of oxen, their preparation being a jealously guarded secret; and it requires 500 oxen to supply enough membrane to make one shoder, which may, however, be beaten for months without the slightest injury. The shoder or packet is beaten for two hours with a ten- or twelve-pound hammer. Finally each G. L. is again divided into four and set between layers of very fine gold-beater's skin, in what is technically called a mould. Here the gold is beaten for the last time, usually for four hours. A seven-pound hammer is used. Twenty-five leaves, which are about $3\frac{1}{4}$ in. square, are sold together in a book, and the fineness of the metal is such that a grain of G. L. will gild 56 sq. in. of surface.

Goldmark, Karl (1830-1915), Austrian musical composer, b. at Keszthely, on the Plattensee; went to Vienna to study

music in 1844. In 1857 he gave a concert of his own works. His first opera, *Die Königin von Saba*, was produced at Vienna in 1875, and was followed by *Merlin* (1886) and *The Cricket on the Hearth* (1900). His descriptive symphony *Landliche Hochzeit* (1887) and some of his overtures—*Penthesilea*; *In the Spring*; *In Italy*—have had a great vogue. See his memoirs, 1912, and monograph by O. Keller, 1901.

Goldoni, Carlo (1707-93), It. dramatist, b. at Venice, and studied for the law, but early began dramatic writing. His first attempts were tragedies, among which were *Amalasunta* and *Belisario* (1734). But he soon turned to comedy, and succeeded in creating a new school of comedy, based upon character and domestic life, in place of the old farcical type. Among his numerous plays are *Momolo Courtesan* (1738); *Il Prodigio* (1739); *La Bancarella* (1741); *La Donna di Garbo* (1742); *L'Impostore* (1743); *Le Baruffe Chiozzotte* (1750); *Dama prudente* (1750); *Il Caffè* (1750); *Locandiera* (1763); *Il Bugiardo* (1760); *Todero Brontolon* (1761); *I Rusteghi* (1763); *Il Ventaglio* (1763); and *Le Bourru bienfaisant* (1771). A collected ed. appeared at Venice in 1788-1789, and a selection was trans. into Eng. in 1892. Later eds. of his complete works were pub. at Venice (1907) and Milan (1935). His letters, ed. by E. Nati, were pub. in 1907. See E. Gimmelli, *La Poesia di Carlo Goldoni*, 1941. See also his own memoirs (1787) and lives by P. G. Molmenti, 1879; P. G. Galanti, 1883; C. Rabany, 1896; and H. C. Chatfield-Taylor, 1941.

Goldsboro, city of N. Carolina, U.S.A., in Wayne co., situated on the Neuse R., about 49 m. S.E. of Raleigh. The manufs. are knitted goods, cottons, lumber, furniture, and agric. tools. Fruit and vegetables are largely cultivated. Pop. 17,200.

Goldschmidt, Madame, see LIND, JOHANNA MARIA.

Goldsmith, Oliver (1728-74), novelist, poet, and dramatist, the son of a poor Irish clergyman, was b. at Pallas, Co. Longford, Ireland. One of a family of nine G. early became familiar with the struggle for existence which was to last throughout his life; he also learnt in his father's house that kindness, sympathy, unselfishness, and love of his fellow men which equally never left him. He was a dull and stupid boy, shy, and of unattractive personal appearance. He first managed to take his degree at Trinity College, Dublin, and then he spent the next three years verse writing, flute playing, making merry, teaching, perfunctorily studying law in London and medicine in Edinburgh and Leyden. Then he set off on foot to make a tour of the Continent 'with a guinea in his pocket, one shirt on his back, and a flute in his hand.' Returning to London after two years he drifted into literature, writing for various magazines and compiling hist. of Greece, Rome, etc. His papers to the *Bee* (1750) and his *Chinese Letters* (pub. under the title of *The Citizen of the*

World, 1762) brought him into notice. He made the acquaintance of Johnson and Reynolds and became a member of the famous Literary Club. His constitutional improvidence, reckless charity, and love of pleasure kept him on the verge of poverty all his life, but he never lost his humorous merriment and love of life. His increasing debts, however, hastened his end. Early in 1774 he was stricken with fever, which, aggravated by mental distress due to the poverty into which his improvidence had steeped him, and by his use of quack remedies against medical advice, terminated fatally on April 4. A monument to him was erected in Westminster Abbey, with a Lat. inscription in eulogy of his works and character by his friend and champion Dr. Johnson.

OLIVER GOLDSMITH

His poem *The Traveller*, which established his position, deals with the conditions of various countries, and has an underlying philosophy. In 1766 he pub. his masterpiece, *The Vicar of Wakefield*, a story of simple, natural life, largely autobiographical. In it G. may be said to have readjusted the people's vision, in that he discarded the lengthy discussions, artificial form, self-analysis, and over-sentimentality, which characterised the novel up to his time and created life-like figures and found new motives outside the restricted sphere where novelists had hitherto sought their materials; he added the idyllic note. In his two comedies which still live and please, *The Good-natured Man* (1768) and *She Stoops to Conquer* (1773), there is a reaction against the false sentimentality of the time. *The Deserted Village* (1770), a poem which still preserves its freshness, embodies the idea that a nation cannot be great unless each individual who helps to create its prosperity has a share in its blessings. G. started in this poem a line of thought which leads straight to the present-day

grappling with industrial problems. G. with his large humanity, pathos, and humour, helps, as Scott said, 'to reconcile us to human nature,' and Dr. Johnson pleads, 'Let not his frailties be remembered, he was a very great man.' See J. Forster, *The Life and Adventures of Oliver Goldsmith*, 1818; W. M. Thackeray, *English Humorists*, 1838; R. Crawford, *Oliver Goldsmith and Medicine*, 1914-15; T. Scott, *Oliver Goldsmith Bibliographically and Biographically considered*, 1928; and A. Tillotson, *Dr. Johnson and the 'Life of Goldsmith'*, 1933. See also lives by W. Irving, 1844; W. Black, 1879; A. Dobson, 1888; F. Moore, 1910; K. C. Balderston, 1926; and S. Gwynn, 1935.

Goldsmiths, one of the livery companies of the city of London. Mention of the G. among the adulterine crafts occurs about 1212, but their guild does not seem to have attained importance till about 1615, when they began to set up as bankers, being instrumental in the introduction of bills and paper currency. Their bills were even accepted by Parliament, but when the Bank of England was estab. after the revolution the company found itself unable to meet the competitors. The G. now stand fifth among the twelve great companies. They have been great educational benefactors and have presented a valuable collection of early books on political economy to the univ. of London. See W. Herbert, *History of the Twelve Great Livery Companies*, 1837; W. Hazlitt, *The Livery Companies of the City of London*, 1892; and C. J. Jackson, *English Goldsmiths and their Marks*, 1905.

Goldsmith's Art and Work. The working of the precious metals, and notably of gold, has been practised with considerable skill by man from very early times. The anc. Egyptians have left many remains of cloisonné work and moulded ornaments, in which they specially excelled, as well as numerous round plated chains. The personal gold jewellery found in Egyptian sarcophagi, sometimes dating as early as 2000 B.C., includes necklaces, rings, bracelets, and hair ornaments. Both design and execution are excellent. Some of the work is inlaid with precious stones, and there are examples of filigree and of granulated gold work. Assyrian art gives plentiful evidence of the existence of the goldsmith's art among that people, but the actual remains hitherto discovered have been slight. The same may be said of Crete. Phœnician goldwork has been found in considerable quantities in Cyprus and Sardinia. Among its distinguishing features are delicate filigrees of gold wire on a gold ground, the use of grain ornaments, relief, and inlaid work, while the articles include all kinds of jewellery for personal adornment, as well as weapons, etc.

Early Gk. jewellery is chiefly of pure gold, usually beaten very thin and delicately ornamented with filigree or granulated work. Gk. filigree work from the sixth to the third century B.C. shows this art in its highest perfection. Other distinguishing features are fretwork, wave ornament, and the guilloché, and the work

is more notable for its exquisite workmanship than for any marked individuality in design and treatment. Etruscan gold-work is directly derived from the Gk., and at its best is scarcely distinguishable from it, being particularly good in filigree and granulated surfaces. The later Etruscan work is more florid and diffuse than good Gk. designs. Rom. jewellery is also mainly an imitation of Gk. forms, though it tends to the larger use of precious stones and of plain surfaces. The early Teutonic nations showed considerable skill in sev. kinds of goldsmith's work. Anglo-Saxon remains include jewels of many varieties which show filigree work, pierced gold sheets, cloisonné work, and

Ashmolean Museum

beaded and twisted gold. Conventionalised animal forms are largely used. The Celtic peoples, notably the Irish, were skilful and artistic workers in gold. The Tara brooch is a very famous example of Irish work, which is distinguished by the use of filigree of curiously complicated knotted designs, hammered work with repoussé details and fillings-in of enamels, etc., and chased lines. In mediæval times the goldsmith's art was highly honoured in all European countries, and, after the Renaissance, reached a very high state of perfection, particularly in Italy. Early mediæval jewellery was mainly massive and simple in design; the later examples are largely in cast work, ornamented with enamels and precious stones, bosses, and borders of filigree. A famous Eng. example is the Barmley jewel. The art declined during the seventeenth and eighteenth centuries, the traditional forms being often combined with most incongruous effects, but a revival of goldsmith's work has lately begun, with excellent results. The preparation of the gold by alloying and colouring, and the manu. of jewellery is largely carried on in Clerkenwell (London), Birmingham, Paris, Vienna, and Berlin. Some very delicate and beautiful work still comes from E. countries, notably from India. See J. Lessing, *Gold und Silber*, 1907; M. Rosenberg, *Geschichte der Goldschmiedekunst auf technischen Gründen*, 1910-25; S. J.

Churchill, *Goldsmiths of Italy*, 1926; L. Weaver, *Art in Industry and Salesmanship*, 1929; A. H. Lee, *Works of Art in Silver and other Metals*, 1936; and M. N. Morrison, *Silversmiths and Goldsmiths of Cape of Good Hope*, 1936.

Gold Standard, currency system under which bank notes may be exchanged for gold at any time at a fixed rate. There are three forms: full G. S.—the central bank is bound to redeem its notes in gold coin and also to buy and sell gold at a fixed price; gold bullion standard—no gold coins are in circulation and there is no redemption of notes, but the central bank is bound to buy and sell gold at a fixed rate (this was the Brit. system from 1925 to 1931); the gold exchange standard—the central bank does not buy and sell gold, but only drafts in foreign currencies on the gold or gold bullion standard. Free exportation and importation of gold, or free sale of foreign gold exchange is necessarily linked up with the G. S. See further under CURRENCY; ECONOMICS; MONEY.

Gold Stick, name of an officer in the royal household to whom the king in person gives the parole and countersign, and who reports directly to the king and the Army Council, as well as laying orders issued by the Army Council before the king. The office was instituted in the reign of William IV., and is held in rotation for periods of a month at a time by the colonels of the two regiments of household cavalry.

Goldstücker, Theodor (1821-72), Ger. Sanskrit scholar, b. at Königsberg. He became prof. of Sanskrit in the univ. of London. He worked on a Sanskrit dictionary, but his most important work was *Pāṇini, his place in Sanskrit Literature* (1861). Owing to his efforts the Sanskrit Text Society was formed in 1866.

Goldwyn, Sam (b. 1882), Amer. film producer, b. at Warsaw, Poland, the son of Abraham Goldfish, he later took the name of G. He went to the U.S.A. in 1896 and started in the glove manufacturing business. He became a naturalised Amer. citizen in 1902. His entry into the film industry in 1913 was as an associate of Jesse Lasky and Cecil B. DeMille in Lasky Feature Photoplay. He afterwards became chairman of the Famous Players Lasky Corporation. In 1918 he resigned and formed the G. Pictures Corporation. His interest in this was sold in 1924 to Metro-G. Mayer, and from 1927 to 1940 G. was director of the United Artists' Corporation. G. has a large number of highly successful productions to his credit, among which special mention should be made of *Stella Dallas* (1925); *Whoopie* (1930); *Wuthering Heights* (1939); and *The Best Years of Our Lives* (1946), this last receiving the Motion Picture Academy award. Indefatigable in his search for new talent, G. was responsible for introducing a number of actors and actresses to films who afterwards became celebrated.

Goléniew, or Gollnow, tn. of Poland, formerly of Prussia, situated in the prov.

of Poznan. It is about 15 m. N.E. of Stettin and is a small manufacturing tn. It is very old and was formerly a Hanse tn. Pop. 11,000.

Goletta, tn. on the gulf of Tunis, and connected with the city of Tunis by a canal and by rail. The importance of the tn. as a port has been diminished by the opening of the ship canal which connects with Tunis. It is well fortified. Stones from the ruins of Carthage were used in the construction of many of its buildings. In 1535 Charles V. captured it from the Turks, by whom it was retaken in 1574. Pop. about 7000.

Golf, originally a Scottish game of great antiquity. Other variants of the name are *goff* and *gouff*, the last of which may be heard in Scotland, although *goff* has become fashionable in England. The name is probably derived from a Celtic form of the Ger. word, *Kolbe*, meaning club. The game, however, has some slight resemblance to the old Dutch game *kolf*, shown in some seventeenth-century Dutch paintings, but it is not known whether the game was introduced into Scotland from Holland. Certainly in the reign of James VI. of Scotland the Scots used to buy their balls and clubs from Holland, as James eventually prohibited their importation. G. was popular in Scotland as early as the fifteenth century, but its origin is suspected to be much older. In 1457 the Scottish Parliament, concluding the game was interfering seriously with the defences of the country, ordained that 'the fute ball and golf be utterly cryit down, and nocht usit; and that the bowmerkis be maid at ilk paroche kirk a pair of buttis and schuttir be usit ilk Sunday.' Further enactments to this effect were passed during the fifteenth century, some of which show us clearly that the game, in spite of the laws, was becoming rapidly more popular every day. In fact, the king, James IV., whose enactments attempted to stop the game, nevertheless broke the law himself and played. G. is usually called the royal and anct. game, and there is much evidence to show that it was often played by Scottish royalty. James V. was a player of note; his daughter, Mary of Scotland, is also supposed to have played. James VI. of Scotland and I. of England is held by some authorities to have been a player himself; and from the evidence quoted above he may, at any rate, be held to have been a keen partisan of the game, whilst from his reign dates the origin of the oldest of all G. clubs, the Royal Blackheath Club (1608). The famous St. Andrews Club was instituted in 1754, and the Musselburgh G. Club in 1774. An earlier foundation is the Honourable the Edinburgh Company of Golfers, with a series of minutes dating from 1744. A silver club is competed for annually, and after 1891 the Honourable Company acquired the links at Muirfield. The St. Andrews Club took the title of the Royal and Anct. G. Club of St. Andrews by the wish of King William IV., who became patron in 1834, a patronage which was continued after his death by his queen, Adelaide. The King

William IV. gold medal, presented in 1837, is still competed for. G. began anew in England with the Westward Ho Club instituted in 1864, followed by the two Wimbledon clubs and the Liverpool Club with links at Hoylake. From the year 1880 G. seems to have thriven enormously, clubs have sprung up all over the country, and in fact at the present day it is wellnigh impossible to go to any part of the country without finding a G. course within easy distance. There are in the Brit. Isles about 2000 clubs, with an average membership of about 300. The game has spread not only in Great Britain and Ireland, but in all the dominions, and in America, especially in the E. states. G. has become popular on the Continent, especially in France, Germany, and Austria. The Royal and Anct. Club of St. Andrews is the governing power in G., and drew up the original rules of the game. In 1899 a standing committee was inaugurated by the St. Andrews Club representing golfing opinion in Great Britain. In the U.S.A. G. is controlled by the U.S. G. Association, and in Canada by the Royal Canadian G. Association. In England, Canada, and America there are also large professional golfers' associations. In America also each state has a G. association, while women's G. is cared for by similar women's G. associations. In the Brit. Isles there are the Ladies' G. Union and the Irish Ladies' Golfing Union. One feature of G. is that there is not the disparity between the amateur and the professional which marks some games. The chief G. championships are the open, the amateur, and the ladies'.

The open championship is played only on the following courses: St. Andrews, Prestwick, Muirfield, Hoylake, Sandwich, and Deal. The winners during recent years have been G. Duncan, 1920; J. Hutchinson, 1921; W. Hagen (U.S.A.), 1922; A. G. Havers, 1923; W. Hagen (U.S.A.), 1924; J. Barnes (U.S.A.), 1925; R. T. Jones, junior (U.S.A.), 1926 and 1927; W. Hagen (U.S.A.), 1928 and 1929; R. T. Jones, junior (U.S.A.), 1930; T. D. Armour (U.S.A.), 1931; G. Sarazen (U.S.A.), 1932; D. Shute (U.S.A.), 1933; T. H. Cotton, 1934; A. Perry, 1935; A. H. Padgham, 1936; T. H. Cotton, 1937; R. A. Whitcombe, 1938; R. Burton, 1939; S. Sneed (U.S.A.), 1946; F. Daly (Helfast), 1947; T. H. Cotton, 1948; A. D. Locke (S. Africa), 1949.

The amateur championship was instituted in 1886, the winners during recent years being C. Tolley, 1920; W. Hunter, 1921; E. W. Holderness, 1922; R. Wethered, 1923; E. W. Holderness, 1924; R. Harris, 1925; J. Sweetser (U.S.A.), 1926; W. Tveddell, 1927; T. P. Perkins, 1928; C. Tolley, 1929; R. T. Jones, junior (U.S.A.), 1930; E. Martin-Smith, 1931; J. de Forest, 1932; Hon. Michael Scott, 1933; W. L. Little (U.S.A.), 1934 and 1935; H. Thomson, 1936; R. Sweeney, 1937; C. R. Yates (U.S.A.), 1938; A. Kyle (Scotland), 1939; J. Bruen (Cork), 1946; W. T. Turnesa (U.S.A.), 1947; F. Strahan (U.S.A.), 1948; S. M. McCready, 1949.

The winners of the Brit. women's open championship in recent years have been O. Leitch, 1920 and 1921; J. Wethered, 1922; D. Chambers, 1923; J. Wethered, 1924 and 1925; C. Leitch, 1926; S. La Chaumc, 1927; L. Le Blan, 1928; J. Wethered, 1929; D. Fishwick, 1930; E. Wilson, 1931, 1932, and 1933; A. Holm, 1934; W. Morgan, 1935; P. Barton, 1936; J. Anderson, 1937; A. Holm, 1938; P. Barton, 1939; W. Morgan (unofficial), 1942; A. C. Critchley (unofficial), 1943; M. Ruttle (unofficial), 1944; G. W. Hetherington, 1946; M. Zaharius (U.S.A.), 1947; F. Stephens, 1948; F. Stephens, 1949.

tance of some 100 to 500 or 600 yds. distance from one another, and each hole is usually marked by a flag. The game is commenced by teeing the ball, i.e. by placing it in a position of advantage from which it can easily be driven, usually on the top of a small mound of sand. After driving the ball from the tee it must not again be touched by the hands or placed in any special position save as the rules of G. allow under special circumstances. The game now consists of playing the ball with one or other of the variety of G. clubs until it is putted into the hole, after which it is taken to the next tee and driven off again in the direction of the next hole. The use

Valentine & Sons, Ltd., Dundee

THE HOME OF GOLF: THE NINETEENTH GREEN AND THE CLUB-HOUSE OF THE ROYAL AND ANCIENT GOLF CLUB OF ST. ANDREWS

Before the First World War the Brit. open championship was mostly in the hands of three professional players, J. H. Taylor, J. Braid, and H. Vardon. Taylor won the open championship in 1900, 1909, and 1913; Braid in 1901, 1905, 1906, 1908, and 1910; and Vardon in 1903, 1911, and 1914. Another famous golfer of this period was the Frenchman, A. Massy, who won the Brit. open in 1907 and tied with Vardon in 1911. G. Duncan, Abe Mitchell, Walter Hagen, R. T. Jones, and Henry Cotton were the most notable successors to those great players.

The Game.—Briefly the game consists in hitting a ball by means of clubs over a certain amount of country into a hole some 4 in. in diameter and about 6 in. deep. The final act of hitting the ball on the green into the hole is called putting. A course usually consists of either eighteen or nine holes, each of which are at a dis-

of a variety of G. clubs is necessary to surmount bunker, and also because the lie of the land is not always of a sufficient equality to allow of the continual use of the same club. It is to a very great extent this variety which gives so much charm to the royal and anct. game. At the end of the round that player is held to be winner who has succeeded in holing out in the least number of strokes on the most occasions. A game may, however, be decided before the round of the links has been actually finished, since if at the seventeenth tee a player is three to the good it is impossible for his opponent to win, and the score would be called three up and two to play. Since the game became popularised many changes have been made in the clubs used, the most notable being the introduction of steel shafts, and many additions have been made to them also. In the matter of balls used great

progress has been made, and the change from the gutta-percha ball to the ball with an india-rubber or soft core has done much to make the game easier for the casual player. It is impossible to give here a definition of all the technical terms used in G., but definitions of the prin. clubs used are as follows: A baffle, a short wooden club used for lofting; brassoy, a wooden club shod with brass; cleek, an iron-headed club, which is used for driving through the 'fairway' and is capable of the largest drive of all iron clubs; driver, the longest driving club; iron, an iron-headed club used for driving or lofting; mashie, a short-headed iron club. The head of a lofting mashie is laid well back and is used for lofting short shots; putter, the club used for playing short shots near the hole, usually on the putting green. There are in almost every case different varieties of each of the clubs mentioned.

Golfing Terms or Slang.—'Birdie,' hole done in one under the par or bogey figure; 'bogey,' score that a good G. player should do; hole or course in; 'bunker,' sand-pit; 'chip-shot,' short lofted approach; 'dormy' or 'dormie,' leading by as many holes as remain to be played; 'eagle,' hole played in two strokes under par or bogey; 'explosion shot,' 'dunting' the ball up into the air without the blade actually coming into contact with it; 'fairway,' smooth turf between rough; 'foozle,' bungle; 'fore,' warning people in way of shot or stroke; 'iron,' iron-headed club; 'par,' the number of strokes a scratch player should require for a (hole or) course (calculated according to a formula and usually less than the bogey figures); 'pitch-shot,' the usual shot if the green be soft (so that the ball can be played to alight on it and stop); 'slice,' stroke making ball curl to right; 'spoon,' club like brassoy, but with more loft; 'stymie,' position on putting green when one ball lies between the other and the hole; 'topping,' hitting (ball) at top instead of true. See H. G. Hutchinson, *Golf* (Badminton Library), 1895; C. J. H. Tolley, *The Modern Golfer*, 1924; B. Darwin, *The Golf Courses of Great Britain*, 1925; A. Mitchell, *The Essentials of Golf*, 1927; H. Cotton, *Golf: a Short Treatise*, 1931, and *This Game of Golf*, 1918; P. Lawless (editor), *The Golfer's Companion*, 1937; and H. Longhurst, *Golf*, 1937.

Golgotha, scene of the crucifixion of Christ, being a small hill just outside Jerusalem. It has been identified with a knoll on the N. side of the city, close to the Damascus gate, and was probably the place of public execution according to the Mosaic law. The Heb. word G. means a skull, but it is uncertain whether this refers to the shape of the hill or to the skulls of criminals which might be found there.

Goliad, vil. in the co. of the same name in the state of Texas, U.S.A. It is situated on the N. bank of the San Antonio. It is an important railway centre and has cotton mills and flour mills. It played an important part in the Texan War of Liberation. Pop. 2000.

Goliath, champion of the Philistines who

challenged the hosts of Israel to combat. David won renown by slaying this champion with a stone from his sling. This is the tradition given us in 1 Sam. xvii. Reference is made to another G. (2 Sam. xxi. and 1 Chron. xx.). In the latter this second G. is held to be a brother of the giant of the Philistines. Evidence, however, seems to prove that the story of David and G. is of late origin.

Goliath Beetle, found in tropical and S. Africa, is so called from its giant size, the male of the largest variety, *Goliathus druryi*, being as much as 4 in. in length. It is a lamellicorn beetle, belonging to the sub-family Cetoniidae, and to the genus of the Scarabæidae. Its size and velvety-black hue, often diversified with white markings, make it a splendid insect.

Gollitsuin, or Gollitzin, see GALITZIN.
Goliuss, James (1596-1667), Dutch orientalist, b. at The Hague; studied Arabic and E. languages under Erpenius at Leyden. In 1622 he went to Morocco on a diplomatic mission, and in 1624 succeeded Erpenius at Leyden, where he occupied the chairs of Arabic and mathematics till his death. During 1625-29 he took a tour through Syria and Arabia. He wrote numerous works on oriental subjects, the chief being the *Lexicon Arabico-Latinum* (1653).

Gollancz, Sir Hermann (1852-1930), Jewish rabbi and Semitic scholar, b. in Bremen, brother of Sir Israel G. Educated at Univ. College, London, and prof. of Heb. there from 1909 to 1923. He was well-known for his philanthropy, and founded many synagogues in working-class areas. Preacher at the Bayswater Synagogue from 1892 to 1923. First rabbi to be honoured with a knighthood (1913).

Gollancz, Sir Israel (1861-1930), prof. of Eng. literature, was educated at the City of London School, Univ. College, London, and Christ's College, Cambridge. After a distinguished scholastic career he acted for ten years (1896-1906) as univ. lecturer in Eng. at Cambridge, and, till his death, held a similar post at King's College, London, where he was also dean of the faculty of arts. His *Cynwulf's Christ* (1892) and *Æteler Book of Anglo-Saxon Poetry* (1895) prove him an authority on old Eng. texts, whilst he also brought out the *Temple Shakespeare* (1894-96), and *Lamb's Specimens of Elizabethan Dramatists* (1893). He was director of the Early Eng. Text Society, honorary secretary of the Shakespeare Memorial Committee, and secretary of the Brit. Academy since its foundation in 1903. See a memoir by Sir F. G. Kenyon, 1932.

Gollnow, see GÖLENIOW.

Golomyinka, unique fish, the only one of its species, which in some respects resembles the gobies and which is only found in Lake Baikal, E. Siberia. It exudes oil from every part of its body, has no scales, and is flabby to touch. Its scientific name is *Callionymus baicalensis*, or *Comphorus*.

Golovnin, Vasily Mikhailovitch (1776-1831), Russian sailor and vice-admiral,

was b. at Gulyuki, in the prov. of Ryazan. He was a great navigator and explored the coasts of Kamchatka and of Alaska. In 1810 he was captured and imprisoned by the Jap., and remained a prisoner until 1813. He then returned to St. Petersburg and planned the circumnavigation of the globe by a Russian ship. He was appointed to the command of the expedition and started in 1817, returning in 1819. He wrote, amongst other works, *Journey Round the World and Narrative of my Captivity in Japan* (1818). A complete ed. of his works was pub. at St. Petersburg in 1864, with a biography by N. Grech.

Goltz, Colmar, Freiherr von der (1843-1916), Ger. field marshal and military author. b. at Bielefeld, E. Prussia, son of Erhard W., Baron von der G. In Franco-Prussian war, 1870-71, general staff officer in Second Army. In 1871 in 8th Regiment, and became teacher in School of War, Potsdam. Taught war hist. at War Academy. In 1883 transferred services to Turkish Gov., for whom he conducted dept. of military education till 1896. Reorganised Turkish Army, 1903-1910. Field marshal, 1911. General Inspector of 2nd Army Corps until retirement from army, 1913. When Gers. advanced into Belgium, Aug. 1914, G. became military governor of that country. In April 1915 took command of First Turkish Army in Mesopotamia, where he fought Gen. Townshend in Dec., and drove him back at Kut-el-Amara. D. at Turkish headquarters near Bagdad, April 19, 1916. Works include *Die Operationen der II. Armee bis zur Kapitulation von Metz* (1874); *Léon Gambetta und seine Armen* (1877); *Das Volk in Waffen* (1883, sixth ed., 1925); *Krieg- und Heerführung* (1901); and *Von Jena bis Preussisch Eylau* (1907). See life (with letters) by von Schmitzerlow, 1925.

Goltz, Heinrich (1558-1617), Dutch engraver and painter. b. at Mulebrecht, and after working for some years in Holland made a tour through Germany and Italy in 1590, returning for the rest of his life to Haarlem. His engravings show great technical excellence, and some of his portraits are very fine. Much of his work is a slavish imitation of Michelangelo, whom he greatly admired. See study by O. Hirschmann, 1919, 1921.

Goluchowski, Agenor, Count (1819-1921), Austrian statesman, descended from a noble Polish family. He entered the diplomatic service, and after being secretary to the legation at Berlin became Austrian minister at Bucharest (1887-93). In 1895 he became minister for foreign affairs. He upheld the Triple Alliance, brought about a better understanding with Russia, practically enforced neutrality during the trouble in the Balkans, and supported Germany in the Algeiras Conference (1905). He was, however, forced by Hungarian opposition to resign in 1906.

Gomal, see GUMAL PASS.

Gomarus, or Gomar, Franziskus (1563-1641), Protestant theologian, b. at Bruges, was educated in the faith of the Reformed Church in Germany, whence he after-

wards crossed to England and graduated at Cambridge Univ. He became prof. of theology at Leyden and opposed the teachings of Arminius. Owing to the victory of the views of Arminius, he forsook Leyden, and after an interval was appointed to the theological chair at Saumur. A posthumous work, *Lyra Davidica*, appeared in 1645. See monograph by G. P. van Ilterson, 1930.

Gomberville, Marin le Roy (1600-74), noted Fr. author of the seventeenth century. His great work *Poltzandre* appeared between 1632 and 1637. He was one of the earliest members of the Fr. Academy. Amongst his other works are *Le Théâtre moral de la vie humaine* (1678?), and *Moral Virtue Delineated*, (2nd ed.) 1726.

Gombo, see OCTRA.

Gombroon, see BANDER-ABRAS.

Gomel, tn. of the G. Region of the Byelorussian S.S.R., situated 140 m. N.E. of Kiev and 100 m. S. of Mogilev, at the point where the railway from Minsk to the Ukraine crosses the R. Sozh, a trib. of the Dnieper. It has a regional power station which uses peat as fuel. At G. machinery for the cultivation, retting, and primary working up of flax is constructed. It has metal and wood-working factories and glass works, and a trade in timber and boat building. In their great counter drive on the E. front in the Second World War the Red Army crossed the Dnieper S. of G. on Sept. 17, 1943. On Nov. 25 the Russians launched an offensive S.E. of Mogilev and captured G. on the following day. Pop. (1939) 145,000. See also EASTERN FRONT or RUSSO-GERMAN CAMPAIGNS in SECOND WORLD WAR.

Gomera, is. situated in the Atlantic, forming part of the Canary Is. group. Its area is 140 sq. m. The is. is very mountainous, and one of its chief industries is cattle rearing. Its chief port is San Sebastian. Pop. of whole is. 22,900.

Gomez, Diego (fl. fifteenth century), Portuguese navigator and writer on discovery, was forgotten until his chronicle was pub. by Schmeller in 1847 from MS. in the State Library at Munich. In 1483 Prince Henry the Navigator equipped the *Wren* and two other caravels, with which G. sailed up the Gambia 'as far as Cantor.' G. was sent by King Alfonso in the same direction in 1460, when he explored the Cape Verde and Canary Is. G. had been made receiver of customs at Cintra in 1440. In 1466 he was made a judge in that place, and his office was confirmed to him in 1482.

Gomez, Juan Vicente (1856-1935), Venezuelan statesman and soldier. An Andino of mixed descent. He was the ruling force of Venezuela for over a quarter of a century, raising it from one of the lesser S. Amer. republics into a Caribbean power. He succeeded Cipriano Castro as president, and soon restored the country's financial position. In 1922 he agreed to accept office for a second term, but in 1929 refused to stand.

Gomm, Sir William (1784-1875), Brit. soldier, son of Lt.-Col. Wm. G., killed at Guadaloupe in 1794. Fought in Holland

under the duke of York (1799), was with Wellington in the Peninsular war, and on Moore's staff at Corunna. Took part in most of the battles of the Peninsular war, and was one of the most trusted men of Wellington's staff. Served in the 5th Brit. Div. in the Waterloo campaign. See *Letters and Journals*, pub. by F. O. Carr-Gomm in 1881.

Gomme, Sir George Laurence (1853-1916), Eng. statistician and archaeologist, son of Wm. Laurence G. of Hammersmith. Educated at the City of London School. At one time he edited the *Antiquary*, the *Archæological Review*, and the *Folklore Journal*. His interest in old-time customs and superstitions was early awakened, and in such books as *Primitive Folk-Moots* (1880), *Chap-books and Folklore Tracts* (1885), and *Folklore as an Historical Science* (1908) he exhibited the results of his investigations. He founded the Folklore Society, and served it in many capacities—including that of president. He entered the service of the Metropolitan Board of Works at an early age and remained therein until its supersession by the London Co. Council with which he continued, being its clerk, 1900-1911. Besides those on folklore, pub. works on the hist. of London.

Gomorrhah, see SODOM and GOMORRAH.

Gompers, Samuel (1830-1924), Amer. Labour leader, b. at 11 Tenter St., Spitalfields, London, England; son of Solomon G., a poor Dutch Jew. In 1863 he emigrated to the U.S.A. and there worked at cigar-making. In 1864 he began to busy himself in developing the International Cigar-Makers' Union, of which he became secretary and afterwards president. Disapproval of the methods of the knights of labour led to his helping to found, in 1881, the Federation of Trades and Labour Unions, of which he was president for three years. When this organisation was merged in the new Amer. Federation of Labour, Dec. 1886, G. was elected president of the new body, and, with the exception of the year 1895, he held its presidency for the remainder of his life. He was opposed to socialistic theory and usually disapproved of 'Labour' politics—nevertheless in 1908 he tried unsuccessfully to throw the whole strength of the federation on the side of the Democratic party. In the First World War, he used all his influence to get the U.S.A. to side with the anti-Ger. powers of Europe. In 1919 he was elected president of the International Commission on Labour Legislation of the Paris Peace Conference. Later he was a member of the Advisory Committee to Amer. delegates to the Disarmament Conference, Washington. He wrote an autobiography, *Seventy Years of Life and Labour* (1925).

Gompertz, Theodor (1832-1912), Austrian classical scholar, b. at Brünn, son of Philipp G., banker, studied at Brünn, and from 1849 under Bonitz at Vienna, where he was qualified lecturer 1867, prof.-extraordinary from 1869, ordinary prof. of classical philology 1873-1901. During the last-named period he became

widely known as a decipherer of inscriptions at Heracleum. Works include *Philodemus Epicureus de ira liber* (1864); *Demosthenes der Staatsmann* (1864); *Herakulanische Studien* (1865-66); *Träumerei und Zauberet* (1866); *Neue Bruchstücke Epikurs, insbesondere über die Willensfrage* (1876); *Die Bruchstücke der griechischen Tragiker und Cobels neueste kritische Manier* (1878); *Herodoteische Studien* (1883); *Ein bisher unbekanntes griechisches Schriftsystem aus der Mitte des 4. vorchristlichen Jahrhunderts* (1884); *Zu Philodems Büchern von der Musik* (1885); *Zu Heraklits Lehre und den Überresten seines Werkes* (1886); *Über den Abschluss des herodoteischen Geschichtswerkes* (1886); *Platonische Aufsätze* (1887-1905); *Lebensbilder von H. Bonitz* (1889); *John Stuart Mill* (1889); *Die Apologie der Heilkunst, Sophistenrede* (1890); *Philodem und die ästhetischen Schriften der herculanischen Bibliothek* (1891); *Die Schrift vom Staatswesen der Athener und ihr neueste Beurteilung* (1891); *Die jüngst entdeckten Überreste einer den Platonischen Phädon enthaltenden Papyrusrolle* (1892); and *Beiträge zur Kritik und Erklärung griechischer Denker—Eine Geschichte der antiken Philosophie* (1893-1902) (Eng. trans., 1901-12). He ed. a trans. of Mill's collected works, Leipzig (1869-80).

Gonçalves Dias, Antonio (1823-64), Brazilian poet, b. at Caxias, Maranhão; educated in Portugal. Returning to Brazil in 1845 he at once began on dramatic and journalistic work, and in 1848 issued a vol. of lyrics, *Primeiros Cantos*. This was followed by *Segundos Cantos e sextilhas de Frei Antão* (1848) and *Ultimos Cantos* (1851). His lyrics are marked by patriotism, love of nature, and beauty of expression.

Goncharov, Ivan Alexandrovich (1812-1891), Russian novelist; studied much but wrote little, and, unlike most of the contemporary men of letters, was a conscientious bureaucrat, indifferent to all the political and socialistic propaganda of the revolutionists. For some time he held a position in the Ministry of Finance at St. Petersburg, and later (1856) visited Japan as Adm. Putiatin's secretary, utilising his experiences abroad in *The Frigate 'Pallada'*. Besides translating Schiller and Goethe, he pub., in 1847, his *Ovirkonennaya Istoria* (A Common Story), but it is his novel *Oblomov* (1857) which has made his name illustrious. So vivid is the picture which he here gives of the idle lives of the landed gentry that Dobrolubov pronounced the country home of the Oblomovs to be 'our fatherland.' See A. A. Mazon, *Un Maître du roman russe*, 1914.

Goncourt, Edmond Louis Antoine Huot de (1822-96), and his brother, **Jules Alfred Huot de** (1830-70), Fr. men of letters, estab. a unique and lasting literary partnership. They were both endowed with a hyper-sensitiveness to the minutest details of existence, and a feverish and wholly extravagant conception of the influence of those details and of what may be called the purely physical and material environment upon the trend and bias of a

human life. Their theories as to novels and composition in general may be studied at length in the nine vols. of their *Journal* (pub. 1887-96), but the practical working of these theories may be best appreciated in their novels, especially in their masterpiece, *Madame Gervaisais* (1869). So personal and unparing was the analysis of emotion and incident in this work that it may be considered with truth to have been written with their life-blood. Other of their joint productions in the sphere of fiction were *Sœur Philomène* (1861); *René Maupérin* (1864); and *Manette Salomon* (1865); whilst the older brother alone wrote *La Fille Elisa* (1878), which attained a remarkable popularity, and *Chérie* (1884). It is an apt similitude to speak of their novels as 'picture galleries hung with pictures of the momentary aspects of the world.' For they strove, not like Flaubert to present the grand unity which binds the most conflicting minutiae of daily life, but rather to depict the kaleidoscopic character which it possesses at the very moment of living, when the smallest things are magnified and there is none but the crudest perspective. Such an ambition entailed the most elaborate and lively knowledge of the period (the eighteenth century) about which they wrote, and this they procured by many years' untiring research into old letters, documents, and records, which but for their efforts would undoubtedly have remained in the oblivion into which they had already fallen. Their books, therefore, will be store-houses for the historians of the future, and the fineness of their miniature painting of the modes and manners of their chosen period, as it is displayed in *Portraits intimes du XVIII^e siècle* (1856-58), and *L'Art du XVIII^e siècle* (1859-75), etc., will long remain an object of wonder and admiration to their posterity as it was to their contemporaries. The brothers endowed a special Académie Goncourt that is to pub. their *Journal*; but 'so far very little has seen the light and it is to be feared, after two wars and much change, that the public may not be greatly impressed when the *Journal* does appear and reveals what many rather forgotten people did about 1870 or 1880' (Denis Saurat). The ann. prize of the Académie Goncourt, however, remains the greatest stimulus that can be given to the sale of a fr. novel. It is awarded for a novel by a young writer unlikely to receive encouragement from the Fr. Academy, and that the choice has often shown remarkable judgment is exemplified in the case of the award to Proust—then almost unknown—for *Les Jeunes en fleurs* (1918). See E. Zola, *Les Romaniers naturalistes*, 1881; P. Sabatier, *L'Esthétique des Goncourt*, 1920; M. Sauvage, *Jules et Edmond Goncourt*, 1932; and F. Fosca, *Edmond et Jules Goncourt*, 1941.

Gonda, tn. and dist. in the United Provs., India. The tn. is an important railway junction, and has a pop. of 15,300. The dist. has an area of nearly 3000 sq. m. and consists of a huge plain, which is remarkable for its fertility. Pop. 1,500,000.

Gondal, Indian native state now merged in Bombay prov. It has an area of 1024 sq. m. and a pop. of over 160,000. The main products are cotton and grain, and it has for long been noted as an extremely progressive state. It is connected with the sea-board by rail. The chief tn. is G., which has a pop. of nearly 20,000.

Gondar, cap. of the prov. of Dembea in Amhara, Abyssinia, 68 m. N.W. by N. of Debra Tabor, 25 m. N. of Lake Taana, and situated at an average altitude of 6500-7500 ft. in rugged country. Formerly cap. of Abyssinia in succession to Axum. It was Basilides (who reigned from 1632 to 1635) who, after reasserting the royal power, built at G. a new cap., which was destined to remain the royal residence until the middle of last century. The tn. itself was built after the expulsion of the Jesuits. In the sixteenth century Father Paetz, a Portuguese missionary, laboured for twenty years building churches, palaces, and bridges, some of which may be seen near G. to this day. In 1714, following a revolt of the army, David, son of Jesus, a king of the old Ethiopian house of Solomon, was restored to the throne and entered G. in triumph. James Bruce of Kinnaird (q.v.) visited it in its period of decadence, leaving in 1772 at a time of continual bloodshed, when Michael returned to G. as king. In 1848 Walter (Nichole) Plowden (subsequently murdered) visited it, where he concluded a trade treaty with Ali, ras of G. In 1851 King Theodore conquered G. and deposed the libertine John II., last of the titular emperors, and transferred his cap. from G. to Magdala. Near G. are the ruins of the fort of Gump built by the Portuguese as a royal residence but burned by King Theodore. The architecture of its churches and mosques occasionally reveals European medieval influences. The pop. in the last century was 30,000 but has since then dwindled to 3000.

The Battle for Gondar (1941). With the capture of G. by Brit. and Abyssinian patriot forces at the end of Nov. 1941 the last It. stronghold in E. Africa fell. To all intents the fighting in It. E. Africa had come to an end six months previously. See ITALIAN EAST AFRICA, CAMPAIGN IN (1940-41). But some 25,000 troops or more, It. and native, who had been garrisoning G., reinforced by fugitives from the beaten and scattered It. armies, continued their resistance within this stronghold, and the weather being unsuitable for campaigning, they were sealed up by besieging Brit. forces and left to be dealt with when conditions were suitable. It was on Nov. 27 that Gen. Nasi surrendered the G. fortress to Gen. C. C. Fowkes, commanding Brit. and allied forces. The battle took place in high mountainous country very favourable to the defence and averaging 6000 ft. above sea level. The Brit. and E. African troops fought magnificently. Attacking at dawn they turned the It. S. flank by midday and were pressing the attack round their rear. Highland, Indian, Sudanese, S. African, and W. African units, with small numbers of Free Fr.,

took part in preliminary operations, which involved an advance on G. from six converging points; but chief credit for the final battle must be accorded to Brit. E. African and Ethiopian patriot troops. By the time the final assault was delivered the enemy's air force had been reduced to one fighter and one bomber. In all 11,500 It. troops surrendered and 12,000 African levies. The Brit. forces were less than half the strength of the It. and sustained only light casualties. Some fifty guns and much other booty were captured.

Gondokoro, vil. of the F. Sudan, on the E. bank of the upper Nile. It is a gov. station, and its pop. is composed chiefly of Brit. military and civil officials, with a small number of natives. It is extremely unhealthy. It was named Ismallia by Sir Samuel Baker. It is practically at the end of the navigable course of the R. Nile, and owes to this fact much of its importance as a trading station.

Canadian Pacific

GONDOLAS ON THE GRAND CANAL,
VENICE

Gondola, name given to the craft used since the eleventh century for the conveyance of people along the canals of Venice. Gs. are long, narrow, flat-bottomed boats, measuring 30 ft. by 4 or 5 ft., whose prow and stern rise high above the water and taper to a point. The gondolier stands on his *poppa* in the stern and skillfully propels the boat with graceful, broad sweeps of his single oar. Usually there is in the centro a *felze* or cabin, low and curtained. Once the Gs. were gaily painted and decorated with oriental silks and rich embroideries, but since the sumptuary laws of the sixteenth century they have been quite black and altogether very different from the splendid craft of Carpaccio's pictures.

Gondomar, Diego Sarmiento de Acuña (1567-1626), Sp. diplomatist, began life as a soldier and in 1584 helped to beat off Drake from the coasts of Bayonne. From 1613 to 1618, and again from 1619 to 1622, he was Sp. ambas. in England, during which periods he boasted that he saved many Rom. Catholics from imprisonment and persecution, and undoubtedly was largely responsible for Raleigh's execution. By astute flatteries he gained the goodwill of King James and exerted his whole influence in vain to further the Sp. marriage. See study by R. H. Lyon, *Gondomar*, 1910.

Gonds, The, Dravidian and aboriginal tribe of India, who to-day do not exceed 1,500,000, though once (from the sixteenth century to the invasion of the Mahrattas in 1741) they ruled a large tract of the central provs., which was named after them (Gondwana). They probably arrived in India with the other Dravidians from the N.W., perhaps from the Iranian highlands at some very remote period. They are non-Aryans, but the upper classes are no longer a pure race, having intermarried freely with their Hindu neighbours. A Gond has a very dark skin, with black, curly hair; his skull is described as dolichocephalic, and his nose is flat and broad. Although many have adopted Hinduism the G. continue to propitiate the evil spirits which swarm in every riv., rock, and tree. The purer, simpler hill-tribesmen content themselves with a waist-cloth as the one article of dress, although the young folk are fond of adorning their bodies with all manner of trinkets.

Gonfalon (derived from Old High Ger. *gundfano*, war-flag), variously used in the Middle Ages for a banner or standard. Sometimes it was just a pennon fastened to the head of a knight's lance, but in religious processions and state functions it was a rectangular banner with numerous streamers. In Florence the 'gonfaloniere' were civic dignitaries.

Gongora, a genus of orchidaceous plants, contains well over one dozen species, all of which are epiphytic and occur in wild tropical America.

Góngora y Argote, Luis de (1561-1627), Sp. poet, b. at Cordova; studied law at Salamanca. His early works are marked by a truly poetic vein and a pleasing purity of style; they include ballads, odes, lyrics, and religious poems. Finding, however, that poetry afforded a poor livelihood, G. became a priest in 1604, and proceeded to develop and elaborate a most affected and somewhat euphuistic style of composition. Thus his *Poísemo*, *Solitudes* (Solitary Thoughts), and *Pyramo y Thisbe* are overlaid with stilted metaphors, grotesque Latinisms, and pompous phraseology, so much so that this new style was labelled Gongorism, or 'stilo culto,' in reference to its pedantic mannerisms. See M. Artigas, *Biografía y estudio crítico de don Luis de Góngora, y Argote*, 1925.

Goniometer (from Gk. *gonia*, angle, and *metron*, measure), instrument for measuring the angles between the faces of crystals.

There are two kinds—the contact G. and the reflection G. The former is used at the present day for the approximate measurement of large crystals. The latter is an instrument of great precision, and is used for the accurate measurement of the angles between the faces of small crystals. The faces must be smooth and bright so that they reflect sharply defined images of a bright object. By turning the crystal about an axis parallel to the edge between two faces, the image reflected from a second face may be brought into the same position as that formerly reflected from the first face. The angle through which the crystal has been rotated is the angle between the normals to the two faces.

Gonorrhoea, a definite disease of the mucous surfaces due to a bacillus, the *gonococcus*. It is classed as a venereal disease. G. attacks the young and innocent in various and manifold forms. The eyes of babies may be affected at, or a few hours after, birth. The eyes become red, inflamed, and weeping and unless energetically treated blindness for life may result. A large proportion of the inmates of asylums for the blind are furnished by these innocent victims. As G. is a contagious disease, should it obtain a footing in schools and institutions, a considerable number run the risk of being affected by the incidents of daily life. In later life it is apt to contaminate the blood and attack the joints, producing a particular form of rheumatism. It may affect the heart, causing ulcerative endocarditis, an extremely fatal complication. The lining of the brain, causing meningitis, or the substance of the spinal cord may be involved, the result of which is seen in an extremely rapidly progressing paralysis. The treatment of babies should be prompt and energetic, with the object of saving the sight, whenever the eyes are affected. Parents and nurses should at once report any trouble, so that the cases may be treated and the infection of others avoided. In older patients suspected cases should be promptly and skilfully treated until the disease is thoroughly eradicated.

Gonsalvo di Cordova, whose correct title was Gonzalo Hernandez y Aguilar (1453–1515), Sp. conqueror, was awarded a large estate as the result of the favourable treaty he concluded with Abu Abdallah, better known as Boabdil, king of the Moors, after a prolonged contest with Granada, the Moorish stronghold. In 1498 he was honoured with the title of duke of St. Angelo, because, with the co-operation of Ferdinand II. of Naples, he had effectively driven the Fr. out of Italy. In 1500 'El Gran Capitán,' as he was called, rescued Cephalonia and Zante from the Turks and gave them back to Venice, and finally in 1503, after many vicissitudes and some reverses, gained a conspicuous victory over the Fr. near the Garigliano, securing Naples and Gesta to the Spaniards. His enemies did not allow him long to enjoy his vicereignty of Naples, for he was early recalled home where he suffered neglect and some disgrace.

Gonzaga, name of a princely family in Italy, founded by Louis G. who was captain of Mantua, and who in 1328 murdered the tyrant of that city. His descendants ruled Mantua till 1708, when Ferdinand-Charles IV. of G. was deprived of the duchy of Mantua because he had assisted Louis XIV. in the War of the Sp. Succession. The last descendant in the direct line from Louis was Vincent II. of G., who became a cardinal. John Francis of G. (1394–1444) was the first marquis of Mantua, and Frederick II. of G. (1500–40) was the first duke. Frederick played a great part in hist., and it was he who annexed Montferrat, which was elevated to a duchy in the reign of William of G. (1536–87). One branch line was estab. by a son of the Frederick II. mentioned above. Its members were dukes of Mantua, Novara, and Montferrat until all but Mantua was sold by Charles III. of G. (1629–65) to Cardinal Mazarin. A second collateral branch ruled Guastalla from 1541, when the Emperor Charles V. gave it to Ferdinand of G. (1507–57) until 1746, when Queen Elizabeth of Spain took possession of the duchy during the reign of the foolish Joseph of G. The general policy of the Gs., many of whom were enthusiastic patrons of art and learning, was to support and promote the imperial interests. See S. Brinton, *The Gonzagas, Lords of Mantua*, 1927.

Gonzaga, Luigi, member of the Castiglione branch of that family, called also St. Aloysius (1568–91), received his education in Florence, Mantua, and Rome. Although entitled to the marquessate of Castiglione, he allowed his brother to adopt the title and in 1585 became a Jesuit. His death was due to plague, with which he became infected after his devoted ministrations to the sick during a serious epidemic at Rome. In 1621 he was beatified for his good works, and in 1726 he was enrolled in the canon of saints.

Gonzaga, Thomas Antonio (1747–93), Portuguese poet, b. in Oporto, but passed his boyhood at Bahia, where his father was a magistrate. Educated at home at the univ. of Coimbra, he returned to Brazil after some years' absence, and after holding public appointments at Villa Rica eventually (1786) succeeded his father as 'disembargador' of the appeal court in Bahia. On the eve of his marriage with Dona Maria de Seixas Brandão, for whom he had conceived a romantic attachment, he was arrested for alleged complicity in a republican conspiracy, and was banished for ten years to the coast of Mozambique, where fevers undermined his health and intellect. He is cherished as the Portuguese Petrarch, for his *Marília de Dirceu* breathes the strength and beauty of love story. This booklet, which has a pastoral setting modelled on Theocritus, is treasured by his compatriots almost as highly as the poetry of Camões, and in the temple of erotic poetry has been set on a pinnacle higher perhaps than it intrinsically deserves.

Gooch, Sir Daniel (1816–89), Eng. mechanical engineer, b. at Redington in Northumberland. At the age of fifteen

he began to work at the Tredegar Iron-works, Monmouthshire. In 1837 he was appointed locomotive superintendent to the Great W. Railway. In 1864 he interested himself in the laying of a telegraph cable across the Atlantic, for which he was created a baronet.

Gooch, George Peabody (b. 1873), Eng. historian, educated at King's College, London, and Trinity College, Cambridge, of which college he subsequently became an hon. fellow. After taking his degree he continued his studies in Berlin and Paris. His first book, *History of English Democratic Ideas in the Seventeenth Century* (1898), was based on much original material and showed the scrupulous regard for sources which was to characterise his later historical work. In 1906 he entered politics and became Liberal M.P. for Bath, retaining this seat until 1910. Returning to the study of hist. he traced the development of the scientific method in the work of modern historians, and in 1913 pub. his *History and Historians of the Nineteenth Century*. He became an authority in the diplomatic hist. and foreign policy of the modern period, and his extensive researches made his *History of Modern Europe, 1878-1919* (1923) one of the best books on the period. He also collaborated with Canon J. H. B. Masterman in the *History of British Foreign Policy*, pub. in 1917 for the Council for the Study of International Relations, a book which was valuable during the First World War for its objective defence of Brit., and condemnation of Ger., policy. This led to his undertaking the joint editorship with Sir Adolphus Ward of the *Cambridge History of British Foreign Policy, 1783-1919* (1922-23). His reputation as a skilled and scholarly editor was further enhanced by his work in collaboration with H. W. V. Temperley on the *British Documents on the Origins of the War, 1898-1914* (1926-29). As a parallel task he compiled a selected list of works on the war, entitled *Revelations of European Diplomacy* (1927), a work notable for its fair-minded comment. During this very productive period he also took over the editing of the correspondence of Lord John Russell (2 vols., 1925), which had been begun by Lord Russell's son, who d. before the work was completed. Writing for a more general public he has contributed two vols. to the Home Univ. Library, *Political Thought in England from Bacon to Halifax* (1914) and *History of Our Time, 1835-1914* (1946), and also a book on Germany (1924) to the 'Modern World' series. He was president of the Historical Association, 1922-25, and of the National Peace Council, 1933-36. His position as a Ger. scholar is shown by his presidency of the Eng. Goethe Society. He was granted the award of C.H. in 1939, and holds the hon. degrees of D.Litt. at Durham and Oxford Univs. In addition to the works already mentioned he has written a number of other books, among which are *Germany and the French Revolution* (1920); *Before the War, Studies in Diplomacy* (2 vols., 1936); *Studies in Diplomacy and Statecraft* (1942); *Courts*

and Cabinets (1944); *The German Mind and Outlook* (1945); *Frederick the Great* (1947); and *Studies in German History*, 1949.

Good, John Mason (1764-1827), Eng. physician and author, b. at Epping in Essex. In 1784 he practised as a surgeon but moved to London in 1793, with the view of obtaining literary employment. He pub. various poems, trans., and professional treatises. Among the trans. are *The Song of Songs*, from the Heb. (1803), *The Nature of Things*, from Lucretius (1805), and *The Book of Job* (1812). See O. Gregory, *Memoirs of the Life, Writings, and Character of the late J. M. Good*, 1828.

Good Conduct Pay, additional pay granted to privates, second corporals, and bombardiers in the Brit. Army for good conduct, as proved by the absence of entries in the regimental defaulters' book. One extra penny per diem is granted after two years' service without an entry, a second after six years, a third after twelve, a fourth after eighteen, and others at intervals of five years. Each penny is awarded together with a good conduct badge, to be worn on the left sleeve. One badge and penny is forfeited for each entry in the defaulters' book, and all are forfeited by desertion or offences calling for court martial.

Goodfellow, Robin, see PUCK.

Good Friday, name applied by the Rom. Catholic and Anglican Churches to the Friday before Easter, sacred as commemorating the anniversary of the Crucifixion. The word most likely arose from 'God's Friday' originally. In the Rom. Church the ritual is marked by many special features: the altar and priests are vested in black; a wooden clapper is substituted for the bell at the elevation of the host; the priest recites a prayer for all classes, orders, and ranks in the church, and even for heretics, pagans, and Jews. Then follows the 'adoration of the Cross.' The black covering is removed from the crucifix, and the entire congregation approach, and upon their knees kiss the feet of the figure. In the Ok. Church the fast is very strictly kept. In the Lutheran Church the organ is silent. The Anglicans hold a three hours' service, consisting of prayers and addresses on the 'seven last words from the Cross.'

'Good Hope,' name of a Brit. cruiser of 14,000 tons which was launched in 1901 at Fairfield.

Good Hope, Cape of, see CAPE OF GOOD HOPE.

Goodrich, Samuel Griswold (1793-1860), Amer. author, whose pen-name was Peter Parley. He ed. an annual called *The Token* from 1828 to 1842, to which he contributed tales, poems, and essays. Most of his publs., of which there are over 200, were written for the young, and deal with hist., geography, travels, and natural hist. Many of his books became popular in Great Britain. See his *Recollections of a Lifetime*, 1857.

Goodrich, vil. of Herefordshire, England, on the Wye, 3 m. S.W. of Ross. It has a ruined castle, a good example of the Norman border style.

Goodsir, John (1814-87), Scottish anatomist, b. at Anstruther; he studied at St. Andrews Univ., from where he served an apprenticeship to a dentist. In 1839 he pub. an essay on the teeth, and the next year he became keeper of the museum of the Royal College of Surgeons. His important memoirs on secreting structures and on the human placenta are still of value. He gained a wide reputation as an anatomical teacher in the univ. of Edinburgh. See W. Turner, *Memoirs*, 1888.

Goodwill, advantage or benefit acquired by an estab. or business beyond the mere value of the capital, stock-in-trade, and funds employed in it, which it receives from constant or habitual customers, whether by reason of the quality of the goods sold, the local position of the estab., the skill, reputation, or personality of the proprietor, or any other reason that popular favour may assign. It is the expectancy of the continuance of such advantage or benefit that constitutes the market value of G. In the absence of express stipulation the transfer of G. leaves the vendor free to compete with the purchaser of his business, provided he does not hold himself out to be still carrying on the old business. It is a settled principle of law that upon the sale of G., the vendor must not solicit the old customers to cease dealing with the purchaser, but he may deal with such persons if they choose to come to him unsolicited, and the vendor may publicly advertise his business. Where a partnership is being dissolved, any partner may require that the G. may be sold together with the other partnership assets, and he may restrain the other partner or partners from doing anything in the meantime to prejudice the value of the G., as, for example, by using the partnership name. G. may be mortgaged, assigned, or taken in execution (q.v.), except where merely personal, as where it is constituted by the ability and skill of the proprietor.

Goodwin, John (c. 1594-1665), Eng. nonconformist divine, b. in Norfolk and educated at Queen's College, Cambridge. From 1633 to 1645 he was vicar of St. Stephen's, Coleman Street, but was rejected from this living for attacking Presbyterianism, and set up an independent congregation. In 1649 he issued a pamphlet *Might and Right Well Met*, in which he upheld Cromwell's army against the Parliament. He also wrote *Anti-Cavalierism* (1642), *Redemption Redeemed* (1651), and the *Trumviri* (1658). See life by T. Jackson, 1822.

Goodwin, Thomas (1800-80), Eng. divine of the later Puritan period, b. at Rollesby, Norfolk, studied at Cambridge, and became a fellow in 1820. In 1825 he was licensed a preacher of the univ., and three years later became lecturer of Trinity Church, Cambridge, and was presented the vicarage by the king in 1832. Harassed by the interference of his bishop, he resigned his living and retired to Holland, where he was a pastor to the Eng. church at Arnheim. In 1840 he returned to London and ministered to a small congregation in St. Dunstan's-in-the

E., where he rose to considerable eminence as a preacher. In 1843 he was elected a member of the Westminster Assembly, and frequently preached before the House of Commons by appointment. He rose high into favour with the protector, and ultimately became somewhat prominent among his more intimate advisers. Five volumes of his works were pub. at London (1682-1704).

Goodwin Sands, range of exceedingly dangerous shoals in the straits of Dover, extending off the S.E. coast of England, co. of Kent, about 7 m. E. of Deal. Large level patches of sand are left dry when the tide recedes and afford a firm foothold, so that cricket has often been played upon them. When covered the sands are shifting and may be moved by the prevailing tide to such an extent as to change considerably the form of the shoal. The roadstead, termed the Downs, lies between them and the mainland. In length they extend for about 10 m. The shoal is divided into two prin. parts, N. and S., between which is the deep inlet of Trinity Bay. A great number of wrecks have taken place on these dangerous shoals, among the most notable the loss of thirteen men-of-war in one night. Near here the Dutch won a naval victory over the Eng. in 1652.

Goodwood, seat of the duke of Richmond and Gordon in Sussex. Its park is famous for cedars and other trees, which in 1754 included thirty different kinds of oaks and 400 different Amer. trees and shrubs. Racing was estab. in 1802, but its importance (since 1825) was due to Lord George Bentinck's exertions. The races are held annually in the park during the last week of July.

Goodyear, Charles (1800-60), Amer. inventor, b. at New Haven, Connecticut. As an iron manufacturer he failed in 1830, but he next turned to Indian rubber. After suffering great poverty and ridicule he patented, in 1844, a process of vulcanising rubber. This process he later perfected until he required sixty patents to secure his inventions. He received medals in London (1851) and Paris (1855), as well as the cross of the Legion of Honour. See Pierce, *Trials of an Inventor*, 1866, and J. Parton, *Famous Americans of Recent Times* (Boston), 1867.

Googe, Barnaby (1540-94), Eng. poet, b. at Alvingham, Lincoln. He studied both at Christ's College, Cambridge, and at New College, Oxford, then travelled on the Continent, joining on his return his relative, Sir Wm. Cecil, and becoming one of the gentlemen pensioners of Queen Elizabeth. He was a friend of George Turberville and imitated his style and the metres of his poems. His best-known works are a series of eight eclogues and his *Cupido Conquered*. A collection of his works was pub. in 1871 by Edward Arber.

Goole, tn. in W. Riding, Yorkshire, on the R. Ouse. It is one of the chief riv. ports in the United Kingdom, and possesses extensive docks. In 1938 the tonnage of ships entered and cleared was respectively, 510,000 and 598,000. The chief exports are coal, stone, machinery, woollen

goods, and cotton. The prin. industries are the manuf. of alum, sugar, rope, and agric. implements. Shipbuilding is also carried on and there is a large dry dock. Steamship services to European ports are worked in connection with the railway. Pop. 13,300.

Goorkhas, see ГОРКАЯ.

Goose, name given to all the birds belonging to the genus *Anser*, of the Anatidae, or duck family; there are about twelve species, which occur in the Nearctic and Palearctic regions. They are characterised by a slightly hooked beak, high at the base, short webbed feet, and legs placed further forward than in the case of other Anatidae. Geese live entirely on grass and other herbage, and are more at home on land than on water, as they swim very little and never dive. *A. cinereus*, the graylag G., is the only species which nests in Great Britain, and is the parent of the domesticated breed; it is found in the W. of Scotland and in the central cos. of Ireland. *A. albifrons*, the laughing G., *A. septem*, the bean G., and *A. brachyrhynchus*, the pink-footed G., are among the species which travel to Great Britain. Geese were domesticated at an early age, and are valued for their quills and feathers as well as for their flesh. Large numbers are bred in Lincolnshire, and more are imported from Holland and Germany. Strasbourg geese having the widest reputation. Embden geese, remarkable for their whiteness, and Toulouse geese, are two of the best known domesticated varieties.

Goose, Barnacle, see BARNACLE GOOSE.

Goose Bay, air port and base at the head of Hamilton Inlet, Labrador. Its construction was undertaken by the Canadian Dept. of Transport at a cost of 15,000,000 dollars. Work on it was begun during the winter of 1911, and the base was in operation late in 1912. By the spring of 1943 it was servicing 100 planes every twenty-four hours for flights to Europe, being the prin. base of the Ferry Command. The building of the airport was a remarkable engineering feat; great runways and aerodromes were estab., power stations, engineering shops, barracks, entertainment and hospital buildings were erected, and roads laid out through the country over which formerly travelling was impossible in winter except on snow-shoes and skis. G. B. in fact soon became a self-contained tn. with its own waterworks, church, cinema, and defence system. It held a bastion against air attack from Ger. planes via Iceland, Greenland, and Labrador, and the execution of the project was expedited as a countermove to the Ger. plot, which had been worked out in detail in the school of geopolitical science in Berlin, to carry out the invasion of Canada from Norway. It was leased to Canada by the Newfoundland Gov. for ninety-nine years, the lease to expire on the termination of hostilities. See W. G. Carr, *Checkmate in the North*, 1945.

Gooseberry, or *Ribes grossularia*, species of Saxifragaceae, closely allied to the red, black, and flowering currants. It is

indigenous to Britain and other European regions of cool temp., as well as to N. America and W. Asia. The name G. is supposed to have arisen from the fruit having been made into a sauce and used for young geese. The shrubby plant is very largely cultivated in Britain for its acid fruits, and it is usually propagated by means of cuttings. It is very hardy, and with good pruning and exposure to the light it will grow in almost any garden; the flavour is best, however, where the low temp. of the N. brings the fruit more slowly to maturity than is the case in the S. The Cape G. is a species of Solanaceae, known in botany as *Physalis peruviana*, and it bears also the popular names of strawberry tomato and G. tomato.

Goose-fish, popular name for *Lophius piscatorius*, the angler fish.

Goose Grass, see CLEVERS.

Goose, Solan, see GANNET.

Goossens, Eugène (b. 1893), Eng. conductor and composer, b. in London, son of Eugène G., a Belgian b. in France and long settled in England. Won a scholarship at the Liverpool College of Music in 1906 and studied under Sir Charles Stanford at the Royal College of Music, London. Played in Sir Henry Wood's orchestra and in the Philharmonic string quartet. Between 1915 and 1920 associated with Sir Thomas Beecham. First notable appearance as a conductor in 1916, when he directed Stanford's *The Critic*. In 1921 he formed his own orchestra, and as a conductor was afterwards associated with many famous orchestras in England and America. As a composer he first attracted attention in 1915 with *Five Impressions of a Holiday*, a trio for piano, flute, and cello. This was followed in 1916 by the *Rhapsody* and two sketches, *By the Turn and Jack o' Lantern*, which are his most frequently played works. Often changed his style, as with the *Kalends ope* (1918) and the symphonic poem *The Farnal Rhythm* (1920), but critics point out that the changes are temperamental rather than methodical. His harmonic sense is keen and his style generally is European rather than Eng. His works also include interesting chamber music and the operas *Judith* and *Don Juan*.

Gopher (*Testudo polyphemus*), land tortoise occurring in the S. states of America. It does great damage to potato crops, upon which it feeds; the flesh is considered excellent eating. G. is more commonly applied to certain small rodent mammals.

Gopher State, see MINNESOTA.

Goppingen, tn. of Wurttemberg-Baden, Germany. It possesses a castle, built partly with stones from the ruined castle of Hohenstaufen, a mineral spring, and many manufs., machine shops, and tanneries. Pop. 22,000.

Gorakhpur, dist. and tn. of United Prov. of Agra and Oudh, India, bounded on the N. by Nepal and on the S. by Gogra R. The dist. (area 4578 sq. m.) is intersected by numerous rivs. and lakes well stocked with fish. The tiger is found in the N., and many other wild animals abound. The chief productions are cotton

and rice. Buddha &c. within the dist. of G., and it became the headquarters of the new creed. During the mutiny of 1857 it was lost to the Brit. for a short while, but under the friendly Ghurkhas the rebels were driven out, and the whole dist. once more passed under Brit. rule until 1947. Pop. tn. 72,000; div. (1853) 1,816,000, (1872) 2,019,000—a large increase in so short a time—(1930) 6,720,000.

Gorbals, suburb of Glasgow, lying S. of the Clyde. Until 1846 it was a separate municipality: now a burgh parl. constituency. It is a poor and crowded part of the city.

'Gorbodue,' or *Ferrer and Porrex*, the earliest regular Eng. tragedy, written in collaboration by Thomas Sackville, Thomas Norton, and Lord Buckhurst, and played before Queen Elizabeth on Jan. 13, 1561, by the gentlemen of the Inner Temple hall. It was pub. in 1565 and again in 1570.

Gorchakov, or **Gortchakov**, Russian family of noble and anct. descent:

Prince Andrey Ivanovich (1768–1855), famous general of the Russian Army, who played an active and important part in the final Napoleonic campaigns.

Alexander Ivanovich (1769–1825), celebrated for the part which he played in the wars with Turkey and later against Napoleon.

Peter Dimitrievich (1790–1868), served in the later campaigns against France. He was afterwards of great use to the Russians in quelling the revolts in the Caucasus, and in the war of 1828 he fought against the Turks. When the Crimean war broke out he offered his services and was present at the battles of Alma and Inkermann.

Prince Mikhail Dimitrievich (1795–1861), brother of Peter. When war broke out with Turkey in 1853 he was made commander-in-chief of the Russian forces in Moldavia and Wallachia, afterwards commanding the Russian forces in the Crimea. He conducted the defence of Sebastopol with great skill. In the following year he became governor of Bland, where he d.

Prince Gorchakov Alexander Mikhailovich (1798–1883), Russian statesman. Received a sound education in Russia, and on the completion of his education entered the Foreign Office. He early distinguished himself in diplomatic circles and quickly became the leading Russian diplomat. He was appointed Russian minister in 1850, when the Ger. confederation was formed, and was next sent as minister to Vienna. He was at Vienna during the Crimean war. He counselled the ending of that war when he saw that Russian objects could not be gained by prolonging it, and he shortly afterwards became minister for foreign affairs. His attitude as minister was bold and firm, and he was rewarded by being made chancellor of the empire. An understanding between Russia and Prussia now gave the Prussians their opportunity of becoming omnipotent in Germany and of crushing France. He now aimed at regaining for Russia what she had lost by

the treaty of Paris (1856), and by the treaty of San Stefano seemed to have done so, but the congress of Berlin caused Russia to make many concessions. He regained for Russia, however, Bessarabia which she had previously lost.

Gordian Knot, see **GORDIUM**.

Gordianus, Marcus Antonius Africanus (A.D. 158–238), Rom. emperor. He was the son of Metius Marcellus, through whom he traced his descent from Trajan. He governed Africa for many years as proconsul, and at the age of eighty was proclaimed emperor by the troops who had rebelled against the tyrannical rule of Maximinus. His young son was killed in battle, and G., overwhelmed with grief, committed suicide at Carthage after a reign of two months.

Gordianus, Marcus Antonius Pius (A.D. 238–44), Rom. emperor, the grandson of the above, was b. about 226. He was proclaimed emperor by the troops after the murder of Balbinus and Pupienus. He defeated the Goths in Moesia and waged war against Sapor, king of Persia, from whom he captured many cities. He was assassinated in Mesopotamia by Mithreus, his father-in-law and chief general.

Gordium, knot, city of Phrygia near the Sangarius on the Persian 'royal road' from Pessinus to Ancyra. It was here that, according to legend, Alexander the Great cut with his sword the G. knot which bound the yoke to the pole of the wagon of Gordius, the peasant king of Phrygia. This act was supposed to fulfil a prophecy which declared that whosoever should undo the knot would be king of all Asia.

Gordon, name of a famous Scottish family called after the lands of G. or Gorden in Berwickshire, and tracing its lineage to the thirteenth century. The first dependable traces of the family belong to the fourteenth century, when Sir Adam, in whom were united the G. and Huntly branches of the original family, took a prominent part in the struggle for independence. Sir Adam at first sided with the Eng., but after the battle of Bannockburn he joined the party of Bruce and was rewarded for his adherence with the lordship of Strathbogie in Aberdeenshire. Thus the chief seat of the family was transferred from Berwickshire to Aberdeenshire. Sir Adam had two sons, Adam and Wm. From the younger son Wm. sprang the Galloway, Irish, and Virginian branches of the stock. The elder, Adam G., was killed at Homildon Hill in 1403, and so brought the direct male line to a close; but two other grandsons (of illegitimate birth) continued the tradition, viz. Jock of Seurdargone (d. 1391), illegitimate son of Sir John of G., from whom the earls of Aberdeen claim descent, and Tam of Ruthven, from whom many of the N. families are derived. Though the direct male line was brought to an end in 1403, Sir Adam left a daughter, Elizabeth. Elizabeth married Sir Alexander Seton and inherited the barony of the G. and Huntly lands in Berwickshire and the barony of the G. lands in Aberdeenshire. From this marriage sprang the Seton-Gs. or the dukes of G. Their

son Alexander was made earl of Huntly in 1445 and subsequently lord of Badenoch. By marriage he fell heir to the baronies of Cluny, Aboyne, and Glenmuick. He was succeeded by his second son, George, who married the daughter of King James I. and who acquired the lands of Schivas, Boyne, Enzie, and Netherdale. The third successor to the title was his son, Alexander, who augmented his ter. by the lands of Strathaven and the brae of Lochaber. He fought with distinction at Flodden. The fourth earl was his grandson George, who fell heir to the earldom of Moray. He thus became the wealthiest and most powerful of Scottish landowners—so powerful that the sovereign, fearing usurpation, deprived him of the earldom of Moray. The earl, incensed, headed an insurrection, but was defeated and slain at Corrichie in 1562. His son George succeeded as fifth earl, and was in turn succeeded by his son George as sixth earl, a champion of Catholicism. He worsted the king's forces at Glenlivet, but was granted pardon and created marquess of Huntly in 1599. His son George, the second marquess, was a fervent royalist and was executed at Edinburgh in 1649. His son Lewis, the third marquess, was reinstated by Charles II. George, fourth marquess of Huntly, was created duke of G. in 1681. A Catholic by persuasion he was appointed by James II. keeper of Edinburgh Castle. He submitted to George I., but being suspected of Jacobite sympathies was forced to reside on parole in Edinburgh. He was succeeded by his son Alexander, the second duke, who associated himself with the Old Pretender but was pardoned on his surrender of G. Castle in 1716. He *d.* in 1728 and was succeeded by his son Cosmo George as third duke, who *d.* in 1752. Lord Lewis G., his brother, was one of the chief promoters of the Jacobite rebellion in 1745. Another brother was Gen. Lord Adam G., who was commander of the Scottish forces in 1782 and governor of Edinburgh Castle in 1786. Cosmo George, the third duke, left three sons. Alexander, the eldest and the fourth duke, is remembered as being the author of the popular song, *'Cauld Kail in Aberdeen'*; the youngest, Lord George (*q.v.*), was leader of the 'No Popery' riots of 1780 and *d.* in Newgate in 1793. Alexander, the fourth duke, had married the beautiful Jane Maxwell, known as the 'beautiful duchess of G.,' and their son George succeeded as fifth duke. The fifth duke raised the famous corps now called the second battalion of the G. Highlanders. He *d.* without issue in 1836, and the title with the earldom of Norwich and the barony of G. Huntly became extinct. The title of marquess of Huntly passed to his cousin and heir-male, George, fifth earl of Aboyne. Lady Charlotte G., daughter of the fourth duke and wife of Charles Lennox, fourth duke of Richmond, had a son Charles, who became heir to the estates and called himself G.-Lennox. Elizabeth, duchess of G., widow of the fifth duke, was a woman of great strength and sweetness of character. The dukedom of G. was

revived in 1876 in favour of the sixth duke of Richmond, who became duke of Richmond and G. George, the sixth earl of G., and first marquess of Huntly, left a second son, George, who became viscount of Melgund and Lord Aboyne (1827). On his death the title of viscount of Aboyne passed to his older brother George and subsequently to his son, Lord James, a fervent royalist. The title then passed in 1866 to his younger brother, Lord Charles G. George, fifth earl of Aboyne, was also ninth marquess of Huntly. His eldest son Charles was tenth marquess and he in turn left a son, Charles, the eleventh marquess. The earls of Sutherland are also a branch of this family. Adam G. of Aboyne (*d.* 1537) acquired the title of earl of Sutherland by his marriage with Elizabeth, countess of Sutherland. From this marriage sprang the G. earls of

GEORGE GORDON, SECOND MARQUESS OF HUNTLY

Sutherland, who retained the surname G. till the eighteenth century, when they revived the original surname of Sutherland. Of the branch of the G. earls of Aberdeen, Sir John G. of Haddo was made a baronet of Nova Scotia, and after him is named Haddo's Hole, of St. Giles's Church, Edinburgh, where he was imprisoned. His son, Sir George G. of Haddo, was raised to the peerage in 1682 with the titles of earl of Aberdeen, viscount of Formartine, Lord Haddo, Methlic, Taryes, and Kellie. See J. M. Bulloch, *The House of Gordon*, 1903-7.

Gordon, Adam Lindsay (1833-70), Australian poet, b. of Scottish parents in the Azores at Fayal. In 1853 he entered the service of the S. Australian mounted police. He led an adventurous and unsettled life, impatient of steady occupation. Two vols. of poems pub. in 1867, *Sea Spray and Smoke Drift* and *Ashtaroah*, brought him into prominence. These were followed in 1870 by *Bush Ballads and Galloping Rhymes*, but in the year of its pub. G. committed suicide. In 1934 a memorial was erected to him in Westminster Abbey. See also AUSTRALIA, *Literature*. See *The A. L. Gordon Memorial Volume* (Melbourne), 1926, and D. Sladen, *Adam Lindsay Gordon*, 1934.

Gordon, Alexander (1692?-c. 1754), Scottish antiquary, b. probably in Aberdeen, where he became M.A., taught languages and music, and painted portraits. Acquired knowledge abroad—Fr., It., art, antiquities. After 1720 toured Scotland and N. of England, examining Rom. remains; results pub. in 1726 as *Itinerarium Septentrionale*. In London issued lives of popes and Fr. kings; made trans. and additions to the *Itinerarium* (1731-32). In 1736 secretary to Society for Encouragement of Learning and to Society of Antiquaries. Became also secretary to Egyptian Society.

Gordon, Arthur Hamilton, see STANMORE, BARON.

Gordon, Charles George (1833-85), known as 'Chinese G.', the hero of Khartoum, was b. at Woolwich, Kent. He was present at the assault of the Redan (1855) in Crimea. In 1860 he joined the expedition in China where the Taiping rebellion was rife. The Russians were pushing their frontiers on the Amur and Ussuri; the Moslems in Yun-nan and the Turkestan regions were insurgent. The Chinese Empire was on the point of destruction, but G. put himself at the head of a Chinese army with a staff of Eng. and Amer. officers. The career of the hand was so glorious that it came to be known as the 'ever-victorious army.' G. recovered Nanking from the rebels and quelled the Taiping forces. In 1872 G. was appointed commissioner for superintending the Danube navigation, and in 1873 he was appointed governor of the Sudan, but resigned in 1880. In 1884 he was again sent to the Sudan where a revolt had broken out under Mahomed Ahmed, who proclaimed himself as the Mahdi. The Brit. Gov. had ordered Egypt to abandon the Sudan, a most hazardous policy to carry out, and G. was deputed to go there and evacuate the Egyptian pop. The situation was beset with difficulties and peril. G. was surrounded and besieged in Khartoum. The siege had been protracted for five months when a relief party was sent from England. In Sept. the relief forces commenced their ascent of the Nile; by Nov. the expedition reached the Second Cataract and the borders of the Sudan. The navigation of the riv. was fraught with difficulties and dangers. It was the end of Jan. before the party, crossing the desert from Korti, made their way to Khartoum. On Jan. 28 the advance reached Khartoum, but found that the place had been captured by the rebels two days before and G. had been put to death. The way in which G. sustained his position at Khartoum is one of the marvels of hist. He was of different nationality and religion from the people of the garrison, but in them he inspired absolute faith and fidelity. On his staff he had only one Brit. officer. The fortifications of the tn. were inadequate, the provisions were scanty, but in the face of all odds he persevered. His jour. dating from Dec. 10 to Dec. 14 was preserved, and is one of the most ennobling and inspiring docu-

ments of hist. See B. M. Allen, *Gordon and the Sudan*, 1931, and P. Crabitès, *Gordon, the Sudan, and Slavery*, 1933. The picture of Gordon in Lytton Strachey's *Eminent Victorians* (1918) is entertaining but unreliable.

Gordon, Charles W., see CONNOR, RALPH.

Gordon, Duke of Richmond and, see RICHMOND AND GORDON.

Gordon, Lord George (1751-93), leader of the 'Gordon' or 'No Popery' riots, was a son of the third duke of G. After some years in the navy he entered Parliament in 1774 and made himself conspicuous by his indiscriminate attacks on both Whigs and Tories. The 'Gordon' riots were provoked by the cancelling of the restrictions on Rom. Catholics. In 1780 G. convoked his followers at St. George's Fields, London, in order to petition a repeal of the new enactments at the House of Commons. The guards were called out, but the rioters held London for a fortnight, doing great damage to property. G. was committed to the Tower on a charge of treason, but was acquitted on the ground of insanity. He d. insane in Newgate jail, though some biographers add that he d. a convert to Judaism. See P. Colson, *Private Portraits*, 1918.

Gordon, George, see BYRON, BARON.

Gordon, George Hamilton, and Sir John Campbell, see ABERDEEN, EARL OF.

Gordon, John Brown (1832-1904), Amer. Confederate general and statesman, b. Feb. 6 in Upson co., Georgia; graduated at the State Univ., 1852, and practised law. In 1861 entered the Confederate army as captain of infantry; rose to be lieutenant-general. Was wounded eight times during the civil war, and commanded a wing of Lee's army at Appomattox Court House. Wrote *Reminiscences of the Civil War* (1905).

Gordon, Sir John Watson, see WATSON-GORDON, SIR JOHN.

Gordon Bennet, name given to a mt. in E. Central Africa seen by Stanley in 1875. Its identity remains undetermined; it may be one of the Ruwenzori group. It rises 14,000 ft. in height.

Gordon-Cumming, Roualeyn George, see CUMMING, ROUALEYN (GEORGE GORDON).

Gordon Highlanders, or the Gay Gordons as they are known historically, are one of the most famous regiments in the Brit. Army. The regiment was raised in 1791 by the marquess of Huntly, afterwards fifth and last duke of Gordon, who at that time was a captain in the 3rd Foot Guards, now the Scots Guards. The regimental tartan was the Gordon, with a distinguishing yellow stripe. The regiment was numbered 92nd, but in 1881 it was linked with the 75th to form the G. II. The 75th was raised in 1787 by Gen. Sir Robert Abercromby for service in India. Gen. Robert Crauford of Peninsula fame was a captain in the 75th. The regiment served with distinction in India, then in the Kafir war in S. Africa, the Indian mutiny, Egyptian campaign (1882), and Nile expedition. The 92nd first saw service in N. Holland at Egmond-op-Zee in 1799,

then in Egypt (1801), and the Peninsula. It formed part of the Scots Brigade at Waterloo and took part in Lord Roberts's famous march from Kabul to Kandahar in 1880, and it was also in the expedition to Chitral. Pipor Findlater of the G. H. won the V.C. at Tirah, 1897, by playing the pipes as the Gordons stormed an Afridi stronghold, though he was wounded in both legs. During the Boer war it formed part of Gen. Sir George White's force defending Ladysmith. During the First World War it raised twenty-one battalions which served in France, Flanders, and Italy. Mons, Le Cateau, and other well-known battles are included in its long roll of battle honours. In the Second World War the G. H. were part of the 51st (Highland) Div. of Montgomery's Eighth Army in N. Africa and rode into Tripoli on the top of their infantry tanks (Jan. 1943). They were conspicuous for their stubborn defence. In Feb. 1944, in the battle for the bridgehead of Anzio, Italy. In Feb. 1945, on the W. front, they were part of Gen. Crerar's Canadian army and were involved in bitter fighting after crossing the Niers R., notably at Gennep and around Kessel.

Gordon-Lennox, Charles Henry, see RICHMOND AND GORDON, DUKE OF.

Gordon Riots, see GORDON, LORD GEORGE.

Gordon Setters, see under SETTER.

Gordonstoun, public school in Moray, Scotland, founded in 1934 by Eng. friends of Salem, Massachusetts, whose headmaster, Kurt Hahn of Salem, had been imprisoned by the Nazis in 1933 and had settled in Britain after his release. The orthodox class system prevails, with certain features of the Dalton plan. Seamanship ranks as the most important outdoor activity. The object of its nautical dept. is to train boys for the R.N. and the merchant service by preparing them in navigation and seamanship, while giving them the benefit of a normal public school education. The duke of Edinburgh (b. 1921) was educated there. The preparatory school for G. is Wester Elchies, Craigellachie, Strathspey.

Gore, Catherine Grace Frances (1799-1801), Eng. novelist, b. at E. Bedford, being the daughter of Charles Moody, a wine-merchant. She married in 1823 Capt. Charles A. Gore, and in the following year appeared her first novel, *Theresa Marchmont*. She resided principally on the Continent, and, until her death, her novels appeared with unfailing regularity. They described the life and customs of the fashionable society of the period, and attained a certain amount of transient popularity. She was also known as a song writer. She became blind shortly before her death.

Gore, Charles (1853-1932), Eng. bishop, son of Hon. Charles Alexander G. Educated at Harrow and Balliol College, Oxford. In 1880 became vice-principal of Cuddesdon College, and in 1884 librarian of the Pusey Library, Oxford. Ed. *Luz Mundt*, essays by contemporary theologians and others, in 1890. Vicar of Radley,

1895, and later canon of Westminster. Chaplain to Queen Alexandra, 1900, and to Edward VII. in 1901. In 1902 he became bishop of Worcester and in 1905 bishop of Birmingham. In 1911 he was appointed bishop of Oxford. In 1919 he resigned and ceased to have any see. A high churchman, with aspirations toward union of Churches. He was engaged in much humanitarian work, and was one of the high churchmen known popularly as Christian Socialists. He founded the fraternity called the Community of the Resurrection, with rules of special devotion and 'a common purse.' His chief works are *The Church and the Ministry* (1889); *Roman Catholic Claims* (1889); *Bampton Lectures* (1891); *The Creed of the*

BISHOP GORE

Christian (1895); *The Body of Christ* (1901); *Spiritual Efficiency* (1904); *The New Theology and the Old Religion* (1908); *Orders and Unity* (1910); *The Religion of the Church* (1916); *Christian Moral Principles* (1921); *Belief in God* (1921); *Belief in Christ* (1922); *The Holy Spirit and the Church* (1924); *Christ and Society* (1928); and *Jesus of Nazareth* (1929). He also ed. *Thoughts on Religion*, 1895, by G. J. Romanos, a converted agnostic man of science. See A. Mansbridge, *Edward Stuart Talbot and Charles Gore: Witnesses to and Interpreters of the Christian Faith in Church and State*, 1935.

Gore, bor. of S. Is., New Zealand, in the Southland dist., 60 m. N.E. of Invercargill, on the Maitara R. With an area of 1910 ac., the pop. (including Maoris) is 5000.

Goree, barren rocky is. 3 m. off the coast of Senegal, Fr. W. Africa, now forming part of the circumscription of Dakar. It lies at the opening of the fine harbour flanked by Cape Verde peninsula. Area, 675 ac., mainly covered by the tn. of G., which was once the chief commercial centre of Senegal, besides being a military stronghold, but has long been eclipsed by Dakar (q.v.), both as a commercial port and as a fortress, while all its more influential inhab. gradually moved to Dakar. The Dutch were in occupation of the is. in the seventeenth century, but in the seven

Years war it was captured by the Eng. and then recaptured by de Ruyter, taken thirteen years later by the Fr., and again taken by the Eng. in the Napoleonic wars, but finally assigned to France in 1817. Pop. now only about 1500.

Gorge, see **BASTION**.

Görgei, Arthur (1818-1916), Hungarian commander and writer, b. at Taporez, Hungary. He fought in the Hungarian interests in the war against Austria and rose to be commander-in-chief in 1849. But his glory as a commander was eclipsed by his surrender to the Russians at Vilagos. His conduct on this occasion was judged with great harshness by Kosuth, and being accused of treason he was imprisoned at Klazensfurt. In 1867 he was pardoned. He pub. *Mein Leben und Werke 1848 und 1849* (1861), of which there is an Eng. trans.

Gorges, Sir **Fernando** (c. 1566-1647), founder of Maine, b. in Somerset. He was both sailor and soldier at an early date. Before he was twenty-one he was a prisoner of the Spaniards, and in the year 1599 he fought for Henry IV. of France. He became governor of Plymouth, and was an especial friend of Essex, whom he supported in his attempt to rebel. He was continued in his office as governor of Plymouth by James I., but he and his garrison were so badly neglected by the king that he finally resigned. He then turned his attention to the colonies and interested himself in many plantations. In 1639 he received a royal charter for Maine. See H. S. Burrage, *Gorges and the Grant of the Province of Maine*, 1923.

Gorgias, of **Leontini**, famous Sicilian rhetorician and sophist, b. about 480 B.C. In 427 B.C. he was sent to Athens to petition aid against Syracuse. The remainder of his life was spent in Athens as a teacher of rhetoric, and at Larissa. His style was highly ornate, rich, and elaborate, and considerably influenced the oratory of Demosthenes, though its effects on rhetoricians of inferior calibre was vicious. Plato's treatise on rhetoric is called the *Gorgias*, and in it G. is made to express his views on the art of oratory.

Gorgons, or **Gorgones**, monsters of classical mythology. Hesiod mentions three—**Medusa**, **Euryale**, and **Medusa**. They were represented as having snakes for hair and brazen claws. **Medusa**, the most famous Gorgon, was once a mortal maid, but was changed into a Gorgon by **Athena** in punishment for her relations with **Poseidon**, and whosoever gazed at her became a stone. **Poseus** slew her by means of a mirror and a sword. With the monster's head the hero turned **Polydectes** to stone. **Athena** afterwards received the head and bore it in her terrible aegis or breast-plate. **Medusa** in later art was represented as being of beautiful countenance.

Gorgonzola, tn. in Italy, about 12 m. N.E. of Milan. Celebrated for its famous cheese-making. Pop. 5000.

Gorhambury, seat of the earls of **Verulam**, in Hertfordshire, England, 2 m. W. of St. Albans. In the grounds are the ruins of **Francis Bacon's** mansion.

Gori, tn. in the Georgian S.S.R., N.W. of Tiflis. It has lumber mills. Pop. 10,000.

Gorilla, large man-like ape, which is a native of W. Africa. It is the largest of the anthropoid apes. It can be distinguished from the chimpanzee by the small ears, elongated head, the presence of a deep groove alongside the nostrils, the small size of the thumb, and the great length of the arm, which reaches half-way down the shin-bone in the erect posture. It also differs from the chimpanzee in its greater size, the height of a male G. being from 5½ to 6 ft. Its weight is approximately 30 stone. In colour it is blackish, but the hair on the head and shoulders often has a reddish tinge. It is chiefly a vegetable feeder, but, like most apes, it also preys upon small mammals, birds,

GORILLA

A, right hand; B, foot.

and their eggs. The G. spends most of its time on the ground, although it is a skilful climber, and is not so very ferocious, for when attacked it generally avoids an encounter, but when driven into a corner is a dangerous enemy on account of its enormous strength. Gs. have not yet been tamed, and fully adult ones have never been seen alive in captivity. Various attempts have been made to add one to the Zoological Gardens, but the animals have all d. young. The G. was first made known to zoology by **Paul du Chaillu** in 1861. Later a second type was discovered, which is indigenous to high altitudes in the Belgian Congo.

Gorinchem, or **Gorkum**, Dutch tn. in the S. of Holland, about 25 m. S.E. of Rotterdam. Its fine fortified gateways are typical examples of Dutch architecture. Its salmon fisheries are important, and the chief exports are grain, hemp, and cattle. Pop. 13,500.

Goring, **George Goring**, Lord (1608-57), Eng. soldier, son of the earl of **Norwich**. He was known for his dissolute manners during his early life. He was appointed governor of **Portsmouth**, and was concerned in the **Army Plot**, which he betrayed to Parliament. Nevertheless he

declared for the king and held Portsmouth for him for a time. He took part in the battle of Marston Moor, and was defeated after Naseby at Langport, after which he retired to France. Finally he d. at Madrid.

Goring, vil. in Oxfordshire, England, 9 m. N.W. of Reading. It is an angling and boating centre. Has a Norman church. Icknield Street crossed the Thames at this point. Also the name of a suburb of Worthing, Sussex, but as yet not much developed.

Gorizia, cap. of the prov. of that name in Austria. It is situated about 30 m. N.W. of Trieste. It manufs. principally silk and cotton goods. Since the fourteenth century it has been a cathedral tn. and is now the seat of an archbishop. G., among other strong positions, was demanded from Austria by Italy in April 1915 as the price of her continued neutrality in the First World War and as 'compensation' for the advantages already gained by Austria (a party to the Triple Alliance) in the attack on Serbia (see also under AUSTRIA-HUNGARY). The Ita. under Cadorna (q.v.) made a general attack on the Trentino front in the summer of 1916, and on Aug. 4 delivered a furious assault along an eight-mile line opposite G. The Austrian trenches were smashed by a continuous bombardment lasting many hours, and the Ita. followed this by an impetuous infantry charge, which carried the heights on the W. bank of the Isonza overlooking G. and also the heights further to the N. S. of G. they stormed Monte San Michele, the key to the G. position which they had been striving to capture for the previous fourteen months. After two days' fighting Gen. Boroevic, the Croat-Austrian commander, lost all the Isonza heights, and on Aug. 9, 1916, Ita. soldiers escorted King Victor Emmanuel into G. But on Oct. 28, 1917, as a result of the resounding Ita. defeat at Caporetto (q.v.), the Austrians reoccupied G. for a short time. Pop. 48,000.

Gorkum, see GORINCHEM.

Gorky, Maxim, or Aleksie Maximovich Pyeshkov (1868-1936), Russian author, b. at Nijni-Novgorod. His father dying, he lived with his maternal grandmother, and was apprenticed to a shoemaker at nine. In his youth he showed a roving and unsettled disposition, rarely remaining many weeks in any of the innumerable occupations in which he was engaged. He was successively a clerk in a draughtsman's office, scullery hand on board a Volga steamer, employed in a biscuit factory (vividly described in *Twenty-six Men and Another*), chorister in a travelling opera company, street hawker, and lawyer's clerk. His life on the Volga steamer and in the lawyer's office seems to have had most influence on his future life. His first sketch, *Makar Chudra*, appeared in 1892. *Chelkash*, pub. in 1893, estab. his position as a writer. This was followed in 1900 by *Foma Gordeyev*, a romance. He then wrote a number of tales descriptive of a tramp's life, with which the vicissitudes of his early career had made him familiar. When he attempts to describe character and manners in the upper

classes his success is not so marked. His best characters are men in conflict with society, who by sheer force of personality rise above its moribund influences, and, in such characters, we have obvious reflections of G.'s own struggle. In 1906 his mission to U.S.A. in the cause of Russian freedom failed when it was discovered that the lady accompanying him was not his wife. He returned to Europe and settled at Capri. Returned to Russia before the First World War and founded a review. He then became a supporter of Soviet republicanism. After the revolution in 1917 he acted as propagandist for the Soviet Gov. His *Reminiscences of My Youth* appeared in Eng. in 1924 and *Byslander* in 1930. *Konovulov* is perhaps his most representative work. G.'s drama, *The Lower Depths* (1912), is a work of great power. Nijni-Novgorod was renamed G. in his honour during his lifetime. Prince Kropotkin's *Ideas and Realities in Russian Literature* estimates G.'s position. See lives by R. Meincke, 1908, and A. Kamm, 1932; also Filia Holtzmann, *The Young Maxim Gorki*, 1949.

Gorky, formerly Nijni-Novgorod, or Nizhny-Novgorod: 1. Region of the R.S.F.S.R., situated on both banks of the Volga, two-thirds being on the right and one-third on the left. The surface is mostly flat, with forests, marshes, and lakes, with limestone hills in some parts. The prin. rivs. are the Volga, which enters the region on the N.W. and flows eastwards, and the Vetluga. The prin. crops are cereals, hemp, and flax, whilst fruit is largely grown. The area of land under forest is about half of the prov., and the timber industry is important. There are machinery and cutlery works, tanneries, flour mills, naphtha distilleries, etc., and a considerable trade in manufactured articles, corn, flour, hemp, etc. Ship-building is also carried on. The chief tns. of the region, besides the cap. G., are Pavlovo and Pochinka. Area 20,000 sq. m. Pop. 2,081,200. 2. City of Russia, cap. of the above region, situated at the confluence of the Oka and the Volga, 276 m. by rail E. of Moscow. Its position is excellent from a commercial point of view, as cereals and manufactured articles from the Oka basin, metal goods from the Kama basin, tea from Siberia, and corn, salt, naphtha, cotton, etc. for transit on the Volga, must all pass through the city. The city may be divided into three parts, the upper tn., the lower tn., and the fair tn. The upper tn. contains the Kremlin, situated at a height of 400 ft. on the r. b. of the Volga; it is surrounded by a high wall, and has the prin. edifices, including the governor's palace and two cathedrals. On the l. b. are monasteries and an old church. The lower tn. is the commercial quarter and contains many warehouses, depositories, etc. On the flat sandy peninsula between the Oka and the Volga, connected with the tn. by a wooden bridge, the great fair is held. The quarter contains 3000 shops, whilst as many more are built expressly at fair time. G. is the chief centre of steamboat navigation of the Volga and

has manufs. of ropes, candles, and machinery, and distilleries, potteries, and flour mills; ship and steamboat building is also carried on. The trade of the city has in the past been more important than the manufs., and the celebrated Makarievskaya, or fair, which was held here from July 29 to Sept. 10, was a most important event, as the operations which were carried out influenced all the leading branches of Russian manuf. The value of the goods sold at the fair sometimes amounted to about £20,000,000. It was interrupted during the First World War, but restarted in 1923 on a smaller scale. The furs of Siberia and N. Russia are, for the most part, collected at G. G. is further notable in possessing the chief automobile factory of the U.S.S.R. Pop. (1943) 645,000 (an increase of nearly 200,000 in ten years).

Gorleston, seaside resort of Suffolk, England. It is part of the bor. of Great Yarmouth, and is situated on the S. side of the Yare.

Gorlitz (Polish *Zgorzeke*), tn. in Lower Silesia, Poland. It has a fine Gothic church which dates from the fifteenth century, and also a fourteenth-century tn. hall. It manufs. woollen goods, machinery, and glass. The tn. stands in the middle of huge forest lands. It was the home of the philosopher Boehme. Pop. 95,000.

Gorlovka, new tn. in the Donetz basin in the Stalino Region of the Ukrainian S.S.R. Building was begun in 1930. It specialises in the construction of mining machinery and is a centre of the chemical industry, producing nitrogen and nitrogenous fertilisers. Pop. 108,600.

Gorno-Badakhshan, autonomous region of the Tajik Republic, U.S.S.R. It lies in the Pamir Mts., which contain various minerals, including gold, radium, lead, and tin. Chief tn. Khorog. See also **BADAKHSHAN**.

Gorodetz, see **KASIMOV**.

Gorse, alternative name for furze (q.v.), a prickly evergreen flowering shrub.

Gorsedd, Welsh term denoting the national assembly and congress of bards, preliminary to the Eisteddfod. The ceremony dates back a thousand years.

Gorst, Sir John Eldon (1835-1916), Eng. statesman, b. at Preston, educated at St. John's College, Cambridge. In New Zealand he was of great value in establishing peace between the authorities and the Maoris. He returned to England and was called to the Bar, 1865, and in the same year was elected M.P. for Cambridge. He sat for Chatham, 1875-92, and for Cambridge Univ., 1892-1906. He formed one of the Fourth Party (see **BALFOUR**; **CHURCHILL**, R.). He was solicitor-general, 1885-86; under-secretary for India, 1886; hon. secretary to the Treasury, 1891. He took a great interest in education, and was vice-president of the Committee of Council on Education until 1902. His attitude had always been independent, and he broke with his party on the question of Tariff Reform and lost his seat.

Gort, Sir John Standish, first Viscount

of Hamsterley (1886-1946), Brit. soldier, elder son of fifth Viscount G. of Limerick. Educated at Harrow and Sandhurst. Succeeded father as sixth Viscount G. of Limerick, 1902. Commissioned Grenadier Guards, 1906. Captain and A.D.C. to Sir Douglas Haig, 1914. Brigade major, 4th (Guards) Brigade, and later 1st (Guards) Brigade, rendering good service at Festubert and Loos, 1915. Appointed to command 4th Grenadier Guards, he led the battalion with great courage and ability at opening of third battle of Ypres, July 31, 1917. Took part in battle of Cambrai, 1917. In March 1918 commanded 1st Battalion Grenadier Guards at Arras. Conspicuous service near Hamel while in temporary command of 1st (Guards) Brigade, notably at Flequières. Frequently wounded, was awarded V.C. for his great gallantry. Eight times mentioned in dispatches. In 1932 he became director of military training in India. Commandant Staff College, 1936. Military secretary, War Office, 1937; C.I.G.S. same year. Promoted general, K.C.B., 1938; G.C.B., 1940. Led B.E.F. to France, 1939. Successfully conducted the forced retreat to the Dender and Escaut without allowing his successive fronts to be broken. Equally successful in withdrawing the B.E.F. to the perimeter covering the Dunkirk beaches where most were evacuated. Passed over as commander-in-chief home forces by Gen. Sir Alan Brooke (later Lord Alanbrooke), being appointed inspector-general. Governor and commander-in-chief, Gibraltar, 1941. Later as governor and commander-in-chief Malta he achieved in the defence of Malta one of the greatest successes of his career, and in 1943 he was promoted to field marshal. The Maltese people, in token of their admiration, presented him with a sword of honour when he left in 1944 to become high commissioner of Palestine and Trans-Jordan. Here he won the confidence of all but the extremists of the Arab and Jewish parties; but at the end of a year his health broke down and he was compelled to resign. Viscount, 1945.

Gorton, Samuel (d. 1677), Eng. sectary, founder of the Amer. sect of Gortonites, b. about 1600 at G., Lancashire. In 1636 he sailed to Boston, Massachusetts, where he was continually involved in religious disputes. He pub. in England (1646) an account of his grievances against the Massachusetts Gov. in a tract entitled *Simpliciter Defence against Seven-Headed Policy*. See L. E. Jones, *Samuel Gorton: a Forgotten Founder of our Liberties*, 1896.

Gorton, suburb of Manchester, England. Has important cotton mills and iron works.

Gortschakov, see **ГОРЧАКОВ**.

Görz, see **CORITZA**.

Goschen, George Joachim, first Viscount (1831-1907), Brit. statesman, son of a London merchant of Ger. origin, b. in London. He graduated from Oriel College, Oxford, with first-class honours in classics. In 1856 he became a director of the Bank of England; entered Parliament as Liberal member for the city of London,

1863; was appointed paymaster-general, 1865. In 1868 G. sat in Gladstone's Cabinet as president of the Poor Law Board, and became First Lord of the Admiralty in 1871. In 1878 he was elected representative for Great Britain at the international monetary conferences held in Paris. In 1880 he became member for Ripon, and as amb. to the Porte he persuaded Turkey to fulfil the obligations to Greece to which she was bound by the treaty of Berlin. He refused the offer of Speakership in the House, 1881. Gladstone, during his administration, found in G. an uncompromising opponent to his Home Rule policy. In 1886 G. lost his seat for E. Edinburgh, but in 1887, under Lord Salisbury's administration, sat as a Liberal-Unionist and accepted the chancellorship of the Exchequer. In 1877, after being defeated at Liverpool, he became member for St. George's, Hanover Square. In 1888 G. carried out a conversion of part of the national debt. In 1895 he became First Lord of the Admiralty. He was a firm and decided opponent of Chamberlain's Tariff Reform policy. G. pub. many works. His first important pub. was *The Theory of Foreign Exchanges*, 1863. Among his other works are *Cultivation of the Imagination* (1811); *Intellectual Interest* (1883); and *The Life and Times of George Joachim Goschen, Publisher and Printer of Leipzig* (1903). He was one of the chief promoters of the Univ. Extension movement. See A. R. D. Elliot, *Life of George Joachim Goschen*, 1911.

Gosforth, urb. dist. of Northumberland, England, 2 m. N. of Newcastle-on-Tyne. Race meetings are held in G. Park. Pop. 18,000. Also the name of a vill. in Cumberland near Scafell and 2 m. from the coast. Has a notable Viking cross. Pop. 800.

Goshawk, or *Astur columbarius*, bird still found in many countries of Europe, but practically extinct in the Brit. Isles. It was formerly found here in fairly large numbers, and was used in the sport of falconry. Its extinction practically coincides with the disappearance of our large forests. The male bird is much smaller than the female. In colour the bird is brown on the upper part of the body and white underneath. The tail has dark bands across it. See also **HAWK**.

Goshen: 1. Part of anct. Egypt given by Pharaoh to the relations of Joseph. The chief tn. was Kesen (Gosen in the Septuagint), or in the classics, Phacusa, modern Fakoos. 2. Cap. of Elkhart co., in Indiana, U.S.A., on the R. Elkhart, a trib. of the Michigan. It is an important commercial centre, its chief manufs. being flour, condensed milk, knitted goods, and products of metal, wood, and rubber. It is served by the Big Four and New York Central railways and has a landing-field for air-mails. G. was settled in 1828 and chartered as a city in 1868. Pop. 11,000.

Goshen, or **Goschen**, Land of, part of Bechuanaland in Brit. S. Africa. Some renegade Boers founded a republic there in 1882. In 1884 it was placed under Brit. protection.

Goslar, anct. imperial city on the R. Gose, dist. of Hildesheim, in the prov. of Hanover, Germany. It was founded by the Emperor Henry I. in 922. G. has many anct. and interesting buildings, including the Kaiserworth, which contains the statues of eight emperors. Towards the S. is the Hammeisberg, which has many valuable ores (gold, silver, copper, zinc, etc.), the mines having been worked since the tenth century. Pop. 22,900.

Gosnold, Bartholomew (d. 1607), Eng. navigator who sailed from Falmouth, 1602, in the *Concord*, and discovered Cape Cod and some neighbouring is. He was the leader of an expedition which discovered the Virginian Capes, and founded Jamestown in 1606, where he d.

Gospel, *The*, the 'Good Story,' or the revelation of God to man of His purpose and will for the salvation of all mankind. It is not *qua* G. the G. as set forth by the four evangelists, but the story of God's will concerning man, as manifested in the life and death of Jesus Christ.

Gospellers, in church hist. name applied to two classes of people: (1) Various precursors of the Reformation, such as Wyclif and the Lollards, who laid much stress upon preaching the gospel and upon the dissemination of the knowledge of the gospels among the people; (2) Antinomian sect which arose about the time of the Reformation. The term is also used in the Church of England for the priest who reads the gospel, usually either from the N. side of the altar or from the middle of the choir.

Gospels, name by which the four accounts in the N.T. of the character, life, and teaching of Christ are designated. The first three G., those of Matthew, Mark, and Luke - are called 'synoptic,' because they summarise the chief events in the life of Christ and, generally speaking, cover the same ground, while the author of the fourth gospel, that of John, follows independent lines. Again the first three run at one narrative, but the purpose of the fourth is dogmatic, and it also probably aims at supplying the deficiencies of the others. The interest, too, of John's account centres in the divinity and per-sonality of Christ, that of the other three in Christ's gospel. See **MATTHEW**, **MARK**, **LUKE**, and **JOHN**.

Gospels, Harmony of the, see **NEW TESTAMENT**.

Gosport ('God's port'), mkt. tn. and important naval depot to the W. of Portsmouth harbour, Hampshire, in England. It is connected with Portsmouth by a floating bridge. The Haslar Hospital, the Clarence victualling yard, and the barracks are among its notable features. Yacht-building is an important industry of G., and ships' anchors, cables, powder magazines, chains, and sails are also manufactured there. Pop. (including Alver-toke) 40,000.

Goss, Sir John (1800-80), Brit. organist and composer, b. at Fareham, Hampshire, pupil of Alwood, who in turn had been taught by Mozart. He was appointed organist of St. Paul's in 1838, retired,

1872. Wrote some excellent anthems and other church music and glees.

Gossamer, fine filmy substance, something like cobwebs seen floating in the air in autumn. It is the web spun by certain small spiders; the threads are invisible when spun, but a number are woven together by the wind. See **SPIDER**.

Gossan, term common amongst the miners of Cornwall for the outcrop of a lode. The Gs. are often composed of rich veins of metal, and are very easily worked. The ease with which they are worked is largely due to the fact that being on the surface they have been thoroughly oxidised.

Gossau: 1. Vill. in the canton of St. Gall, Switzerland. Lace and embroideries are made there. Pop. 7500. 2. Vill. in the canton of Zurich. Cotton and silk industries. Pop. 4000.

Gosse, Sir Edmund William (1819-1928), Eng. poet, critic, and essayist, b. in London, the son of Philip Henry G., the naturalist. In 1867 he was appointed assistant to the Brit. Museum, and held that appointment till 1873. He then became translator to the Board of Trade. In 1884 he became Clark lecturer on Eng. literature at Trinity College, Cambridge, and in 1904 he was made librarian to the House of Lords. His style is characterised by its lucidity and sweetness. His chief works are *On Viol and Flute* (1873); *Studies in the Literatures of Northern Europe* (1879); *New Poems* (1879); *From Shakespeare to Pope* (1885); *Raleigh* (1886); *Life of Congreve* (1888); *History of Eighteenth-century Literature* (1889); *Robert Browning* (1890); *History of Modern English Literature* (1897); *Life and Letters of Dr. John Donne, Dean of St. Paul's* (1899); *Life of Jeremy Taylor* (1904); *French Profiles* (1905); *Coventry Patmore* (1905); *Life of Sir Thomas Browne* (1905); *Father and Son* (a study of his early family life) (1907); *Henrik Ibsen* (1908); *Two Visits to Denmark* (1911); *Portraits and Studies* (1912); and *Life of Swinburne* (1917). His chief service to letters is perhaps his introduction of modern European writers into Eng. For his services to Scandinavian literature he was created in 1901 a knight of the Norwegian order of St. Olaf. In early manhood a great friend of R. L. Stevenson, with whom he exchanged many interesting letters. *Selected Essays* were pub. in 1928. See life by E. Charteris, 1931.

Gosse, Philip Henry (1810-88), Eng. naturalist. After farming in Canada he returned to England and pub. *The Canadian Naturalist* (1810). In 1847, after visiting Jamaica for the Brit. Museum, he pub. *Birds of Jamaica*. Among his other works are *Artinologia Britannica* (1858-60) and *The Romance of Natural History* (1860). See life by his son, Edmund G., 1890, and *Father and Son*, 1907.

Gosselies, tn. in Belgium, in Hainaut, in the administrative dist. of Charleroi. It has coal-mines, and manufs. cutlery, soap, and linen. Pop. 10,000.

Gosson, Stephen (1555-1624), Eng. author and divine; graduated from Oxford, 1576. He wrote the tragedy *Calicles Conspiracies* and the comedy

Captain Mario (neither now extant), but later wrote severely against the stage. G. was rector of Great Wigborough, 1591, exchanging his living for that of St. Botolph, Bishopsgate, London, 1600. His famous *The Schoole of Abuse* (1579) led ultimately to Sidney's *Apologie for Poetry* (1595). G. was a contemporary of Lyly at Oxford, but though the *Schoole of Abuse* contains alliterative and antithetical tricks of speech and other features of Lyly's style, it is probably true, as Saintsbury says, 'that he must rather have mastered the Lillian style in the same circumstances as Lyly, than have borrowed it from his fellow at Oxford.' This work is a 'pleasant invective against poets, pipers, players, jesters, and such-like caterpillars of a commonwealth,' and the G.-Sidney controversy which arose out of it shows that play-writing and play-acting were then becoming the concern of the best literary and social circles. He also wrote *The Ephemerides of Phialo* (1579) and *Plays Confuted* (1582). See T. Lodge, *Defence of Plays*, 1580 (ed. of 1853, p. 7); J. Collier, *Dramatic Poetry*, ii., 1698; and E. Arber, *The School*, 1868.

Gosudarstvennaya Duma, see **DUMA**.

Göta: 1. Canal in S. Sweden connecting the navigation of the Götaälf with the gulf of Bothnia by Lake Vener (Venern), Vikeen, Wetter (Vettern), Boren, and Boxen, and the Baltic with the Kattegat (Kattegat). It terminates at Mem, 3 m. from Söderköping. Length about 50 m., depth 10 ft., breadth 79 ft. Including lakes some 235 m. are navigable and there are 57 locks. It was projected by Gustavus Vasa, but not carried out till 1810-32, under Count Platen and Telford. 2. Riv. flowing from Lake Vener to the Kattegat. It branches into two at Kongelf, the S. branch passing Göteborg (Gothenburg). It is 68 m. long and navigable. To avoid the falls of Trollhatta near its source the Trollhatta Canal was constructed.

Gotaha, see **GOTHA**.

Gotescaulus, see **GOTTSCHALK**.

Gotha, *Almanach de*, 'universal political register, pub. in Ger. since 1764 and in Fr. since 1871. It is a diplomatic governmental and statistical record of the world. A section of it is devoted to the genealogy of royal families, distinguished members of the nobility, etc., and statements as to pop., trade, and similar matters of all civilised states are contained in the other sections. It has gained authority all over the world from the care and exclusiveness with which it is ed. It takes its name from the place of pub.

Gotha, tn. of Thuringia, Germany, cap. of G. state, 14 m. W. of Erfurt. One of the most important mercantile tns. of Thuringia, it is among the foothills N. of the forest. There are narrow streets in the old part, but much has been destroyed by fires at different times. S. is a park fronted by the ducal castle of Friedenstein (1643) containing the state archives, ducal library, and a fine coin collection. Other noted buildings are the church of St. Mary

(twelfth century), Augustinian church (thirteenth century), new museum, tn. hall (a Renaissance building of the sixteenth century), the castle of Friedrichsthal, and the observatory (1872). There is also the famous geographical estab. of Justus Perthes. Manufs. include porcelain, tobacco, smoked meats, sausages, sugar, toys, machinery, pianos, fire-engines, rubber hose, and woollens. The *Almanach de Gotha* has been pub. here since 1764, and Petermann's *Mitteilungen* since about 1854. The tn. is mentioned as early as 770 as 'Gotha'. It was surrounded by walls, 930 by Gothard, abbot of Hersfeld. It was occupied

of the *Merric Tales*, 1840, and *Nursery Rhymes*, 1842; W. Hazlitt, *Shakespeare's Jest books*, 1864; J. Ashton, *Chap books of the Eighteenth Century*, 1882; E. Cunningham, *Amusing Prose Chap-books*, 1889. For simpleton stories generally see W. Clouston, *Book of Noodles*, 1888 (new ed., 1903) and W. Busch, *Deutscher Volkshumor*, 1877.

Gothard, St., see ST GOTHARD

Göteborg (Swedish Göteborg), situated on the R. Göta and next to Stockholm, the cap. the most important city of Sweden. The tn. is quite modern, having been rebuilt to a large extent in consequence of numerous fires but it was

GOTHENBURG

The museum, the Christina church, and the town hall

by Amer. forces in mid April 1945. Pop. 50,000.

Gotha, Duchy of, see SAXE-COBURG-GOTHA

Gotham, *Tales of the Mad Men of*, collection of jests, representing the absurd doings and sayings of the people of G. a Nottingham par. near Trent junction. The simplicity of the mch has become proverbial, but was said to have been assumed originally to avert a king's anger. One absurdity attributed to them is the building of a wall round the cuckoo to secure eternal spring. These tales are similar to the *astoria*, or *facti e*, ascribed to the fifth century Alexandrian philosopher, Hierocles. The tales were first printed about 1550 under the title, *Merric Tales of the Mad Men of Gotham*, collected by A. B. (Dr Andrew Boorde?). The people of Abdera in Thrace had a similar reputation for folly, and such stories exist, *mutatis mutandis*, among almost all races of mankind. See J. O. Halliwell's reprint

originally founded in 1615 or thereabouts by Gustavus Adolphus. It has an excellent harbour seldom obstructed by ice, which affords a shelter for a large number of vessels from all parts of the world. G. has a univ. (founded in 1449), philosophical faculty with over 500 students, and an academy of commerce. Its commercial importance dates from the continental blockade of 1806, when it became the chief Brit. depot of N. Europe. It is the prin. port in Sweden and the centre of the shipping industry. The harbour has been enlarged and the navigation school was rebuilt in 1916, while a marine museum was opened in 1913. Among its manufacturing industries are shipbuilding, cotton-spinning, iron and steel milling, and it produces sugar, paper, leather, sailcloth, etc. It receives about one fourth of the total foreign commerce of Sweden. Has a valuable fishing industry. The lower portion of the tn., along the riv., has broad streets, partly formed by canals.

The exchange, cathedral, tn. hall, and museum deserve special mention among the buildings of G., and it has a fine garden belonging to the Horticultural Society. Pop. 250,400. The prov. of G. and Bohus has an area of 1948 sq. m. and a pop. of 523,500.

Gothic Architecture, see ARCHITECTURE, Gothic.

Gothic Language and Script. The Goths constituted the E. branch of the Germanic peoples. They are described by ant. writers as tall, athletic men, with fair complexions, blue eyes, and light hair, not unlike many Scandinavians of the present day. About the second century A.D. the Goths lived between the Vistula and the Black Sea. As late as the sixteenth century descendants of the Goths, speaking G., still lived in Crimea. The Goths played an important part in the European hist. of the fourth and fifth centuries. They were the first Teutonic people to be converted to Christianity, but they adhered to Arianism. About the same time they divided into Visigoths, or W. Goths (who then lived in what is now Bulgaria), and the Ostrogoths, or E. Goths (who were settled on the Black Sea). The great Visigothic apostle Wulfila, who lived in the fourth century and d. in 381 or 383, trans. a greater part of the Bible into G. He also invented an alphabet, consisting of twenty-seven letters, mainly based on the Gk. uncial script as used in his time. Some nineteen or twenty letters were taken over from the Gk. alphabet (the letter *g*, *thela*, however, received the phonetic value of *hw*), two letters were borrowed from the Runes (*q*, *r*), or freely invented, and the remaining signs, partly modified, were taken over from the Rom. character. Six different MSS. have been found containing Wulfila's trans. of the Bible. The earliest extant MS. is the *Codex Carolinus*, preserved at the univ. of Göttingen (Germany), and assigned to the fifth century A.D.; but the most important and the most famous is the *Codex Argenteus*, preserved at the univ. of Upsala (Sweden) and attributed to the sixth century. It is a beautiful MS. written in silver and gold on purple-red parchment, and is considered as one of the most precious treasures in the possession of any library. Some scholars hold the opinion that there were two varieties of the G. alphabet, the book hand, as represented by the aforementioned *codices*, and the cursive hand, as shown by a sale contract of the sixth century, now at the National Library of Naples, and by an alphabet written on a MS. from Salzburg, now at the National Library of Vienna. The Gothic *codices* have a very great philological importance; they are the oldest known literary documents written in a Germanic language, and are studied by scholars who desire to know what the Teutonic speech was like at that early day. This early Gothic language and script, however, had not the slightest influence on the subsequent Germanic culture.

'Gothic Line,' see under ITALIAN FRONT, SECOND WORLD WAR CAMPAIGNS IN.

Gothicus, see CLAUDIUS II.

Gothland, Gottland, Gotland, or Gautland, largest of the Swedish Is. in the Baltic, forming a prov. (lan) of Sweden, off the E. coast. It is about 40 m. E. of Sweden, about 1215 sq. m. in area, 83 m. long. The surface is 200-300 ft. above sea level. The coast is steep, but the interior mostly level. Visby (Wisby) on the W. coast is the chief tn., connected by rail with Helsing in the interior. The chief occupations of the people are agriculture, cattle-raising, shipping, fishing, and lime-burning. Timber, marble, sandstone, and lime are exported to Stockholm. There are some fine architectural remains. By the eighth century G. was trib. to Sweden, Visby being one of the most important trading tns. of N. Europe till late in the fourteenth century. In 1030 St. Olaf probably introduced Christianity there. It belonged to the Ger. Hanseatic League in the Middle Ages, being subject alternately to Denmark and Sweden from 1361. In 1645 it was finally ceded to Sweden. Pop. 58,900.

Goths, name of a powerful Teutonic people who played an important part in the barbarian invasions and made themselves masters of Italy for upwards of a century. From a fragment of a Gothic calendar (see GOTHIC LANGUAGE) it would seem that they originally called themselves *Gut-thiuda* ('the people of the Goths' *thiuda*, people). Their first home is supposed to have been the S. shores and the Is. of the Baltic. Legend makes them to have come there from Scandinavia, but this does not appear to be supported by facts. The earliest mention of the G. belongs to the time of Alexander the Great, and is that of the Gk. traveller Pytheas of Marseilles. His evidence still exists in quotations from him to be found in the writings of Pliny and others. According to Pytheas a tribe of *Guttones* lived and gathered amber on the Prussian shores of the Baltic. Next Tacitus mentions the *Gothones*, evidently the *Guttones*, but they are neighbours of the Lygii, and no longer on the coast. Their certain hist. begins in the earlier years of the third century, in the reign of Alexander Severus. They had then founded an empire on the N. shore of the Black Sea and about the delta of the Danube. They greatly increased their numbers by conquering other Teutonic tribes, and came into conflict with the Romans into whose prov. of Dacia they made successful inroads. Gibbon says (*Decline and Fall*, x.): 'The Emperor Decius (A.D. 249) . . . was summoned to the banks of the Danube by the invasion of the Goths. This is the first considerable occasion on which history mentions that great people.' They devastated Moesia and Thrace, vanquished and killed Decius, and withdrew on receiving great sums of money and a promise of yearly tribute. In 258-59 they crossed the Black Sea, the Bosphorus, and the Hellespont, embarked on the Mediterranean, pillaged the shores of Asia Minor, burnt the temple of Ephesus, and sacked Athens. In 269 they equipped an immense fleet, ravaged Crete and Rhodes,

and, returning through Thessalonica, were completely crushed by the Emperor Claudius. They recovered, however, and the Emperor Aurelian secured a term of comparative peace only by ceding to them Dacia and the l. b. of the Danube. During this period the G. mingled with the Romans, and were influenced by the Rom. civilisation; they were converted to Christianity.

It was at this epoch that Wulfila trans. the Bible into the Gothic language (q.v.). Now, too, the G. divided themselves into two great groups, the Visigoths (or W. G.) inhabiting the slopes of the Carpathians in Dacia and the Ostrogoths (or E. G.) who dwelt on the shores of the Black Sea. This separation became complete when, after conflicts with Constantine (321), who imposed peace upon them, and with Valens, whom they subdued, the terrible Huns made a successful irruption among them and completely crushed their empire. The Ostrogoths submitted to the Huns, the Visigoths crossed the Danube, and settled finally within the Rom. Empire (376). Their hist. deviates at this point.

The Visigoths made peace with Valens and were allotted cantonments. Many accepted service in the Rom. army, others, who came to be known as the *Vesogoths*, devoted themselves to agriculture under Rom. protection. In 387, provoked by the vexatious conduct of the Rom. functionaries, they revolted and forced the Emperor Theodosius to conclude a new treaty with them, by which some received land and others provisions in exchange for military contingents. After the death of Theodosius their king, Alaric, claimed a prov. for his people. The refusal of this demand led to an insurrection which marks an epoch in the hist. of Europe. The Visigoths under Alaric devastated Macedonia, Greece, and Illyria, then, passing into Italy, they took and pillaged Rome (410). Alaric d. the same year. Withdrawal from Italy, the Visigoths under Alaric's successors overran S. Gaul and Spain. Under Wallia (415-19) they obtained from the Romans *Aquitania secunda*, and fixed their cap. at Toulouse. The Gothic kingdom was actually now a vassal kingdom of the Rom. Empire; the G. greatly helped the Romans in their conflicts with the Vandals, the Huns, and the Alani, and in their turn reaped benefit from the Rom. civilisation. Theodoric I. played an important part in the reduction of the Huns under Attila at Châlons. Theodoric II. and Euric conquered Spain and extended their kingdom as far as the Loire. They estab. a constitution and adopted some of the arts of civilised life. But they were forced to retreat by the Franks under Clovis (507), and their kingdom was completely broken up by the Saracens (711). Dispersed and decimated the greater number of the Visigoths settled, keeping up their institutions, in the region of the Pyrenees. Their laws were trans. into Castilian under Ferdinand III. (thirteenth century) to serve as their code of justice. They gradually became absorbed in the Lat. peoples of Spain and Languedoc (see CATALONIA).

The Ostrogoths took part with the Huns under Attila in the expedition against Gaul and so encountered their kinsmen, the Visigoths, in battle, sharing in the terrible defeat at Châlons (451). Under their greatest sovereign, Theodoric, they warred against the E. Emperor Zeno and acquired some of his richest provs. Theodoric also defeated Odoacer (q.v.), king of Italy (488), and reigned gloriously and wisely in Italy until his death (526), dealing even-handed justice to the conquered and to those of his own race. On the death of Theodoric the Emperor Justinian organised a campaign against the Ostrogoths with the object of wresting Italy from them and restoring it to the emperors of Constantinople. After a protracted struggle Justinian's general, Narses, succeeded in crushing them, and with their defeat (553) Theodoric's kingdom came to an end. The Ostrogoths dispersed; many of them were absorbed in the Rom. Empire, some returned to the Danube, where they commingled with other Teutonic peoples. A small number of the Ostrogoths have an interesting hist. apart from that of the rest. These had remained N. of the Black Sea when the great body of the people migrated with the Huns. They survived all the other Gothic peoples and were found in the Crimea by the Flemish traveller, Burbeck, in the sixteenth century, still speaking their own language. They were in succession vassals of the Rom. Empire of the E. and of the Mongols; finally they became absorbed in the Tartar race. See E. Gibbon, *Decline and Fall* 1776-88; T. Hodgkin, *Italy and her Invaders*, 1899; G. Schütte, *Our Forefathers*, 1929-33; F. Lot, *Invasion Terms*, 1935; and A. Vasilev, *Goths in the Crimea*, 1936.

Gotland, see GOTHLAND.

Goto, or Gotto group of is., five in number, belonging to the Jap. archipelago, and forming the westernmost group in the channel of Korea. W. of the is. of Kjusiu. The largest of the group is about 25 m. long.

Götterdämmerung, see RAGNARÖK.

Gottfried von Strassburg (Strasbourg), Middle High Ger. epic poet, the most brilliant of the thirteenth century (fl. c. 1200), contemporary with Hartmann von Aue, Wolfrum von Eschenbach, and Walter von der Vogelweide. In 1210 he began his great epic, *Tristan und Isolde*, after Fr. originals (especially that of the *trouvére* Thomas of Brittany). He d. between 1210 and 1220, leaving his work unfinished. It was completed by Ulrich von Turheim (1233-66) and Heinrich von Freiberg (c. 1300). This poem furnished the subject for Wagner's great opera. See works, F. H. von der Hagen's ed., 1823; Reichenstein's ed., 1881; eds. and trans. of *Tristan* by H. F. Massmann, 1813; H. Kurz, 1844; W. Hertz, 1877; and W. Simrock, 1885; also works of W. Franke, 1865, and W. Goltzer, 1887.

Gotthardt, Matthias, see GRUNEWALD.

Gotthelf, Jeremias, see BRZJUS, ALBRECHT.

Göttingen, tn. of Hanover, Germany,

cap. of G. principality, on the Leine Canal, at the foot of Mt. Hainberg, 37 m. N.E. of Kassel. The famous univ. founded here by George II. of England (c. 1737) was rechartered in 1836 as 'Academia Georgiana Augusta.' The tn. was taken by Tilly in 1626. The Royal Academy of Sciences was founded in 1751 by Haller. In connection with the univ. are the academical museum, botanical garden, library, observatory, institutes of anatomy and chem., etc. Manufs. linen and woollen stuffs (famous in the fourteenth and fifteenth centuries), leather goods, musical and surgical instruments, scientific apparatus, soap, starch, sausages, and beer. The book trade is important. The G. school of poets and writers included Voss (d. 1826), C. Stolberg (d. 1819), F. L. Stolberg (d. 1821), Holtz (d. 1776), and Leisewitz (d. 1806). The tn. fell to Amer. forces in April 1945. Pop. about 41,000. See F. Frensdorff, *Göttingen in Vergangenheit und Gegenwart*, 1887.

Gottschalk, Gutescalous, or Fulgentius (c. 805-88), Ger. monk, prominent in a theological controversy of the ninth century. Son of Berneo, a Saxon count, he early entered the monastery of Fulda. Prevailed from securing release from his vows by his abbot, Rabanus Maurus, he was transferred to the Benedictine convent of Orbais (Sotissons). G. studied St. Augustine's writings and adopted the doctrine of twofold predestination (to sin or salvation). He visited Italy (837-38 and 845-48), but his views roused much opposition. At the synod of Mainz, 818, he was found guilty of heresy by Hincmar, and condemned at an assembly at Quircy, 819. He d. imprisoned in the monastery of Hautvilliers, Rheims.

Gottschall, Rudolf von (1823-1909), Ger. dramatist, poet, and miscellaneous writer. B. at Breslau, he studied at Königsberg, Breslau, and Berlin. His sympathy with the revolutionary movement of 1848 produced the tragedies *Die Marschallin* (1848); *Wiener Immortellen* (1848); *Lambertine von Méricourt* (1850); and *Herrn von Schill* (1851); the first poems, *Gedichte* (1850), and the lyric, *Die Götter* (1853). Among his plays are *Pill and Fox* (historical comedy), the most successful (1854); the tragedy *Mazeppa* (1859); his best play; and *Katharina Howard* (1872) (See *Dramatischen Werke*, 2nd ed., 1881.) In two epic poems, *Die Götter* (1853) and *Carlo Zeno* (1854), he largely abandoned the exaggerated style of his earlier poems. Among his novels may be mentioned *Im Banne des schwarzen Adlers* (1875); *Das Goldene Kalb* (1880); *Die Papierprinzessin* (1883); and *Die Tochter Rubenahls* (1889). In his valuable *Die deutsche National-literatur des 19. Jahrhunderts* (the 7th ed. of which appeared in 1901-2), and also in a work on poetry (1855, 6th ed. 1893), he advocates the cause of 'modern ideas' in literature. After writing a number of other plays, he became, in 1884, editor of two Leipzig journals, *Blätter für literarische Unterhaltung* (1861-88), and the review, *Unsere Zeit*. See autobiography, *Aus meiner Jugend*, 1898, and biographical study by M. Braach, 1892.

Gottsched, Johann Christoph (1700-66), Ger. critic and writer, educated at Königsberg Univ. He was prof. of poetry in 1730, of logic and metaphysics in 1734. G. tried to abolish the bombastic affectations of the second Silesian school, and substitute a nobler drama based on Fr. models. His *Kritische Dichtkunst* appeared in 1730, founded on Boileau's *Art poétique*. He became later involved in a violent literary controversy with Bodmer and Breitinger. Lessing (1729-1781) destroyed his reputation as a 'literary dictator,' and Gellert (1715-69) replaced him as a popular favourite about 1750. See J. A. Ernesti, *Memoria J. C. Gottschedii*, 1767; G. G. Gervinus, *Geschichte der National-literatur der Deutschen*, 1835-38; T. W. Danzel, *Gottsched und seine Zeit*, 1848; K. Breitmaier, *Die poetische Theorie Gottscheds und der Schweizer*, 1879; E. Reichel, *Zu Gottscheds Lehrjahren*, 1892; G. Krause, *Gottsched und Flottwell*, 1894; E. Wolff, *Gottscheds Stellung in deutschen Bildungsleben*, 1895-97; G. Wanke, *Gottscheds und die deutsche Literatur seiner Zeit*, 1897; E. Reichel, *Ein Gottsched-Denkmal*, 1900, and *Gottsched; Biographische Skizze, Kleines Gottsched-Wörterbuch*, 1902; and G. Schumann-Kv, *Gottscheds deutsche Bildungsziele*, 1939. Reichel founded the Gottsched Gesellschaft in Berlin.

Gotz von Berlichingen, see BERLICHINGEN, GOTZ VON.

Gouda, or Ter-Gouw, tn. of Holland in the prov. of S. Holland. It is situated on the N. side of the Gouw, where it joins the Yssel, 10 m. N.E. by E. of Rotterdam. Founded in 1485, it was destroyed by fire, and rebuilt in 1552. Formerly the prin. industry was cloth weaving, and later the making of clay pipes. It now has factories for steaming candles, cigars, and yarn, and the G. cheeses are celebrated. Its shipping trade is large and it is one of the chief markets of S. Holland. It has a regular steamboat service along the canals. Pop. 36,900.

Goudimel, Claude (1505-72), musical composer of the sixteenth century. He was b. probably at Besançon, but both the Fr. and Belgians claim him as their countryman. In 1510 he founded a school of music at Rome, but later returned to Paris, where he pub. in 1555, a musical setting of Horace's *Odes*. He also pub. in 1565 a collection of vocal pieces as a setting to the celebrated Fr. version of the Psalms by Marot and Beza; and some of his songs appeared in a collection at Lyons, entitled *La Fleur des Chansons* (1571). In 1572 G. became a convert to the reformed religion and met his death in the massacre of the Huguenots. See Michel Brenet's 'Biographie' (*Annales franco-cantonses*, Besançon, 1898, p. Jacquin).

Gouge, see under CHISEL.

Gough, Sir Hubert de la Pöer (b. 1870), Brit. general, b. Aug. 12, eldest son of Gen. Sir Charles John Stanley G. Educated at Eton and Sandhurst. Joined 16th Lancers, 1889. Tirah expedition, 1897-98. Severely wounded in S. African war, 1899-1902. Prof. at Staff College, 1904-6. As brigadier-general in com-

mand of 3rd Cavalry Brigade at the Curragh in March 1914, he was the principal one of those officers who refused to be employed against any resistance from Ulster to the Home Rule Act if passed. In France and Flanders in the First World War, with 2nd Cavalry Div. and 7th Div., 1915; 1st Army Corps, 1916. Commanded the ill-starred Fifth Army, 1916-18: Pozieres, Thiepval, Beaumont-Hamel; operations on Ancre, Langemark, and St. Quentin—promoted to lieutenant-general. He was unsuccessful in defence at the Somme, March 1918, and was superseded. Chief of the allied mission to the Baltic, 1919. Retired with rank of general. In *The Fifth Army* (1931) he vindicated his conduct of affairs in 1918 and this vindication was subsequently accepted by Lloyd George, who, as Prime Minister, had been instrumental in G.'s recall.

Gough, Hugh, Viscount (1779-1869), Brit. field marshal, b. at Limerick. He was a descendant of Francis G., bishop of Limerick in 1626. In 1794 he obtained a commission in the army, and saw active service in S. Africa and in the W. Indies. In 1809 he was called to take part in the Peninsula war, and joined the army under Wellington. He was severely wounded at Talavera and had his nose shot under him. He was afterwards promoted lieutenant-colonel. He also fought at the battle of Barrosa, and again at Vittoria and Nivelle, where he was once more severely wounded. He returned home at the close of the war and enjoyed a respite of some years from active service. In 1830 he was promoted major-general. In the first Chinese war he was appointed commander-in-chief of the British forces and achieved many victories in the face of great difficulties. In 1862 he was made a field marshal. See R. S. Rait, *Life and Campaigns of Hugh, 1st Viscount Gough, Field Marshal*, 1903.

Gough, Richard (1735-1809), Eng. antiquary, b. in London, d. at Enfield. His father was a director of the E. India Company and a wealthy man. G. showed signs of an unusual intelligence at an early age, and at sixteen pub. a work called *Geography Modernised*. He went to Cambridge in 1752 and began his work there on Brit. topography. His best known pub. are *History of the Society of Antiquaries* (1768) and *The Sepulchral Monuments of Great Britain* (1786).

Goujon, or Gougeon, Jean (c. 1515-68), Fr. sculptor of the Renaissance, known as the French Phidias and the Coreggio of sculpture. He is first mentioned in 1540 as working on St. Maelou at Rouen. In 1541 he went to Paris, joining P. Lesot in the decoration of St. Germain l'Auxerrois, his work there including the 'Evangelistes' and 'Déposition de la Croix' (now in the Louvre). G. decorated the Château d'Ecouen for the Huguenot constable Anne de Montmorency, 1544-47. His chief productions there were 'La Victoire allée', 'La Foi', 'Le Sacrifice d'Abraham' (Chantilly). He did woodcut illustrations (1547) to the *Vitruve* de J. Martin. G.'s first period

of work upon the Louvre was between 1547 and 1550, including the staircase of Henri II., figures of the Cél-de-Bour, caryatides of the Salle des Cent-Suisses in the Louvre, and figures of the Fontaine des Innocents, 1549. His 'Diane Chasseresse', originally in the courtyard of the Château d'Anet, is now in the Louvre. By 1560 the Louvre decorations were completed. G.'s name disappears from the list of 'Maîtres Maçons' under Lesot, 1560-61. The tradition that he was shot during the St. Bartholomew massacres (1572) is now no longer accredited. See L. Audot and A. Pottier, *Essai sur la vie de Goujon*, prefixed to Itévell's engravings of G.'s works, 1827-44, and R. Lister, *J. Goujon*, 1903.

Goulburn: 1. City of Argyle co., New S. Wales, Australia, on R. Wollondilly, 128 m. S.W. of Sydney. It is the see of the Anglican bishop and a Rom. Catholic archbishop. Public buildings include two cathedrals, hospital, jail, and a council library. There are breweries, tanneries, boot and shoe factories, and flour mills. G. co. has Murray R. on the S. Pop. 16,000. 2. Riv. of Victoria, Australia, rising near Emerald Hill in the Great Dividing Range (Wonnangatta co.), flowing N. and N.W. through the Jamieson and Wood's Point goldfields, and falling into Murray R. about 10 m. above Echuca. Irrigation works have been carried on in the valley since 1893. The course above Seymour is much impeded by rapids, fallen trees, and rocks, and not easy to make navigable. Total length about 345 m.

Gould, Benjamin Apthorp (1824-96), Amer. astronomer, son of B. A. Gould, the educationist (1787-1859). He was organiser and director of the National Astronomical Observatory at Córdoba, Argentina, from 1868 to 1885. His *Uranometria Argentina* (1871) did for the S. hemisphere what Argelander's *Atlas* (1813) did for the N. G. also wrote *Catálogo de Zonas Estelares* (1881). He was among the first to realise the importance of photography in determining stellar positions accurately. He became president of the Amer. Association for the Advancement of Science, 1868.

Gould, Sir Francis Carruthers (1841-1925), Eng. writer, son of Richard Davie G., architect. Member of the Stock Exchange for some twenty years of his early life, and later assistant editor of the *Westminster Gazette*. Early evinced great skill in caricature and was for many years a contributor of illustrations to the *Pall Mall Gazette* and *Truth*. A notable authority and lecturer on parliamentary matters. His brilliant series of cartoons in the *Westminster Gazette*, extending over a considerable number of years, to the very end of its appearance as an evening paper, were an undeniably strong factor in the Liberal cause, and were doubtless that part of his work which primarily earned for him his knighthood in 1906. They dealt with every important phase of parliamentary controversy, epitomising the very pith of a political situation in cleverly executed sketches often adapted

from scenes in Shakespeare or Dickens, or from the drawings of Tenniel in *Alice in Wonderland*. His draughtsmanship was angular and rough, but the humour was unflinching and often startling. His puns include *Frossart's Modern Chronicles* (1902-23), *Who Killed Cock Robin?* (1897) and *Tales told in the Zoo* (1900).

Gould, George Jay (1864-1923) Amer. financier, son of Jay G. Privately educated he later obtained control of large railway interests. He was president of the Little Rock and Fort Smith Railway, 1888, of the St. Louis, Iron Mt. and S. Missouri Pacific and others 1893, and of the Manhattan Elevated 1892.

Gould, Gerald (1855-1937) Eng. poet and critic, educated at Norwich and Magdalen College Oxford. From 1911, he was associate editor of the *Daily Herald*. Among his works are *The English Voice of To-day* (1921), *Beauty the Pilgrim* (1927), and *The Future of Laughter* (1929).

Gould, Jay (1836-92) Amer. capitalist, educated at Hobart Academy and on his father's farm. For a time he was engaged in surveying (1852-56) and in the lumber and tanning business. By 1857 he became chief shareholder in the small bank at Stroudsburg, Pennsylvania. He began buying up railroad bonds at this time, becoming a broker in New York 1859. After the panic of 1857 he became president and manager of the Rutland and Washington Railway, later uniting it with the Rutland Railway. He was president of the Erie Railway Company, 1868-1872 and introduced into the company 'Boss' Tweed and other rascals who unscrupulously enriched themselves at the expense of the public. He controlled the Union Pacific from 1873 to 1881 and invested largely in the stocks of other railways and telegraph companies, finally controlling them all. He made about 25,000,000 dollars. His worst action was a scheme formed with Jim Fisk for cornering the gold market, leading to the Black Friday panic 1869. He has been called the Napoleon of America since See J. S. Ogilvie *Life and Death of J. Gould* 1892.

Gould, Nathaniel (1837-1919) Brit. novelist, b. at Manchester who had a wide experience in journalism in England and Australia. His very numerous novels include about 130 novels of a sporting character. Among the best known of these are *The Dilettante* (1891), *The Araway* (1891), *The Miners' Cup* (1891), *A Gentleman's Life* (1898), *The Staff Mystery* (1900), *The Tiger's Flare* (1901) and *A Run of Fortune* (1901). Other pulps *On and Off the Edge of Australia* (1891), *Sporting Sketches* (1891) and *The Hour of the Ring* (1900).

Gould, Sabine Baring-, see BARING-GOULD

Gounod, Charles-François (1818-93) Fr. composer of sacred music and later of operas in Paris. His mother was an accomplished pianist. He showed an early passion for music when, after studying under Halévy, passed brilliantly through the Conservatoire, receiving at the age of

twenty-one the Fr. Institute's *grand prix* for composition. His intention had been to study for holy orders, and he went to Rome with that object, and although nothing came of it he continued to devote himself wholly to the composition of church music. The great success of his third mass (1849) aroused in him the ambition to explore a wider field, and, saturated with the ideals of Gr. art, music, and literature, he turned to the lyric drama, *Phélonie et Baucis* being his first attempt. But it was not until 1851 that he was accorded any recognition as an operatic composer. In that year *Sapho* was produced, and was very generously received. In 1852 he wrote choral music for a production of Ponsard's *Ulysse* and two years later a favourable reception was given to

CHARLES-FRANÇOIS GOUNOD

his *La Vierge au glorie*. His real success, however, came with the production of *Raoul* (1859), a very beautiful work in which G.'s genius reaches its zenith, and perhaps the most widely popular opera ever written. Subsequently he wrote *La Fanciulla del Sale* (1862), *Mireille* (1864), *La Colombe* (1865), *Roméo et Juliette* (1867), *Le Grand Magasin* (1877) and *Polyeucte* (1878), none of which has any present interest, although excerpts are frequently given on the concert platform. He also wrote some oratorios which were popular in London where G. stayed during the Franco-Ger. war and afterwards until 1871. Among other but slighter works is his popular *March of a Marionette*. His work is full of suave melody and harmony, and his writing for the orchestral parts in his operas is beautifully balanced and restrained. He also wrote a fairly large number of songs and romances, among the former being his famous *Ave Maria* based on Bach's first prelude, and many devout songs, the less devout being the better. His own *Mémoires d'un artiste* were pub. posthumously (1896). See also C. J. Saint-Saëns, *Charles Gounod et le Don Juan de*

Mozart, 1892, and 'Le Livret de Faust' (*Monde Musical*, 1914); and G. Doret, *Musique et Musiciens*, 1915; also lives by M. A. de Dovot, 1890; P. L. Illenmacher, 1906; C. Ballaigue, 1910; and J. G. Prod'homme and A. Dandelot, 1911.

Gour, see GÜRÜ.

Gouraud, Henri Joseph Etienne (1867-1916), Fr. general, b. in Paris. Rendered distinguished service in Moroccan campaign, 1911-14. In the First World War he succeeded Gen. d'Amado as commander-in-chief of the Fr. forces in the Dardanelles, having previously commanded the 1st Corps on the W. front. By 1919 he had become commander-in-chief of the army of the Levant. In his able defence in the Argonne sector he earned the soubriquet the 'Lion of the Argonne.' Was wounded by a shell in 1915, losing an arm. In the allied offensive, July-Aug. 1918, he defeated the Ger. forces E. of Rheims. Accorded the grand cordon of the Legion of Honour. Sent, in 1919, to act as Fr. high commissioner to Syria, where he succeeded in establishing the Fr. mandate. Member of the Conseil Supérieur de la Guerre, 1922. Military governor of Paris, 1923-1938.

Gourd, name given to various species of the order Cucurbitaceæ, which are distinguished on account of their fruit. These fruits are nearly always large and fleshy, curiously shaped, and abound in nutritious matter. Most of the Gs. belong to the genus *Cucurbita*, e.g. *C. Pepo*, the pumpkin; the bottle G. or calabash cucumber is *Lagenaria vulgaris*, with a bitter and dangerously purgative fruit; the snake G. belongs to the genus *Trichosanthes*; the bitter G. or colocynthis is *Citrullus colocynthis*, and is allied to the water-melon.

Gourko, Joseph Vladimirovich (1828-1901), Russian count and general of Lithuanian extraction. His claim to distinction is based on his services in the Russo-Turkish war of 1877, where he greatly distinguished himself, capturing Sofia, Philippopolis, and Adrianople. He also took part in the Crimean war, being stationed at Belbek. For his services in the Russo-Turkish war he was decorated with the order of the second class of St. George. From 1879 to 1880 he was governor of St. Petersburg, and from 1883 to 1894 governor-general of Poland.

Gourmont, Remy de (1858-1915), Fr. author and critic; b. April 1 at the château de la Motte, Bazoches-en-Houlme (Orne). Studied at the Lycée of Caen, and at the Faculty of Letters at Caen. Went to Paris, and was attached to the Bibliothèque Nationale, 1883-91. His early works, from *Un Volcan en eruption* (1882) to *Les Canidiens de France* (1893), were of the diffusion-of-knowledge type. Then came novels, of which the best known is *Satine* (1890). In 1890 helped to found the *Mercur de France*; ed. it and sev. other journals. His style was fastidious, and he indulged in much philosophic tmesis in his essays. See M. Coulon, *L'Enseignement de Remy de Gourmont*, 1921; and life by P. Jacob, 1931.

Gourock, tn. of Scotland, in W. Renfrewshire, situated at the mouth of the Clyde, on the l. b. It is 2 m. W. of Greenock and has of late years become famous as a holiday resort, having considerable passenger traffic by the Clyde steamers. Pop. 9000.

Gout. A first attack of G. usually commences by waking the patient up during the night with intense pain in the foot. The next morning there is redness over one or more joints, with extreme tenderness. The pain and swelling last for a week or more and, as a rule, leave the patient feeling better than before. An attack of G., though not serious, is a warning that the patient must reconstruct his mode of living and endeavour, as far as possible, to avoid unnecessary worry, take regular exercise, and be warmly clad, so as to avoid any risk of chill. An appropriate diet is all important. Alcohol should be avoided—beer, stout, and porter are the most injurious forms; strong wines (port, sherry, Madeira) come next and then light wines (hock, etc.) and spirits, which are the least injurious forms. But, unless the attack is due to a preventable cause, total abstinence is strongly recommended. There should also be distinct moderation in food. A 'purin' free diet should be aimed at, that is to say, one containing the smallest possible amount of nitrogen. For instance, butcher's meat should be restricted, and eggs taken but occasionally. The disadvantages of a restricted diet are that the patient feels he is not getting sufficient nourishment if leading an ordinary life. It is better therefore to commence the regimen during an attack, when loss of appetite is generally present. The patient is then content to live on slops such as vegetable soups, milk puddings, gruel, arrowroot, etc., while barley water is advantageous in quenching thirst. When the attack lessens and the appetite improves the patient may be given fried or boiled fish, without any indigestible sauce, chicken, and other forms of white meat. Recurrent attacks of G. are apt to appear with slight cause, or none at all, and to affect an increasing number of joints, which become misshapen and stiff, the attacks becoming prolonged until the pain is almost continuous.

It is of interest to consider that the prime cause of G. is the failure to utilise the food taken, sometimes because too much is taken, sometimes because of the failure of the digestive powers, sometimes because the kidneys are incapable of performing the work required of them. Despite the peculiarities of any individual case, these three conditions become more marked, and a more and more rigid diet is indicated, till at length only as much food is taken as can be used and the waste products, particularly uric acid, removed by the kidneys. The kidneys are relieved by flushing them out with water, which can be taken best thing in the morning, last thing at night, and in the interval between meals. If this is not done the products of digestion circulating in the blood injure the walls of the blood vessels

and so weaken them that they may burst. When this result occurs in the brain the condition is described as apoplexy, and in all parts of the body impaired vessel walls interfere with the nourishment of the parts they supply. When this takes place in the lungs bronchitis sets in; in the case of the skin eczema and other diseases result. In addition the changes in the vessel walls produce changes in the heart and kidneys which are of such extreme severity that they may bring about a fatal result. As G. tends to run in families the tendency must be counteracted. The children of gouty parents should avoid the errors of their elders, particularly in diet, mode of life, such as exposure to cold, and lack of exercise. Regular exercise acts in two ways: by utilising the products of digestion and increasing the amount of invisible perspiration less work is thrown upon the kidneys. Further, a gouty parent should seriously consider the question whether his profession or occupation is a suitable one for his children. The treatment of G. mainly depends upon relieving the pain by heat, i.e. by hot baths, to which soda may be added, the administration of potassium and lithium salts (since the urates of these metals are more soluble than sodium urate, which forms in their absence), and colicium.

Gouvion St. Cyr, Laurent, Marquis de (1764-1830), Fr. marshal, b. at Toul. He took part in the Prussian and Polish campaigns of 1807 and 1808, and in Aug. 1812 obtained a victory over the Russians at Polotsk, for which he was created a marshal of France. St. Cyr accompanied Napoleon all through the Russian campaign. On the restoration of the Bourbons he was created a peer, and in July 1815 was appointed war minister. He d. at Hyeres (Var). Besides his military career, he was the author of many works of value, notably of *Mémoires pour l'histoire militaire sous le directoire, le consulat, et l'empire* (1831). See Gay de Vernon, *Vie de Gouvion Saint-Cyr*, 1857.

Govan, former burgh of Lanarkshire, Scotland, on the S. bank of the Clyde, since 1912 a suburb of Glasgow, with which it is connected by railway and electric tramways. It owes its importance to the shipbuilding and other industries of the Clyde, and possesses some of the largest shipbuilding yards and engineering works of the Brit. Isles. Elder Park is situated here. Its pop., prior to its incorporation in Glasgow, was over 90,000. It sends one member to Parliament.

Government implies sovereignty, and the sovereign is defined by Austin to be the person or persons vested with the supreme authority in an independent political society. Such a society is a state and in every state there must be a sovereign power which exercises and controls the functions of G. and conducts and regulates the relations of that political society with other political societies. A single ruler, where there is one, is called the sovereign; the body of rulers, where there are sev., is called the sovereign body of the G., or the supreme G. The rest of

the members of a political society are called the subjects.

Origin of Government.—The whole subject of G. has ever in the past been productive of what now, in the light of evolution, may be justifiably characterised as sheer dogmatism and a *priori* assumption. Probably no more remarkable theory of the origin of G. or the beginnings of political societies has ever been put forward than that of the social compact. This theory with different philosophers and publicists assumes the formation in some remote period of the past of an original compact whether between the governor and governed, or between all the subjects exclusive of the governor or ruler, whereby it was mutually agreed to surrender all the sovereign powers to a sovereign or a sovereign body for the benefit of all. The theory in its various forms was a reaction against the absolutism of the equally dogmatic patriarchal theory of the origin of G. With Hobbes the social compact was useful in getting rid of the theory of the erection of political societies on a basis of force; a theory which, as it evolved the state from a delegation of 'permanent and inextinguishable power' to the sovereign, gave no room for the existence of justice and moral obligation. Locke reverted to the theory of Althus and assumed the prince or other ruler to have been a party to a contract by which the sovereign agreed to govern according to the laws and for the public good, while the people on their side agreed to obey so long as the prince remained faithful to his part of the bargain. With Rousseau the theory underwent a radical change. He rejects with indignation the idea of a bilateral contract between sovereign and people, and postulates a literally social compact. His theory was the revolutionary expression of equality, while those of the Eng. philosophers were eminently consistent with either an aristocratic or monarchic form of G. The doctrine of Rousseau bound all to all and allowed society to exist solely by reference to this free convention of associates. Such a theory is justifiably described by Prof. Holland as no more than 'a dangerous truism.' Bentham's utilitarian analysis of the origin of G. by reference to the 'immense interest which men have in maintaining a government' assumes a similar historical basis. Every form of this theory of the genesis of G. makes the capital error of regarding a political society or state as a conscious human contrivance, as against its far more probable evolution from natural causes. The merit of the theory, however, is neatly expressed by Whewell as 'a convenient form for the expression of moral truths,' and, indeed, it is not to be supposed that all of its exponents necessarily put it on any higher plane. Whether any really satisfactory theory of the origin of G. has ever been put forward is a matter rather to be referred to individual opinion. Spencer advances the idea of the evolution of political power and institution by a process determined by conditions to the entire exclusion of intentions, the prin. condition being war. Jenks

thinks there is not the slightest difficulty in proving that all political communities of the modern type owe their existence to successful warfare, and as a natural consequence are forced to be organised on military principles. Maine, harking back to the patriarchal theory, sees the microcosm of the state in the family, expanded and developed into clans and tribes. Seeley inclines to a similar idea of insensible gradations, but regards tribal communities as in themselves states or political societies. It seems to be justified in regarding all political society proper as arising out of some external pressure, e.g. to repel a common foe or to uphold a common religion or superstition. McLennan and Morgan of the earlier school of evolution conceive of large hordes of people existing as groups anterior to the family as imagined by Aristotle, Maine, and others; but they do no more than bring the family one or two steps forward in chronological order and hardly claim to do more than examine the origin of primeval society in general. There are other theories of the origin of G., notably the eccles. notion of G. by divine appointment, but this, like the philosophical suggestions of the origin from a social compact, involves assertion which, however consistent they may be with the external phenomena presented by a modern form of G., derive therefrom not a scintilla of positive proof.

Forms of Government.—Aristotle and most later writers have classified the regular forms of G. into (1) monarchy, or G. by a single person; (2) aristocracy, or G. by a select council; (3) commonwealth, or G. by the many. Corresponding to these terms are the forms of tyranny, oligarchy, and democracy, each with a depraved connotation; but the term democracy has long since virtually displaced commonwealth as the description of a republican polity without connotation of praise or blame. It is to be noted, however, that the term democracy is confounded with corrupt plutocracy by the modern totalitarian propagandists. Blackstone wrote that in a democracy public virtue was more likely to be found than in either of the other forms of G., that in aristocracies there was more wisdom but less honesty than in a republic, and less strength than in a monarchy; and that a monarchy was the most powerful form of any, because the legislative and executive powers were united in the hand of one prince. But a hybrid and paradoxical form of G. like the limited constitutional monarchy of the Brit. Empire presents features which are not readily susceptible of such orthodoxy, while the republican Gs. of the U.S.A. have been characterised by no little corruption, much wisdom, and great strength. Prof. Seeley's classifications of societies into tribal, theocratic, and states proper, with an elaborate classification of states by reference to the proportional weight or distribution of governmental authority as between the locality and the central body, is infinitely more in accordance with modern facts. It is obviously immaterial

how Gs. may officially designate themselves, if in substance they do not conform to set patterns. Seeley, like Bluntschli, rejected the Aristotelian classification as useless, because it inquires after one feature only, viz. that of the number of rulers, and results therefore in classifying together states of an otherwise totally dissimilar nature. As a scientist should, he omits all politico-ethical considerations, regarding both state and G. not as contrivances of the conscious human will, but as instinctive natural growths. He adopts many cross-divs. of states based on various considerations, particularly in regard to the degree of local G. and the curtailment of liberty in special directions; liberty in this connotation being primarily freedom from over G., and secondarily as an equivalent to parl. or responsible G. Such divs., if a little bewildering, do undoubtedly conduce to a clearer understanding of the characteristics of different kinds of G. Modern writers, however, are not prone to adopt any classification of forms of G. beyond that into parliamentary and non-parliamentary (see CABINET), or some other div. designed to bring into prominence the degree to which the principles of representation may obtain. With the same idea Gs. are also referred to as autocratic or constitutional. The anc. Grecian states were at first truly democratic; but the later communities were in the truest sense self-governed, and there never has been so close an approximation to the literal ideal of democracy as the Gk. city state, where every citizen took his turn at the proper business of G. In anc. Rome the G. was, under the kings, the monopoly of an exclusive caste of citizens; while in the later days of the republic was presented the spectacle of the inhab. of one tn. wielding the resources of a world-wide empire. On the estab. of the empire Rome in its declining days fell under the extreme autocracy of Caesarism, where, in Lord Gowrie's words, 'the Master of the world posed as the humble servant of a menial state,' but in reality exerted complete authority through the military despotism of Rome. In the earlier days of England the feudal form of G. was in its essentials autocratic, but the mutual contractual relation between the king and his vassals, and between the latter and under-tenants, soon paved the way to a system of representation (see ELECTORATE).

Up to the time of the First World War Russia and Turkey were commonly regarded as being under autocratic forms of G., and post-war developments in those two countries seemed only to emphasise this position. But while the Ottoman Empire, till comparatively recent times at all events, lagged far behind the rest of Europe in its adherence to a despotic form of monarchy, the Russian autocracy evolved itself into G. by depts. or a bureaucracy (q.v.). At the present day in Turkey all sovereignty belongs to the Grand National Assembly, but the Soviet G. of Russia is even more autocratic than the Tsarist G. Most Gs. of the day are constitutional in form, and as such subject

to varying degrees of popular control. The essence of a constitutional G. is that the executive powers are limited by legal restriction contained in some written or conventional constitution, and such prerogative powers as may remain to it are, in reality for the most part, popular privileges. Constitutions (q.v.) are said to be either rigid or flexible: rigid constitutions are written documents containing fundamental laws or legal principles which cannot be changed otherwise than by some exceptional procedure: a flexible constitution is one, like the Brit. constitution, which recognises no difference between constitutional and other laws, but permits the legal sovereign Parliament to change them at will. Practically, however, there exist in flexible constitutions principles which no Parliament would undertake lightly to alter. Most of the great nations of the day, except Great Britain, have adopted rigid constitutions, under which the rights of the subject are expressly guaranteed by the G. The common element of all constitutional forms of G. is that the sovereign legislative powers are really exercised by assemblies of a popular and elective character. In most federal nations the functions of G. are divided between the central G. and the constituent states, there being in most cases written constitutions strictly defining the powers of the former and leaving to the latter all such powers as are not thus expressly taken away. This is so in the U.S.A., but in Canada the authority of the dominion Parliament is indefinite, while that of the provs. is defined. The Swiss Federal Assembly, like Congress, can legislate only on a limited number of matters, and it has no power of annulling laws passed by the different canton Gs.

Totalitarian Government.—Totalitarian G. is a modern variant of dictatorship and, as exemplified in Fascist Italy, Nazi Germany, Communist Russia, and Falangist Spain, has its own variants. In ancient republics like Rome there were periods when the absolute rule of a person or group, without the necessity of the consent of the governed, prevailed and the term dictatorship dates from this time, when in an emergency a man might be appointed dictator by the Senate for seven years and held absolute power for that term after which he had to retire and constitutional rule was restored. Modern dictatorship is either personal or that of a group or class—military or proletariat—though even in the latter case it is commonly embodied in the person of a leader. Until the emergence in the inter-world-war period of the totalitarian Gs., it was axiomatic that most Gs. of the day were constitutional and more or less democratic, as opposed to authoritarian. The total states of Germany and Italy were the antithesis of constitutional and democratic states. In them constitutional forms were abolished and G. was the function of a dictator and his clique—in short, the totality of powers, executive and legislative, were vested in a dictator or leader, while in the constituent states or provs. delegated powers were given to dist.

leaders. The cardinal feature of a totalitarian state is the single-party system of G. as opposed to the liberal conception of G., which assigns to the State only certain conventional spheres of control while leaving as many as possible of the residuary powers to the free decision of the individual. The 'total state' extends the sphere of state influence over the whole of life, both private and public, and exacts subordination of the individual to the demands of the State. Thus in Germany the Nazi party, in Italy the Fascist, in Russia the Communist, and in Spain the Falangist are or were the only political parties permitted. Denazification in post-war Germany, and the liquidation of the Fascist party in Italy during the Second World War, have abolished the totalitarian system in those countries, but the Falangist party still exists in Franco's Spain, while in Russia the Communist party still holds undisputed sway.

Functions of Government.—These are threefold: (1) legislative; (2) judicial; (3) executive or administrative. The first is concerned with the making and altering of laws, the second with the interpretation and application of those laws, and the third with the carrying those laws into effect. In a narrower sense G. is identified with the executive, and this is really the modern connotation of the term. In most states these three functions are vested in separate entities, but in some cases, e.g. in certain crown colonies, all or the first and last may be vested in a single person or body of persons. The Brit. Cabinet illustrates in a striking manner the narrower sense of G. as above indicated. All the most important and far-reaching legislative measures of recent years have been introduced into Parliament by responsible ministers, and the skill, tact, and ingenuity of those ministers in 'piloting' their Bills through the Lower House, coupled with the fact that the Parliament Act has virtually abolished two-chamber G., so identify these measures with the ministry that the remaining members of the House of Commons more and more assume the role of an automatic voting assembly, the majority in which is pledged to support the ministry of the day. Where, however, the ministry really reflects the opinion of the majority of the electorate, the principle of representative G. is in no wise disturbed, and it can hardly be doubted that the strong cohesive action of a unanimous Cabinet, faithfully endeavouring to interpret the popular will, does make for efficiency and dispatch in the functions of G.

After the First World War the intrusion, in Great Britain, of the G. in the economic sphere was accentuated by the policy of 'reconstruction'—a policy which appeared to be warranted by the spectacle of a world disorganised by the necessities of war. In the years immediately following the war it was suggested by some Eng. statesmen and publicists that the experience of the war revealed in England the essential weakness of the old Cabinet system. Lord

Curzon, a great authority, declared that the old system had irretrievably broken down both as a war machine and as a peace machine (House of Lords debate, June 19, 1918). He predicted that in future the presence of other ministers than Cabinet ministers at Cabinet discussions would become an inevitable feature of Cabinet procedure and that the system of devolution and decentralisation of G. work would be considerably developed. Yet by 1920 the Cabinet once more consisted in the main of departmental ministers; its numbers had not been substantially reduced, and the principle of collective responsibility again prevailed. The experiments of the War Cabinet and the Imperial War Cabinet, effective in the time of war, did not become, as was hoped by Lloyd George, 'an accepted convention of the British constitution' (see also CABINET, IMPERIAL WAR). In 1917 a committee was appointed by the minister of reconstruction to inquire into the responsibilities of the various depts. of the Central Executive G. This 'machinery of G. committee' under the chairmanship of Lord Haldane (q.v.) suggested in its report that the business of the various depts. of G. should be distributed as far as possible according to the nature of the service with which they were concerned; and on that principle it was proposed to reduce the number of depts. and simplify the functions of the State, but to increase the number of ministers. The weakness, however, of this report was that it contemplated the intrusion of the State into every corner of social and industrial activity, and it is hardly a matter for surprise that the proposals were not implemented, though two new depts. of state, the Ministry of Transport and the Ministry of Labour, were created. In time of major wars private enterprise is bound to prove entirely inadequate to the enormous strain on its resources. Governmental control is the only way of salvation, and when the Second World War broke out a number of new ministries were quickly set up, including Ministries of Information, Aircraft Production, Home Security, Supply, Shipping, and Economic Warfare (or Blockade).

Science and Government.—A consequence of two world wars is the accelerated evolution of G. machinery for the promotion and use of scientific knowledge. Up to the outbreak of the First World War the only notable interventions of G. in the scientific sphere were the foundation of the National Physical Laboratory, the formation of the Development Commission, and the setting up of national research institutes. The need to apply scientific knowledge to everyday affairs became acute after 1914 with the necessity to develop new methods for war requirements, and a committee of the Privy Council for scientific and industrial research was appointed in 1915 and, in 1916, a Dept. of Scientific and Industrial Research. Then in 1920 the Medical Research Council was estab. to administer funds accumulated out of the operation

of the National Insurance Act, 1911, and in 1930 was set up the Agric. Research Council. The appointment by the G. after the Second World War of the Advisory Council on Scientific Policy was a further significant recognition, through war experience, of the fact that scientific knowledge and method must be considered in the direction of national affairs. The existence of this council, together with that of the newly estab. Defence Research Policy Committee, indicates that to-day the advice of scientists, like that of economists, is now recognised as being of immediate importance in the formulation of general national policies no less in peace than in war. To-day the Dept. of Scientific and Industrial Research maintains, in addition to the National Physical Laboratory, which acts both as a central bureau of standards and a research laboratory of applied physics, a building research station, a chemical research laboratory, food investigation institutes, a forest products research laboratory, a fuel research station, the geological survey, a radio research laboratory, and others, all of which are concerned not so much with basic research as with the development to some practical end of fundamental discoveries and ideas which have normally developed out of an academic environment.

Government's Island, is, belonging to the U.S.A., in the R. Mississippi, situated between Rock Is. city and Havenport, containing arsenals and armouries.

Governor, Colonial. The king is represented in the colonies by Gs. appointed by commissions under the Royal Sign Manual conferring upon them their powers, together with instructions defining their duties. Gs. are appointed during the royal pleasure, but do not generally retain office for more than five or six years. The extent of the powers and duties of a G. varies with the constitution of the colony. In self-governing colonies, which have attained dominion status and are no longer styled colonies, the G. is called a governor-general and is in the position of a constitutional monarch who acts on the advice of responsible ministers; but in the case of crown colonies (q.v.) the G. is an autocrat exercising both legislative and administrative powers subject only to the control of the Colonial Office. *Intra alia* the powers and duties of a G. are (1) To assent to, or withhold assent from, Bills passed by the local legislature, except in certain cases such as currency, army and navy, and foreign treaty matters, where he must reserve them for the royal assent (see COLONIAL LAW);

(2) to pardon criminals and remit fines and penalties; (3) to issue warrants for the expenditure of public money; (4) to appoint and dismiss public servants; (5) to grant licences for marriages, letters of administration, and probate of wills; and (6) to defend the colony against external aggression. A G. is entitled to obedience and assistance from all civil and military officers in the colony. He is not entitled to leave the colony without royal permission. He has no authority over Brit. ships, but should he require their assistance he must communicate with the Colonial Office save where the lives of Brit. subjects are endangered, when he may ask for such assistance directly from the navy. The celebrated cases of *R. v. Wall* and *R. v. Eyre* establish that a C. G. can be tried in England for crimes committed in the colony in his official capacity. See C. J. Tarring, *Law relating to the Colonies*, 1893, and D. Chalmers, *Outlines of Constitutional and Administrative Law*, 1910.

Governor-General. The status and functions of a Brit. G.-G. have been radically changed as a corollary to the altered status of the great self-governing dominions. The Imperial Conference of 1926 made an important declaration through the report of its Inter-Imperial Relation Committee, to the effect that the G.-G. of a dominion was now the 'representative of the Crown, holding in all essential respects the same position in relation to the administration of public affairs in the dominion as is held by His Majesty the King in Great Britain, and that he is not the representative or agent of His Majesty's Government in Great Britain or of any dept. of that government.' This declaration necessitated a change in the procedure for the appointment of G.-G., and accordingly the Imperial Conference of 1930 arrived at the following conclusions: (1) the parties interested in the appointment are the king and the dominion concerned; (2) the constitutional practice that the king acts on the advice of responsible ministers applies in this instance; (3) the ministers who tender and are responsible for this advice are the ministers in the dominion concerned; and (4) the ministers tender their formal advice after informal consultation with the king. The conference also declared that the channel of communication between the king and the gov. of any dominion was a matter solely concerning the king and such gov., and they recorded that the gov. in the United Kingdom had expressed its willingness to act in relation to any of the king's gov. in any manner in which that gov. might wish. Finally it was declared that the manner in which the instrument containing the G.-G.'s appointment should reflect the principles accepted by the Imperial Conference was a matter for the advice of the ministers in the dominion concerned. The position now therefore is that the home gov. is not consulted, though the appointment of the Earl of Clarendon in S. Africa in 1929 and Mr. Tim Healy in Ireland two years

previously seemed to show that the home gov. still retained a share in the advice to be given to the king. At all events the constitutional functions of the sovereign remain unimpaired by the changes. The old aspect of the royal prerogative is unchallenged, and the king can approve or reject any nomination. The G.-G. having ceased to be the channel of communication between gov. and gov., consideration was given to the question of securing some kind of representation of the home gov. in the dominions, and the most natural solution was the appointment of a high commissioner to correspond with the dominion high commissioners in London. The first dominion to receive such a representative was Canada (Sir Wm. Clark, 1929). Later high commissioners were appointed in Australia, the Union of S. Africa, and New Zealand. A United Kingdom representative was appointed to Eire in 1910, but, by way of concession to Irish prejudices, was not styled 'high commissioner.'

Goward, Mary Ann, see KEELEY, MARY ANN.

Gowbarrow Park, estate in Cumberland, England, N. of Ulswater, on the slopes of G. Fell. The property of the National Trust, it contains the beautiful waterfall of Aika Force and Aika Crag (1579 ft.). Area, 748 ac.

Gow, Neil (or Niel) (1727-1807), Scottish violinist and composer, father of Nathaniel (1766-1831). He was early reputed to be the best performer of reels and strathspeys in Perthshire, and noted for his skill in bowing. Raeburn frequently painted his portrait for his numerous patrons, the chief being the duke of Athol. See W. Chambers, *Famous Scotsmen*, II, 1855, and Glen, *Scottish Dance Music*, II, 1895.

Gower, John (c. 1325-1408), one of the earliest Eng. poets, probably of good family, perhaps connected with Sir R. G. a landowner both in Suffolk and Kent. He seems to have been a personal friend of Chaucer, who called him 'the moral G.' in dedicating to him *Troilus and Creseide* (1372-86). He married late, and became blind about 1400. G. wrote three long poems, the *Spectulum mediantis* (originally *Homines*) in Fr. verse (c. 1378), found at Cambridge, 1896, by G. C. Macaulay; *For Amantis*, in Lat. elegiacs, 1382-84, dealing with Wat. Tyler's rebellion (see Cox's ed. for Roxburghe Club 1850), to which was added *Cronica tripartita* on Henry IV.'s accession (see T. Wright, *Political Poems*, I, c. 1855, and T. Fuller, *Church History*, II, 1655); and *Confessio amantis*, in Eng. octosyllabic verse (c. 1386), completed by 1394. First dedicated to Richard II., it was afterwards transferred to Henry of Lancaster (Henry IV. by 1399), on which and other grounds G. has been called a timid time-server. The *Confessio* was one of the first books printed by Caxton (1483). It consists of a prologue and eight books of over 100 stories taken from Ovid, Valerius Maximus, Justin, *Gesta Romanorum*, chronicles of Cassiodorus and Isidore, Godfrey of Viterbo's *Pantheon*, and

other sources. His *Cinquante Balades* were printed for the Roxburghe Club, 1818. His work is mostly tedious and uninspired, but he deserves respect for his painstaking if monotonous verse, and for his influence on Eng. literature down to Shakespeare's time. His tomb is in St. Saviour's (old St. Mary Overies), Southwark. See eds. of the *Confessio* by R. Pauli, 1857; H. Morley (Carrisbrook Library), 1889; T. Macaulay, *Works of J. Gower*, 1899-1901. See T. Warton, *History of English Poetry*, 1781; G. Ellis, *Specimens of Early English Poets*

GOWER'S MONUMENT IN ST. SAVIOUR'S CATHEDRAL, SOUTHWARK, LONDON

1., 1790; J. Lowell, *Conversations on some of the Old Poets*, 1845; F. W. Snell, *The Age of Chaucer*, 1901; and G. C. Fox, *The Medieval Sciences in the Works of Gower*, 1931.

Gower, or **Gwyr** (crooked), peninsula in Glamorganshire, Wales, situated between Swansea Bay and the Burry Inlet. Its rocky coastline is principally composed of limestone, with numerous caves, and the scenery is magnificent. Thurba Head is the property of the National Trust. In the eleventh century it was overrun by the Normans, who built castles and churches; in the reign of Henry I. it was inhabited by the Flemings, the descendants of whom still live there. It contains picturesque ruins and supposed Druidical remains. Pop. of G. rural dist., 10,000.

Gowhatty, see GAUHATTI.

Gowrie, *Carse of*, see CARSE OF GOWRIE.

Gowrie Conspiracy, mysterious event in the hist. of Scotland, which took place in Aug. 1600 and resulted in the slaughter of the earl of G. and his brother by the attendants of James VI., afterwards James I. of England, at G. House, Perth.

John Ruthven, third earl of G., and his brother, Alexander Ruthven, were, at the time, living on the earl's estate at Perth, and early in Aug. the king, with a few attendants, visited the castle to confer with the earl regarding a debt. There seems to have been ill feeling at the time between the two, on account of the earl's father having been put to death by King James for treason, and the king also owed Earl G. a large sum of money. After dinner, on the evening of Aug. 5, 1600, Alexander Ruthven is said to have taken the king to a private study, while his brother, the earl, was engaged with other guests, and here James was confronted by an armed man, who, as appeared, was none other than G.'s servant, Henderson. Alexander Ruthven thereupon drew Henderson's dagger and presented it at the king's breast, threatening to kill him on the spot if he cried out for help, but that his life should be safe if he remained quiet. He then left King James in the custody of Henderson, who professed ignorance of any plot, and at the king's request opened one of the windows, when Alexander Ruthven returned, and on seeing the king about to call for help, struggled with him. James, however, managed to reach the window and cried out 'Treason!' to his followers below, who ran up the staircase to the king's help, led by John Ramsay, afterwards earl of Holderness. They found James struggling with Ruthven, whom Ramsay managed to wound and push down the stairway, where he was subsequently killed by other of the king's followers. G. then entered upon the scene, and seeing his brother's dead body rushed into the *mêlée* and was killed himself. The tragedy caused intense excitement throughout Scotland, and all the details of the investigation into the circumstances were reported to Elizabeth's ministers in England. The estates of the Ruthvens were confiscated, their name and honours abolished, and the house in which the strange event took place destroyed. Those politically hostile to James said that, with the help of the court, he invented the story of a plot by Queen Elizabeth in order to cover his own fault and his design to extirpate the Ruthven family. Some colour was given to the belief by the relentless severity with which James pursued the two younger and undoubtedly innocent brothers of the earl. They both fled to England at the time; but after the accession of James to the throne, one escaped abroad, while the other was imprisoned for nineteen years in the Tower of London. The event is amongst the unsolved enigmas of hist. See D. Calderwood, *History of the Kirk of Scotland* (Edinburgh), 1642-49, and A. Lang, *James VI. and the Gowrie Mystery*, 1902, and the authorities there cited.

Goya y Lucientes, Francisco José de (1746-1828), Sp. painter, b. at Fuendetodos in Aragón. His passion for painting was awakened by a monk of Santa Fd. near Saragossa, and at the age of sixteen he was admitted into the studio of José

Luxan Martinez. Here he participated in the quarrels of painters, and after one of these street fights had to flee to Madrid. He afterwards went to Italy and settled in Rome, where he met Louis David, but in 1771 returned to Spain. His work, like his career, is wild, but is very fine in execution, and his paintings include church pictures in fresco and in oil, portraits, etchings, and engravings. (i. was made *pintor de camera* by Charles IV. in 1799, and his portrait of Charles shows that he excelled in portraiture. 'The Caprices,' 'The Disasters of War,' and the thirty-three plates of scenes in the bull-ring are perhaps his best work. See lives by A. L. Meyer, 1924, and C. Poore, 1938; also *Goya: Drawings from the Prado* (introduced by A. Malraux), 1948.

Goya, tn. and port. of Corrientes, Argentine Republic, on the Rio Paraná. It was estab. in 1807 by Capt. G. It is served by the Central, Entre Rios, and N.E. railways and is a distributing centro for agric. products and timber. Pop. 19,000.

Goyana, or Goyanna, city of Brazil, in the prov. of Pernambuco. It is a trade centre for sugar, coffee, tobacco, rum, cattle, cotton, etc. The Dutch held possession of it from 1636 to 1661. Pop. about 53,000.

Goyaz, central state of Brazil, including all the ter. between the two branches of the Ita. Tocantins and Aragua, nearly the whole basin of the prin. one, from its origin, and the high valleys of the Parana-hyba-Parana. Its climate is sub-tropical, and the soil is not very productive, though tobacco is exported. Cattle-grazing is extensively carried on, and gold, iron, diamonds, mica, and copper are mined. Neither of the rvs. between which the state lies is navigable, so the only outlet for the state is by means of mule trains until the railways are extended from Sao Paulo and Minas Geraes. The cap. is Joyania, a mining tn. on the Rio Vermelho. It is the see of a bishopric and possesses a small cathedral. Pop. 28,200. State area 288,500 sq. m.; pop. 925,700.

Goyen, Jan van (1596-1656), Dutch painter, b. at Leyden. He spent the greater part of his life at The Hague, and in 1610 was elected a member of the Painters' Guild. He was one of the earliest of the Dutch landscape painters, and owing to the greatness of his colours, his sea and riv. pieces are the most valued. He also studied atmospheric effects in black and white.

Gozo Island, or Gozzo (anct. Gaulos), Brit. is. in the Mediterranean, 4 m. N.W. of Malta. It is 9 m. long and 4 1/2 m. wide, has an area of 26 sq. m., and is composed of coralline and globigerina limestone, with tracts of marl and blue clay. The chief tn. is Victoria (formerly Rabat) and on the S.E. coast is Fort Chambray. In the Second World War Ger. air raids the is. suffered a serious loss in the seventeenth-century (Giant's) Gorgion Tower. It was unique in the Maltese archipelago, and was of great interest with its many stone drop-boxes, heraldic shields, and slender domed staircase tower. It was completely obliterated in 1942 to make a

temporary landing-ground for aircraft. Pop. 22,500.

Gozzi, Count Carlo (1720-1806), It. dramatist, brother of Gasparo, b. at Venice. He was a member of the Gran-leschi Society, which was especially zealous to preserve the anct. It. literature, and became famous for his wit by the pub. of his satirical poem *Tarlatana degli influssi per l'anno bisestile* (1757) and his comedy *Fiaba dell' amore delle tre mclanranche* (1761). This latter, which was noted by the Sacchi company of players, was very successful, and led to the production of a series of dramatic pieces based on fairy-tales. Of these the best example perhaps is *Turandot, Princess of China* (1762), which was trans. by Schiller. (i. also trans. Calderon's dramas, and pub. his autobiography, which is very amusing. His dramas, though praised by such eminent men as Goethe, Simondoni, and Tieck, have long since disappeared from the stage, and are very scarce even in their printed form. See study, with bibliography, by E. Cestaro, 1932.

Gozzi, Count Gasparo (1713-86), It. poet and essayist, b. at Venice, brother of Carlo. His works are remarkable for the purity of their language and the elegance of their diction. His *Sermoni* are written in the style of Horace, and *Il Mondo morale* shows the wonderful organisation of a philosophical mind. His version of Lucan, too, is remarkable, and his *Disesa di Dante* puts him in the first rank among commentators. He also acquired great reputation by the pub. of *Osservazioni Veneziane*, a paper compiled in imitation of the *Spectator*. He spent some years of his life at Venice, where he was busy translating dramas (chiefly from the Fr.) for the Theatre Sant' Angelo, and he was also censor of the press in that city for a considerable period. See G. de Beauville, *Gasparo Gozzi, giornalista venetian du XI^{le} siècle*, 1937.

Gozzoli, Benozzo (1420-98), It. painter, b. at Florence. He was an assistant of Fra Angelico, and is chiefly famous for his work in fresco. His largest and most important piece was begun in 1469, and took sixteen years to accomplish. It consists of a series of twenty-four designs drawn from Bible hist., and is in the Campo Santo at Pisa. See study by H. Stokes, 1906.

G.P.U. (Gossudarstvennoye Politicheskoye Upravleniye), or Soviet State Political Dept., also called O.G.P.U. The Soviet secret police, organised after the Russian Revolution of 1917, to exterminate the opponents of the Communists. At that time it was known as the Tekhka, from the initials of its former title, Chrezvychaynaya Komissiya or Extraordinary Commission, which was designed, with wide powers, to combat political and economic counter-revolution, espionage, and brigandage in Russia, and, indeed, through propaganda and money, elsewhere. The chairman was a member of the council of people's commissaries of the union. The legality of the acts of the G.P.U. was controlled by the attorney-general of the Soviet under a decree of the

'Tsik' or central executive committee of the union. Like the Ger. Gestapo (q.v.) the (I.P.U. employed special methods to detect opposition, even to the extent of spying on the behaviour and utterances of the Russian pop. Later, when the Communists became divided against themselves, their activities were directed against the opponents of Stalin, particularly the followers of Leon Trotsky—even pursuing their victims abroad. They played a leading part in the party purges and political trials in 1936 and 1937, and controlled the forced labour camps in Russia. In 1936 they were renamed the N.K.V.D., and after the Second World War were divided into the M.G.B. and the M.V.D.

Graaf Reinnet, tn. in Cape Prov., S. Africa, about 58 m. from Middelburg. It is one of the oldest tns. in the colony, and is noted for its gardens, vineyards, and choice fruit. It is also the terminus of one of the railway lines from Port Elizabeth. Mohair and merino wool are produced in the dist. Pop.: European, 4800; others, 9000.

Grabbe, Christian Dietrich (1801-36), Ger. dramatist, b. at Detmold. He studied law at the univ. of Leipzig, but soon abandoned this to devote himself to literary work. In 1829 he determined to become an actor, and wrote the drama *Herzog Theodor von Gothland*. This was not really successful, and G. went to the univ. of Berlin and passed his advocate's examination in 1824. He afterwards practised as a lawyer in Detmold. He is remarkable for his poetic genius, and his dramas contain some very fine passages, but his work is marred by indelicacy. His best works are *Don Juan und Faust* (1829); *Friedrich Barbarossa* (1829); *Heinrich VI.* (1830); and *Napoleon, oder die Hundert Tage* (1831) which places the battle of Waterloo upon the stage. See A. Bergmann (*Grabbes Begegnungen mit Zeitgenossen*, 1930).

Gracchus, Caius Sempronius 159-121 B.C.), younger brother of Tiberius, and like him was an ardent reformer of the wrongs suffered by the people, but went much further than Tiberius. He served as quaestor in Sardinia for two years, and on his return in 124 stood for the tribunate and was elected, and re-elected at the end of 123. He at once began his reforms; he procured the exile of Popilius, the consul who had proceeded against his brother's followers, and proposed a law that all who had been deprived of any office by the people should in future be ineligible for any other office; this was aimed against his brother's opponent, Octavius. By these measures he revenged his brother's death. He next struck at the power of the Senate by enacting that the *iudices* should be chosen from the *eques*, not as before from the Senate, and that the Senate should decide the *prova*, which the *comitia* should have before their election. He also rearranged the whole taxation of the new prov. of Asia, and won over the Rom. mob by his corn law; by this enactment any citizen might every month buy of the State, at about half the cost price, sufficient corn for his own livelihood. To

relieve the economic distress he renewed his brother's agrarian law and set on foot a scheme of colonisation, and he also proposed that the franchise should be given to all Lat. communities, and that the rest of Italy should receive Lat. rights. This last was most unpopular, and the Senate induced Livius Drusus, another tribune, to come forward with extravagant proposals in the people's interest, proposals which could not possibly be fulfilled. The plot was successful; G. failed to secure re-election for 121; a riot followed in the Forum, and he was slain with 3000 of his followers. He was a great orator, and was the first of Rom. orators to employ violent action when speaking.

Gracchus, Tiberius Sempronius: 1. (c. 167-133 B.C.), brother of Caius and son of Cornelia, by whom he was trained after the death of his father. He was quaestor in Spain with the consul Mancinus in 137, and took part in the war with Numantia. In 133 he was elected tribune, and brought forward his agrarian law; it enacted that no person should have more than 500 jugera of land as his absolute property; that if he had more it should revert to the State and be portioned out in small lots at moderate rents to the poorer citizens. He also proposed to distribute the wealth of Attalus, king of Pergamum, which had just been bequeathed to Rome, among the recipients, to enable them to stock their land. The bill met with great opposition from the Senate and capitalists, but G. succeeded in getting it passed. He was killed by a mob of senators, headed by Scipio Nasica, when he was seeking re-election. 2. (c. 210-151 B.C.), father of the tribunes and husband of Cornelia, the daughter of Scipio Africanus the Elder. He was tribune in 187, and spoke on behalf of the Scipios when they were accused of bribery after the war with Syria. In 181 he went as praetor to Ulterior Spain, and won the respect and affection of the inhab. by his strict sense of justice. In 177 he was consul, and suppressed a revolt in Sardinia. In 169 he was censor and showed himself an opponent of the capitalists, and in 163 again consul. 3. (fl. third century B.C.). Distinguished himself in the second Punic war. In 215 he defeated the Carpuans, in 214 he was successful near Beneventum, and in 213 earned on war in Lucania. Here the next year he was betrayed into the hands of the Carthaginian Mago.

Grace, Edward Mills (1841-1911), Eng. cricketer, b. at Downend, near Bristol, third son of Dr. Henry Mills G. and elder brother of 'W. G.'—like whom he followed the medical profession. Played at Lord's first in 1861. In Australia 1863-1864. In great international match, 1880. A famous fielder at point. Four times married.

Grace, William Gilbert (1848-1915), Eng. cricketer, b. at Downend, near Bristol. His father, a Gloucestershire doctor and an enthusiastic cricketer, taught the game to his five sons and four daughters in the orchard of their Downend home. His son (W. G. junior) was also a keen player. G. became famous as a

cricketer at an early age, and played for S. Wales in 1864. He was very soon recognised as the best batsman in England, and took part in tours to Canada, the U.S.A., and Australia. His highest score in first class cricket was 344, while his highest aggregate for one season was 2739 made in 1871. He was also efficient as a bowler and took 192 wickets in 1875. By profession a doctor, he studied at St Bartholomew's Hospital London and in Edinburgh and practised in Bristol where he captained the Gloucestershire cricket team till 1899. In 1879 he received a testimonial of £1400 and in 1892 a further

W. G. GRACE

one of £2000. On the house where he was born is a simple tablet with the name, date of his birth and death and the words 'The World's Famous Cricketer, Father of International Games'. G was 5 ft 2½ in tall. He rode to hounds without beagling, but up a large practice was a doctor and smoked smoking and drank moderately. His biographies have never suggested that he was an intellectual. Indeed G considered reading a waste of time. In fact he lived largely for cricket from his youth and early toured Canada with an eleven. He pub *Cricket* in 1891 and also wrote *Cricketing Reminiscences* (1899) and *IV (The Little Book)* (1909). See B. Darwin *W. G. Grace* 1948.

Grace (Lat. *Gratia* (h. xps, favour). In Christian theology G conveys the notion of a favour or benefit, freely bestowed by God whose relations with the human race are distinguished into (1) those in which He acts as creator and sustainer of the universe and mankind in particular, (2) those in which He bestows

favours on us which are above our natural condition, and to which therefore we have no strict claim. It is to this latter class of God's benefits that G refers. In the N.T. it refers particularly to the act of redemption performed by Christ and to the application of that redemption to the individual. The precise manner in which it operates has been the subject of controversy among theologians. All agree on the necessity of G for the salvation of man as laid down by St Paul who combated the Jewish idea that salvation depended essentially on the observance of the Mosaic law. It is also generally granted that the first G called sanctifying or habitual G because it effects the regeneration of the soul is conferred by baptism. Those who have received this first G are said to be in a state of G. In opposition to this is distinguished actual G i.e. those moral benefits and helps to perform good actions which a man receives in the course of his life from God. The explanation of how this a. G concurs with the action of the free will has led to much controversy. At one extreme is the view of Pelagius (anglican Morgan, a native of Britain c. 400) who held that without the aid of G a man is perfectly able to fulfil the law of God and that of the Semi-Pelagians who taught that the first and last good actions or desires could be performed unaided by G. With the Reformers the tendency was in the other direction and Calvin made salvation depend entirely on divine G, largely to the exclusion of the human will. The position of Jansen (1638) was akin to this. Inside the Roman Catholic Church these diverse tendencies were represented by a Dominican school headed by Banez and a Jesuit school founded by Molina. The general sense of the controversy may be gathered from the decision of the papal tribunal known as the *Congregatio de Auxiliis* (1598-1607) which decreed that Jesuits should not call Dominicans Calvinists and Dominicans should not call Jesuits Pelagians. But the concurrence of G and free will remains among the thorniest questions in theology. It may be noted that the year of Grace means the date measured from the birth of Christ or Incarnation understood as the fountain head of all subsequent Gs. G is also used as the name of prayer before and after meals (Lat. *gratia* plural thanks). See I. Dorner *System of Christian Doctrine*, IV, 1886; J. Torrien *La Grace et la gloire* (2 vols.) 1907; van Noort, *De gratia Christi* 1908; J. Brunner *The Mystical and das W. at 1921*; J. Powers, *Actual Grace* 1924 and *Sanctifying Grace* 1930, and K. Barth *Gottesgnadenschaft* 1936.

Graces, cf. GRACIOUS.

Gracián, Baltasar (1601-58), Sp. writer b. at Belmonte. Little is known of his life, except that he was a Jesuit of Aragon. He is chiefly famous for having followed up the affective classicism which was popular in the seventeenth century under the name of Gongorism. His chief work was *Crithon* (1651-57), which is allegorical, and which has been compared with the *Pilgrim's Progress*. Most

of his books were not pub. under his own name. Other works of his are *Agudeza, y arte de ingenio* (a manual of rhetoric); *El Héroe* (1637), which describes the qualities of an ideal man; and *El Oráculo manual y arte de prudencia* (1647), a system of rules for the conduct of life; trans. into Eng. anonymously as *Courtier's Manual Oracle* (1684), and into Ger. by Schopenhauer (1862). See study by A. F. G. Bell, 1921. 302

Gradient of a railway is the rate at which it rises or falls above or below the horizontal, and is generally expressed in terms of the distance travelled to gain or lose one foot in height. The ruling G. of a section of railway is the steepest incline in that section, and is determined by the character of the country to be traversed, as well as by financial considerations. A moderate G. is 1 in 200, while 1 in 100 is heavy. The Great W., when laid out by Brunel, had a G. of 1 in 1320 for a long distance out of London, but later engineers improved on this. The maximum G. possible depends on the climate, a dry one being most favourable; the limit is about 1 in 10.

Grading and Conditioning. Grading is the action or process of sorting goods into grades according to their quality. Conditioning, in textile industry, especially the silk trade, is the process of determining the quality and net weight of the raw material when freed from moisture and impurities, a testing of the condition of silk, yarns, or other articles. A 'conditioning house' is an estab. where such materials may be prepared and arranged and sampled at fixed charges, and an official warranty as to their condition be obtained. The term grading is also applied to foods of various kinds, such as milk, jams, etc. In some cases definitions of grading standards have been provided by statute.

Graduation, process of dividing any given scale, straight or circular, into a given number of parts. As the whole accuracy of an observation with any instrument depends primarily on the correctness of the scale in use, extremely accurate G. is an essential. It was probably the advance of astronomy that first called for a special study of this subject in comparatively recent times, and the first really important attempt to obtain special accuracy occurred in the early part of the eighteenth century. To-day the very wide use of sextants, surveying, and astronomical instruments has demanded a very high state of perfection. Much of the work now is done by copying an accurate scale by machine, but as the copy itself has first to be constructed, it is well to deal first with *original* G. The scales in use are of three kinds: straight, arcs of circles, and complete circles; and in the last two cases the G. is in degrees and fractions of a degree. In nearly all cases, so far as is possible, the method of continual bisection is adopted. By the methods of pure geometry it is possible to bisect an arc, and to divide a line into any given number of parts, but in actual practice these are found to be far

too clumsy and inaccurate. In graduating a straight scale, the whole length is accurately laid down, and is then bisected as follows: Any arc as nearly as possible equal to half the length is laid off from each end (by means of a beam compass), and if the marks coincide the middle point is found; but if not, as is nearly always the case, the short distance is bisected accurately by hand with the help of a lens. Each part in turn is then bisected, and so on. If necessary the subdivisions in their turn must be bisected or quinquesectioned until the required marks are obtained. An alternative method is known as 'stepping,' by which the required div. is taken and marked off successively by the use of spring dividers. Obviously if any error is made in the original div., this is multiplied at each successive div. The points may, however, each be altered by use of a dividing punch, but much alteration is very undesirable.

The G. of circular arcs employs the same method. The arc of the circle itself on which the graduations are to be made is first laid down, and an arc of the same radius laid off along it to give 60°. This is bisected, giving 30°, and half the arc laid off on the other side of 60°, giving 90°. Each div. is bisected, then trisected, giving marks of 5°. Each is quinquesectioned, giving single degrees, and each degree is twice bisected and then trisected, giving twelfths of a degree. In some cases a second scale has been graduated on an arc concentric with the first, and divided entirely by continual bisection, to act as a check. In graduating an entire circumference additional tests of accuracy may be made. Troughton first of all constructed a roller whose circumference was exactly one-sixteenth of the given circumference. The circumference of the roller was divided accurately into sixteen parts. The roller was fixed to the work by means of a framework which allowed it to be rolled round the circumference without slipping. As each div. of the roller came in contact with the work, a point was marked by the help of microscopes; and by this means the whole circumference was divided into 256 equal parts. The error of each point was then tested and finally corrected by means of microscopes with cross wires moved by screw heads at points diametrically opposite. Each of the 256 divs. was then divided into 16 equal parts with the subdividing sector, so that each final div. measured one-twelfth of a degree. When once an original scale is made, copying may be done by hand or machine. If a straight scale is to be exactly copied, it is firmly clamped to the work, the dividing square is laid across, and the marks made by means of the dividing knife. If necessary the new scale may be made proportionally larger or smaller by fixing it at an angle to the copy. The dividing square is then applied to the copy and notches made, the divs. being finally marked with the knife by applying the square to the new scale. In a similar way a circular scale may be copied. The copy is known as the dividing plate, and is provided with a

movable radius. But most copying at the present day is done by a machine known as the dividing machine. The new scale is firmly affixed to the dividing plate and made concentric with it. The dividing plate is then turned mechanically through small angles successively being stopped accurately by means of a tangent screw at each div. At each stop the dividing knife moving along a radius of the dividing plate, cuts a new div., and thus the new scale is quickly and accurately made. The machines at present in use contain one improvement due to Simon, by which the copying is done with greater accuracy from a large circle to a smaller one.

Gradus ad Parnassum (a step to Parnassus), dictionary either Lat. or Gk. in which the quantities of the vowels are marked. It contains synonyms and poetical expressions and extracts and is most useful to students for verse composition. The first Lat. gradus was pub. in 1702 and was the work of the Jesuit Paul Aler.

Graeco-Turkish War (1921-22). This war arose out of the Turkish refusal to accept that term of the treaty of Sévres (qv) which purported to mandate Smyrna to Greece. Mustafa Kemal (qv) after the Allies had signed the treaty (Aug. 10, 1920) set up a *de facto* Nationalist gov. at Angora and it once made preparations for war with Greece whose forces were in occupation in Asia Minor under Gen. Parnassopoulos. After the First World War Venizelos cherished dreams of a Magna Graecia extending over a large part of Asia Minor and the is. off the W. coast of that country, and he relied to some extent on the moral and even material support of Great Britain for the realisation of this ambition. Kemal on the other hand was encouraged by the Franklyn Bouillon agreement of Oct. 1921 to rely on the moral support of France particularly as the somewhat mysterious Franklyn Bouillon had evidently acted in a semi-official capacity in lending aid to the Turks in the shape of arms. Much had been accomplished by Venizelos after the fall of King Constantine to improve the organisation of the Gk. Army in Asia Minor but his power was largely owing to the traditional love of the Gk. people for their dynasty and after the death of King Alexander in 1920 Venizelos failed to secure a majority at the general election, notwithstanding the notorious fact that Gen. Parnassopoulos was in favour of further military intervention on his behalf and worked to secure a Venizelist majority in the polling at the front. When King Constantine returned in 1920 to the throne, he restricted to the Gk. Army the officers who had been loyal to himself but retained also the pro-Venizelist officers, the result was that the Gk. Army was divided in its aims as well as in its political sympathies. It was the state of things in 1921 when on March 23, the Gks. launched their offensive in Asia Minor. At first the offensive seemed to meet with a fair measure of success. In April, however, the Gks. were defeated

near Eskishehr and withdrew towards Ushak. The offensive was resumed from Ushak and Itrusa in July and on the 20th the Gk. forces were back again in Eskishehr. The Turks made a strategic retreat to the Salaria R., ostensibly to defend their new cap. Angora, the Gks. continued to advance but hesitation subsequently marked their further movement and the Turks turning on them in Sept. heavily defeated them. The Gks. then retired on Eskishehr once again and succeeded in repelling several Turkish attacks at Afion, Katakissai, and Ort. Winter having set in the situation remained quiet for over seven months during which time Kemal completely reorganised his army and on July 26, 1922 a general Turkish offensive was begun. Throughout Aug. and Sept. the Gks. were in headlong flight. Smyrna was evacuated by the Gk. garrison in the latter month and was then burned by the Turks (Sept. 13). Complications might have ensued at Chank and Ismid with the Brit. forces under Sir Charles Harington (qv) but the Mudania Convention or armistice between Sir Charles Harington for the Allies, and Kemal averted further war (Oct. 1922). Discussions between the Allies and Turkey were protracted and it was not until July 24, 1923 that the treaty of Lausanne was signed which *inter alia* recognised Turkey's right to Asia Minor. Much light is thrown on the pitch of mobilisation to which the Gk. Army had fallen in 1921 by the hist., *Ionian Disaster: the Greek Army in Asia Minor in 1921* by Prince Andrew of Greece (1930).

Graetz, Heinrich (1817-91) Ger. historian b. in Posen. He went to Breslau in 1842 where he met the leader of Jewish reform, Abuhaim (qv) and was much opposed to his teaching. He himself advocated freedom of thought but did not see the necessity for freedom of ritual. He became famous by the pub. of his hist. of the Jews in 1853 which produced a greater sensation than any other Jewish book of the nineteenth century and he was recognised as a master of Jewish hist. The book is the work of genius though it is often biased in his views and lacking in sympathy. His *Geschichte der Juden* was completed in 1871 and has been trans. into many languages.

Graevius, Johann Georg (1632-1703), Ger. classical scholar b. at Nuremberg, Saxony. He was historiographer royal to William III. He pub. eds. of Cicero, Hesiod, Lucan, Suetonius, Catullus, and *Theophrastus antiquitatum Romanarum* (1694-99) etc.

Graf, Arturo (1848-1913) It. scholar and poet, b. at Athens though of Ger. descent. He was one of the founders of the *Giornal storico della letteratura italiana*, and is chiefly famous for his poetry. His poems are contained in *Versi* (1874), *Poesie e novelle* (1876), *Medusa* (1880 and 1890), *Dopo il tramonto versi* (1893), *Le Pandure* (1897), *Morgana* (1901), and *Poemetti drammatici* (1901), sev. of which have been set to music. His prose works include an

important work on *Foscola, Manzoni e Leopardi* (1898).

Grafteneire, see COMBIN, GRAND.

Grafy, Charles (b. 1862), Amer. sculptor, b. Dec. 3, at Philadelphia, son of Charles G. Educated: Pennsylvania Academy of Fine Arts under Thomas Eakins; in Paris under Chapu and Dampet. Returned to Philadelphia. Works: portrait busts; also life-size and colossal figures; ideal figures and groups—largely in bronze. e.g. 'Fountain of Man,' Buffalo Exposition (1901);

contact with those of the stock. G. is useful for various purposes, such as the rapid increase of varieties (e.g. roses), propagation of desired varieties on modifying stocks (e.g. fruit-trees), propagation of plant mutations or sports (e.g. fastigate and weeping trees), imposing a desired variety upon an unwanted one, etc. The practice is old. Virgil discusses it in his *Eclogues*. The methods are many. To succeed, the plant parts to be grafted must be from closely related species of the same

GRAFTING

1. scion (left), stock prepared; 2. scion and stock prepared; 3. bud; 4. stub; 5. scion.

'Symbol of Life' (small bronze); 'Mauvais Présage,' Detroit Museum; 'Vulture of War,' St. Louis Museum; 'England' and 'France,' New York Custom House; Gen. Reynolds Smith Memorial, Philadelphia. 'Graf Spee, Admiral,' see 'ADMIRAL GRAF SPEE.'

Grafting, gardening technique of vegetative propagation whereby a portion (the scion) of one plant is caused to grow on a root system (the stock) of another, to build a composite individual plant. The scion may be a single bud, a piece of bark including a bud, or a shoot or twig. The stock may be a stump of main stem, a branch, or a whole tree. In all cases the essential point for success is to bring the inner bark tissues or green, slimy cambium layers of cells of the scion into intimate

contact with those of the stock. G. is useful for various purposes, such as the rapid increase of varieties (e.g. roses), propagation of desired varieties on modifying stocks (e.g. fruit-trees), propagation of plant mutations or sports (e.g. fastigate and weeping trees), imposing a desired variety upon an unwanted one, etc. The practice is old. Virgil discusses it in his *Eclogues*. The methods are many. To succeed, the plant parts to be grafted must be from closely related species of the same genus. Even then some varieties are incompatible and do not 'take' on the chosen stock. G. by budding is usually done in July-Aug. A bud is cut with a sliver of bark from a well-grown, well-ripened shoot of the current season's wood of the chosen variety. A T cut is then made in the bark of the stock where the bud is to be inserted, the edges of the bark eased loose with a knife blade, and the bud slipped into position, securely tied and bound above and below with raffia, which is removed later when the bud has 'taken.' In Jan. the stock is cut down to about 6-8 in. above the bud. G. with shoots or slips is done in spring (March-April) when sap is rising. Grafts should consist of hard, well-ripened shoots of 1-2-year-old wood, preferably 1 year, cut in Nov.

and kept moist by being buried in a spade slit in a cool, shady part of the garden. The most popular methods of G. are: Rind G., where the stock is prepared by sawing and smoothing the branch, and making a vertical slit in the bark into which the freshly cut tapered end of the scion will fit snugly with cambiums in close contact. Cleft G., in which the stock is split and tapered scions fitted at each side into the split with their outer bark tissues coinciding with those of the stock. Bark G., where an angle of bark is lifted from the branch of the stock to admit a slender wedge-ended scion, fastened in place with a brad. Stub G., in which a side shoot on the stock is bent down and a cut made close to the junction of the shoot with a main branch, and into which a wedge-shaped scion is then pushed, the surplus end of the shoot being cut off. Saddle G., in which the stock is cut to a wedge and a scion of equal thickness is cut to cap it. Bridge G., chiefly used to remedy bark damage, wherein scions are prepared at both ends to slip under living bark above and below the damaged area. Tongue, whip, and shoulder Gs. are more elaborate methods of preparing stocks and scions to increase the area of contact and likelihood of success. By Approach G. or in-arching, the shoots of two plants growing in proximity can be brought together and united before the scion part is severed from its parent. This technique is useful to repair extensive bark damage to a cherished tree or to unite scions to stocks which cannot be easily grafted in the normal ways. Whatever method of G. is used, the united parts should be closely fastened together with raffia or adhesive tape and air excluded from the points of contact by smearing with G. wax or a mixture of fresh cow manure, finely chopped hay, and clay. By June or July the grafts will have taken hold and ties should be cut.

Grafting, Skin, see under SKIN.

Grafton, Augustus Henry Fitzroy, Duke of (1735-1811), politician, was a descendant of Charles II. Educated at Westminster and Cambridge, he entered Parliament in 1756, where, as Horace Walpole explains, he rose into prominence with an almost meteoric rapidity. His early promise, however, was hardly fulfilled and he is now chiefly remembered for his prudent insistence on the folly of retaining the tea and other duties levied on the Amer. colonies in the face of so sturdy an opposition. First lord of the treasury in Chatham's ministry of 1766, he became Prime Minister in the following year as the result of his leader's incapacity. But his conciliatory policy towards America was unpopular, and in 1770, after being the butt of Junius's thunders, he was glad to retire from his uncomfortable pedestal and to pursue at leisure his private amours and distractions.

Grafton, Richard (d. 1772), chronicler and printer, collaborated with Whitechurch in 1537 to produce a modified version of Coverdale's Bible, and in the following year departed to Paris in the company of Coverdale to print a revised version of the

same work. But the Inquisition pronounced the book heretical, and G. was obliged precipitately to flee to England, where he completed his task in 1539. In 1544 G. and Whitechurch obtained the monopoly for printing church service books, and at Edward VI.'s accession G. became king's printer. A number of the works he printed, including a continuation of Hardyng's *Chronicle* (1543) and Hall's *Union of the Families of Lancaster and York* (1548), have come down to us, and also some of his original and contemporary commentaries.

Grafton: 1. Riv. port on both sides of the Clarence R., 342 in. N.E. of Sydney by sea, and connected by rail with Brisbane, etc., in Clarence co., New S. Wales, Australia. Sea-going vessels of moderate burden can reach the city, which has an extensive shipping trade with Sydney. It has both Anglican and Rom. Catholic cathedrals, and is commercially important as the centre of a fertile agric. country. Pop. of G. and S. G., 11,000. 2. Town-ship, connected by rail with New York, Hartford, Boston, etc., 6 m. S.E. by S. of Worcester, in Worcester co., Massachusetts, U.S.A. Pop. 7100. 3. Tn. with machinery, foundry, and glass works, on the Tygart, 100 m. by rail S.E. of Wheeling, in Taylor co., of which it is the cap., W. Virginia, U.S.A. Coal-mines are at hand. Pop. 7100.

Graf Zeppelin, two Ger. airships and an aircraft carrier. The first G. Z. airship (LZ 127) was successful commercially, flying a regular service to S. America between 1932 and 1936. It made the first flight round the world in 1929, and went to the N. Pole in 1931: 772 ft. long, its five engines produced a speed of 80 m.p.h. The second launched in 1938, never came into commercial use owing to the outbreak of war. The aircraft carrier was launched in 1938 but never finished.

Graham, name of an anc. and illustrious Scottish family. The 'gallant Grahams,' as they are styled in the ballads, were Anglo-Normans who settled in Scotland during the twelfth century. 'The hardy wight and wise' Sir John de G. of Dundaff was a boon companion of Wallace, and was slain in the battle of Falkirk (1298). King Robert Bruce rewarded the loyalty of Sir David G. by granting him the estate of Auld Montrose in exchange for Cardross, and it is from this estate that the title of earl of Montrose was taken, a title first conferred on Wm. G. in 1504 as a recognition of his services at Sauchieburn (1488) and elsewhere, for all the Gs. of this period were great warriors. This Wm. was one of the 'flower of Flodden' who fell with the king, his master. The great Montrose (*see* MONTROSE), who was the fifth earl and first marquess, was the grandson of a distinguished G. who had been lord chancellor (1599) and viceroy of Scotland, whilst his own son was always called the 'good Montrose,' because of his gentle and peace-loving nature. The fourth marquess (d. 1742), like his famous forbear, won numerous honours. An eager upholder of the Union, he was created a duke in

1707, and in George I.'s reign became secretary of state (1717) and also chancellor of Glasgow Univ., an office held by his equally distinguished grandson, the third duke (d. 1836). Among his 'splendid employments,' which were legion, were the office of paymaster of the forces, master of the horse, lord justice-general of Scotland, and of president of the Board of Trade. Throughout his public life he followed Wm. Pitt. His son (d. 1874) was postmaster-general, and his grandson, the fifth duke (d. 1925), served in the S. African war, and from 1890 was lord clerk registrar of Scotland.

Graham, Sir Gerald (1831-99), Brit. general, entered the Royal Engineers in 1850. During the Crimean war his courage at the storming of the Redan won for him the Victoria Cross. In 1884, as commander in the E. Sudan, he was victorious at El Teb and Tamai, and the following year defeated the Arabs at Hoshi and Tamai.

Graham, Sir Hugh, see ATHOLSTAN, BARON.

Graham, James, see MONTROSE, MARQUESS OF.

Graham, John, Viscount Dundee, see DUNDEE, VISCOUNT.

Graham, Robert, often called Cunningham-Graham (d. c. 1797), Scottish poet, the son of Nicholas G. of Gartmore, was educated at Glasgow Univ. He went out to Jamaica and became receiver-general. In 1785 he was appointed rector of Glasgow Univ., and from 1794 to 1796 was M.P. for Stirlingshire. He was a keen Liberal and was an adherent of the principles of the Fr. Revolution. G. is chiefly remembered for his poem *If Doughty Deeds my Lady please*.

Graham, Robert (1786-1815), Scottish botanist; studied medicine at the Glasgow and Edinburgh Univs., and practised in the former tn. As a doctor he had great faith in the efficacy of drugs, such as opium and calomel, but he made his name as a botanical enthusiast, and occupied from 1820 till his death the regius professorship of that science in his native metropolis. His descriptions of newly discovered species appeared in the *Edinburgh New Philosophical Magazine*, etc., but it was in his supervision of the Edinburgh Botanic Garden that he made his influence most widely felt.

Graham, Stephen (b. 1881), Eng. novelist and travel writer. Began career as a clerk in the civil service; lived in Little Russia and Moscow among students and peasants to study at first hand the conditions of life there. In the First World War he served as a private in the Scots Guards, and the sequel to this service was the much-discussed novel *Private in the Guards* (1919), which purports to reflect the degrading influence of military discipline. His other pubs. include *A Vagabond in the Caucasus* (1911); *Undiscovered Russia* (1913); *With Poor Emigrants to America* (1914); *Children of the Slaves* (1920); *London Nights* (1925); *The Gentle Art of Tramping* (1927); *Stalin: an Impartial Study* (1931); *Life of Ivan the Terrible* (1932); *Boris Godunov* (1933); *A*

Life of Alexander II., Tsar of Russia (1935); and *From War to War* (1940).

Graham, Thomas (1748-1843), see LYNECOCK, LORD.

Graham, Thomas (1805-69), Scottish chemist, led an exceptionally full and busy life, and yet found time to follow up a number of most valuable and original researches in his chosen science, chem. From 1837 to 1855 he was prof. of chem. at Univ. College, London, having already held, for seven years, a similar post at the Andersonian Institution of Glasgow. The most exacting of his public appointments, however, was his mastership of the mint, which he accepted in 1855 and retained till his death. It was G. who discovered the famous law of the diffusion of gases, and it was he also who estab. the polybasic nature of phosphoric acid and the formation with alcohol of certain definite salts, which he called alcoates, and which he observed were analogous to water-salts or hydrates. G. further examined the diffusibility of liquids, dividing them into crystalloids and colloids, the properties of the water of crystallisation of salts, and the passage of gases through small apertures, platinum disks, palladium, and india-rubber partitions, etc. Honours fell thick and fast upon him; his fellowship of the Royal Society dates from 1836, and he was first president both of the London Chemical (1841) and Cavendish (1846) Societies.

Grahame, Kenneth (1859-1932), Scots novelist and writer, b. in Edinburgh. Educated at St. Edward's School, Oxford, he was a secretary in the Bank of England, 1894-1908. In 1890 he pub. a satirical story, *The Headsoman. The Golden Age* (1895), a delicate story of childhood, achieved much popularity, but he is more famed for *The Wind in the Willows* (1908), a story of animals, treated as human beings, as popular with adults as with children, for whom it was written. (A. A. Milne dramatised it in 1930 as *Toad of Toad Hall*.) He also wrote *Dream Days* (1908), *See P. Chalmers, Life and Letters*, 1933.

Grahame-White, Claude (b. 1879), Brit. aviator; was educated at Crondall House College and Bedford Grammar School. He was one of the first men in England to own a petrol-driven car; and, after touring in S. Africa, he estab. a motor engineering business in Albemarle St. In 1910 he opened an aviation school at Pau, and also won the Gordon Bennett trophy. Later in the same year he estab. his works and school of flying at the London aerodrome, Hendon. Flight-commander, 1914. His company's premises and plant at Hendon were acquired by the gov. in 1925. In addition to pubs. in magazines, etc., he has written *The Aeroplane, Past, Present, and Future* (1911); *The Aeroplane in War and Aviation* (1912); *Learning to Fly* (1914); *Aircraft in the Great War* (1915); *Air Power* (1917); *Our First Airways* (1918); *Flying, an Epitome and a Forecast* (1930); and sev. air books for boys.

Graham Land, Antarctica, icebound tract consisting of two large and numerous

smaller is, included in the Brit crown colony of the Falkland Is. It is almost completely destitute of plant life. An expedition of research under the explorer Rymill went out to the area in 1935, and another expedition went out in 1936-37.

Graham's Dyke, Rom wall extending between the fiths of Forth and Clyde.

Grahamston, small town N of Falkirk in Strathgairn, Scotland. Pop. 9000.

Grahamstown, 1. Cap of the dist of Albany, 106 m N.E. by rail of Port Elizabeth on the railway to Kimberley in the E. of Cape Prov., S. Africa. It lies 28 m from the coast and stands 1776 ft above sea level in a healthy and pleasant situation, and was named after (Col. Graham, who in 1812, defended the region from the Kaffir invasions. It is one of the prin. educational centres in the Union of S. Africa and Rhodes Univ. College represents an active intellectual life and there is a teachers' training college, the gov. veterinary laboratory, gov. herb.arium, and the S. African library for the blind. There are sev. good schools and both Anglican and Roman Catholic cathedrals. It is the centre of a large agricultural area. Pop. 22,800. 2. G. or Thames, a gold mining centre 46 m E.S.E. of Auckland, in Thames Co., N. Is., New Zealand. Pop. 6000.

Graian Alps, range of the W. Alps forming a boundary between Piedmont and Savoy, reaching northward to the Col de la Seigne. The highest summit (Gran Paradiso) (1320 ft) rises S. of Aosta in Italy.

Grail, *Grail* (probably from Low Lat. *gradalis*, *gradulus* a kind of vase or from Modern Lat. *water crackle* a bowl) vessel from which Christ drank at the Last Supper and wherein the precious blood of the Saviour was received on the day that He was put on rood and crucified by Joseph of Arimathea in whose family the sacred vessel was religiously preserved.

According to legend the G. was taken by Joseph or his descendants to Britain. It possessed mystic properties, being able to multiply bread to feed those who were free from sin to strike blind by its splendor all those who not being pure, yet looked upon it or to strike them with dumbness. The tocs of the miracles which occurred in its presence, and of its quest after its mysterious disappearance throughout Christendom abound in the romances of the history of the Middle Ages. Most of them have their origin in the Anglo-Norman romances, oral or written, belonging to the Arthurian cycle. The G. first appears bound up with the story of *Perceval le Galois* or *Peredur*, as he is called in Welsh. *Perceval* had been brought up by his widowed mother in complete ignorance of chivalry, but by accident he sees some knights in armour whereupon he becomes a knight errant and goes to the court of the Fisher King, the then guardian of the G. He sees the sacred vessel, but, failing to put some mysterious question, great trouble ensues, and the G. disappears. A great sorrow is befallen in the land of Iste through a young knight that was harboured in the

hostel of the rich King Fisher, for that the most Holy Grail appeared to him and the Lance whereof the point runneth of blood, yet never asked he to whom was served thereof nor whence it came, and for that he asked it not are all the lands commoved to war, nor no knight meeteth other in the forest, but he turneth upon him and slayeth him. Later Galahad plays the most important part in its quest. He, Perceval, and Bors are the only knights to whom a vision of the G. was vouchsafed. The following are the sources of the G. legend: (1) the incomplete *Conte del Graal*, written by Christian de Troyes (d. c. 1195), (2) the *Parzival* of the Gt. Wolf ram von Eschenbach (c. 1210) founded upon the former, and continuing it, (3) the trilogy *Joseph d'Armathe Merlin, Perceval* of the franc. romances poet Robert de Boron, who attached the legend to the Breton cycle about the beginning of the thirteenth century, (4) the *Queste du Saint Graal*, of unknown authorship but attributed in a later form to Gautier Map.

(5) the *Saint Graal* (c. 1230), in prose founded on Boron's poems, (6) the *Mabinogi of Peredur*, a Welsh prose version of the fourteenth century, and (7) *Sur Perceval de Galles* (c. 1440), an Eng. poem. The story began to be popular in England with the printing by Caxton in 1485 of Malory's *Morte d'Arthur* founded on the *Queste du Saint Graal* and Pennycuik, in the nineteenth century, created widespread enthusiasm for the romances of the Arthurian cycle in his *Idylls of the King*. Wagner's *Parzifal* draws its inspiration from the same source. See G. Paris, *Littérature française au moyen-âge* 1898; Newell, *King Arthur and the Round Table* (Boston) 1897; Jessie Weston, *Legend of St. Perceval* (vol. xvii), 1906; A. Birch, *Illustrations of the Sage rom. Graal* 1877; *The Holy History of the Holy Grail* 1898 trans. from *Perceval le Galois* by Sebastian Evans (Everyman's Library), and L. Rolt Wheeler, *Mystic Gleams from the Holy Grail*, 1949.

Grain, name of the smallest unit of weight both in England and the U.S.A. The origin of the use of the word in this sense is supposed to be that it represents the weight of one G. of wheat. Regarding the G. as fractions of a pound the word dupons G. and the Troy G.

Grainger, Percy Aldridge (b. 1892), Australian pianist and composer, b. at Brighton, Victoria. From 1911, he has lived mostly in the U.S.A., of which he is now a citizen. Studied under Busoni. Became an intimate friend of Grieg in London in 1906 and later played Grieg's concerto at Leeds Festival at that composer's request. Performed in New York for the first time in 1915, since when he has been identified with Amer. musical activities. As a composer and pianist G. introduced many of his own works at the prin. concerts in London and in America, and also did much to spread the works of Debussy, Ravel, Albeniz, etc., and other modern composers. In the *Journal of the Folk-Song Society* (May 1908, No. 12) he pub. a collection of Brit. folk-tunes which have become the bases of many of his

compositions. In 1935 he applied the proceeds of a tour in Australia to the founding of a G. museum, of wide cultural range, in the grounds of Melbourne Univ.

Works: (orchestral) *Molly on the Shore*, *Shepherd's Hey*, *Irish Tune from County Derry*, *Hill Songs*, *Marching Song of Democracy*, *Sir Eglamore Brag Fair*, *Morning Song on the Jungle*, and *Tiger*, *Tiger*. See study by D. O. Parker, 1918.

Graining, species of dace thought by Günther to be merely a local variety, but elevated by Pennant and Yarrell into a distinct species called *Leuciscus lancastriensis*, because G. are found in the Mersey.

Gram, see CHICK-PEA.

Gramineæ, large order of plants containing grasses. It is a monocotyledonous order characterised by having leaves which are alternate and usually linear, with a long split sheath enclosing the stem; the nodes are prominent, the internodes long and hollow. The flowers, often unisexual, have no perianth, but are enclosed by bracts, termed paleæ, and are arranged in complicated inflorescences. Cereals are fruits of this family. Among the better known genera are *Saccharum*, the sugar-cane; *Zea Mays*, the maize; *Oryza*, the rice; *Avena*, the oat; *Briza*, the quaking grass; *Cynodon*, the pampas-grass; *Triticum*, the wheat; *Hordeum*, the barley; *Bambusa*, the bamboo, etc. See GRASSES.

Grammar (Gk. *γραμμα*, letter; *γραφειν*, to write) treats of the usage of a word and of combinations of words in a language. It is an exposition of, or a treatise on, a language as it is customarily spoken among a particular people. Its function is to teach what is, not what ought to be, spoken. The first Gs. were written by the Sophists of anc. Greece, who studied the G. of their language primarily for the purpose of discovering the rules that govern the art of rhetoric. They first distinguished between the noun (*ονομα*) and the verb (*ρημα*), which together form the basis of the G. of every language. Protagoras made a further advance upon the study of the language by marking the distinction between the three genders, masculine, feminine, and neuter, and between the various verbal moods. It was Aristotle who introduced the word *πρως*, case, using it to denote any flexion whatever. Later the Stoics confined case to nouns. Thus the elements of G. were set forth and the parts of speech defined.

The second impetus given to the study of G. was due to the desire of studying a language unintelligible except with the aid of glosses and vocabularies. During the second century B.C. Alexandria was the literary centre of Greece. In that city there flourished many scholars, but there was a lack of any creative original talent. The Alexandrians consequently applied themselves to the study of the great poets of an earlier time. The Gk. language having changed in certain ways during the intervening centuries the language had to be studied in order that the poetry might be understood. Thus there grew up in Alexandria various

schools of grammarians, who studied the language of anc. Greece. Among these were Zenodotus, a native of Ephesus, the superintendent of the great library, Alexander the Ætolian, and Lycophron the Chalcidian, who were employed by Ptolemy Philadelphus about 200 B.C. to revise the Gk. poets. Later there were two distinct schools of grammarians, known as the Analogists and the Anomalists. The former was founded by Aristarchus of Samothrace (c. 220-144 B.C.), a pupil of Aristophanes of Byzantium. This school upheld the law of analogy between the idea and the word, whereas the Anomalist denied the existence of rules except in so far as they were proved by custom and practice. Among the latter were numbered Crates of Mallus in Cilicia, who founded the famous school of G. at Pergamus. His pub. a commentary on Homer in opposition to the ed. of Aristarchus. His was the first formal Gk. G. In the following century the Romans used the Gk. Gs. of the Alexandrians; then, in comparing their own language Lat. with Gk., they came to write Lat. Gs. The Lat. G. books were modelled on that of Dionysius Thrax, an analogist. The Romans were obliged to modify and to enlarge upon existing definitions, to suit their own case. For example, a Lat. noun has one more case than a Gk. noun, namely, the ablative case, which was first defined by Julius Caesar in his *De Analogia*. The most famous grammarian of later Rome was Donatus, the teacher of St. Jerome. He lived in the fourth century A.D. The treatise formerly attributed to him on Lat. G. has formed the basis of most books on that subject, from his own time up to the present day.

Formal G. comprises morphology and syntax. Morphology treats of the forms of a language, the modifications of such forms, and the treatment of inflections, etc. In order to classify different branches of linguistic knowledge, definite nomenclature is indispensable, but has always been variable; continental grammarians are continually proposing new sets of names for even the parts of speech. Most of the common names used in Eng. G. books are derived through the Lat. from the Gk.; the Rom. grammarians using, translating or mistranslating the Gk. names as they found them in Alexandrian G. books. Morphology also deals with the various parts of speech, which, according to most Eng. grammarians, are eight in number: noun or substantive, pronoun, adjective, verb or predicate, adverb, preposition, conjunction, and interjection; and with the classifications and inflections of these. Many grammarians do not recognise the interjection as belonging to the so-called parts of speech, arguing that it can form no part of a sentence, and is nothing more than an articulated gesture. Morphology is closely related with etymology and phonology, for the classification and analysis of a word depends largely upon its stem and its form. It is also connected with accentuation and orthography in so far as the grammatical meaning of words is affected by a change

of accent or of spelling, as, for example, in inflect (noun) and incline (verb), and practice (noun) and practise (verb). Morphology treats of the form and structure of single words, whereas syntax treats of words in relation to other words, that is, of the arrangement of words into sentences according to the established usages of a language. Syntax is generally similar in languages belonging to the same family, though each has, of course, its own idioms. In an inflectional language like Lat. less depends on the arrangement of words as their meaning is made clear by the inflectional endings. In an uninflectional language like Eng. there must exist certain laws of position, which show the meaning of a word. For example, the word sleep might denote an action or a state, that is to say, it might be a verb or a noun; its meaning is made clear by its relation in a sentence to other words. Eng. syntax is usually taught in schools by means of analysing and parsing. Analysis is the differentiation of types of sentences and the resolution of a sentence, whether 'simple' or 'compound,' into its component parts, whereas parsing is assigning each word in the sentence to its class as a part of speech and showing its syntactical relation towards other words in the sentence.

The rules of grammar depend upon the common practices of people, and, if these practices change, the rules become modified by the consent of the majority. The rules of Modern Eng. G. are very different from the rules of O.E. G. By a continuous process of monophthongisation, Eng. has ceased to be an inflectional language. But in order to understand fully the G. of Modern Eng., the grammarian must study the change and development of O.E. through the Middle into Modern Eng. Moreover, a language has, in a sense, as many Gs. as it has dialects. O.E. had various forms, W. Saxon, Mercian, Kentish, Northumbrian, etc., the influence of the court of Alfred making W. Saxon the chief literary form. In the Middle Ages the chief dialects were E. Midland, W. Midland, N., Kentish, and S.W. Through the influence of the works of Chaucer, Eng. as now spoken and written by educated men, is a development of E. Midland. This particular dialect of Eng. has become prevalent among Eng.-speaking people all over the world, and by English G. in common parlance we mean an exposition of that language as it is used by educated people. But, nevertheless, the dialects of Middle Eng. still exist in a modified form among the more unsophisticated inhab. of Scotland, Lancashire, Somersetshire, etc. The vocabulary, use of forms of speech, and construction of sentences differ in different cos. What is grammatical to an Irish peasant would be unintelligible to a Cornish fisherman. When G. treats of the different usages of a language in different places and at different periods of time, it is known as *historical G.* Historical G. can only be studied by consulting older records and inscriptions. The G. of a language can only be traced as far back as documentary evidence permits,

and can only be continuous in a language where a succession of written records exists. The grammarian may, however, reconstruct one language by comparing its forms with those of cognate languages. Thus by comparing O.E. with Gothic and Old High Ger., and these in turn with Lat. and Gk., he would obtain some idea of the hypothetical forms of Primitive and Indo-Germanic, from which those languages are derived. This is known as the comparative method, and the system which regards one language in relation with other languages of the same family is known as *comparative G.* The object of *universal G.*, which has been called the 'metaphysics of language,' is, by comparing the Gs. of different families or groups of languages, to arrive at some knowledge of the ideas that underlie all G.

Grammaticus, see **SAXO**.

Gramme (from Late Lat. from Gk. *gramma*, small weight), standard unit of Fr. measures of weight, corresponding to 15.43258 grains troy. It is the thousandth part of the weight of a litre of distilled water at 0° C. The metric system includes centigrammes, decigrammes, decagrammes, hectogrammes, kilogrammes, and myriagrammes. Whilst the centigramme only represents 0.1543234 grain troy, the myriagramme represents 154323.4 grains troy, which is little short of 1 cwt.

Grammichele, tn. in the prov. of Catania, Sicily, situated on the side of a hill. Beautiful marble is found in the neighbourhood. Pop. 16,000.

Grammont, see **GREBAARDSBERGEN**.

Gramont, Antoine Alfred Agénor, Duc de (1819-80), came of an illustrious family. Ambas. at Rome and Vienna, and, later, appointed minister of foreign affairs in the Ollivier Cabinet. His administration ended in disaster and led to the Franco-Prussian war.

Gramophone (phonograph, graphophone, or talking machine). The essential principles of the G. and the dictaphone are identical, and owe their origin to Edison, who invented the phonograph in 1877. This consisted of a cylindrical drum covered with a sheet of tinfoil on which rested a blunt-pointed stylus which was

fixed to a membrane situated at the base of a conical mouthpiece. Records were made by speaking into the mouthpiece; the sound waves, being focused by the mouthpiece, set the membrane vibrating sympathetically and the style indented the foil on the rotating drum to varying depths. Reproduction of the recording was obtained by returning the drum to its original position and turning it at the same rate as before. The stylus thus executed its former vibrations, and these transmitted to the membrane gave rise to sound-waves of the same form as the original waves. C. S. Tainter with A. G. and C. Bell improved this instrument by substituting for the tinfoil a cylindrical drum of cardboard coated with wax.

judges of music may be said to be three-fold, viz. (i.) electrical recording, (ii.) modern technique in making copies of the original record, (iii.) modern methods of reproduction. The standard sizes of disks for domestic use are 8-, 10-, and 12-in. diameter, operating at 78 or more rarely 80 r.p.m., and having records pressed on both sides. The disks for educational sound film use, and at one time used in cinemas, are 16 in. in diameter and rotate at 33 $\frac{1}{3}$ r.p.m., and are normally pressed on one side only.

Electrical recording followed in 1925 the invention of the modern microphone and thermionic valve by means of which it is possible to amplify the feeble fluctuations of the electric currents in the microphone

Electric and Musical Industries Ltd., Hayes

GRAMOPHONE RECORD GROOVES

Typical gramophone record grooves, magnified approximately 11 times. On an average record there are some 100 of these grooves to the inch. The white lines seen in the grooves are due to reflection of light from the walls, the grooves themselves, of course, being black like the material.

But this type of record survives only in the dictaphone, which uses semi-hard wax and in which, for office use, duplicates are not required. On the other hand, recent improvements in recording have reintroduced contour recording; and such records have been used for recording broadcasting programmes, but they are too costly for domestic use. The first disk records were invented by E. Berliner in 1887; in this form of recording the stylus travels in a spiral groove, running from the circumference to the centre of a flat wax disk rotating on a horizontal turn-table. Reproductions of sound from disk records are either mechanical (acoustic) or electro-mechanical (pick-up), the former being the original method, and the latter introduced when recorded material was found to be useful for broadcasting purposes. The output of a pick-up can be amplified to any extent required, depending on the ultimate acoustic power required and the efficiency of the reproducers. Thus the improvements that, since about 1920, have made the G. an instrument acceptable to critical

circuit caused by the impact of sound waves on the microphone. Distortion is not completely absent even in the best microphones, but a corrective device known as an 'attenuation equaliser,' inserted in the amplifying circuit, reduces it to a minimum. Further, the design of studios to give the natural effects produced by reverberation in a concert hall has resulted in the great improvement of modern recording. The recorder itself is essentially an electro-magnet with a soft iron armature pivoted between its pole-pieces. The amplified microphonic currents traverse coils surrounding the armature and cause it to vibrate sympathetically between the poles of the electro-magnet. The armature carries a shaft to which is attached the holder for the stylus.

This electro-magnetic recorder is responsible for some of the improvements that have resulted in the uniform response to notes of varying frequencies. Recently a new type of G. pick-up has been developed commercially. This makes use of the piezo-electric effect of quartz or rochelle-salt

crystal when subjected to varying mechanical pressure.

Modern Technique of Record Making.—The original record is a soft wax disk. This is coated with a fine metallic powder in order to prepare it for the electrolytic bath in which copper is deposited on the record. The shell of copper thus produced is known as the 'master shell,' and it is, of course, a negative of the original record. The master shell is placed in another electrolytic bath and copper is deposited on it until a positive shell is obtained called 'the mother.' Another negative shell, the matrix, is prepared from the latter, and this, after suitable strengthening, is ready for producing the actual copies. The mixture forming the copy is heated to make it plastic, and it is then pressed on the negative by means of a hydraulic press with a force of approximately half a ton per sq. in. The final result is the positive copy. The Columbia Company in 1922 discovered that surface noise during reproduction could be almost entirely eliminated by using exceedingly finely ground material for the record surface.

Modern Reproduction.—The improvements effected under this heading include the new designs of tone arms, horns, and electric pick-ups. The chief considerations are the faithful reproduction of the original music and the amplification required for performances to large audiences. It has been found that the type of horn that gives even response to notes of different frequencies is the logarithmic or exponential horn, i.e. its longitudinal section is an exponential curve. The old external horn has now long been superseded by the internal horn or resonator.

Gramophone Pick-up (Radio).—This is an electro-magnetic device enabling G. records to be played with the aid of a suitable amplifier or the audio-frequency portion of a radio receiver and loud-speaker. The pick-up consists of a vibrating iron armature in the field of a permanent magnet. As the needle, following the sound track of the rotating record, vibrates, the armature causes variations of the magnetic flux through one or two coils of wire, and the electromotive force so produced operates the amplifier and loudspeaker.

The word G. is a protected trade name, and the industry is a large one, owing its increasing popularity in recent years to the demand for records of dance music, while electric recording of music and speech has resulted in a much increased purity of reproduction which has also enhanced the popularity of the G. See Wilson and Webb, *Modern Gramophones and Electrical Reproducers*, 1929, and A. Wood, *Sound Waves and their Uses*, 1930.

Grampians: 1. Mt. chain composed of granite, gneiss, quartzite, marble, and schists, which separates the Highlands from the Lowlands in Scotland. The highest well-known summits are Ben Nevis, Ben Macdui, Ben Alder, and Ben Lomond. The chief river flowing from the watershed N. are the Spey, Don, and Dee, with their tribes, whilst those flowing

S. are the Esk, Tay, and Forth, with their tribes. The general aspect of these mts. is wild and rugged in the Highland district, but the Lowlands afford excellent pasturage. 2. Another range lies in Victoria, Australia, partly skirting the basin of the Glenelg and its trib. streams; the chief peak is the height of Mt. William.

Grampus (corruption of the Fr. *grand poisson*, Norman *grapois*, Sp. *gran pez*, It. *gran pesce*), enormous fish which is to be found in the N. seas and off the coast of Greenland. It belongs to the Dolphinidae or dolphin family, and is the only cetacean which preys upon its own kind, the porpoise, dolphin, and whale. It is enormously strong and very voracious. Its special characteristics are the rounded head, conical teeth, and high dorsal fin. The adult G. measures from 20 to 30 ft. long, and is more than 10 ft. in girth. The upper part of the body is black, changing to white on the under surface and on part of the sides. It sometimes appears in herds numbering hundreds.

Gran, or **Esztergom**, cap. of the co. G., Hungary, and seat of the prince-primate of Hungary. It is 25 m. N.N.W. of Budapest, on the R. Danube, and has a bridge of boats connecting it with the mkt. tn. of Parkany. The cathedral, erected in 1870, is built after the plan of St. Peter's at Rome, and occupies a commanding position on the site of what was once a fortress. G. is one of the oldest tns. in Hungary, and reputed for being the bp. of St. Stephen. Mineral springs are to be found there. Pop. 18,000.

Granada, Luis de (1505-88), Sp. preacher of humble extraction, b. at Granada. His mother became widowed when he was only a child, and was assisted by the Dominicans. The boy received a good education, and after a period as page to the alcaide, took vows at the Dominican convent of Santa Cruz at Granada. He was later on appointed procurator at Granada, and then at the end of seven years he became prior of the convent of Santa Cruz in Cordova. He acquired great fame as a preacher, and was ultimately appointed confessor and counsellor to Catherine, the queen regent. He wrote two books, one on prayer, the other entitled *La Guia de Predicadores* (1556), both of which enjoyed immense popularity. See P. Rousselot, *Les Mystiques Espagnoles*, 1867; also studies by F. J. Cuervo, 1919, and M. Llanza, 1926-28.

Granada: 1. Anc. Moorish kingdom of Spain, now comprising the three modern provs. of G., Almeria, and Malaga. It was the last Sp. ter. to be freed from Moorish invasion under the leadership of Ferdinand and Isabella in 1492. The modern prov. embraces an area of nearly 6000 sq. m. It is bounded by Cordova, Jaen, and Albacete on the N., and S. by the Mediterranean Sea. It is overshadowed by the lofty mts. of the Sierra Nevada, and is watered by the Rs. Guadiana, Guadalquivir, and Rio Grande. The climate is very variable, being often almost tropical in the valleys whilst on the higher ground the temp. is freezing. It possesses a fertile soil, and there are valu-

able minerals and precious stones in the neighbourhood. There are valuable iron mines and manufactories of all kinds, such as woollen, linen, cotton, soap, spirits, gunpowder, and sugar refining, which is the prin. industry. The main Madrid-Málaga-Algeciras railway passes through the cap. and there are sev. branch lines. For the events in G. of the Sp. civil war of 1936 see under SPAIN, History. Pop. 806,000. 2. The cap. of the kingdom of G. presents a curious mixture of anct. and modern architecture, and lies at the foot of the Sierra Nevada and between two hills. The oldest portion of the tn. rests on the N. hill, Albalcín, whilst the main part of the tn. lies in the plain near the Genil.

E.N.A.

THE ALHAMBRA: THE COURT OF THE LIONS

This portion of the city has a great number of buildings, principally churches, the cathedral, and a univ. Some of its buildings are distinctly oriental in character, such as the Alhambra Palace and castle of the Moorish kings. The cathedral is a Christian edifice containing the magnificent tombs of Ferdinand and Isabella, and of Philip I. and his wife. G. is derived from the word *granada*, pomegranate. Pop. 128,000. 3. Dept. and city in Nicaragua, Central America, covering an area of nearly 2600 sq. m. It lies between the Pacific and Lakes Nicaragua and Managua; although a huge plain it contains the volcano of Masaya and the Mombacho Peak. It is the terminus of the Pacific railroad. The chief products are hides, sugar, cotton, indigo, coffee. Pop. 20,000.

Granados y Campina, Enrique (1867-1916), Sp. pianist and composer, b. at Lerida, son of an army officer. Studied piano under the Catalonian master, Juan Pujol, and composition under Pedrell. His death, in the sinking of the *Sussex* by a Ger. submarine in 1916, after the production of his opera *Goyescas* in New York, gave universal prominence to his name, but more in reference to his talent as a composer than as a pianist. But in the latter capacity he was among the greatest virtuosos of any country. In his earlier compositions Grieg and Chopin

seem to be his models. In the later work the influence of Albeniz is evident. Other operas: *Petrarca*, *Follet*, *Maria del Carmen*, *Zarzuelas*, *Piccoli*, *Liliana*, etc. Also composed much dance music (*Danzas españolas*, *Danza gitana*, *Valse de amor*, *Valse poelicas*, etc.) and numerous miscellaneous compositions.

Granby, John Manners, Marquess of (1721-70), Brit. soldier. His father was the third duke of Rutland. He entered Parliament in 1741, but undertook military duties as well, taking part in the campaign of Flanders. He was appointed colonel of the Royal Horse Guards in 1758, and was present in the great action at Minden in the Seven Years war. He was eventually appointed general of the Brit. force in Ferdinand's army, where he gained great distinction. In 1766 he was appointed commander-in-chief, but he resigned his post at the end of three years owing to ill health.

Gran Canaria, one of the chief Canary Is., is of volcanic origin. Its cap. is Las Palmas (pop. 85,300). Area 65 sq. m. Pop. 180,000.

Gran Chaco (from Sp., 'great hunting ground'), vast ter. in the centre of S. America, occupying the ters. of E. Bolivia, W. Paraguay, and part of the N. Argentine republic. It may be roughly divided into three dists., the Chaco Boreal, extending from the plains of Chiquitis to the Pilcomayo (bird riv.), and consisting of giant forests. The Chaco Central lies between the two rvs., the Pilcomayo and the Bermejo (red riv.). The third dist., the Chaco Austral, lies between the Bermejo and Salado Rs. The whole region is inundated at times to so great an extent that it presents the appearance of one vast lagoon. Indians are the chief inhab. In 1933 Bolivia and Paraguay went to war over the possession of the G. C. After four years, in which the resources of both countries, human and material, were almost exhausted, there was a truce. Neither side had won, but Paraguay appeared to have been winning. In 1935 a peace treaty was drafted, under which they agreed to accept the decision of neutral arbitrators on the question of the G. C. boundary. The treaty, which was ratified soon afterwards, gives Bolivia free commercial transit across the Chaco and free commercial entry to Puerto Casado, on the Paraguay R.

Grand, Sarah (Frances Elizabeth McFall) (1862-1943), Eng. novelist, b. in Ireland, of Eng. parents; daughter of Edward John Bellenden Clarke, Lt. R.N. Married, at sixteen, Brig.-Surgeon Lt.-Col. McFall (d. 1898). She became famous through her first novel, *Idealia* (1888). She also wrote *The Heavenly Twins* (1893); *The Beth Book* (1897); *Babe the Impossible* (1900); *Adam's Orchard* (1912); *The Winged Victory* (1916); and *Variety* (tales, 1922). She took part in the campaign for women's rights, and also in the municipal affairs of Bath, of which city she was mayoress in 1923 and 1925-1929.

Grand Alliance, alliance signed at Vienna, 1689, by England, Germany, and

the states-general of the Netherlands to prevent the union of France and Spain.

Grand Bahama, one of the prin. is. of the Bahamas. W. Indies, in lat. 26° 41' N. and long. 79° W. It is about 70 m. long and 9 m. wide.

Grand Bank, great submarine elevation in the N. Atlantic, S.E. of Newfoundland; it is a free fishing-ground, teeming with cod and other fish. Area, about 500,000 sq. m.

Grand Bassa, seaport of Liberia, W. Africa, about 50 m. S. of Monrovia.

Grand Bassam, Fr. port of the Ivory Coast, Upper Guinea, Africa, which produces gold, palm-oil, and mahogany. Pop. 7400.

Grand Canal, The: 1. Main waterway of Venice, from which branch the lesser canals. 2. or Imperial Canal, one of the most important means of communication in China, as the roads are so defective; it is also called Yunho (transport), and extends from Hangchow to Peiping, covering a distance of nearly 1000 m. This canal has existed for centuries, the first section, from the Yangtse-kiang to the Hwei R., being opened c. 500 B.C. The section of the canal lying between Hangchow and Yangtsekiang was constructed early in the seventh century. In the eighteenth century it was found necessary to protect the canal from sudden inundations, and for this purpose a double series of lakes was formed on the W. side of the canal to enable the surplus waters to discharge themselves and flood the land beyond. The main body of the stream empties its waters into the Yangtse-kiang.

Grand Canyon, spectacular gorge of the Colorado R. in Arizona, U.S.A. The greatest of a series of such canyons, it is 217 m. in length, from 3000 to 6000 ft. in depth, and from 2 to 15 m. wide.

Grand-Combe, La, com. of France, in the dept. of Gard and the arron. of Alès. There are coal-mines, glass works, and zinc mines. Pop. 14,100.

Grand-Combin, see COMBIN.

Grand Duke, title of the sovereigns of sev. of the states of Germany prior to the revolution of 1918 at the close of the First World War. The title was also held by many members of the Russian imperial family.

Grande, Rio, see GUAPAI.

Grandet, Jean François, see BLONDIN, CHARLES.

Grand Falls: 1. Cataracts of the Hamilton, or Grand R., in Labrador, situated about 250 m. from the mouth of the riv. There are two falls, each having a clear drop of 300 ft. or more. 2. City on Exploits R., Newfoundland, founded in 1805, and engaged in the manuf. of paper. Pop. about 4000.

Grand Forks, city of N. Dakota, U.S.A., and cap. of G. F. co. It is situated on the W. bank of the Red R., opposite the mouth of Red Lake R.; it is served by two railways, and is about 55 m. N. of Fargo. The surrounding dist. is a rich wheat valley, and a trade in wheat and flour is carried on. There are saw-mills, breweries, and ironworks. In 1922 the state

built a large terminal elevator and flour-mill here, and a sugar-beet factory has also been erected. On the borders of the city is the univ. of N. Dakota, opened in 1884. A trading post of the N.W. Fur Company was estab. here in 1801, and permanent settlement began in 1871. The city was chartered in 1881. Pop. 20,200.

Grand Haven, city of Michigan, U.S.A., and the cap. of Ottawa co. It is situated on Lake Michigan opposite Milwaukee and 30 m. from the Grand Rapids. It is served by two railways, by lake steamers, and by motor bus and trolley lines. In 1821 the Amer. Fur Company estab. a trading post here, and permanent settlement began in 1834. The city was chartered in 1867. Pop. 8700.

Grandi, Dino, Count (b. 1895), It. politician, educated for the law. Took part in the Fascist march on Rome. Minister of foreign affairs, 1929-32; permanent It. delegate to council of League of Nations, 1925-32; It. ambas. in London, 1932-39. Minister of Justice, 1939-43. Head of It. delegation to London Naval Conference, 1936. At the meeting of the Fascist Grand Council April 25, 1913, his order of the day led to the fall of Mussolini and the Fascist regime. (d. fled later to Portugal. Pubs.: *Origins of Fascism* (1929) and *Italian Foreign Policy* (1931).

Grand Island, tn. of Nebraska, U.S.A., and the cap. of Hall co., situated on the Platte R., and served by three railways and an air service. It has an extensive trade in cattle and grain, and has a large beet-sugar manuf., besides creameries, flour-mills, marble works, etc. It possesses a college, estab. 1892, and the state Soldiers' and Sailors' Home is situated here. Settlement was begun in 1857 and the city was incorporated in 1873. Pop. 10,100.

Grand Junction, city of Colorado, U.S.A., in Mesa co., of which it is the cap. It forms an important railway junction. In the neighbourhood gold, silver, and coal are mined. It is about 200 m. W.S.W. of Denver. It was settled in 1881 and incorporated in 1882. Pop. 12,400.

Grand Jury, see JURY.

Grand Manan, is. at the entrance of the bay of Fundy in the co. of Charlotte, New Brunswick. Well known as a health resort. (Greatest length is 16 m. and greatest breadth 6 m. Pop. 2700.)

Grand National, Eng. steeplechase, and the prin. cross-country horse-race of the season. It was inaugurated in 1839 and takes place in March or April at Aintree, near Liverpool, on the eve of the Liverpool spring meeting. The course is 4 m. 850 yds., and includes thirty jumps. The water-jump is 15 ft. across, and other difficult obstacles are Valentine's and Becher's Brooks and the Canal Turn.

Grand Pré: 1. or Lower Horton, postern vil. in Nova Scotia, situated in King's co., 15 m. from Windsor. Stands in the midst of very fertile country. Has been made famous as the scene of Longfellow's poem *Evangeline*. Pop. 900. 2. Fr. tn. in the dept. of the Ardennes. Pop. 790.

Grand Rapids, city of Michigan, U.S.A., situated in Kent co., of which it is the cap. It stands on the Grand R. It is served by five railways and by motor coach and truck lines. The city has been much improved since 1922; roads have been widened and viaducts built to accommodate the increasing traffic, and the hill portion of the city is being laid out as an attractive residential quarter. It has a junior college and special classes for backward children. It has been under commission manager gov. since 1916. The chief industries are the lumber industry and the quarrying of gypsum. It manufs. paper, flour, hosiery, tobacco, and furniture, the latter being the chief manuf., though the manuf. of aeroplanes, etc., during the First World War has given rise to a variety of industries. It is the seat of both a Catholic and a Protestant bishop. Pop. 164,200.

Grand River, The: 1. Canada, rises in Grey co., flows S. and then S.E., entering Lake Erie after a course of 150 m. It can be used for navigation for 70 m. up, and communicates with Lake Ontario by the Welland Canal. 2. One of the head streams of the R. Colorado, U.S.A.; it rises in the Rocky Mts. and joins the Green in Utah, flowing through a very mountainous dist. Length 318 m. 3. Rises in the co. of Jackson in Michigan, U.S.A., and after flowing first in a westerly then a northerly direction, directs its course once more westward, emptying its waters into Lake Michigan at Grand Haven. It is about 300 m. long. 4. Rises in Missouri, U.S.A., and eventually joins the Missouri at Brunswick. Length 300 m.

Grand Serjeanty. In the feudal system of land holding tenure by C. S., or *per magnum serjeantium*, meant that the vassal held his land on condition of rendering special services to the king instead of serving the king generally in time of war. The services were always free, but were uncertain in nature. Instances of such services were carrying the king's banner or lance when he went to war, filling the post of butler, champion (officer whose duty it was to ride fully armed into Westminster Hall at the banquet, and challenge to single combat any who should deny the king's title to the crown), or other officer at his coronation. In contradistinction to G. S. was the tenure by *petit serjeanty*, where the duties or services were of a somewhat servile nature (see *PETIT SERJEANTY*). A rather similar tenure was that by *coronage*, where the tenant's duty consisted in winding a horn to give men warning of the coming of the Scots or other enemies.

Grand Union Canal, part of the E. portion of the canal system of Great Britain, connecting London via Northampton and Leicester to Nottingham and the R. Trent. See also CANALS.

Grandville, pseudonym of the celebrated Fr. caricaturist Jean Ignace Isidore Gérard (1803-47), b. at Nancy. Quite early in life a series of caricatures, which portrayed the woes of the small proprietor, gained him a certain amount of popularity. He

was also well known as a book illustrator; he illustrated eds. of *Gulliver's Travels*, *Don Quixote*, and *La Fontaine's Fables*. His political caricatures also came in for much praise. He d. in a mental hospital at the age of forty-four.

Granel, François Marius (1775-1849), Fr. painter, b. at Aix (Provence), son of a master builder. Learned painting in an art school directed by Constantin, a landscape painter. He became famous for Capuchin studies with striking effects of light. His masterpiece is 'Chœur des capucins de la place Barberine.' Other pictures: 'Stella dans la prison du Capitole' and 'St. Louis délivrant des prisonniers français à Damiette.'

Grange: 1. or **Grange-over-Sands**, par. and vil. on Morecombe Bay, N. Lancashire, situated about 10 m. N.W. of Carnforth. A well-known watering place, especially popular among the inhab. of Lancashire and Yorkshire. Pop. 3000. 2. Vil. of Cumberland at the S. end of Herwentwater and at the entrance to Borrowdale.

Grangemouth, seaport tn. in Scotland, in Stirlingshire, at the entrance of the Forth and Clyde Canal, about 3 m. N.E. of Falkirk. Coal is mined in the immediate vicinity. There are saw-mills and shipyards. The chief exports are pig-iron, iron ore, and timber. It has direct communication with the Continent. Docks (93 ac.) were opened in 1905. Pop. 13,600.

Granger, James (1723-76), b. at Shaston, Dorset, England, and took orders. He became vicar of Shiplake, in Oxfordshire. He is remembered for *A Biographical History of England* which he pub. 1769-74, and which went from the eighth to the end of the seventeenth century. The striking feature of this biographical hist. was the collection of portraits with which he illustrated his work. A continuation of his work by M. Noble appeared in 1806 in three vols. See J. P. Malcolm, *Letters between the Rev. James Granger and many of the more eminent Literary Men of his Time*, 1805.

Granicus (modern *Bığa Çayı*), riv. in Asia Minor. Its source is in Mt. Ida and it flows into the sea of Marmora. Here Alexander the Great defeated the Persians in 334 B.C., and it was also the scene of the defeat of Mithridates in 73 B.C. by Luculus.

Granier de Cassagnac, see CASSAGNAC.

Granite, group name for sev. plutonic rocks which form the great bulk of the igneous rocks of all ages, and consist of a completely crystalline mixture usually of quartz, felspar, and muscovite. This last substance may be wholly or partly replaced by sev. other minerals, e.g. hornblende or biotite, or in rare cases by augite. Accessory minerals are always found, the most common being apatite, garnet, zircon, or sphene, with varying quantities of glaucophane. Sections of G. show considerable diversity of detail, but usually it is found that the quartz is a colourless transparent allomorphic substance filling the interstitial spaces between the other crystals. The orthoclase,

which is the general type of felspar present, will have a clearly marked outline, and is generally translucent, on account of more or less decomposition. The muscovite will show definite cleavage cracks, and in large crystal specimens separate flakes can be easily removed. The presence of biotite is generally indicated by glistening black particles which are readily flaked. In some specimens the crystals can only be distinguished under the microscope, and such are said to possess a micro-granitic structure. Although G. possesses at least three essential minerals, yet there are related rocks which possess two of the constituents. Gneiss is composed of quartz and muscovite, while aplite is made up of quartz and

GRANITE

The light mineral is orthoclase and the very dark mineral is black mica. The intermediate or greyish mineral is quartz, which appears dark in the photograph by reason of its transparency.

orthoclase. There is hardly any extensive region in the world in which granitic masses do not occur. To mention but a few sites: N.W. Portugal; S.W. Spain; between Dresden and Gorlitz (Zgorzelec); in the Grampians of Scotland; the Lofotens off Norway; Corsica; Sardinia; S. chain of the Urals; S.E. across France from St. Malo towards Avignon; along the E. coast of Brazil; plateaux of S. Africa, etc. The great value of the rock is as a building material, and the fact that masses of great magnitude can be procured of perfect continuity is one of the many reasons for its popularity. For vast and massive structures intended to resist weather and violence most Gs. are admirably adapted, though in the case of those rich in potash felspar they are less valuable against weathering. The Egyptian obelisks consist of porphyries and syenitic Gs. The Aberdeen quarries yield massive blocks of stone of excellent quality, in which the chief felspar is albite (soda-felspar). The ultimate result of the disintegration of G. is to yield soils rich in plant food, and a long list of com-

pounds of which the kaolin (china clay) of Dartmoor, etc., is specially noted. See also IGNEOUS ROCKS. See G. F. Harris, *Granite and the Granite Industries*, and A. R. Warnos, *Building Stone*, 1926.

Granite City, city of Madison co., Illinois, situated on the Mississippi, about 3 m. N.N.E. of St. Louis. It is served by six railways. Iron and steel goods are manufactured here, also there are car factories, syrup plants, and many other small industries. The city was founded in 1893 and incorporated 1896. Pop. 22,900.

'Granite State, The,' see NEW HAMPSHIRE.

Gran Sasso d'Italia, mt. group in the Apennines, reaches an elevation of 9585 ft. in Monte Corno, which is the highest point in the whole mt. chain. Here Mussolini was imprisoned for a month in 1944 after the fall of It. Fascism until rescued by the Gers.

Grant, Albert (1830-99), b. at Dublin, son of V. Gotthelm of London; he was usually known as Baron G. His early attempts at company promoting were enormously successful, and in 1874 he purchased Leicester Square, which at that time was practically waste land. He had this land laid out properly and presented it to the Metropolitan Board of Works for the benefit of the public. He was twice member of Parliament for Kidderminster. His later speculations were not fortunate, and he d. a comparatively poor man.

Grant, Duncan James Corrow, Scottish painter, b. 1885 at Rothiemurchus, Inverness, the son of an army officer. He was educated at St. Paul's School with the intention of taking up an army career. This was abandoned, however, and he was sent to the Westminster School of Art. He continued his studies in Italy and Paris, where in 1906-7 he came under the influence of Cézanne. This is evident in 'The Tight-rope Walker,' 'The Hammock,' and 'Dead Mimosas.' Since then, apart from travels in N. Africa, Greece, and elsewhere, he has worked mainly in London and the S. of France. He was represented in the Post-Impressionist exhibition in London in 1913, and in that year also became associated with Roger Fry in the craft-work of the Omega Workshops. G. possesses a highly cultivated decorative talent which he has put to good use in room decoration and theatrical décor as well as in designs for pottery and textiles. His reputation rests mainly on his oil paintings, which are noted for their vitality, their delightful use of colour, and the rhythmic harmony which he imparts to his subjects, whether still life, modern interiors, portraits, or scenes from classical legend. His first one-man exhibition was in 1924, and he has also exhibited in the New Eng. Art Club and as a member of the London Group. Pictures by him now in the Tate Gallery, London, include 'The Lemon Gatherers' (1908); 'Girl at Piano' (1938); 'Portrait of Vanessa Bell' (1912); and 'Haystack before Trees' (1910).

Grant, Sir Francis (1803-78), Scottish portrait painter, b. at Edinburgh. He

became an R.A. in 1851. In 1866 he became president of the Royal Academy and in the same year was knighted. Amongst the more famous of his works are an equestrian portrait of the queen and prince consort, and portraits of the marchioness of Waterford, Palmerston, Macaulay, and Russell.

Grant, Sir James Hope (1808-75), Brit. general. Brother to Sir Francis G., b. at Kilgraston, Perthshire. He greatly distinguished himself in the Sikh wars. He was of great service during the mutiny, taking part in the relief of Cawnpore and the retaking of Lucknow. Commanded the cavalry at the siege and capture of Delhi. After the mutiny had been broken he commanded the army which finally pacified India. He also took part in the Chinese war which followed the Indian mutiny. From 1861 to 1865 he was commander-in-chief of the army in Madras. See life by H. Knollys, 1894.

Grant, Sir Patriok (1804-95), Brit. field marshal, b. at Auchterblair, Inverness-shire. Entered the Bengal native infantry as an ensign and became a captain in 1832. He rose fairly rapidly in the service, and was present at the battle of Maharajpur (1843), Moodkee (1815), and Sobraon (1846). He served under Sir C. Napier in 1851, and from 1856 to 1861 he was commander-in-chief of the Madras army. In 1857 he took over the command of all troops in India, and directed the operations against the mutineers until the arrival of Sir Colin Campbell. He was governor of Malta (1867-72), made field marshal (1883). From 1874 to 1895 he was governor of the Royal Hospital at Chelsea.

Grant, Robert (1811-92), Scottish astronomer, b. at Grantown, Morayshire. He received the gold medal of the Royal Astronomical Society in 1856 for a work entitled *A History of Physical Astronomy*. In 1859 he became prof. of astronomy in Glasgow Univ. He pub. in 1883, *A Catalogue of 6415 Stars* and, nine years later, *A Second Catalogue of 2156 Stars*.

Grant, Ulysses Simpson (1822-85), Amer. general; eighteenth president of the U.S.A.; b. at Mount Pleasant, Massachusetts. He was descended from a Scottish family which had settled in Massachusetts in the seventeenth century. He was brought up on a farm in Clermont co., Ohio. He was, however, sent to West Point to the military academy there, and entered the army of the U.S.A. He was present at the battles of Palo Alto, Resaca de la Palma, and at the capture of Monterey. He was also with Scott in his Mexican campaign, being twice promoted for bravery. After this latter war he returned to the U.S.A., resigned his commission, and lived for some time on a farm near St. Louis, Missouri. On the outbreak of war in 1861 he offered his services to the Federals, and was appointed as a lieutenant-colonel to a Missouri infantry regiment. He soon proved his ability as a soldier and was made a brigadier-general. He fought at the battle of Belmont, captured Fort Donelson on the Cumberland, and made a great attack in 1863 on Vicksburg, forcing the enemy to surrender, and

took over 31,000 prisoners. He was then made major-general, placed in command of the div. of the Tennessee, and defeated Bragg at Chattanooga. In 1864 he was made lieutenant-general and given supreme command of the U.S. Army. His campaign as commander-in-chief was the bloodiest of the war. The great battles of the Wilderness, Spottsylvania Court-house, and Cold Harbor crippled the enemy, and finally the taking of Petersburg caused the evacuation of Richmond, the S. cap. On April 9, 1865, Lee surrendered the whole of his army. This practically ended the war. In the next year G. was made general, and in 1868 was elected president. At the expiration of his term of office he was again elected. In 1880 his friends wanted to have him nominated for a third term, but there was so much sentiment against this that the project was dropped. Probably the greatest event of his presidency was the peaceful settlement of the Alabama claims. When he retired from the presidency he accepted a position as a partner in a banking firm, which, however, in 1884 suspended payment, the two other partners having defrauded G. and absconded, ruining the ex-president. In the same year he commenced to write his autobiography to earn money for himself and his family. He d. in the following year of cancer of the tongue. Before his death, however, he was restored to his rank of general, which he had to resign on becoming president. See *Personal Memoirs*, and lives by J. Anderson, 1864, W. Church, 1897, and C. Atkinson, 1908.

Grant, in Eng. law, a term which, in its widest sense, is a synonym for any transfer of property. In a narrower sense it is interchangeable with 'assurance,' as meaning a conveyance by deed of lands. In this sense it connoted not only such old forms of conveyance as feoffment, and bargain and sales, but also all such existing forms as leases, charges, and settlements. In this sense, too, it was contrasted with transfer by 'livery of seisin,' i.e. by delivery of possession; practically all real property is now conveyed by deed, but formerly corporeal hereditaments in possession were transferable by mere delivery of possession, whereas incorporeal hereditaments (reversions, remainders, advowsons, tithes, rights of way, franchises, annuities, rents, etc.), not being physically capable of delivery, were said to lie in G., i.e. they were transferred by deed. In relation to personally G. is used as opposed to *gift* (q.v.), which latter term implies a transfer without consideration (q.v.).

Grantham, municipal and parl. bor. of Lincolnshire, England, situated on the R. Witham, and forms an important railway junction. The par. church of St. Wolfraim is a most magnificent building, mainly in the Early Eng. style. Two libraries of the sixteenth and seventeenth centuries are preserved in the church. There are many other old and interesting buildings of note, among them Grantham House, once known as Hall Place, after its owners, the Hall family, wealthy wool merchants

in medieval times; it dates from the late fourteenth and early fifteenth centuries, and was fairly extensively altered in the eighteenth, notably the pleasant S. façade with sash windows and stone architraves. Princess Margaret, daughter of Henry VII., 'lodged' there on her way N. to marry James IV. of Scotland in 1503. It is the property of the National Trust. The main hotel of the tn., the 'Angel,' was originally a hostel of the fifteenth century, and its architecture preserves many traces of its antiquity.

The chief industries of the tn. are manuf. of implements for agric. use and malting. It also has iron foundries. The tn. is mentioned in the Domesday Book, and was originally governed by the bailiff of the lord of the manor. A mayor and alderman were granted it early in the reign of Edward IV. From 1463 to 1885 G. returned two members to Parliament, but by the Redistribution Bill of the latter year the representation was reduced to one. The tn. has a famous grammar school, founded in 1523, of which the best-known pupil was Sir Isaac Newton. There is an important R.A.F. station. Pop. 20,600.

Granton, port of Edinburgh, Scotland, situated on the frith of Forth, 2½ m. N.W. of Edinburgh, with timber yards, and printing ink and chemical works. G. was made a head port in 1860. It is served by two railway lines, and is the headquarters of sev. steamboat lines. There is a large tobacco bonding warehouse. Pop. 2500.

Granulite, name used by petrographers for two distinct classes of rocks. By Fr. geologists it is regarded as synonymous with muscovite-biotite granite. Ger. petrologists give the term to a schistose metamorphic rock consisting essentially of small irregular crystals of quartz and orthoclase with minute pale red garnets; these last may be accompanied by kyanite, zircon, sillimanite, etc. The second use of the term is more common in England and America. Saxony is a typical region for Gs., which are here for the most part igneous; the 'moine gneisses' of N. Scotland related to these were originally sediments.

Granville, Antoine Perrenot, Cardinal de (1517-86) b. at Besançon, his father being a lawyer who afterwards became chancellor of the empire under Charles V. He studied law and divinity at Padua and Louvain, and at the age of about twenty-three became bishop of Arras. He showed himself a past master of the art of diplomacy, and became, in 1550, secretary of state. He helped to draw up the treaty of Passau (1552), and when the emperor abdicated he transferred his services to Philip II. He negotiated the marriage of Mary of England and the treaty of Cateau-Cambrésis. He became archbishop in 1560 and cardinal in 1561. For a short time he was forced to withdraw from the Netherlands, but was called from his retirement to go on a mission to Rome, the result of his mission being the alliance which overthrew the Turks at Lepanto. He presided over Naples for some time,

and had just been raised to the archbishopric of Besançon when he d. See P. Geyl, *The Revolt of the Netherlands*, 1932.

Granville, George Leveson-Gower, second Earl (1815-91), eldest son of the first earl, was educated at Eton and at Christ Church, Oxford. From 1841 to 1846 he sat in the House of Commons as member for Lichfield. He was made vice-president of the Board of Trade in 1848 and king's secretary in place of Palmerston in 1851. He was invited to form a ministry in 1859, but was unable to do so, and served as president of the council in the administration of Lord Palmerston. In 1868 he was colonial secretary in the first administration of Gladstone, and was foreign secretary in the Liberal administrations from 1870 to 1874 and from 1880 to 1885. As a politician and diplomat he had great influence, but his tenure of the foreign secretaryship gives him no marked place amongst the great statesmen of the time. See life by E. P. Fitzmaurice, 1905.

Granville, or Grenville, George, Baron Lansdowne (1667-1735), Eng. poet and politician, b. in Cornwall. Wrote some verses eulogizing James II. on his accession, but, after the revolution of 1689, he lived in retirement for some time, devoting himself to literature. His tragedy *Heroick Love* (1694) was acted with great success. This was followed by the dramatic poem, *The British Enchanters* (1700). In Queen Anne's reign he secured a seat in Parliament and became secretary-at-war. Married a daughter of the earl of Jersey and was raised to the peerage. In George I.'s reign he was sent to the Tower on suspicion of taking part in a plot against the gov., but was released in 1717, and, later, went to France, where he lived for some years. See E. Handasyde, *Granville the Poète*, 1923.

Granville, John Carteret, Earl of, see CARTERET.

Granville: 1. Port and watering-place of France in the dept. of La Manche. It is situated at the mouth of the Bosq, on the Eng. Channel, and is fortified. The harbour is accessible to the largest vessels, and there is regular communication with the Channel Is. Vegetables, fruit, fish, oysters, etc., are exported, and shipbuilding and the manuf. of brandy, cod-liver oil, etc., are carried on. In the Second World War, after Contances was captured by the Allies, the 7th Corps and two armoured divs. attacked S.-westward towards G. and Avranches (July 28, 1944) and the Ger. withdrawal soon became a disorderly retreat. On July 31st the 6th Armoured Div. reduced the remaining forces resisting at G. and thereafter no effective barrier lay between the Allies and Brittany. Pop. 10,100. 2. Tn. of New S. Wales, Australia, situated in Cumberland co., 12 m. W. of Sydney. It is an important railway junction and there are iron works, flour-mills, tanneries, and kerosene works. The chief manufs. are twined, pipes, tiles and bricks, and agric. implements. Pop. 20,000.

Granville-Barker, Harley (1877-1946), Eng. playwright and actor-manager, b. in Kensington, London, son of Albert James B. and Mary Elizabeth, daughter of an It. physician who had settled in London and changed his name from Bozzi to Granville. He made his first appearance on the stage in 1891 under Charles Hawtrey and afterwards acted in Ben Greet's and Wm. Poel's Shakespearian companies. In partnership with J. E. Vedrenne he became manager, in 1904, of the Court Theatre, Sloane Square, though he did not abandon acting, himself interpreting many leading parts in Shaw's plays. The Vedrenne-Barker partnership, which also centred in the Kingsway and Savoy Theatres, not only gave London an opportunity of seeing the plays of Euripides, but succeeded also in popularising those of Shaw. G.-B.'s earlier plays included *The Marriage of Anne Leele* (1901), the story of a decadent eighteenth-century family, with woman seen, Shavian-wise, as a snare for man, yet written before G.-B. fell under the spell of Shaw's ideas on play-writing. G.-B. had first become directly acquainted with the plays of Shaw through his connection with the Stage Society—to which he served as producer—founded in 1899, and nothing in his earlier years contributed more than this connection to his histrionic development and sense of dramatic values. His *Voysey Inheritance* (1905) is perhaps his greatest play; certainly it was the most successful with the public and it was revived at Sadler's Wells in 1931. Then came *Waste* (1909), a play dramatising the impact of the moral convention on the public life of a statesman—exemplars can easily be imagined from our political hist.—and it is not surprising that the censor refused a licence for it, and it is perhaps still less surprising that this refusal was the spearhead of the protest against the censorship of plays which led to the Royal Commission of 1909. In a later venture at the Savoy (1912), he produced Shakespearian plays in an original manner, notably *Twelfth Night*, the costumes and stage-setting being new in style, unobtrusive yet adequate, thus leaving the minds of the audience free to take in the play. It is not too much to say that G.-B. enabled some thousands of his contemporaries to hear, for the first time, Shakespeare as he should be heard; and, further, he prescribed the correct tempo in a Shakespearian play as in a great piece of music (A. C. Ward). The famous production of *A Winter's Tale* at the Savoy in 1912, and of *A Midsummer Night's Dream* in 1914—both of which productions roused violent enthusiasm and equally violent hostility—exemplified G.-B.'s preference for a 'conventional' décor to the realistic one, for the reason that a realistic décor tended to do the work of the actors. As he said is one of the many lectures which he delivered in univ. centres and elsewhere—he gave the funeral oration on Barrie in Edinburgh—the foundation of the whole of the theatre is acting, and nothing else. It was, therefore, perhaps ironic that he

himself in later life should have become a man of letters, highly esteemed by scholars, for his work in the Shakespearian field. The last of his original plays to be seen on the public stage was *The Madras House*, produced in 1910, which has been described as the most Shavian of all his plays or as a 'dramatic debate' in four various settings of middle-class home and shop. In collaboration with Berte Thomas he wrote *The Weather Hen*, and he was part author, with Laurence Housman, of *Prunella* (1906), a fantasy. He collaborated with Wm. Archer in a book called *A National Theatre* (1907), and he pub. *The Exemplary Theatre* in 1922. His later plays included *The Secret Life* (1923) and *His Majesty* (1928). At the time of his death he had not accomplished the full task which he set out to perform in Shakespeare criticism; it was in Jan. 1946 that he produced the fifth vol. of his celebrated *Prefaces to Shakespeare*. Why he deserted the stage for this field it is hard to say; perhaps he considered that he had failed, but if so scholarship has been the gainer. In his later years he rendered notable service by translating the plays of the Sp. dramatists, Martínez Sierra and the Quinteros.

Grao, or Villanueva del Grao, maritime tn. of Spain, in the prov. and dist. of Valencia, situated on the Mediterranean, and is the port of Valencia; it has a fine beach, suitable for bathing. Pop. 6000.

Grão Pará, see **PARÁ**.

Grape, see **VINE**.

Grape-fruit, see **SHADDOCK**.

Graphic Arts, see **DRAWING**; **ENGRAVING**; **ETCHING**; **PAINTING**.

'**Graphic**,' The Eng. illustrated weekly newspaper, founded in 1869 as a journal of independent political principles, and appealing to popular taste by reason of its photographs, original drawings of topical interest, reproductions of masterpieces of painting and drawing, and excellent serials, which were illustrated by leading artists of the day. Hardy's *Tess of the d'Urbervilles* first appeared in the *G.*, while George Meredith, Anthony Trollope, Charles Reade, Wilkie Collins, W. S. Gilbert, Lord Tennyson, Rudyard Kipling, and J. M. Barrie were also contributors. Richard Jefferies formerly provided a countryside diary. Some of its distinguished artists have been Randolph Caldecott, who contributed Christmas pictures portraying hunting squires and hounds, stags, highwaymen, finely executed sketches of life at Monte Carlo; Arthur Boyd Houghton, serial illustrator; J. E. Penwell, the water-colour painter; Sir Hubert von Herkomer, whose 'Chelsea Pensioners' originally appeared in the *G.*; E. J. Gregory; Sir Luke Fildes, whose academy picture, 'Applicants for a Casual Ward,' appeared first as a woodcut in the *G.*; W. L. Wyllie; Sir John Millais; George du Maurier; and Phil May. In the seventies the *G.* sent out Josephine Butler as artist-correspondent; and among other distinguished war artists of the *G.* were Frederic Villiers, Stanhope Forbes, and Sidney Hall; in 1913 some striking impressionist pictures of the Balkan war

by George Scott, pupil of Edouard Detaille, appeared under the title of 'Mud, Blood, and Silence.' Many of the greatest contributors were known during the editorship of W. L. Thomas. Some of the well-known later-day artists are Frank Brangwyn, Jorge Clausen, Seymour Lucas, Solomon J. Solomon, Melton Fisher, Reginald Cleaver, E. T. Reed, and Lewis Baumer. In 1926 the *G.* was purchased by the Inveresk Paper Company Ltd., the resulting company being called Illustrated Newspapers Ltd. The diamond jubilee of the *G.* was celebrated by a special number on Dec. 13, 1929.

Graphical Methods of Representation, as the name implies, are methods by which varying values or estimates are placed side by side, so that their changes and fluctuations may be readily seen. Suppose, for example, we are considering the yearly average price of wheat per quarter for the twenty years from 1890 to 1910. Take for convenience a piece of squared

GRAPH OF WHEAT PRICES, 1890 1910

paper and draw two lines Ox and Oy at right angles to each other. Let each point along Ox represent one year beginning with 1890 at O to 1910 at A (see fig.). Then taking any convenient length as a standard, measure off along Oy and the successive perpendiculars to Ox lengths representing the average prices for each year in turn. By joining up the points so obtained the yearly change may be followed much more readily than from any table of figures. In a similar way the changes in any series of values taken at intervals may be graphically represented; and the method is particularly convenient in the case of economic, political, and meteorological statistics, where returns are made at regular intervals and comparison with previous returns are most important. So long as we are considering estimates for which there is one definite value for each year, the graph is obviously a complete record of fluctuations; but where we have a value which changes from day to day, for which observations are only made at longer intervals, the graph made up of a series of short straight lines is no indication of values at any time during an interval. In cases where it is practicable, where, in fact, the values do not fluctuate too abruptly, we can obtain a fair estimate of values for intermediate positions by

joining the points by as smooth and continuous a curve as is possible (see INTERPOLATION). The most complete form of graphical representation is obtained in the barograph, which traces out mechanically, in one line on specially ruled paper, every slight variation in the height of the barometer throughout the day. A drum covered with ruled paper is made to revolve regularly by means of clockwork, while a pen rising and falling with changes of atmospheric pressure traces out a continuous line.

FIG. 1. VECTOR

Graphic Statics deal with the determination of stresses, tensions, etc., of frameworks and systems in equilibrium, by geometrical methods of construction. A force is completely determined when its magnitude, direction, sense, and point of application are known. It may, therefore, be represented by a straight line of definite length, drawn in a given direction through a point with an arrow head to determine the sense. This line is called the *vector*. It is proved that the resultant of two forces acting on a particle may be found by representing the forces by two straight lines OA , OB (Fig. 1), drawn through a point O , and by completing the parallelogram $OACB$. Then

FIG. 2. TRIANGLE OF FORCES

the diagonal OC represents the resultant in magnitude and direction. It is evident that the three sides of the triangle OBC represent the three forces in magnitude and direction, though BO does not represent the point of application. Thus if we are not concerned with the point of application, the proposition (known as the *Triangle of Forces*) may be stated thus: If two forces acting at a point are represented in direction, magnitude, and sense by two sides of a triangle OB , BC , then the third side OC similarly represents the resultant. Further, the three forces

OB, BC, and CO, if acting at a point are in equilibrium. This may be extended to the *Polygon of Forces* which states that the resultant of forces represented by the lines AB, BC, CD, DE...HK taken in order is represented by the line AK which closes the polygon. Consider first the

Take any point T on the vertical through L, and draw TU, UV, etc., successively parallel to XA, XB, etc., and join TY. Through X draw XO parallel to TY. Then OA and DO represent the reactions at the supports L and Q. For the stress diagram consider first the forces at L;

FIG. 3. LINK OR FUNICULAR POLYGON, AND VECTOR POLYGON

simple case of a load supported by a simple wall crane consisting of two bars, considered weightless (Fig. 2). The pin at O is kept in equilibrium by three forces acting along OA, OB, and OC. Draw the load line XY, vertically, to some given scale, say 1 in. to 1 ton. Through X and Y draw lines XZ and YZ parallel to BO and AO. Measure YZ and ZX and find the weights their lengths represent, and hence are found the pull which BO exerts on the pin O, i.e. the tension in BO, and the force of compression in AO.

To determine the magnitude and the line of action of the resultant of any number of forces of given magnitudes acting on a body in given straight lines. Let p, q, r, s, t be the lines of action (Fig. 3) of the given forces. Draw the vector AB to scale to represent the force along p . Similarly draw BC, CD, etc., parallel to q, r , etc., and proportional to the forces along them. Join AF and take any point O called the pole. Join OA, OB, etc. On p take any point I, draw PV parallel to AO, PQ parallel to BO, cutting q in Q. Through Q draw QI parallel to CO, and so on, finally drawing TV parallel to OF. Then the straight line through V, parallel and equal to AF, completely determines the resultant. This may be proved from the polygon of forces. The two figures are known as the *link or funicular polygon* and the *vector polygon* respectively. When the vector polygon is closed the forces are either in equilibrium or are equivalent to a couple. When the link and vector polygons are both closed the forces are in equilibrium. To find the stresses in the bars of a roof truss of the shape shown in Fig. 4, where the joints M, N, and P are loaded, and to determine the reactions at the supports L and Q. Here the vector polygon becomes a straight line called the line of loads. Draw the load line AD, AB, BC, and CD, being respectively proportional to the loads at M, N, and P. Take any pole X and join XA, XB, XC, XD.

OA represents the vertical force. Through O and A draw lines OE and AE parallel to LI and LM respectively. Then EO and AE measured according to the scale will give the stresses in LR and LM. The

FIG. 4. DETERMINATION OF STRESSES

former is in tension and the latter in compression. Consider now the point Q. In a similar way OK is the stress diagram and OK and QD measure the stresses in QS and QP. It is now possible to consider the points M and P. At M we know already the vertical force and the stress in LM. They are represented in the stress

diagram by AB and EA. Through B and E draw BF and EF parallel to MN and MR. Then BF and FE represent the stresses in MN and MR. Similarly KH and HC give the stresses in SP and PN. For the point N draw HG and FG parallel to NS and NR. Finally by joining GO, which is parallel to RS, the stress in RS is measured and hence all the stresses are found. It is convenient to denote the spaces on the figure by small letters, which correspond to the capitals in the stress diagram. Thus AE in the stress diagram represents the stress in LM between the spaces a and e.

The shearing force (S.F.) and the bending moment (B.M.) at any section of a beam or bridge are defined as being the sum and the sum of the moments respectively of all the external forces perpendicular to it. To draw the S.F. and B.M. diagrams for the case of a beam or bridge loaded with a given weight at one point.

FIG. 5. BENDING MOMENT AND SHEARING FORCE

The method here given will hold equally well for any number of loads. Let PQ (Fig. 5) represent the bridge drawn to scale, and B the position of the given load. Draw the load line AB for the vector polygon. Let X be the pole at a definite distance from AB. Construct the link polygon CDE, closing it by joining CE. Through X draw XO parallel to CE, thus determining the reactions at the ends. Through any point L on PQ draw a vertical line LMN, cutting the link polygon in M and N. Measure MN and multiply it by the number of units distance of the pole X from AB. Then this product represents the B.M. at X. Thus the B.M. at any point may be found. To determine the S.F. draw any horizontal line HK to intersect the verticals PC and QE at H and K. From K measure off KS downwards along QE equal to OB, and from H measure off HW upwards along QP equal to OA. Through S and W draw ST and WY to meet RD in Y and T. Then the S.F. at L is measured by the vertical line LZ, and similarly the S.F. at any point is measured by its vertical distance between HK and the line WYTS, thickened in the figure. When there are a number of loads this line moves upwards in a series of steps and the method is identical with the present one. For a further discussion on the subject see

G. C. Turner, *Graphics Applied to Arithmetic, Mensuration, and Statics*.

Graphite, see BLACK-LEAD.

Graphology, science which purports to reveal the psychological laws underlying the various features of handwriting. G. assumes that of all the movements of the human body, the handwriting movement can claim to be the expressional phenomenon best adapted for study and exploration. The expressional phenomenon of handwriting was studied by Chinese philosophers more than eight centuries ago and, in more recent times, it has attracted such famous men as Leibniz, Goethe, Gainsborough, Scott, and Browning among many others. G., in short, is self-knowledge through the analysis of handwriting, and in his analysis entitled *Self-Knowledge through Handwriting*, H. J. Jacoby treats the psychology of handwriting in a manner which is novel in the hist. of graphological research and literature, being the first to make the experiment of using illustrative photographs of bodily movements and scenes from life which are analogous to handwriting, instead of theoretical discussion. In the course of teaching G. he has found it easier for the student to understand the expression of a peculiarity in writing if he is able to compare it with that of a familiar movement, gesture, or object in everyday life. This approach to G. assumes that the writing movement follows the same laws as other expressional movements of the human body—gait, a movement of the hand or head. The same is true of the habits and situations in life typical of each person; for every human being, purposely or otherwise, gives a personal touch to the way he behaves in society or expresses himself in his tastes. This characteristic stamp may vary in intensity, but the graphologist assumes that it is always present and that even a complete conscious or unconscious elimination of a personal trait expresses a certain type of personality. The very same habits which find expression in a man's everyday behaviour are correspondingly reflected in his writing. Examples of the handwriting of a man between, say, the ages of twenty-seven and ninety-five show that the basic features of his handwriting remain unchanged and are manifested during all phases of his life. In letters which seem to march like soldiers in their stiff uprightness, the graphologist detects in the writer discipline of will, exactness, or compulsion; in letters irregularly running in all directions, he detects emotional excitability, impulsiveness, or lack of planning; weak writing pressure again may indicate tenderness, conciliatoriness, or lack of energy; strong writing powerful energy, forcefulness, or constraint; angular forms seem to indicate firmness, power of resistance, or rigidity of character; large expansive movements, occupying much space, are deemed to show enthusiasm, display of pathos, or illusionism; and the 'flourishing' writer stresses the unessential, and shows himself lacking a sense of proportion, with a predilection for cheap

effects. It is obvious that these illustrations may be multiplied at will, and that the analogy borne by the writing to character or habits may be more or less remote; but experience, coupled with much graphological knowledge, no doubt conduces to a measure of accuracy in analysing the peculiarities of any given example of handwriting in relation to psychology. See J. Crépéux-Jaunin, *L'Écriture et le caractère*, 1888, and *L'Âge et le sexe dans l'écriture*, 1925; L. Klages, *Handschrift und Charakter*, 1916, 1943; H. Sandek, *Experiments with Handwriting*, 1929; M. Pulver, *Symbolik der Handschrift*, 1931, and *Trieb und Verbrechen im Spiegel der Handschrift*, 1934; H. J. Jacoby, *Analysis of Handwriting*, 1939, *Handschrift und Serialität*, 1932, and *Self-Knowledge through Handwriting*, 1940; and E. Singer, *Graphology for Everyman*, 1949.

Grapsus (Gk. *γρᾱψαίος*, a crab), name of a genus of crustaceans belonging to the family Grapsidae; they are marine crabs and are very numerous on the shores of the Mediterranean. Frequently they are found on exposed rocks, over which they travel at a very rapid pace.

Graptolites, group of fossil remains of extinct marine animals which floated about hanging to the underside of seaweeds, or in some cases were anchored to the sea bottom. They are usually found in great abundance in the Palaeozoic rocks extending from the Cambrian to the Carboniferous.

Gras, Félix (1844-1901), Provençal writer, b. at Malesmort in the dept. of Vaucluse. He made a distinguished appearance as author in 1876 by publishing a work called *Li Carboumié*. An epic dealing with the topic of Simon de Montfort and the Albigenians appeared in 1882, and five years later he pub. his celebrated collection of Provençal ballads, *Lou Roumançero Provençal*. In 1891 he pub. a series of stories dealing with the Hungarian popes under the title *Li Papalino*. His three great novels on the revolutionary period have been trans. into Eng. by C. A. Janvior—*The Reds of the Midi* (1896), *The Terror* (1898), and *The White Terror* (1900).

Graslitz, tn. of Bohemia, situated near the Saxon frontier and 32 m. N.E. of Eger. The manufs. are musical instruments, articles made of mother-of-pearl, and embroidery. Pop. 10,000.

Grasmere, small lake situated in Westmorland. It lies 4 m. N.W. of Ambleside, between Thirlmere and Windermere. It drains through to Windermere by the Ithay. Its length is about a mile. To the N. of the lake the vil. of G. lies. The church of this vil. has been made famous by the description of it given by Wordsworth in *The Excursion*. The poet himself lived much in the immediate vicinity, and lies buried, together with his daughter and sister, in the churchyard there. Pop. 870.

Grässe, Johann Georg Theodor (1814-1885), Ger. historian, b. at Grimma, Saxony. He was the royal librarian and head of the museum of porcelain at Dresden for the greater part of his life.

He retired in 1882. The greatest of his works is *Lehrbuch einer allgemeinen Litterärsgeschichte aller bekannten Völker der Welt* (1837-60). He also wrote *Beiträge zur Litteratur und Sage des Mittelalters* (1850) and *Handbuch der alten Numismatik* (1853), and trans. *Gesta Romanorum* (1842).

Grasse, tn. of France in the Alpes-Maritimes dept., about 20 m. S.W. of Nice. It stands well over 1000 ft. above sea level, and is situated in such a way as to be sheltered from the cold winds of the N. and open to the S. The vegetation produced is typical of S. Europe, and many ac. of land are devoted to the cultivation of flowers. The tn. is the centre of the manuf. of perfumes. Pop. 21,200.

GRASSES

A, cough; B, seed-head, C, fox; D, false oat.

Grasses (natural order Gramineae). These form one of the largest orders in the vegetable kingdom, and some of its members are of great service to man. They are evergreen, ann., or perennial herbs, though bamboos sometimes reach a height of 100 ft. All G. either flower on a spike upon the same model as wheat, or upon a panicle such as oats; some are awned or bearded like barley. Each spikelet, whatever the inflorescence, consists of one to five flowers arranged alternately on a short axis, and beneath the lowest flower there are usually two (or more) empty bracts known as glumes. Each flower is sessile in the axil of a bract termed the outer palea or flowering glume, and there is an inner palea, opposite to and higher than the outer one; these two paleas completely enclose the flower. In some species both stamens, usually one to three in number, and pistil are in the same flower, but more commonly the flowers are unisexual. The stem is generally characterised by swollen or tumid nodes to which the sheathing leaf-bases contribute; the long internodes are hollow, and a membranous ligule is developed at the junction of leaf-base and lamina.

The ovary is one-chambered and one-ovuled, and the fruit or grain, technically known as a caryopsis, is entirely filled by the seed. G. are abundant on land, and a few species inhabit fresh water, but there are no marine forms. In the tropics they acquire a much greater height than in colder regions, but those species of a 'social' habit, constituting turf, are found only in temperate regions. The cereal G., wheat, oats, barley, rye, maize, rice, and various millets, cultivated for the sake of their grain, are the most valuable members of the order to mankind. Among the most esteemed fodder G. are rye grass (*Lolium perenne*); cocksfoot grass; timothy grass (*Phleum pratense*); the sweet-scented vernal grass gives much of its fragrance to new-mown hay; and various species of *Poa* and *Festuca*. The tussock grass (*Dactylis cuspilosa*) of the Falklands is also much liked by cattle. Sugar is extracted from the stems of the sugar cane, *Saccharum officinarum*, a native of S.E. Asia, but now cultivated throughout the tropics; and to a smaller extent from those of the guinea corn, *Sorghum saccharatum*. Other useful products of the family are bamboo; a valuable material for paper making, obtained from esparto grass (*Macrocloa tenacissima*); aromatic 'grass-oils,' such as verbena, citronella, and geranium or ginger grass, much used in perfumery. See also LAWN.

Grassholm, is. 18 m. off the coast of Pembroke-shire, S. Wales. The rocky ground is covered in summer with Yorkshire fog (*Lolium Panatas*) and lichen, and seals abound in the surrounding waters. G. is the property of the National Society for the Protection of Birds, and is the home of several rare species of birds. The is. is especially famous as a breeding place of the gannet or solan goose, of which about 7000 pairs are said to assemble there yearly.

Grasshoppers, insects belonging to the families Locustidae and Acrididae, which have very long hind legs with strong thighs, enabling them to jump great distances. The Locustidae or green G. have very long antennae, four-jointed tarsi or feet, a long ovipositor, and the stridulatory organ in the wings; while the Acrididae (to which family the 'locusts,' the true G., belong) have short antennae, no ovipositor, feet with three joints, and the stridulatory organ in between the hind leg and the wing. These insects inhabit woods, thickets, and fields, and feed on vegetables and plants, but some eat flies and caterpillars as well. They generally fly about in the twilight, and being of a green or brown colour can easily hide themselves among the foliage. They lay their eggs either in the earth or in a dry stem; these hatch in spring and produce the young G., which moult six times before they become full grown. The 'chirp' is produced by the friction of the hind legs against portions of the wings or wing-covers in the Acrididae, but in the Locustidae by scraping one wing against the other. The common Brit. type is the *Locusta viridissima*, which has a body about an inch long, but the *Decticus ver-*

rucivorus (so called because the Swedish peasants use it to cure warts) is also found.

Grass Lands, Agric. areas may be roughly divided under three headings: permanent pasturage, rough grazing land, and arable lands. In England and Wales 9,917,000 ac. are devoted to pasturage, 4,155,000 ac. to rough grazing, and about 14,369,000 ac. are arable lands. In Ireland out of a total area of 17,000,000 ac., 11,565,000 are devoted to crops and pasture, while 2,000,000 ac. are mt. grazing land. In Scotland half the complete area of the land, 10,956,000 ac., consists of rough grazing land suitable for the most part for sheep-rearing. Arable land—that is, land suitable for raising crops and ploughing—are also grass lands at frequent intervals. Those are determined by the method adopted for the rotation of crops. In England and Wales one year in each series of four, or two years in each series of five, would be devoted to grass, but in Ireland the method is frequently five years crops and roots, followed by three years grass.

Grassmann, Hermann Gunther (1809-77), mathematician and Sanskrit scholar, b. at Stettin. Was prof. of mathematics at the Gymnasium at Stettin. In 1844 he pub. his mathematical work, *Die Wissenschaft der extensiven Grossen oder die Ausdehnungslehre*, which did not at first meet with a favourable reception. At the age of fifty-three he began his study of Sanskrit and made a great reputation. He pub. on this subject *Wörterbuch zum Rig-Veda* (1873) and a trans. of *Rig-Veda* (1873). Among his other scientific works are *New Theory of Electro-dynamics*; *Theory of the Mixture of Colours*; and treatises on arithmetic and trigonometry. He enunciated, in 1863, the linguistic law which bears his name.

Grass-moth, small moth, allied to the clothes-moth, which inhabits pastures. It is generally brown in colour, and long and narrow in shape, with a pointed head.

Grass of Parnassus, or *Parnassia palustris*, species of Saxifragaceae, which is found in damp places of Britain. The flower consists of five sepals, petals, and stamens, and there are also five staminalodes; the petals are white, and the plant is of graceful appearance. It is fabled to have appeared first on Mt. Parnassus, hence its name.

Grass Oil, name under which sev. volatile oils derived from widely different plants are grouped. Ginger G. O., derived from the Indian plant *Andropogon nardus*, and geranium oil, from *Pelargonium radula*, are very similar in properties, and are used for adulterating oil of roses. Turkish G. O., and lemon G. O. or citronella oil are both obtained from India; the latter has an odour resembling citron, and is largely used for scenting soap.

Grass Snake (*Tropidonotus natrix*), ringed snake found in England and in all the countries of Europe except Scotland and Ireland. It is of a brownish colour and differs from the common viper or adder in that it has not the zigzag black line down its back. There are two yellow

or white spots behind its head which make it easy to recognise. The usual length is 3 ft. or a little over; it rarely reaches 4 ft. The snake hisses and strikes out with its head when attacked, but does not bite. It inhabits moist places, and feeds chiefly on frogs, toads, and fishos. It lays its eggs (which resemble a dove's in size and shape) in mould or under damp leaves. These vary in number and are glued together.

Grass-tree and Black-boy, names given to a liliaceous plant found in Australia, and called technically *Xanthorrhæa hastilis*.

Grass Valley, tn. in Nevada co., California, U.S.A., 55 m. N.E. of Sacramento. It is served by the Nevada Co. narrow gauge railway, which connects with the S. Pacific. It is noted for its gold-mines and is a growing health resort. Pop. 5,700.

Gratian, or **Gratianus**, was b. at Chiusti in Tuscany at the beginning of the twelfth century. The greater part of his life was spent in the monastery at Bologna, but he also taught in the univ. He is famous as the founder of the science of canon law and for his book, *Concordia discordantium canonum* or *Decretum Gratiani*.

Gratianopolis, see GRENOBLE.

Gratianus, Augustus (A.D. 359-83), Rom. emperor, son of Valentinian and Severa, b. at Sirmium in Pannonia. In 366 he was made consul, and the following year received the title of Augustus. On the death of his father in 375 the troops proclaimed Valentinian II., his half-brother, emperor. G. divided the provs., but the real authority remained in his hands. In 378 he defeated the Lentienses at Argentaria, and in 379, with the help of Theodosius, drove the barbarians out of the Balkans. The first years of his rule were marked by energy and success, but later in life he became indolent and pleasure seeking. This aroused the contempt of the Rom. troops, and they elected Maximus, who was then in Britain, as emperor. He at once crossed to Gaul and defeated G. near Paris. G. fled to Italy, but was overtaken near Lyons and killed.

Grattan, Henry (1746-1820), Irish statesman and the greatest of Irish orators, b. in Dublin. He was educated at Trinity College, Dublin, and gave himself up to the study of the classics, especially the great orators of antiquity. At the age of twenty-one he entered the Middle Temple, London, but took little interest in his legal studies, availing himself of every opportunity to listen to debates in the House of Commons. In 1772 he was called to the Irish Bar, and in 1775 entered the Irish Parliament as member for the bor. of Charlemont. The nation was then suffering from the loss of markets that followed the war with America, and from the restrictions upon trade which dated back to William III.; G. championed the cause of Irish independence, and in 1779 got a total repeal of all the restriction Acts. His next step was to move a declaration for the independence of the Irish Parliament; it was granted, and

his countrymen voted him £50,000. This independence, however, was only nominal without reform, and for this G. pressed. He was also in favour of Catholic emancipation, and in 1785 supported Pitt's commercial propositions for establishing free trade between Great Britain and Ireland. In 1792 he succeeded in carrying an Act conferring the franchise on the Rom. Catholics, and in 1794 introduced a Reform Bill; but his mild measures promoted more extreme opinions, the country drifted into rebellion, and G. retired from Parliament in 1797. He returned to take his seat for Wicklow, however, in the last session of the Irish Parliament and fought the Union Bill. He was member for Malton, Yorkshire, in 1805 and for Dublin in 1806. His last years were devoted to the cause of Catholic emancipation, but, though supported by Canning and other statesmen, did not live to see his triumph. He was buried in Westminster Abbey beside Fox. G. was famous for his remarkable eloquence and incorruptible patriotism. See W. Lecky, *The Leaders of Public Opinion in Ireland*, 1861, and lives by H. Grattan (the younger), 1839-46, R. Dunlop, 1889, and A. Zimmermann, 1902.

Gratz, see GROTZISK.

Grätz, in Austria, see GRAZ.

Graubünden, see GRISONS.

Graudenz, or **Grudzianz** (Polish, *Grudziądz*), tn. in the prov. of Pomerze, Poland, situated on the r. h. of the Vistula, 18 m. S.S.W. of Marienwerder. It has communication by boat with Danzig and many munitions. "The fortress was built by Frederick the Great in 1772-76, and was a little to the N. of G. The remains were later used as barracks and prison. It was seized by Prussia in 1773, but restored to Poland. Captured from the Gers. by the Russians in Jan. 1915. Pop. 54,000.

Graun, Karl Heinrich (1704-59). Ger. musical composer, b. at Wahrenbrück in Saxony. He studied under Johann Schmidt, and at an early age composed a number of sacred cantatas. He had a beautiful voice, and when a boy was in the choir at Dresden; and later, when his voice changed to a tenor, made his début at the opera of Brunswick (1725). He wrote much of the music he had to sing and was commissioned to write an opera for the next season. This piece, *Polydorus*, made him famous throughout Germany, and he was engaged by Frederick the Great for his private chapel at Rheinsberg. He composed twenty-eight operas, of which *Merope* is the best, as well as cantatas and pieces for the church service; his oratorio, *The Death of Jesus*, is perhaps his greatest achievement. See K. Mennicks, *Hasse und die Brüder Graun als Singschüler*, 1906.

Gravel, collection of small stones formed by the action of water upon rock, which is found in rivs. and on the seashore. It varies much in character and appearance; when the fragments are small the deposit is sand, when large it is called shingle. It consists of pieces from all kinds of rock, but pebbles of quartz and quartzite are most common. When first deposited the

G. is loose, but after a time it forms a hard rock known as 'puddingstone.' There are various kinds, the best being the 'Kensington,' a pit G. consisting of large quantities of oxide of iron which makes it binding (a quality essential for a good G.), and gives it a rich colour. Other kinds are the 'Dorset Pea,' composed of flinty pebbles about the size of a pea; the 'Lymington,' a flint G. which comes from Hampshire; the 'Sussex Pea,' and 'Sussex Bean,' and the 'Shell G.,' found on the coasts of the Channel Is.

Gravelines, port and tn. of France, in the dept. of Nord and the arron. of Dunkirk. It is situated about 11½ m. S.W. of Dunkirk and 48 m. N.W. of Lille. The harbour is 75 ac. in extent, with a depth of from 16 to 18 ft. The cod and herring fisheries are important, and an export trade with England is carried on in fruit, vegetables, eggs, and fish. Other industries are paper, sugar, fish curing, and vegetable preserving. Pop. 5400.

Gravelotte, tn. in Alsace-Lorraine, France, about 6½ m. W. of Metz. A famous battle was fought in the neighbourhood of this tn. in 1870, in the Franco-Ger. war, resulting in the defeat of the Fr. under Marshal Bazaine. Pop. about 360.

Graves, Alfred Perceval (1846-1931), Irish author and expert in folk-song, b. in Dublin; son of a bishop of Limerick (1812-99). Educated at Trinity College; a civil servant and, from 1876 to 1910, inspector of schools. Famous as author of *Father O'Flynn* (1872) and *To Return to All That* (1930). Wrote a play, *The Absentee* (1908).

Graves, Clotilda Inez Mary (1863-1933), Brit. journalist, novelist, and playwright; b. at Barracks, Buttevant, co. Cork; third daughter of Maj. W. H. G. Among her plays are the Drury Lane pantomime *Puss in Boots* (1888) and *The Bond of Union* (1906). Her best known novel is *The Dog Doctor* (1910), written under the pseudonym of Richard Dehan. Other work: *Between Two Thieves* (1912); *The Headhunter Recruit* (1913); *The Man of Iron* (1914); *Earth to Earth* (1916); *A Sailor's Home* (1919); *The Just Steward* (1922); *The Lovers of the Market Place* (1923); and *Dead Pearls* (1932).

Graves, Richard (1715-1804), Eng. poet and novelist, b. in Gloucestershire. Some of his poems appeared in the collections of Dodsley and Pearch. He attained greater popularity, however, by his novels, all of which are now forgotten except the *Spiritual Quixote*.

Graves, Robert Ranke (b. 1895), Brit. poet, novelist, and critic, son of Alfred Perceval G., a well-known figure in the Irish literary movement. He served with the Welsh Fusiliers on the W. Front in the First World War, when he became known in England as one of three friends and poets, the others being Siegfried Sassoon and Robert Nichols. He was appointed prof. of Eng. literature, Egyptian Univ., in 1926. His poems have been classified into war, amatory, metaphysical, and poems of unrest; they are generally simple in expression. In those on nursery

rhymes and fairy-tales, the old and new are happily interwoven. The war poems present a mood of satiric desolation. Traditional themes, in poems like *In the Wilderness* and *The Avengers*, are invested with a rare pathos and lucidity. It is because his poetry seems to tend 'towards no certain end' that it merits consideration. 'Chaos may in the end be too strong for him, yet every poem he writes is worth reading, since he creates confidence that he has the power to organise, out of his very interesting chaos, a universe of corresponding interest' (A. C. Ward). His poetry includes *Over the Brazier* (1916); *Fairies and Fusiliers* (1917); *Country Sentiment* (1920); *The Pier Glass* (1921); *The Feather Bed* (1923); and *Weichman's Hose* (1925). *Collected Poems, 1914-27*, appeared in 1927. *Collected Poems* in 1938, and *Poems, 1938-45*, in 1946. Other works include *Goodbye to All That* (1929); *I, Claudius* (1934); *Claudius the God* (1934); *Count Belsharius* (1938); *Sergeant Lamb of the Ninth* (1940); *The Story of Marie Powell, Wife to Mr. Milton* (1943); *The Power of the Dog* (1945); and *King Jesus* (1947). His prose work is mainly critical. A theorist as well as poet, his treatise *On English Poetry* (1922) is a sound piece of criticism, avoiding the extremes of traditionalism and emancipation.

Graves, Thomas, first Baron G. (c. 1725-1802), Brit. admiral who served in many famous expeditions, among which may be mentioned the engagement in Chesapeake Bay in 1781 and the operations against the Fr. in Hudson Bay. He was second in command to Nelson at Copenhagen.

Graves, Sir Thomas (c. 1747-1814), admiral, the first cousin once removed of Adm. Thomas Lord G. In 1773 he went on a voyage of discovery in the Arctic Seas, with Lord Mulgrave. He was in command of the *Bidford* during the action in Chesapeake Bay and was present in the engagement at St. Kitts. In 1783 he fought the Fr. frigate *Sybilie*, and, later, was at the battle of Copenhagen.

Gravesend, municipal bor., gateway of the port of London, and mkt. tn. in Kent, extending 2 m. along the r. b. of the R. Thames, 22 m. E. of London. One member is returned to Parliament, the par. bor. including Northfleet, Swanscombe and the rural dist. of Strood. It is mentioned in Domesday Book under the name of Gravesham and was among the bishop of Bayeux's lands. The municipal bor. was incorporated by charter on July 22, 1562, superseded June 5, 1568, and renewed and extended on March 14, 1632. Queen Elizabeth estab. G. as the point of welcome by the corporation of London for eminent foreign visitors. It was the point of departure for E. Indians and for other sailing ships, and was formerly defended by two forts on the Kent side of the riv. and by Tilbury fort on the Essex side. It was formerly a boundary for the coal dues of the port of London. Princess Pocahontas d. at G. in 1617 and is reputed to have been buried at St. George's Church. Gen. Gordon of Khartoum resided in G. from 1865 to 1871. His home was destroyed by enemy action

in Nov. 1944. There are two piers—the Town Pier, built 1834 and the Royal Terrace Pier, built 1845. It is a headquarters of Trinity House (London), pilot station, and has a custom house. The corporation owns a promenade and gardens along the riverside. Trade is principally concerned with paper manuf., cement works, electrical supplies, shrimping, and market gardening. Pop. 41,200 (estimated).

Graves, Soldiers'. The enormous casualties of the First World War brought into prominence the question of burial and of

continued up to the outbreak of the Second World War (1939), but in the year 1938–39 the number was much less than in previous years. Visits to the cemeteries have been organised by voluntary associations, particularly on the occasion of the unveiling of a general memorial. Much detail may be obtained from the annual reports of the commission, whose permanent headquarters are now situated at Woodhull Green, near High Wycombe, Buckinghamshire. By fostering the remembrance in common of the dead of the First World War the com-

Imperial War Graves Commission

THE BRITISH MILITARY CEMETERY AT ROME, ITALY

This cemetery contains 429 British Commonwealth graves of the First World War

the upkeep of the graves of the dead. In the case of the British Empire it was agreed at the Imperial Conference (Nov.) of 1918 that such graves should be maintained permanently. To deal with the matter the Imperial War Graves Commission was constituted, which consists of the secretaries of state for war (chairman) and the colonies, the minister of works, the high commissioners of Canada, Australia, New Zealand, South Africa, India and Pakistan and various other persons. The Duke of Gloucester is president and Admiral Sir Martin Dunbar-Nasmith, V.C., K.C.B., vice chairman. In every battlefield of the First World War proper cemeteries have been made and headstones and other means of identification provided. Areas have been searched for the 'missing', their identity established, and proper burial carried out. The discovery of British bodies by local inhabitants on the former battlefields con-

mission was persuaded that they might make a practical as well as a sentimental and emotional contribution to the maintenance of peace. But while the commission were still finding on the battlefields of the First World War, and giving burial to the remains of men who had given their lives 'to end war' they were called upon to prepare for a new harvest of death and to protect the very memorials visibly recording the sacrifice of the past from the effects of a fresh outbreak of violence. In 1938 following a visit by members of the 'Anglo-German mixed committee' to England, an informal agreement was reached under which Great Britain and Germany reciprocally assured the care of enemy graves during the subsequent hostilities. By agreement with the participating governments the powers bestowed on the commission by the original charter and supplemental charters have been

extended to cover the commemoration of the dead of the Second World War. So swift was the allied advance in N. France in 1944 that the tide of battle swept past the Brit. war cemeteries and memorials of the First World War and left them for the most part unscathed. As France and Belgium were liberated, it was found that the cemeteries had, on the whole, been respected by friend and foe alike. At Cologne the Brit. cemetery was found to be in good condition (1945). Of the great memorials, the Menin Gate suffered rather more damage than had been expected, though largely on the surface, but name panels were found damaged and the bronze gates had been removed. Much remains to be done to bring the cemeteries to their former standard; but fortunately the commission is in a strong financial position, with an endowment fund of nearly £6,000,000. Cemeteries and memorials of the First World War in many other parts of the world have been maintained at a high standard. For the commemoration of the dead of the commonwealth and empire in the Second World War arrangements were made for taking over recorded G. as soon as conditions allowed. First cemeteries in N. Africa to be constructed are those at Sollum and Acroma, designed by Sir Hubert Worthington, first of the commission's prin. architects appointed for Second World War cemeteries. As in other foreign countries, the Egyptian Gov. expressed willingness to provide the requisite land for the new cemeteries considering that Brit. troops had d. not only for the mother country but also for Egypt. A local chieftain in Eritrea gave the site of the Brit. cemetery at Keren. Numerous sites and layouts S. of Rome were prepared for Brit. G. in Italy. Under the guidance of Mr. Edward Maufe, whom the commission appointed its prin. architect in the United Kingdom, the R.A.F. regional cemeteries, and many of the larger service plots in municipal cemeteries, have developed in such a way as may render some of them places of pilgrimage no less beautiful in their horticultural and architectural features than the cemeteries of the last war overseas. Wooden crosses and other markers, later to be replaced by permanent headstones, are wherever possible set in narrow flower borders between stretches of level turf. At Brookwood are special plots for Fr., Belgian, Czechoslovak, and Polish dead, and similarly for the Canadian dead from the Dieppe raid. Out of a total of about 350,000 graves scattered throughout the world, by autumn 1948 some 212,000 G. had been taken over from the army by the War G. Commission. Approximately 40,000 of these are located in Italy. They are divided among forty-two cemeteries, stretching from Sicily to the foothills of the Alps. Their size varies: the large necropolis at Cassino contains over 4000 G.; others, like Padua, a few hundred. The pilgrim will naturally see the close connection between the progress of allied military operations in 1943-44 and the cemetery sites. They lie in most cases

near or on the spot where many actions for the liberation of Italy were fought. Sicily has three concentrations—Agrig, Catania, and Syracuse. The cemetery at Cassino is set in a tremendous natural amphitheatre. Of all those moving burial areas in Italy none is more serene than that at Assisi, near to the churches and monastery rich in memories of the saint who perhaps more than any other is dear to the Eng. race. The commission have made it their particular concern to blend the layout of the cemeteries with the natural beauty and architectural character of their environment. The general treatment of the sites is uniform, and on the lines adopted for the G. of the First World War. The effect aimed at is that of an Eng. garden rather than that of the local *campi santi* and headstones take the place of crosses. The central features are again the great Cross of Sacrifice designed by Sir Reginald Blomfield and the Stone of Remembrance, by Sir Edwin Lutyens, serving to underline the fact that here is ground 'that is for ever England.' Among cemeteries in the Pacific area the sites of three are of outstanding interest and beauty: Bita Paka, 32 m. from Rabaul, with 2800 burials; Ambon, overlooking Ambolna Bay, with 2000 burials; and Makassar, with 600 burials, mostly United Kingdom sailors and marines who were prisoners of war in Celebes.

Graville St. Honorine, tn. in France in the dept. Seine-Inferieure, about midway between Havre and Harleur. It has copper, zinc, and lead mines. Pop. about 13,000.

Gravina, Giovanni Vincenzio (1661-1718), It. jurist, b. at Rogliano, near Cosenza in Calabria. In 1699 he occupied the chair of civil law in the college of La Sapienza, and in 1703 that of canon law. He wrote *Origines juris civilis*, which estab. his reputation as a jurist; *De Romano imperio*; *Della ragion poetica*; and sev. tragedies.

Gravina, tn. of S. Italy in the prov. of Bari, about 32 m. from the tn. of Bari. It is surrounded with walls and towers, and a castle of the Emperor Frederick II. rises above the tn. Pop. 22,500.

Graving Docks, see under Dock and HARBOUR.

Gravitation, term used in physical science for the mutual attraction between masses of matter. The full statement of Newton's law of G. is *Every particle of matter in the universe attracts every other particle with a force whose direction is that of the line joining the two, and whose magnitude is directly as the product of the masses and inversely as the square of their distance from each other*. In order to marshal the evidence for this great generalisation it is convenient to consider it under the following heads: (a) The direction of the force between the particles; (b) the law of inverse square of distances; (c) the universality of the law of inverse squares; (d) the proportionality of the force of attraction to the product of the attracting masses. Newton based his investigation into the law of G. on the three laws deduced by Kepler from the astronomical observa-

tions of Tycho Brahé. Kepler's laws are purely kinematical. They completely describe the motions of planets, but they say nothing about the forces by which these motions are maintained. Their dynamical interpretation was discovered by Newton. *Law 1:* Each planet describes an elliptical orbit. The sun occupies one focus of the ellipse. *Law 2:* The radius vector of each planet sweeps out equal areas in equal times. *Law 3:* The square of the periodic time (in an elliptical orbit) is proportional to the cube of the major axis of the ellipse.

(a) As an immediate consequence of Law 2, Newton showed that the direction of the attraction of the sun for a planet must be that of the line joining them. For twice the area described by the radius vector of a planet in one second is numerically equal to the moment of its velocity about the centre of the sun. Hence, as the moment of the velocity of the planet is constant, the moment of each successive increase of velocity must be zero. Hence these increments in velocity (i.e. the accelerations) must be directed towards the sun. But the direction of the acceleration must coincide with the direction of the force which causes the acceleration. Therefore the force of attraction must be directed towards the sun.

(b) The acceleration of the planet can readily be calculated to be $\frac{4\pi^2 a^3}{T^2} \cdot \frac{1}{r^3}$, where a is the semi-major axis of its elliptical path, T the periodic time, r the distance of the planet from the sun. Hence the acceleration of the planet is inversely proportional to the square of its distance from the sun. Therefore the force of attraction due to the sun varies inversely as the square of the distance.

(c) Kepler's third law states that $\frac{T^2}{a^3}$ is the same for all planets. Hence it is the same G , diminishing as the square of the distance increases, which acts on each one of the planets. In other words, the force of attraction due to the sun does not pay any attention to the quality of matter. The inverse square law is universally true for every kind of matter.

(d) The expression $\frac{4\pi^2 a^3}{T^2} \cdot \frac{1}{r^3}$ shows that the acceleration of a planet towards the sun depends only on its distance r from the sun, since $\frac{T^2}{a^3}$ is constant for all planets. Hence the force acting on a planet due to the sun's attraction is proportional to the mass of the planet. Since action and reaction are equal, each planet reacts on the sun with a force equal and opposite to that exerted by the sun or the planet. Hence each planet acts with a force proportional to its own mass and inversely as the square of the distance away. We must therefore conclude that the sun, which is a planet of great magnitude, also acts with a force proportional to its own mass. Hence the force acting on a planet due to the sun is (1) proportional to the mass of the planet; (2) proportional to the

mass of the sun, i.e. the force is proportional to the product of the attracting masses. In the above discussion the dimensions of the sun and planets have been considered as inappreciable compared with their distances apart. Measurement shows that they are approximately spherical; is, then, the attraction exerted due to the attracting body as a whole, or is it due to its separate particles each acting independently? Newton attacked the question by assuming the law of G for the separate particles of a body, and thence finding the law of attraction for the body as a whole. He thus arrived at two exceedingly striking theorems: (1) A spherical shell of uniform matter exercises no attraction on a particle inside it. (2) A spherical shell or uniform matter attracts an external particle as if its whole mass were concentrated at the centre.

An obvious corollary from the second theorem is that a sphere made up of uniform concentric shells attracts, and is therefore attracted by all external bodies, as if its whole mass were concentrated at its centre. Since the planets behave as if their masses were concentrated at their centres, and since their departures from this behaviour can all be accounted for by their want of sphericity, there is very strong presumption that the attraction is the resultant of all the attractions, each particle of mass m of one body exercising on a particle of mass n of another body an attractive force of $\frac{Gmn}{d^2}$, where d is the

distance between the two particles, and G is a constant—the constant of G . The law of G is unique among the laws of nature in the fact that it is unaffected by any condition or cause whatsoever. The force of attraction between two electrified charges is modified by the medium intervening between them, and also by their relative or absolute motions. But no conditions to which matter has ever been subjected have been found to affect its G , in the slightest degree.

Determination of the mass of the earth and the mass of the sun.—Astronomical observations enable us to compare the masses of the various members of the solar systems. For example, the acceleration of the earth towards the sun is about 0.6 cm. per sec. per sec.; the distance between the two is 15×10^{14} cms. The acceleration of the moon towards the earth is about 0.27 cm. per sec. per sec., and the distance between them is $\frac{1}{4} \times 10^{10}$ cms. If S is the mass of the sun, E the mass of the earth, M the mass of the moon, then $\frac{GS}{(15 \times 10^{14})^2}$ and $\frac{GE}{(\frac{1}{4} \times 10^{10})^2}$, therefore the ratio $\frac{S}{E} = 300,000$ approximately. To determine S and E in terms of the terrestrial standards of mass, the kilogramme and the pound, recourse must be had to experiments with terrestrial masses. A body of mass m suspended at the earth's surface is attracted by a force $G \times E \times \frac{m}{R^2}$, where E is the mass of the

earth. But if g is the acceleration of a body falling freely under the influence of the gravitational force of the earth, the value of this force is also expressed by mg . Then $mg = \frac{G \times E \times m}{R^2}$ or $E = \frac{gR^2}{G}$. To determine G the force F between two artificially prepared masses M_1 and M_2 at a distance apart d is measured, and since $F = \frac{GM_1 \times M_2}{d^2}$ we get at once $G = \frac{Fd^2}{M_1 M_2}$.
 $\therefore E = g \times R^2 \times \frac{M_1 \times M_2}{Fd^2}$

Cavendish's experiment.—An experiment for determining the force of attraction between two artificial masses was first planned by the Rev. John Mitchell who did not live to begin work on the apparatus which he had designed and completed. After Mitchell's death the apparatus came into the hands of Henry Cavendish, who largely reconstructed it but adopted Mitchell's original plan. The attracted masses consisted of two small balls, A and B, an inch or two in diameter, connected by a stiff wooden beam suspended at its middle point E by a long fine wire.

The whole of this part of the apparatus was enclosed in a case, carefully coated with tinfoil to secure, as far as possible, a uniform temp. within the case. Irregular distribution of temp. would have resulted in convection currents of air which would have had a serious disturbing effect on the suspended system. To the beam was attached a small mirror with its plane vertical. A small glazed window in the case allowed any motion of the mirror to be observed by the consequent deviations of a ray of light reflected from it. The attracting masses consisted of two equal, massive, lead spheres, so mounted that they could be made to move from the positions $C_1 D_1$ to the positions $C_2 D_2$ or $C_1 D_2$. Cavendish found that the suspended system was never at rest. The equilibrium position was determined by the method usually employed when weighing with a delicate balance. When the large masses were placed at $C_2 D_2$, the oscillations were

practically due to the torsion of the wire. If T is the period of vibration for this position of C and D , and I the moment of inertia of the suspended system, then $\mu = \frac{4\pi^2 I}{T^2}$, where μ is the couple required to

twist the lower end of the wire through unit torsion relatively to the top end. The angle θ through which the beam was deflected when the attracting masses were moved from the positions $C_1 D_1$ to the positions $C_2 D_2$ was measured. Then $\mu\theta = 2G \times M \times m \times l$, where l is the length of the

beam and d the distance between the centres of the attracting and attracted masses. Whence $G = \frac{\mu\theta d}{2M \times m} = \frac{2\pi^2 I \theta d^2}{T^2 M m}$.

The experiment has been repeated by Reich, Bailey, Cornu, Boys, and Braun. Cavendish obtained for the value of G 6.6×10^{-8} dynes, Reich 6.613×10^{-8} , Bailey 6.685×10^{-8} , Boys 6.6576×10^{-8} , Braun 6.65786×10^{-8} . The remarkable agreement between the results of these experiments, which were performed at different times and at different places on the earth's surface, provides a powerful confirmation of the truth of the law of G .

Cause of Gravitation.—The cause of G remains undiscovered. Newton, in his celebrated *Letters to Bentley*, says: 'You sometimes speak of gravity as essential and inherent to matter. Pray do not ascribe that notion to me; for the cause of gravity is what I do not pretend to know, and therefore would take more time to consider it. It is inconceivable that inanimate brute matter should, without the mediation of something else which is not material, operate on and affect other matter without mutual contact, as it must do if gravitation in the sense of Epicurus be essential and inherent in it. . . . That gravity should be innate, inherent, and essential to matter so that one body may act upon another at a distance through a vacuum, without the mediation of anything else, by and through which their action and force may be conveyed from one to the other, is to me so great an absurdity, that I believe no man who has in philosophical matters a competent faculty of thinking, can ever fall into it. Gravity must be caused by an agent constantly acting according to certain laws; but whether this agent be material or immaterial, I have left to the consideration of my readers.'

Attempts have been made to account for G by means of stress in the intervening medium on the plan adopted for electric and magnetic forces. Calculation shows that the stress which must be supposed to exist in the invisible medium must be 3000 times as great as that which the strongest steel could support. Le Sage's theory that the G of bodies towards each other is caused by the impacts of streams of atoms flying through space leads to the inverse square law of attraction, but it demands that the rate at which the energy of the bombarding atoms is spent in order to maintain the gravitating property of a single pound is at least millions of millions

of foot-pounds per second. In fact, all these theories which have been advanced to account for G. imply the existence of stresses or the presence of stores of energy absolutely gigantic in comparison with anything hitherto observed or even suspected to exist in the universe. These difficulties are resolved by the general theory of relativity, in which the notion of gravitational attraction is itself abandoned (see RELATIVITY).

Gravity, Centre of, see CENTRE OF GRAVITY.

Gravity, Specific, see SPECIFIC GRAVITY. **Gravosa,** fortified harbour of Dubrovnik in the state of Yugoslavia. It is a seaport and fishing tn. Pop. 1500.

Gray, Asa (1810-88), Amer. botanist, b. in Paris, New York. In 1812 he was appointed Fisher prof. of natural hist. at Harvard Univ. and devoted himself to the estab. of a herbarium and a library there. His *Manual of the Botany of the Northern United States* (1862) is his most important work, but he also pub. a *Botanical Text-book* (1839); the *Botany of Japan in Relation to North America* (1849), which is remarkable for its originality and far-reaching results; *How Plants Behave* (1872); *Synoptical Flora* (1886); and *How Plants Grow* (1891).

Gray, David (1838-61), Scottish poet, b. at Merikland, near Glasgow. He was educated at Glasgow Univ. for the church, but at an early age began to write verses. He became intimate with the poet Robert Buchanan, with whom he went to London in 1860. There he became acquainted with Lord Houghton, who gave him some literary work and endeavoured to get his poem *The Luggie* pub. in *The Cornhill Magazine* (1862). This poem, a reminiscence of the scenes and events of his childhood, is his chief work, but he also wrote a series of sonnets, *In the Shadows*, which have a beauty all their own. See R. Buchanan, *David Gray and other Essays*, 1868, and B. Ifor Evans, *English Poetry in the Later Nineteenth Century*, 1933.

Gray, Elisha (1835-1901), Amer. inventor, b. at Barnesville, Ohio. He studied for a time at Oberlin College, but afterwards took up the subject of telegraphy, and in 1867 patented a telegraphic switch. He also experimented with the telephone, which he claimed to have invented, his application for a patent being received only a few hours after Alexander Bell's. He was engaged for some time in the manuf. of telegraphic apparatus, and was the electrical expert of the W. Electric Company of Chicago. Among his inventions are the multiplex telegraph, by which eight messages can be sent at a time, and the telantograph, by which handwriting can be transmitted.

Gray, John Edward (1800-75), Eng. naturalist, b. at Wat-all. In 1840 he was appointed keeper of the Zoological collections and made them the most complete in the world. He wrote many books, the most important being his catalogues of the Brit. Museum collections.

Gray, Stephen (c. 1670-1736), Eng. physicist, was a Charterhouse pensioner, and became a fellow of the Royal Society

in 1732. His most important contribution was the div. of substances into electric and non-electrics, and the discovery of methods of their mutual transformation.

Gray, Thomas (1716-71), Eng. poet, son of a scrivener, who was of so cruel and violent a temper that his wife had to separate from him; b. in London, and educated at Eton and at Peterhouse, Cambridge. To his mother and sister, who carried on a business, he was indebted for his liberal education at Eton (where he became a friend of Horace Walpole) and Cambridge. Of a studious and reserved nature, he formed few intimate friendships, but these were lasting ones. The story of his life is simple and colourless, the outstanding event in it being his tour on the Continent with Horace Walpole, 1739-41. Their unfortunate quarrel, late in this tour, which was not healed for three years, was the only break in a life-long attachment. Returning to England, G. found his father dying and his mother only moderately provided for. After residing with her for a while at Stoke Poges he went back to Cambridge, where, except for brief intervals, he spent the rest of his life. There he became a fellow of Peterhouse and, later, transferred himself to Pembroke College. He had always a tendency to melancholy, the best cure for which would have been plenty of exercise and cheerful company; of the former, however, he took little, and the latter he was too reserved to enjoy freely. Yet he was naturally very humorous, and his letters, charming in their mixture of fun, sincere friendliness, and wise criticisms of men and books, are worthy to stand with those of Lamb. His learning was immense, not only in the classics, but also in art and natural science. He holds an honourable place in Eng. literature, though his works are small in quantity, and in quality do not attain the highest rank, even the immortal *Elegy* owing its fame to exquisite expression and natural pathos rather than to greatness or originality of thought. But if this, the Odes, and the trans. from the Norse be compared with anything written by his immediate predecessors (except Thomson), it will be seen that G. was a pioneer, a true poet in a prosaic age, and the forerunner of Goldsmith and Cowper in breaking away from the monotonous artificiality of early eighteenth-century verse. No wonder that Johnson, who condemned *Lucidas*, failed to appreciate *The Progress of Poesy* and *The Bard*, but it is quaint to find the author of *Rasselas* complaining of the 'cumbrous splendours' of G. and elsewhere of his 'dullness.' Other contemporaries called him obscure. G. was one of the first to celebrate the glories of mt. scenery. While other writers were still shuddering at 'horrid precipices' and 'frightful solitudes' he was enthusiastic in his admiration of the Alps, and later of the Grampian and Cumbrian peaks. See E. Gosse, *Gray's Works*, 1884, and life, 1889; *Poems and Letters* (Everyman's Library); and Matthew Arnold's fine essay on G.

Gray, com. of France, on the l. b. of the Saône in the dept. of Haute-Saône. It has

a fine quay on the riverside and carries on a busy trade. Pop. 5800.

Grayling, fresh-water fish of the salmon family, having a long many-rayed fin. It is found in the N. of Europe, Asia, and N. America. The Brit. G. generally inhabits rivs. with a rocky or gravelly bottom, and is in best condition when trout are out of season.

Grayling Butterfly (*Hipparchia semele*), butterfly widely distributed over the Brit. Isles. It has dark brown wings with two black eye-spots on each of the forewings and one black eye-spot centred with white on the hind wings. It is found on heaths and in dry stony places, especially on chalk and in clearings in woods.

Gray's Inn, see INNS OF COURT.

Grayson, David, see BAKER, RAY STAN-NARD.

Gray's Thurrock, par. and tn. of Essex, England, situated on the Thames, 3 m. N.W. of Tilbury and 12 m. S.E. of Romford. There are two training ships and a trade in cement, lime and bricks. A portion of Rom. tessellated pavement and other antiquities have been found here. Pop. 60,000.

Graz (Grätz until 1843), tn. of Austria, cap. of Styria, on the Mur, at the head of the valley's expansion round the foot of the hill, Schlossberg. There is a railway communication both N. and S. across the Mur's valley, and E. by the valley of the Raab. It is a bishop's see. Buildings of interest are the univ. (1586, new buildings 1890-95); fifteenth-century Gothic cathedral (with fine altar-pieces and glass-paintings); mausoleum of Ferdinand II., with sarcophagi of his parents, the Archduke Charles and his wife; thirteenth-century Gothic par. church of the Teutonic knights; Landhaus (1569), in Renaissance style; the Joanneum with natural hist. library, given by the Archduke John (1811); arsenal (1644); eleventh-century castle. The castle hill was fortified till 1809, and there is a curious clock tower on the Schlossberg. There are cold mineral springs at Radegund near by, and the health resort, Tobelbad. A polytechnic was opened 1888, and there are other educational institutions. Manufs. included machinery, rails, ironwares, paper, leather, soap, beer, hats, and wine. The lignite of Kalnack valley, the chief mineral fuel deposit of the Alps, is important. G. fell to Soviet troops in the course of their advance on Vienna (April 1945). Pop. 153,000. See G. Fels, *Graz und seine Umgebung*, 1897.

Graziani, Rodolpho, Marchese de Neghell (b. 1882), It. soldier and colonial administrator. Served in Eritrea from 1908 to 1913; in Libya, 1914. Held an infantry command in Macedonia in 1919. Served in Tripolitania for the next eight years. Took part in the occupation of Fezzan; general of div., 1928. Commander of the forces in Libya 1930-34, conducting operations which resulted in the occupation of the Kufra oasis and in the final pacification of the colony, which latter he accomplished with great brutality. Governor of It. Somaliland 1935-1936. Hon. governor of It. E. Africa,

1938. Commander-in-chief of the It. Libyan forces 1939. When Italy declared war on Britain and France in 1940 he advanced from Benghazi to the invasion of Egypt, the Brit. forces, vastly outnumbered, falling back slowly to Mersa Matruh. G., in his advance, built a series of powerful fortifications all the way to Sidi Barrani. In the winter of 1940-41 Gen. Wavell, commanding the Brit. forces, suddenly turned to the attack and inflicted on G. one of the most spectacular defeats in the hist. of warfare. G. endeavoured to disclaim responsibility by placing before the It. supreme war council the actual orders sent him by Mussolini for the conduct of the campaign, contending that in a series of dispatches he had opposed in the strongest terms the entire strategy conceived by Mussolini. He resigned in March 1941. After Italy's surrender in 1943, G. became defence minister in Mussolini's republican gov. In 1945 he surrendered to the Amers, and was imprisoned on Procida Is. until 1946, when he was handed over to the It. Gov. for trial.

Grazzini, Antonio Francesco (1503-83), It. poet and dramatist, founder of the Accademia degli Umidi (Florentine Academy), 1540, assuming the name 'Il Lasca' (mullet, or barbel). He was also later chief founder of the Accademia della Crusca (1550), formed to perfect the Tuscan language. His works include a collection of tales in the style of Boccaccio's *Decameron*—*La prima e la seconda Cena* (selections appearing as *Le Cene*, 1756); sonnets, satirical poems, and comedies; *La Gelosia* (1568); *La Spiritata* (1561); *I Parentadi*, *La Pinzochera*. His works were considered 'testi di lingua' by the Della Crusca Academy. See P. Fanfani, 'Vita del Lasca' in *Le Cene ed altre prose*, 1857, and ed. of the *Comedie*, 1859; P. L. Ginguené, *Istituto Letterario d'Italia*, 1810-24.

Grease, see under HORSE (DISEASES).

Great and Little Bear, see URSA MAJOR and URSA MINOR.

Great Australian Bight, see AUSTRALIAN BIGHT.

Great Badminton, see BADMINTON.

Great Barrier Island, or Otea, is. of New Zealand, about 20 mi. long, on the E. coast of N. Is. To the W. is a small is. known as Little Barrier Is.

Great Barrier Reef, series of coral reefs off the E. coast of Australia, about 1250 mi. in length. In its widest part it is 100 m. broad and is 150 m. from the coast, but towards the N. it comes nearer the land, and in some places is only 10 m. distant. The reef can be seen at low tide, but can always be distinguished by the breakers which wash over it. It is not continuous but is broken up by many deep channels, the chief of which are the Billeh entrance, the Olinda entrance, the Halmoe entrance, and Flinders passage. The channel between the reef and the coast is a valuable route of communication for steamers owing to the calmness of the sea, but careful navigation is necessary, especially at night, when the reef can scarcely be discerned; honoo sailing

vessels only use the route by day. The most valuable products of the reef are pearls, pearl shells, and trepangs.

Great Barrington, tn. in the Berkshire co. of Massachusetts, U.S.A., on the Housatonic R. about 12 m. from the S.W. corner of the state. It is a popular summer resort. The chief manufs. are cotton and woollen goods, electrical appliances, paper, etc. There is a good building stone quarried in the dist. The Sedgwick Institute is situated here. Pop. 5800.

Great Basin, large region of drainage in the U.S.A. which includes nearly all Nevada, Utah, Oregon, and California, and lies between the Sierra Nevada on the W. and the Wasatch Mts. on the E. Mts. run from N. to S. of it, and rise to a height of 4000 ft. above the plateau. The soil is fertile where irrigation can be applied, but the hills are barren. It has numerous lakes, most of which are salt, the chief being Great Salt Lake, Lake Utah, Lake Sevier, Lake Walker, and Lake Carson. The mts. are rich in minerals, especially silver ore.

Great Bear Lake, see BEAR LAKE, GREAT.

Great Britain, name in general use for the is. that contains England, Wales, and Scotland, together with the adjacent small is., such as the Isle of Man and the Isle of Wight. It is thus the larger part of the United Kingdom of Great Britain and Northern Ireland and the headquarters of the Brit. Empire. Its official use dates from 1603, when James I. united the crowns of England and Scotland and called himself king of G. B. But the constitutional use of 'Great Britain' as the title of the United Kingdom dates from the Act of Union, 1707, by which the Eng. and Scottish Parliaments were united and the commercial advantages of England thrown open to the Scots, while the estab. Church of Scotland and the Scottish laws and judicial procedure were secured. This article, which is exclusively historical, deals with the hist. of G. B. from the accession of George I. in 1714 as a convenient point to commence the hist. of the nation. (For the hist. of England prior to 1714 see ENGLISH HISTORY; and for Irish, Scottish, and Welsh hist. see IRELAND; SCOTLAND; WALES). The Protestant succession in 1714 was the final step in the revolution of 1688, the vindication of the principles of Protestantism and election of the monarch by Parliament. Further, it marked very distinctly a new era in the constitution. The king was a foreigner and a figurehead; the real power had passed from the hands of the Crown into the hands of the Parliament, and during the eighteenth century that meant that the power remained in the hands of the great Whig families. These families had been responsible for the revolution of 1688 and for the peaceful succession of George I., but they were inspired by no feelings of loyalty, rather they regarded the matter as a financial speculation, and supported the Hanoverians because, whilst a Protestant sat on the throne, their funds were safe. The first two Hanoverian kings had little,

if any, doubt as to the exact feelings of their subjects.

The first event of importance during the reign of George I. was the Jacobite rebellion of 1715, which was really of little importance and which hardly stirred the absolute apathy of the nation. During that rebellion the Septennial Act was passed, prolonging the duration of Parliament to seven years instead of three. This was obviously an Act passed in order to prevent an election during these troublous times, and was but a temporary expedient. It lasted, however, down to the passing of the Preamble to the Parliament Bill of 1910, which reduced the duration of Parliament to five years. One important development also took place. The king no longer attended Cabinet councils; his place was taken by a first or prime minister. The system of party gov. had been developed previously, but now the entire personal element of the Crown was eliminated. Under kings who simply regarded England as a source of revenue the plan worked well, but under more ambitious kings it was apt to become a trifle irksome. The mania for speculation, which broke out during this reign and was really one of the results of the treaty of Utrecht, culminated in the S. Sea Bubble, which broke, reducing many people in England to penury. The ministry could not entirely exonerate itself, but financial matters were put right by the genius of Walpole. From 1721 to 1742 Walpole ruled the country. This period of office was a period of stagnation; nothing happened, affairs dragged themselves quietly along, other countries took part in wars, G. B. stood aloof and prospered. Walpole was intensely fond of power and could brook no rival, hence we find during this period of office the Whigs themselves began to be divided, and the discarded rivals of Walpole led the opposition. The Patriots and the Bays were two such parties. In 1727 George I. had d. and his son had succeeded. George II. had no love for Walpole, but guided by his wife, Caroline of Anspach, he retained Walpole in office. In 1733 Walpole introduced his famous excise scheme, a scheme which was years ahead of his time, but withdrew it rather than resort to extreme measures. In 1739 he declared war with Spain, 'the war of Jenkins's Ear', which ran on into the war of the Austrian succession, and in 1742, finding his majorities continually dwindling, he resigned. It is important to notice during this century that in every war which G. B. fought we either were in direct opposition to France or ranged amongst the allies opposed to her. Also the wars were no longer European wars solely, but struggles for colonial and maritime supremacy. The European wars were repeated in India and America, and often even, when the two countries were at peace at home, war was going on in the colonies.

During the war of the Austrian succession the second and last Jacobite rising took place. Again it illustrated the apathy of the country at large, but this time, owing to more efficient leadership,

G. B. was invaded and the Pretender reached Derby. That day has since been known as Black Friday. The gov. were seriously upset, the only person who scoffed at the danger being the king himself. But from Derby the Pretender had to retreat and was finally defeated at Culloden and after many adventures got safely out of the country. At the battle of Dettingen in 1743 for the last time, a Brit. sovereign led his troops in person. The war of the Austrian succession ended with the treaty of Aachen

throughout the country. He was succeeded in 1760 by his grandson, George III, eldest son of Frederick Prince of Wales, who predeceased his father George III (q.v.) was ambitious and had been dangerously educated. He proudly proclaimed, however, that he gloried in the name of Briton. Before he had been on the throne long Bute his tutor, was in possession of the premiership. Pitt had resigned and a peace had been signed by which G. B. obtained much, but not so much as would have been obtained with a

THE BATTLE OF CULLODEN, APRIL 16 1746

This contemporary (coloured) engraving, reproduced by courtesy of the Parker Gallery, 2 Albemarle St. London, bears the following description: This view of the Glorious Victory obtained over the Rebels Shows His Majesty's Army commanded by His Royal Highness the Duke of Cumberland drawn up in 3 lines, the Front consisting of Six Battalions of Foot, the Second of 3, the Third was a Body of Reserve composed of 4. Part of the Highland Army is here represented as furiously attacking, with Swords and Targets to brail in upon the left of the Duke's front line, where their rashness met with its chastisement from the Fire and Bayonets, of Barclay and Munro's Regiments. The right wing, of the Rebels, covered by a Stone Wall, Kerr and Coburn's Dragoons and Hawley and Bland are described as passing through a breach made for them in it, to attack the rear of the Rebels, which put them into confusion. Kingstons Horse wheeled off by the right of the King's 1 or 25 and falling on the left of the Rebels met our Dragoons in their center which began the total rout of these disturbers of the Public Peace.

(1748) and eight years later began the Seven Years' war. During this war Wm. Pitt the Elder became minister for war and owing to his genius the war was the most successful that G. B. had yet waged. He set himself to conquer India and America on the plains of Germany. He instituted a system of financing the Brit. allies, keeping France busy in that way on the Continent, as if attacking at the same time India and America. During this war G. B. definitely established the beginnings of an empire in India, and Canada also passed into her hands. France had been defeated in both countries. Before the end of the war George II. d. He had not been unpopular, and he was certainly respected

competent man at the head of affairs. The early part of the reign resolved itself into a struggle between the king and the Whigs. The king desired personal rule, and ultimately he for a short time obtained it. One of the indirect results of the cession of Canada to Britain was the outbreak of war with the colonies. The king's Parliament declared itself capable of taxing the colonies. The colonies protested that taxation went with representation. The gov., under Grenville, remained obstinate, the king regarded the colonies as rebels from the first. Conciliation was tried, but it was useless conciliating with one hand and irritating with the other, and finally, in 1775, war broke out and in

the following year the Amers. declared their independence and became a republic. By 1778 the war was extended and G. B. found herself fighting practically the rest of Europe. In America she was defeated at Yorktown, and the surrender of Cornwallis there in 1781 sealed the fate of America. Against France and Spain she was more successful, and the victories of Rodney in the W. Indies and the failure of the Spaniards to recover Gibraltar enabled G. B. to come out of the war with flying colours, but, nevertheless, at a lower pitch of power than she had reached before in the century. America's independence was of course recognised. The disasters of the Amer. war put a period to the personal power of the king, although he was still able to influence events by the use of the body of politicians known as the 'King's Friends.'

That series of changes in the economic world usually known as the industrial revolution began to become prominent just about this time. Change seemed to be in the air. The fiscal system was altered; the influence of Adam Smith's *Wealth of Nations* was felt; free trade began to be seriously spoken of; parl. reform found some bold and strenuous advocates, and then came the greatest event of all—the Fr. Revolution. For over four years that revolution remained disregarded by G. B., save in as far as it found some supporters but more enemies. The peace of Europe was held to be unaffected by it. Pitt himself declared the year before the outbreak of war that peace with France had never been so secure. Then, in 1793, Louis XVI. was executed and the international treaties of Europe were torn up by France. The republic desired to fight Europe, and speedily Europe found that the fight was not so unequal after all. But the enthusiasm of the revolution calmed down, the natural genius of the people slowly returned, and step by step they were led by Napoleon (q.v.) until the republic was a consulate and then an empire. Still the menace of imperial France was as great as that of republican France, and certainly it is due to the fact that it was impossible to invade and conquer G. B. that Europe was saved. Every other country in Europe suffered from actual invasion, but, as Pitt said, England saved herself by her courage and Europe by her example. Waterloo decided the fate of Europe, and Napoleon was sent to the Is. of St. Helena. Undoubtedly the victory had been due to a very great extent to the resources of G. B.; without her manufs. even her enemies could not exist. The Berlin decrees failed owing to the number of exceptions which Napoleon had to make.

During the reign of George III. (c. 18), had begun to change from an agric. to an industrial nation. The new manufs. had led to new roads and new means of transit; it was obviously necessary to obtain quick transit for goods, and necessity was the mother of invention. Roads were better constructed, canals were made all over the country, and finally came the steamship and the steam-engine. The period which

followed the war was one of great distress. (See under INDUSTRIAL REVOLUTION in GREAT BRITAIN.) The new machinery was attacked, and the increasing numbers of soldiers returning from the war made affairs worse. In 1819 the great riots broke out, and at Manchester the mob was charged by the military and a number of the rioters were killed; this event is known as the Manchester massacres or Peterloo. (For details see Prentice's *Manchester*, where it is stated that the assembly was 'peaceable' and that there was no riot.) In the meantime the demand for reform had continued, but the revolution had stopped all chance of immediate reform. Anything savouring of reform was regarded as revolutionary, and anything revolutionary was anathema to the vast majority of the people of the country. Catholic emancipation had been mooted at the time of the Union (1800) (see IRELAND, *History*), but the king had refused to hear of it, and Pitt, rather than break his promise to the Irish, resigned. The king, who had now for some considerable time been incapable of ruling, d. in 1820, weak, old, blind, and insane. His son, the prince regent, became king as George IV.

The death of George III. in 1820 was in itself unimportant. The king had for long been imbecile and blind, and the accession of the regent made but little change. The effect of the revolution in France, however, was tremendous, and this intellectual awakening, stimulated by and stimulating the movement which we know as the industrial revolution, brought in its train result of the highest significance. There was more real progress in the nineteenth and early twentieth centuries than in most of the preceding hist. of the world. Democracy, hitherto an unattainable ideal became not only a possibility but, during the later years, a reality. During the reign of George IV. toleration became a real thing in spite of violent opposition; the Test and Corporation Acts were repealed, and a Bill for the relief of the Catholics was passed. These changes seem nowadays but small and necessary; to the age which passed them they were practically revolutionary. It is necessary also to remember that the close of the Napoleonic wars had been followed by a reaction in almost every country in Europe, and, in spite of this, revolutionary measures were passed in G. B.

In 1830 George IV. d., and was succeeded by his brother, William IV. In his reign the principles which were then called Radical largely supplanted the solid and, to a certain extent, unreasoned Toryism of the previous century, as may be gauged from the measures that were passed during this reign. The agitation for a Reform Bill at last had its reward in the passing of the great Reform Act of 1832, to the aristocracy of the time the beginning of the end of all things. Slavery was abolished, a Poor Law was passed, legislation for the protection of the worker passed, and the abuses of bor. patronage and trading privileges began to receive that critical attention which was to result in the Municipal Corporations Act of 1835.

In 1837 William IV. *d.*, and was succeeded by his niece, Queen Victoria, whose long reign witnessed so much change and material progress. The early years of the young queen's reign witnessed the repeal of the Corn Laws and the great Chartist agitations, together with the beginning of the great Irish question. The year 1848 was called the year of the revolution; all Europe was in a state of unrest, and every side of the social fabric seemed to be agitated. The forties witnessed the Scottish Disruption movement and the Oxford movement, both indications of the state of unrest. Commercially G. B. was prospering and progressing by leaps and bounds. The great European wars had left her the workshop of the world, and for a time she had no competitors at all. Politically her progress was equally great, while the great parties still remained fairly true to the old ideas; nevertheless the Liberals, who represented the Whigs, and the Conservatives, who represented the Tories, were both being gradually tinged with the democratic spirit. The people were at last being recognised as a real factor in political existence, but this fact must not be overestimated. The power of the Crown and of the landed proprietors was as great as ever, but was skillfully disguised. The power of the House of Lords, although still great, was not great enough to compete with the Lower House, and gradually from this period the power of the House of Commons increased until it is now recognised as the greatest power in the legislature.

It will perhaps be best here to review as briefly as possible the main political events of the period from 1830 to the present time. The Reform Bill of 1832 stands out as the great event of the ministry of Lord Grey, and before this ministry relinquished office they had attempted the reform of the Poor Laws and had introduced the first Factory Act. Melbourne became Prime Minister in 1831, and although the ministry was dissolved by the king, the Tory minister, Peel, after trying to hold office with a minority in the House of Commons, resigned, and Melbourne continued in office until 1841. In 1839, defeated on a question of the affairs of Jamaica, he resigned, and Peel was again sent for, this time by Queen Victoria. The question of the change in the ladies of the bedchamber, however, roused so much difficulty that Melbourne was again induced to accept office. In 1841 he dissolved Parliament, and a Tory majority was returned. On the whole the ministry had not been very successful; they had passed the Municipal Corporation Act, and had introduced penny postage, but their policy in Canada and Jamaica had been bad, and the zeal for reform seems to have left the Whig party. The prin. event of the ministry of his successor, Peel, was the repeal of the Corn Laws (1846), which overshadowed his other successes. The Irish famine forced his hand, and the head of a nominal Protectionist ministry introduced the greatest measure of free trade which the country had yet been given. The 'betrayal of the party,' as many Con-

servatives considered it, was bitterly attacked by a young politician, Benjamin Disraeli (*q.v.*), the future leader of the Conservative party. Peel was almost immediately defeated on the question of a Coercion Act for Ireland, and resigned, never to hold office again. The Tory party was split up by this measure, and the Peelites, chief among whom were Gladstone and Aberdeen, ultimately joined forces with the Whigs to form the Liberals, whilst the Protectionists, under Bentinck and Disraeli, ultimately formed the Conservative party. Peel was succeeded by Lord John Russell, whose greatest difficulty during this period was the quelling of the Chartist riots. The Chartist demands were manhood suffrage, vote by ballot, ann. Parliament, payment of members, abolition of the property qualification, and equal electoral dists. Russell's plan was the presentation of a monster petition to the House of Commons, but the procession failed, and almost half the total number of signatures in the petition were found to be forged. In 1851 Palmerston's somewhat cavalier methods of conducting affairs at the Foreign Office led to his resignation, and in 1852 he threw the ministry out by defeating them on the Militia Bill. The ministry was succeeded by Lord Derby's first administration, and this, after a short period of office, was succeeded by a coalition ministry under the leadership of Lord Aberdeen. Its chief ministers were Aberdeen, Gladstone, Russell, and Palmerston. It lasted only for three years -- whence Disraeli's historic remark, 'England does not love coalition.' During its tenure of office, however, Gladstone definitely abolished all the remaining protective duties, and G. B. became altogether a free trade country. Nevertheless this ministry's utter mismanagement of the Crimean war led to its overthrow in 1855.

During the next ten years the outstanding figure in Brit. politics was Palmerston. After two years of office he was defeated, but appealed to the country and was returned by a large majority. Later, in 1858, his Conspiracy to Murder Bill was thrown out, and Lord Derby formed his second administration, which lasted only for fifteen months, after which Palmerston again came into power. From this time until his death Palmerston was supreme. The main events of importance were those concerned with foreign affairs. The position of France and the ambition of Napoleon III. made very many apprehensive of France. Gladstone, who was by this time a Liberal, was rapidly making a name for himself as a great financial minister. The invasion scare of 1858 led to the formation of the volunteers. In 1861 the Prince Consort *d.* In 1865 Palmerston *d.* and was succeeded by Lord John Russell, who attempted to pass a Reform Bill, but was so bitterly attacked by many members of his own party that he resigned, and was succeeded by Lord Derby. In 1867 Disraeli introduced a Reform Bill, and, 'educating his own party' up to it, passed

It was described by Lord Derby as 'a leap in the dark,' and contained many amendments accepted from Gladstone.

From 1867 almost to the end of the century the field of politics is almost entirely occupied by the duel between Gladstone and Disraeli. Seldom have two statesmen of such genius been opposed to one another, or been so entirely different in character. In 1868 Disraeli became Prime Minister in succession to Lord Derby, but was defeated in the general election of that year and resigned before the end of the year. Disraeli was

returned to power having for the first time since 1841 a real majority in the House of Commons. The ministry formed by Disraeli was a brilliant one, and the opposition was for a time weakened by the withdrawal into private life of Gladstone. The question of Home Rule was gradually forcing itself to the front, and the Irish tax-ticks in the House became obstructive. It was at this time that Disraeli put forward his imperial policy, and the ministry is chiefly noticeable for its attitude on foreign and imperial affairs. The Bulgarian atrocities led to the inter-

THE REFORM BILL 1867 'A LEAP IN THE DARK'

A cartoon by Sir John Lubbock, reprinted by permission of the proprietors of Punch.

succeeded by Gladstone, who during the five years of his ministry passed more measures than almost any previous one. Education became compulsory, trade unions were legalised, the Ballot Act was passed. Under Cardwell the army was reformed, and the linked battalion method adopted. The Irish Church Act and a Land Act for Ireland were passed and the state of Ireland at that time led to Coercion Acts. But the ministry gradually became unpopular— even those sections of the community that would benefit most from its measures turning against it— whilst the foreign policy of the gov. was decidedly unpopular. G. B.'s action towards Russia during the Franco-Prussian war and towards the Alabama claims of the U.S.A. being decidedly weak. In 1874 Gladstone resigned, and the Conservatives were

vention of Russia and to the Congress of Berlin from which G. B. issued in 1878 with 'peace and honour'. Affairs in Africa and India also attracted much attention, the title of Empress of India was taken by the queen and the majority of the shares of the Suez Canal became the property of G. B. In 1880, however, Disraeli, or Lord Beaconsfield as he was now called, was badly defeated at the polling booth and resigned. The renewed enthusiasm of the Liberals on the reappearance of Gladstone and the 'swing of the pendulum' account to some extent for this. But as Disraeli remarked, 'hard times' was the chief cause. The influx of wheat from the American prairies, coupled with crop blights, did much to depress agricultural prosperity. Gladstone now formed his second administration. He again remained in power for about five years.

During that time he was much troubled by the Irish question, and the agrarian outrages in that country led to the passing of fresh Coercion Acts. In 1882 Lord Frederick Cavendish was murdered. In 1880 the Boers were, after the defeat at Majuba, granted independence, and in 1885 the Egyptian question, which had necessitated the bombardment of Alexandria in 1882, was marked by the murder of Gordon at Khartoum. In 1881 the second Irish Land Bill was passed, and in 1884 the Reform Bill became law. In 1885 Gladstone resigned and was succeeded by Salisbury, but he held office only for a short time. In 1886 at the general election the Liberals were again returned to power. Gladstone formed his third ministry, but his majority was dependent on the Irish. He determined, however, to introduce a Home Rule Bill, which led to grave dissensions in his own party. On a div. on the second reading he was deserted by Hartington, Chamberlain, and Bright, and was defeated by a majority of thirty. He appealed again to the country, and was defeated. Lord Salisbury now formed his second administration.

From 1888 to 1906, broken only by a short administration of the Liberals, the Conservatives were constantly in power. The introduction of the Home Rule Bill had seriously split the Liberal party, and later, at the retirement of Gladstone, differences became still more marked. The dissident Liberals called themselves Liberal-Unionists, and refused at first to co-operate with the Conservatives. The chief members of the second Salisbury administration were Lord Randolph Churchill, Sir Michael Hicks-Beach, and Balfour. The Liberal-Unionists, however, gradually became willing to accept office, and in 1887 Goschen succeeded Lord Randolph Churchill as chancellor of the exchequer. In 1892 the Liberals succeeded to office, but after a second Home Rule Bill had been introduced and thrown out in the House of Lords, Gladstone finally retired and was succeeded by Lord Rosebery. In 1895 the Conservatives again came into power, and the Liberal-Unionists formed a coalition with them, the duke of Devonshire (Hartington), Lord Lansdowne, and Chamberlain accepting office. Chamberlain quickly made a name for himself as colonial secretary. In 1899 the Boer war broke out and was concluded in 1902. In the same year, after the Conservatives had again been returned to power at the 'khaki' election (1900), Lord Salisbury *d.*, and was succeeded by Balfour. Queen Victoria, who had celebrated her diamond jubilee in 1897, *d.* on Jan. 22, 1901, and was succeeded by Albert Edward, Prince of Wales, his coronation, as Edward VII., postponed from June 26, 1902, owing to an attack of appendicitis, taking place on Aug. 9 of that year. During Balfour's administration the highly controversial Education Act was introduced, and in 1903 Chamberlain put forward the Tariff Reform scheme which succeeded in breaking up the Conservative party and

led to the overwhelming victory of the Liberals at the election of 1906. Sir Henry Campbell-Bannerman formed the first administration, and was succeeded shortly before his death by Asquith (1908). Edward VII. *d.* on May 6, 1910, and was succeeded by his second son, George Frederick Ernest Albert, as George V., who was crowned on June 22, 1911. The rejection of the budget in 1909 by the House of Lords led to the introduction of the measure for the curtailment of the power of that House, and after a conference of the parties had failed, the Parliament Bill of 1911 was introduced and finally, after a great struggle, passed, since the Prime Minister obtained from the king a promise to create enough peers to swamp the Tory majority in the House of Lords if the Bill were thrown out. Mr. Asquith's ministry continued until 1915 as Liberal and continued as Coalition Gov. until 1916.

G. B.'s entry into the First World War on Aug. 4, 1914, subdued political differences, but the Home Rule Bill and the Welsh Church Bill became law automatically, being the first measures to be passed under the new Parliament Act (*q.v.*). In 1915 a Coalition Gov. was formed comprising twelve Liberals, eight Conservatives and Unionists, one Labour member, and Lord Kitchener. Legislation was passed to lessen any danger to war efficiency at home, especially with respect to war munition centres. In 1916 the Conscription Bill was passed. Industrial unrest at the Clyde munition works culminated in a series of strikes. The Defence of the Realm Act (*q.v.*) (D.O.R.A.) was applied and the leaders were deported. Meanwhile financial difficulties arose. The new entertainments tax (*q.v.*) was imposed. Adopted as a war measure it is still regarded as a source of normal revenue. In April 1916 Irish volunteers in Dublin, during what appeared to be a holiday parade, seized the prin. building, and a serious conflict with the regular troops took place. The rising was an expression of Sinn Féin (*q.v.*) hostility to the Brit. Gov. Civil war was proclaimed. The rebellion, however, was eventually subdued, though not before a hundred lives had been lost. An interesting domestic measure was the passing of the Daylight Saving Bill (*q.v.*). At first ridiculed the originator of the idea, Wm. Willett, is now recognised as a public benefactor. The death of Lord Kitchener at sea left the war secretaryship vacant, and Lloyd George succeeded him. Zeppelin raids having taken place, lighting restrictions were enforced to minimise the conspicuousness of large towns. A food controller (*see* FOOD CONTROL) was appointed, and in Dec. Lloyd George became Prime Minister, being in close association with Balfour Law. In 1917 a new Irish Convention saw Irish prisoners released, among them Eamon de Valera (*q.v.*). Gen. Smuts accepted a place in the War Cabinet (*see* CABINET, IMPERIAL WAR), while the Whitley Councils were set up under the chairmanship of J. Whitley as a step towards

Industrial peace. The protraction of the war by this time caused a system of 'rationing' of essential foods. At the end of the session (Feb. 1918) the People's Representation Bill was passed by which all men of twenty-one, and women of thirty, with residential or business qualifications, were given the franchise. Early in the same year the House of Lords gave its approval to the principle of the League of Nations (*q.v.*). In Sept. industrial disputes again occurred, charges of 'profiteering' were made, and increased pay was demanded. Meanwhile rumours of peace encouraged the Irish to agitate for a settlement of their claims, but the armistice had been signed before any definite step could be taken, and the end of the First World War meant the end of a war gov.

Parties returned to their old distinctive groups, though there was inevitable overlapping. The Labour party came back with greatly increased strength and challenged the Liberal position as the official opposition. Irish Nationalists practically disappeared, while the seventy-three Sinn Féiners refused to take their seats, among them being Countess Markievicz, the first woman M.P. They formed a Dail Eireann (*q.v.*) (assembly, of Ireland), and were the predominating force in that country. Gov. appointments included Sir S. B. Sinha, the first Indian member of the House of Lords, as under-secretary for India. In industrial relations peace presented her problems as insistently as war. The Miners' Federation called for nationalisation of mines, and formed with railwaymen and transport workers the Triple Alliance (*q.v.*). The Sankey coal commission settled the wages difficulty and recommended nationalisation, though its recommendation was not adopted. On June 28, 1919, the peace treaty was signed. In addition to its territorial and guarantee provisions, important industrial ambitions were included. Among social changes at home was the Women's Emancipation Bill, whereby women were no longer barred from professions hitherto restricted to men. During the year an industrial court (*see* CONCILIATION) was set up, composed of employed and employers, to settle trade difficulties. But Irish affairs continued to dominate domestic politics. A form of guerrilla warfare had developed. The Irish Self-Determination League demanded recognition of the republic and the evacuation of the 'English army of occupation.' In 1920 the Restoration of Order Bill did nothing to remedy the trouble, while added violence resulted from alleged reprisals by the Auxiliary Irish police known as Black and Tans. Martial law was proclaimed in many of the S. Ius. With the intervention of Gen. Smuts in the following year a more favourable stage was reached, and eventually a truce was arranged, and Ireland was granted Dominion Home Rule. (*See also* HOME RULE; EIRE.) In 1922 confidence in the Coalition Gov. diminished, a general election took place, and a Con-

servative ministry under Bonar Law was returned to power. Labour became the second party in the House. The Conservatives, however, had no clear majority, and on Baldwin's fiscal policy another general election occurred, resulting in a stalemate.

At the general election the following year the Labour party assumed office under Ramsay MacDonald. In Feb. the gov. formally recognised the U.S.S.R. and in its first budget removed the McKenna duties (*q.v.*). Unemployment, now over the million figure, claimed immediate attention, and it was generally admitted that the problem was more difficult than any which the war had given rise to or aggravated. As foreign secretary MacDonald enhanced his reputation over his conversations with France respecting the Dawes reparations plan (*see* DAWES PLAN). But the gov.'s insecurity by this time had led to defeat, and once again a general election had to be faced. The notorious 'red letter' (*see* ZINOVIEV LETTER), alleged to have come from Russian Communists demanding propaganda among Brit. Communists, affected the election, and the Conservatives, under Baldwin, were returned to power with an independent majority. In industry class feeling had become bitter. The phrase 'class war' appeared in trade union literature. Mr. Churchill, in his first budget, reimposed the McKenna duties. Unemployment gave rise to alarm. In the coal industry many mines were closed and many areas were reduced to destitution, especially in S. Wales and in the N. of England. Meanwhile the Locarno Treaty (*q.v.*) was signed, and Germany was free to enter the League of Nations. In 1926 disturbances in China caused some misgiving. Civil war between Cantonese and Pekingese forces endangered Brit. lives and property, and troops were dispatched to Shanghai. Fresh concern was caused by events in the coal industry. Negotiations having failed a general stoppage resulted, which led to the general strike (*see* STRIKE, GENERAL). The Emergency Powers Act of 1920 was invoked and the gov. took control of necessary supplies. Eventually the strike spread to the railways, transport workers, newspapers, and iron and steel trades. Two and a half million men ceased work. By the time it was called off £30,000,000 had been lost. A Bill to secure longer hours in the mines was passed and discontent grew unchecked until Nov., when agreement was reached. Various expedients were tried to mitigate unemployment, among them the Industrial Transference Board, by which men were transferred to likely areas, and training schemes. There was unrest in the cotton industry and a deadlock followed protracted negotiations. Mr. Churchill's budget of 1928 was notable for its de-rating scheme (*see* DE-RATING), a policy of granting rating relief to depressed industries. In April diplomatic friction occurred with Egypt over certain legislation which offended Brit. military obligations, and not until warships were

dispatched was the crisis avoided. The gov.'s Trades Unions Bill aroused fierce opposition from its Labour critics. By it a general strike was declared to be illegal, but in spite of violent criticism it became law. A diplomatic sensation was caused during the year by the police raid on Arcos, a Russian trading agency, and relations were severed with Russia as a result of the discovery of subversive

original scopo, and now, as the Local Government Bill, pursued a stormy passage, while unemployment had reached the ominous figure of over 1,500,000. The gov.'s Franchise Bill, whereby women received the vote at twenty-one (see ELECTIONS), and a desire for safeguarding duties among its supporters, led to a general election. Labour returned to office, though without a working majority.

**THE SIGNING OF THE LOCARNO TREATY IN THE GRAND ASSEMBLY ROOM
OF THE FOREIGN OFFICE, LONDON, OCT. 16 1925**

Seven representatives of the subscribing powers put their signatures to the historic document in the Grand Assembly Room at the Foreign Office. Left to right, starting with Mr. Baldwin, Prime Minister, at the top table, are Sir Austen Chamberlain, foreign secretary; Sir Cecil Hurst, legal adviser; Mr. M. W. Lambton, M. Briand, French Premier; M. Berthelot; Dr. Beneš, foreign minister, Czechoslovakia; Count Skrzyński, Prime Minister, Poland; M. Preziosi; M. Vanderveelde, foreign minister, Belgium; M. Rolin, Herr Kempner; Herr von Schubert, Herr Stresemann, foreign minister, Germany; Dr. Luther, Prime Minister, Germany; Marquis Medici; M. Pilatti, Signor Scialoja, Locarno delegate. Behind Mr. Baldwin is Mr. Winston Churchill.

propaganda. Nation-wide interest was aroused later by the revision of the Prayer Book (see also DAVIDSON, LORD). Parl. sanction was sought for its voluntary adoption. The measure was thrown out amid acrimonious hostility. In agriculture a further anxiety beset the gov.: the industry demanded gov. aid, and, receiving none, voiced its grievances with an emphasis which had its effect on the subsequent general election.

The beginning of 1929 saw political struggles overshadowed by the serious illness of the king, who was successfully operated on for pleurisy. Meanwhile the De-Rating Bill had grown beyond its

Awaiting the new gov. were unemployment, new treaties with Russia and Egypt, and the ratification of the Anglo-Amer. naval pact, sponsored by F. B. Kellogg, Amer. diplomat and lawyer. The threatened lock-out in the cotton industry took place in July, and after a stoppage of three weeks by 500,000 operatives, a return to work was effected by arbitration. By Aug. relations with Egypt were amicably settled, and the acceptance of the Young plan of reparations at the Hague coincided with the evacuation of the Rhineland (q.r. and see also REPARATIONS), and Ramsay MacDonald successfully terminated con-

versations with Hoover, thus accepting the Kellogg Naval Pact (*see also* LONDON CONFERENCE). A form of agreement was once again arranged with Russia, and the Unemployment Insurance Bill with its benefits was finally passed. But by 1931 unemployment had reached the startling figure of over 2,000,000, and it became clear that the question was one which must be considered irrespective of party politics.

G. B.'s financial and economic situation, after only a year or two of Labour government, deteriorated in a marked degree, the unemployment figures reaching over 2,800,000 in 1931, while a budget deficit of £10,000,000 was shown to be imminent (report of Sir George May's Committee, 1931). Yet neither misgovernment nor prodigality need be imputed to the Labour Gov., since, on the one hand, their tenure of office coincided with a world economic crisis and, on the other, the sums they were prepared to spend on social services, judged by really progressive standards, were by no means excessive. Actually the gov. went out on the issue of a low tariff on imports and was succeeded by a Coalition or National Gov. of all parties under Ramsay MacDonald, one of the first acts of the new gov. being the abandonment of the gold standard in order to avert the collapse of the £. After the National Gov. (*q.v.*) had been returned a second time and by a great majority, Neville Chamberlain, chancellor of the exchequer, reversed the country's traditional free trade policy by introducing the Import Duties Bill, 1932, under which Britain's fiscal policy now became protectionist. The same year saw the passage of the now historic Statute of Westminster (*q.v.*), which, by giving extra-territorial operation to the legislation of the Parliaments of the self-governing dominions, in effect rendered those countries independent of G. B. for all purposes. By now the nation's financial outlook had so far been redressed as to show a budget surplus in 1932 of over £31,000,000—a recovery so rapid as to lend some support to the contention that it could hardly have been so black as it was painted only a few months previously. But no appreciable decline in unemployment came until 1934, the serious state of the Lancashire cotton industry being one disturbing factor and the more so from the flooding of markets by cheaply produced Jap. textiles. But in 1936 unemployment showed a further decline in consequence of the improvement in the iron and steel industry—which had been under a cloud ever since the close of the First World War—through the gov.'s plans for rearmament in reply to Hitler's policy in that direction. Domestic policy indeed was now overshadowed by considerations of foreign policy and the exigencies of national defence. In the Far E. Japan's expansionist ambitions had their repercussions in G. B.'s naval policy; while Mussolini's designs in Abyssinia, with their implicit threat to Brit. interests in the Near E., involved in the Brit. Gov.'s view a discussion of

G. B.'s obligations under the Covenant of the League. The policy of economic sanctions against Italy effected nothing owing to the backward state of Brit. rearmament, and merely served to embitter relations for some years between the It. and Brit. peoples (*see further under* ABYSSINIA). But the National Gov., which had been once again returned to power in 1935, was in an awkward situation, being pledged to pursue an active policy against Italy and, at the same time, receiving no real support for that policy from France, whose evil genius in this as in many other matters subsequently was Laval (*q.v.*). At this juncture Sir Samuel Hoare, Brit. foreign secretary, and Laval, Fr. Premier, concluded a pact by which Italy was to receive substantial concessions at the expense of Abyssinia. The Brit. Cabinet, however, repudiated the pact, and Sir Samuel Hoare was replaced by Mr. Anthony Eden, a minister who was also destined to suffer temporary eclipse until the outbreak of the Second World War.

The year 1935, the silver jubilee of George V., was celebrated in May amidst unprecedented enthusiasm; but in the next year the popular monarch d. at Sandringham (Jan. 30) and was succeeded by Edward, Prince of Wales, as Edward VIII. The new king reigned for less than a year, abdicating on Dec. 10, 1936, uncrowned, in consequence of manifestations of widespread distaste in regard to his proposed marriage to Mrs. Wallis Warfield (formerly Mrs. Ernest Simpson), an Amer. subject. He left England immediately afterwards and married her in France the following year (*see* EDWARD VIII.).

Early in 1936 the international situation underwent further serious deterioration through Germany's denunciation of the Locarno Treaty, ostensibly as a counterpoise to the little Franco-Soviet Pact. Italy had by now completed the conquest of Abyssinia, the only course open to G. B. being to carry out rearmament on a larger scale, her existing forces, particularly in the air, being totally inadequate to ensure any respect from the dictators. Provision was made for the immediate expenditure of £300,000,000, chiefly on new naval and air armaments. When, however, Germany occupied the demilitarised Rhineland zone, the Brit. Gov. evinced a measure of sympathy towards Hitler's professions of peaceful intentions as outlined in a comprehensive peace plan—a plan, however, which left much to be clarified if it were really to form the basis of a binding treaty. The Brit. Gov.'s view was that the situation had so developed that Germany could signify that she at least recognised and intended to respect the existing territorial and political status of Europe. It was the gov.'s view too that if any W. air pact were made, it should be accompanied by a regional agreement for limitation of air strength.

During 1937 the international situation appeared to be steadily growing worse. The desire of the nations for collaboration

with one another was often expressed and as often frustrated. Two wars were in progress—the Sino-Jap. war and the Sp. civil war. Japan and Germany had both left the League of Nations before the year ended. In many centres of pop. there were realistic rehearsals of measures of defence against attack from the air. Had G. B. at that time been blessed with a strong Prime Minister the fatal policy of appeasement might not have been continued and the rate of rearmament could have been to a great degree accelerated. But the repeated warnings by Mr. Winston Churchill of the growing Ger. menace fell on unwilling ears in the Commons and the public was apathetic. Indeed it remained, if not apathetic, unrealistic in its attitude towards G. B.'s danger even for many months after war had broken out in 1939. Regarding the civil war in Spain, the Brit. Gov. pursued the policy with France of 'non-intervention' and, at the same time, strove to bring about the withdrawal from Spain of It., Ger., and Russian 'volunteers'—representing the rival ideologies of Fascism and Communism. Italy was not in a position to proceed much further in this adventure in view of her commitments in Abyssinia, and Germany, while not concealing her resolve to control her own destinies, continued to proclaim the essential peacefulness of her intentions. The great problem of the Brit. Gov. was to devise the appropriate means of approaching Germany with the view of initiating useful discussions of her desires, needs, and grievances. It was recognised that the way towards appeasement through the approach of G. B. and France to Germany would be long and difficult, yet under the lead of Neville Chamberlain, who this year had succeeded Lord Baldwin as Prime Minister, the hope of accomplishing something practical by these means was not abandoned; and indeed Chamberlain held on his course even to the fateful meeting with Hitler and Mussolini in 1938 at Munich where, even if his policy was unpopular with a considerable part of the Conservative elements of G. B., he did undoubtedly postpone war for a year during which some of the leeway in rearmament may have been made up. Almost equally problematic, too, were Brit. and other foreign interests in China. In this year the coronation of King George VI. and his consort, Queen Elizabeth, was solemnised at Westminster Abbey (May 12)—an event which announced, in anxious moments, the unanimous intention of the Brit. Commonwealth to stand, through the renewal of this ancient symbolism, by its well-tried institutions and traditional loyalties. Another event at this time of importance to Brit. interests was the conference of imperial Prime Ministers, which took place in London in the month of the coronation. The dominions represented at this conference were mentioned for the first time by name in the coronation oath as taken by King George VI. The year closed with the country united on the main issue of rearmament. To raise the means to this end the rate of income tax

was increased, a special tax was imposed on business profits—foreshadowing the policy of taking or endeavouring to take the profit out of war—and a large loan floated. It was evident that only on the basis of being well armed could G. B.'s foreign policy take a firmer line without, at the same time, incurring contempt and the charge of opportunism. In the sphere of domestic legislation a notable social reform was the Matrimonial Causes Act, which enlarged the grounds for divorce (*see* DIVORCE). In education matters of interest were the laying by Queen Mary of the foundation stone of the new Bodleian extension and the completion of most of the building of the new administrative headquarters of the univ. of London—destined, however, in 1939 to become the seat of the Ministry of Information in the war period.

The threats to the peace of the world, which had thrown their shadow over the close of 1937, grew rapidly more imminent and more specific in 1938, and the year was marked by successive crises, each passed without universal catastrophe, but always leaving a sense of heavy foreboding. The sombre events in the Sp. civil war, which was now approaching its final stages, and the implacable fighting in the Far E., played their part in the ultimate collapse of the international system created at Versailles, and in enhancing the pitfalls of G. B.'s foreign policy. Hitler now assumed command of all the armed forces of the Reich, thus proclaiming the restoration of Germany to her full military strength and her reliance upon that strength in seeking a remedy for her grievances. Early in the year Mr. Anthony Eden, foreign secretary, left the gov. of Neville Chamberlain owing to a difference of opinion with the Prime Minister over Anglo-It. relations. Mr. Eden based his policy on the hope of reasserting the diminished authority of the League of Nations. Chamberlain, while not denying the ideal of collective security on which the league had originally been founded, preferred to postpone the re-establishment of the ideal to a settlement of international problems by direct negotiation with aggrieved nations. Events, however, were moving too swiftly for conciliatory action, and, by the beginning of Sept., all the great powers of Europe were ranging themselves for a conflict more terrible than that of 1914. The arrogance of the Ger. Gov. over the Czech frontiers (*see* CZECHOSLOVAKIA) seemed to make war inevitable and, as France had guaranteed Czech integrity and G. B. stood pledged for the ultimate security of France, G. B. was immediately involved. But in Sept. Chamberlain, now a man of seventy years of age, resolved to make an unprecedented personal effort to avert the catastrophe. Travelling for the first time in his life by aeroplane, he sought a direct interview with Hitler in his home at Berchtesgaden and followed this journey by two other flights to Germany in order to secure the acceptance of a plan agreed upon with France, which, in effect, called upon

Czechoslovakia to make heavy sacrifices in the cause of peace. In the same month the Brit. Navy was mobilised and, on Sept. 28, the famous Munich Conference was held, at which Chamberlain signed (Sept. 29) with Hitler a declaration pledging their two countries to seek peaceful means of settling any future differences arising between them. Chamberlain sincerely believed that he had, in his own words, 'brought back peace in our time'; but most neutral opinion justifiably regarded the declaration on Hitler's part as worthless and hypocritical and the whole transaction as a betrayal of Czechoslovakia. In G. B. rearmament for the forces and recruitment and training for civilian defence proceeded with greater intensity than in the previous year, for the alarms of the Sept. crisis outweighed in this respect the new hopes engendered by the Munich pact, and to meet the cost of this movement the budget raised the income tax to a level unprecedented in time of peace. Civilian training for air-raid precautions (see A.I.T.P.) became a major national pre-occupation. Many local authorities made issues of gas-masks. Meanwhile, however, an agreement with Italy for stabilising relations in the Mediterranean and the Near E. had a stormy reception in Parliament, being closely associated with the resignation of Mr. Eden and with the tardiness of the reduction of the foreign forces in Spain, which had been made a condition of bringing it into effect. Another notable, if inconclusive, agreement signed this year was that under which the Brit. Gov. and that of Eire composed long-standing differences over the payment of land annuities and the Brit. occupation of certain S. Irish ports. The evacuation of these ports was a political blunder of the first magnitude and was bitterly regretted when its consequences to Brit. shipping were fully realised during the Ger. submarine blockade in the Second World War. Popular confidence in the strength of Anglo-Fr. bonds was confirmed (July) by the success of the state visit of King George and Queen Elizabeth to Paris, and a visit (Nov.) by Chamberlain and Lord Halifax, who had succeeded Mr. Eden, seemed to emphasise the closeness of Brit. political and military collaboration with France. In 1939 foreign policy still dominated all other political issues in G. B., and nominally the gov. was still wedded to 'appeasement,' though, by now, Chamberlain did not refrain from free criticism of the Nazi regime, while the gov. rejected outright Hitler's claim for colonies. The curious feature of Chamberlain's foreign policy was that he still reposed implicit trust in the document he had brought back from Munich and, in spite of caustic comment in the press, he not only adhered to the idea of personal contacts between heads of gov. but retained more strongly than ever his hold on the Conservative party. He also paid a visit to Rome to see Mussolini. But despite his diplomatic activity the international position remained unaltered.

The work of rearmament went on with as much vigour as was then possible without a complete overhaul of industrial organisation. Public anxiety in the progress of air-raid precautions increased as the previous detached view of the danger of war yielded to a growing apprehension of its approach. Sir John Anderson, Lord Privy Seal, announced that the gov. would provide steel shelters for the protection of the homes of occupants of small houses—shelters which were soon popularly known as 'Andersons.' Volunteers were enrolled for air-raid precautions services. About this time the Irish Republican Army, taking advantage of the agitation in Eire to abolish partition, organised a number of bomb explosions in central dists. of London and Manchester in an effort to intimidate the Brit. Gov. into incorporating N. Ireland in Eire. This campaign, which was encouraged by foreign agents, was soon suppressed after some of the malefactors were hanged for the murder of victims in Coventry. Another agitation in London was staged by Communists in an endeavour to compel the gov. to supply arms to the Span. Republican Gov., but the gov. adhered to its policy of non-intervention, and, in any case, as Franco was in possession of most of Spain, it was impossible to regard the Span. Republican Gov. as the sovereign gov. of that country. Realising that if war came the civilian pop. would be involved the gov. pledged itself in time of war to pay compensation to injured civilians on a scale appropriate to the private soldier recruited for the army, on the principle that civilians would be exposed to a common danger. Compensation was also promised for loss or damage to stocks of commodities in order to secure the continued flow of necessary supplies. But the Prime Minister still repeated his remarkable conviction that Germany had no more intention of aggression than had Britain. If that were so the logical conclusion was that for G. B. to rearm on its present scale was folly; but Chamberlain met this argument with the retort that this was the only way to make Germany desist from its folly. The only inference to be drawn would seem to be that Chamberlain was playing for time and no longer had any real belief in appeasement. Yet after Hitler had overrun Czechoslovakia, he still held on his course of substituting the method of discussion for that of force in the settlement of differences. It was, however, becoming ever clearer that the gov. was completely out of touch with the Brit. people, who were furious at this latest Nazi outrage on the liberty of other nations. The first sign of any change in the gov.'s policy was the opening of consultations with Russia on the possibility of Ger. aggression in S.E. Europe, but the discussions led to no concrete result. On March 31, when the air was full of rumours of Ger. designs on Poland, Chamberlain announced that G. B. would lend its support to Poland if that country were attacked. Again, when Italy overran Albania, the Prime

Minister announced that, in the event of any action which threatened Greece or Rumania, G. B. would lend those countries all the support in her power. These pledges marked the end of the much-criticised appeasement policy and the gov. now prudently introduced a limited measure of conscription by calling up for military training men of the ages of twenty to twenty-one and by doubling the strength of the Territorial Army. Having given guarantees to Greece and Rumania, the gov. realised the importance of securing the assistance of Turkey, and negotiations with that country were entirely successful. Chamberlain was in fact making every effort to build up a 'peace front,' but his hopes of getting the adhesion of Soviet Russia were disappointed. In May the king and queen made a tour through Canada and, by invitation of President Roosevelt, the tour was extended to the U.S.A. They were to have sailed in the *Repulse*, but the threat of war made it impossible to spare the battleship and they sailed in the liner *Empress of Australia*. Early in June a disaster, recalling the loss of the ill-fated airship *R101* in 1930, stirred the sympathy of the whole nation: while carrying out trials in Liverpool Bay the submarine *Thetis* (which was built at a cost of over £350,000), after submerging, failed to rise at the appointed time and, though she was soon located, all efforts to raise her failed, and of over 100 men there were only four survivors. With the Ger. threat to Danzig (July) and flagrant violations of Polish rights there, the approach of war was now obvious. The spirit of the nation, however, had by now become thoroughly inured to the prospect of war, and on all sides it was recognised that Nazi methods were incompatible with any settled order in Europe. On the eve of the Ger. invasion of Poland Lord Halifax (foreign secretary) reiterated (G. B.'s resolve to stand by that country (Aug. 24). G. B. went to war with Germany on Sept 3 (see WAR, SECOND WORLD, Causes).

Under the National Service Bill all men from the age of eighteen to forty-one, apart from a number who were excepted, were made liable to be called up for military service, the text of the Bill following closely the provisions of the Military Training Act passed earlier in the year. Another Bill was passed to implement the gov.'s promise to provide grants in respect of injury or death of the civilian pop. An Emergency Powers Act was passed at the same time which empowered the gov. to do almost anything for securing the public safety, maintaining order, and prosecuting the war. Large-scale evacuation of children and mothers was carried out from London and other big cities, leading to serious educational and social problems. Owing, however, to the fact that there were no air raids in the early months of the war, many of these returned to their former homes, and for many months the people of G. B. appeared mostly to be following their ordinary avocations and pursuits, a state of things which was

destined to be rudely interrupted after the fiasco of the Norwegian campaign, and which finally ended with the defeat of France. The gov. set its face against any statement of war aims beyond that of winning the war and therefore did not repeat the mistake made in the previous war, when a ministry of reconstruction was appointed which made fancy plans for creating a new world, only to be followed by disillusionment.

It may be said that during the first nine months, while Chamberlain was Prime Minister, the war was not being prosecuted with the efficiency or vigour necessary to ensure even the possibility of ultimate victory. Critics of the gov. felt that to achieve the impulse demanded by war in modern conditions, there should be a gov. representing all parties in the state. The gov. was roundly charged with being half-hearted in its determination to speed up industrial production to the requisite level. The Labour leaders had declined to take office in Chamberlain's gov., and, until they should change their minds, it was difficult to get the full support of the trade unions behind the national war effort. Matters came to a head with the utter failure of the Norwegian expedition (see NORWAY AND DENMARK, GERMAN INVASION OF (1940)), and the various elements of discontent boiled up in a debate in the Commons in which Mr. Amery summed up the feeling of the effective majority when he addressed to the Prime Minister the words of Cromwell to the Long Parliament, ending in the cry 'In God's name go!' Despite a loyal speech by Mr. Churchill, the motion of confidence was carried by so small a majority that Chamberlain felt bound to resign. Mr. Churchill formed a new administration within a few hours, and the prin. Labour leaders entered the gov. In the War Cabinet and in the crucial ministries of Labour and Supply. The new gov. met Parliament on May 13, 1940, when Mr. Churchill, veritably the captain of the nation, made the first of a series of memorable speeches which heartened the nation in dark and dangerous days and impressed the friends of freedom throughout the world. In a famous passage he said on that occasion: 'I should say to the House, as I said to those who joined the government. I have nothing to offer but blood, toil, tears, and sweat.' The new gov.'s policy, he said, was to wage war with all their might and their aim was victory; victory at all costs, victory in spite of all terrors. This, at long last, was realistic language, and though still darker days lay immediately ahead, with the approaching collapse of France and the evacuation of Dunkirk, the nation now knew what to expect and through all vicissitudes stoically bore its burdens. On May 22 Parliament passed the Emergency Powers (Defence) Act, which gave the gov. complete power of control over persons and property for the prosecution of the war. The collapse of France (see WESTERN FRONT IN SECOND WORLD WAR and FRANCE, History, Causes of French Collapse) caused a situation of extreme peril

for G. B. On her coasts the danger was obvious and imminent, since the enemy's first object after his conquest of Franco and the capture of the whole of the equipment of the Brit. expeditionary force, was to mass his armies in and about the channel ports and to assemble a large fleet of transports and barges, apparently intended for an invasion of the Brit. Isles. A 'Home Guard' (g.v.) of part-time soldiers was hastily enrolled to assist in the defence of their factories and homes. But it was evident that as the Gers. did not command the sea, they could not hope

which they avoided heavy casualties at the cost of giving up their hope of destroying the defending air force and also at the sacrifice of anything like accuracy of aim. Their attacks were now made on the great towns, especially London, and were directed with scarcely any pretence of seeking military objectives. The Brit. civilian pop., facing an ordeal unique in their history, showed a fortitude that became the wonder of the world. The king and queen set an example by refusing to leave their own bombed home, except to pay sympathetic visits to whatever town seemed for

THE HOME GUARD, NEAR DOVER

to land an invading army with any chance of success unless they first secured complete mastery of the air over the channel and the Brit. Isles. In the middle of Aug. they began air operations on a large scale with this end in view, and battles between large forces occurred almost daily for over a month. In these battles the R.A.F. fighters, though always heavily outnumbered, at once demonstrated a decisive individual superiority over their adversaries, inflicting on the average at least four times as many casualties as they suffered. By the middle of Sept. it was clear that the Gers. were suffering ruinous loss—in one day (Sept. 15) 185 Ger. planes were shot down over Great Britain—and were no nearer to their objective of obtaining sufficient mastery of the air to launch their projected invasion (see OPERATION SEAFIELD). They then abandoned the massed assaults by daylight and adopted the policy of night raiding, in

the moment to be suffering most acutely, and to inspect the forces and all kinds of national effort. The Ger. menace to the new world, obvious in the Tripartite Pact, drew closer the bonds of sympathy between G. B. and the U.S.A., and the return of Franklin Roosevelt for his third term was due mainly to this sympathy and to the realisation that continuity of administration was the best guarantee that help in planes, guns, tanks, and other war material would be both effective and speedy. Losses at sea and the diversion of labour and shipping to war purposes necessitated a great curtailment of goods available for civil consumption and accordingly the rationing system became progressively more severe. In the financial year 1940-41 income tax rose to 8s. 6d. in the £, while a tax on purchases, ranging up to 33½ per cent, was placed on nearly all goods not already taxed. The gov.'s appeal for national saving met

with a great response, and 'Spitfire' and other fighting and relief funds were widely supported. On Sept. 7 London was bombed without cessation for many hours. The most savage attack was concentrated on dockland, creating an enormous fire problem. Something of the kind had been prepared for, but the strain on the service was very heavy. Fire-fighting organisation was, however, rapidly developed and, as a result, every situation that arose after that time was adequately met. On Dec. 29 another fierce onslaught was made on the city of London, the evident intention being by means of incendiary bombs, to be followed later by high explosives, to destroy the commercial heart of the empire by fire. Though fierce while it lasted the raid ceased suddenly and the work of extinguishing the bombs was quickly put in hand. In this fire many Wren churches of great beauty were destroyed, including St. Bride's, Fleet Street; St. Lawrence, Jewry; St. Stephen, Coleman Street; Christ Church, Greyfriars; St. Leonard, Foster; St. Mary, Aldermanbury; St. Andrew by the Wardrobe, and St. Mary Woolnoth. Dr. Johnson's house in Gough Square was gutted, Trinity House and a number of the old city halls were demolished, and many streets were severely damaged, including Newgate Street, Cheapside, Alder-gate, London Wall, St. Paul's Churchyard, Paternoster Row, Tower Hill, and the Minorities. Many newspaper offices and publishers' houses were gutted. The famous 500-year-old London Guildhall was also destroyed, and business premises were grievously damaged. The orgy of destruction, failed in its purpose, but the lesson that buildings, when otherwise unoccupied, should be guarded against a similar danger recurring was brought home to the people by the gov. and press, and very soon compulsory fire-watching services were ordered by the home secretary. Prov. cities and tns. were also heavily raided, especially in Nov. 1940. Coventry suffered appalling damage (Nov. 16), the famous cathedral being almost destroyed, together with the chief shopping centre. In Manchester the Free Trade Hall was burnt out and a large part of the Royal Exchange. The Elizabethan St. Peter's Hospital, the Dutch House, and the Univ. Great Hall (opened in 1925) in Bristol were destroyed. Other tns. to suffer very grave damage to shops, offices, churches, and dwelling houses were Birmingham, Southampton, and Sheffield (Nov.-Dec.). Many famous buildings in Britain were used as targets by Ger. raiders and damaged more or less severely; these included the following:—*Churches*: Westminster Abbey (at least twice); St. Paul's Cathedral; St. Martin-in-the-Fields; St. Clement Danes (twice, being burnt out on the second occasion in 1941); St. Giles, Cripplegate; St. Swithin's, Cannon Street; St. Augustine, Watling Street; St. Margaret's, Westminster; Christ Church, Westminster Bridge Road; Canterbury Cathedral; and Exeter Cathedral. *Hospitals*: St. Thomas's; Great Ormond

Street; London Hospital; Queen Mary's Hospital; St. Bartholomew's Medical School; Charterhouse Clinic; St. Dunstan's headquarters; Royal Hospital, Chelsea; and Ford's Hospital, Coventry. *Famous buildings*: Buckingham Palace; St. James's Palace; Kensington Palace; Lambeth Palace; Eltham Palace; House of Commons (the debating chamber gutted in May 1941); House of Lords; Brit. Museum; Law Courts; Tate Gallery; the Old Bailey; Imperial War Museum; Queen's Hall (burnt out); Somerset House; Hertford House; Burlington House; Tower of London; Westminster Hall (at least twice); Temple; Inner and Middle Libraries (very serious damage); Stationers' Hall; Radnor House, Twickenham; Australia House; Bank of England (near); Co. Hall; Mino Tussand's; National City Bank of New York; Public Record Office; S. Africa House; Univ. College Library; V.M.C.A. headquarters; the Zoo; Royal Empire Society, Northumberland Avenue; Royal College of Surgeons; Argyle Theatre, Merseyside; Arts Theatre, Birkenhead, Birmingham Art Gallery; and Birmingham tn. hall. *Clubs*: Arts Club, Dover Street (almost demolished); Carlton; and Reform (see also under LONDON). Very considerable damage was done to business premises, shops, and other buildings in the spring of 1941 in Plymouth, the Merseyside, Glasgow, Swansea, Bristol, and other ports, this being part of the effort to crush Brit. trade in the so-called battle of the Atlantic. (For further details of damage see under the names of cities and towns).

Mr. Churchill's prestige as G. B.'s war leader remained undimmed throughout the war. When events culminated towards the end of 1941 in the marshalling of a world-wide alliance of great powers against the aggressor nations there was an enhanced appreciation of how much his leadership had contributed to this since the period when, immediately after the fall of France, G. B. and the commonwealth faced a terrible menace undaunted but alone. In particular his prompt declaration of G. B.'s full support for Russia, after she was invaded by the Ger. armies, his historic meeting at sea with President Roosevelt and the framing of the Atlantic Charter (q.v.), and his further visit to Washington (Dec.) to promote the co-ordination of the war effort of the Allies, were recognised as decisive marks of statesmanship. The increasing scale of Amer. aid for G. B. before America formally declared war on the Axis, and the growth of collaboration in every sphere between the two countries also owed much to Mr. Churchill's handling of Anglo-Amer. relations. War finance became more stabilised. G. B.'s total expenditure in the year ended March 31, 1941, was £3,881,000,000 of which £1,409,000,000 was raised from revenue and the balance borrowed. The standard rate of income tax was increased to 10s. in the £ and the reduction of the exemption limit to £110 a year increased from 2,000,000 to 7,800,000 the number of persons liable to tax. The object of this heavy new taxation was not merely to raise revenue

towards paying for the war, but also to reduce purchasing power in the hands of the public as a safeguard against inflation. By Dec. war expenditure had reached the rate of nearly £83,000,000 a week, or nearly £11,750,000 a day, while G. B.'s total expenditure during the war had by that time reached £8,300,000,000. Organisation of man-power and woman-power developed rapidly. Compulsions were extended in sev. directions, notably for the recruitment of the women's auxiliary services and for the transfer of workers to the making of munitions from industries less important in wartime. Concentration of industries possessing surplus labour and factories became public policy directed by the Board of Trade. There were large applications of the Essential Works Order to control the supply of labour in shipbuilding, railway transport, dock transport, building, coal-mining, and also agriculture. The second National Service Act received the royal assent on Dec. 18, when a proclamation was signed by the king calling up women between twenty and thirty years of age. The Act declared that a liability rested on all persons of either sex to undertake some form of national service, and it fixed the higher age limit of the National Service Acts at fifty-one and extended their application to women for the purpose of maintaining the women's auxiliary services. Married women and women with a child under fourteen were exempted from conscription.

Over the broad field of strategy throughout the year the ultimately dominant factor was Brit. sea-power. The problem for Germany, whose dominion now extended over most of W. Europe, was to make its *Lebensraum* stable under the constant pressure of the Brit. blockade; and if the blockade could be maintained it was evident that the Gers. during the year must attempt to break out of the encirclement, whether by invasion of G. B., by a thrust towards the Mediterranean at either end, or by an eruption still further E. than Poland. At the same time the attempt to set up a counter-blockade continued throughout the year in the Atlantic where the Ger. Admiralty hoped, by means of unrestricted submarine warfare based on the Fr. ports, to cut off G. B. from Amer. food supplies and munitions; but by this time the U.S.A. had become convinced that her own national future depended upon sustaining G. B.'s resistance to aggression. The U.S. Gov. saw that the logic of lease and lend (*q.v.*) required also a guarantee that the supplies could reach their destination. The weakest link in the Brit. chain of encirclement was the Mediterranean, and the contest for its control was long drawn and fluctuating. In the course of this struggle Brit. arms triumphed over the It. forces. In the course of Gen. Wavell's campaign in Libya the entire It. army in Cyrenaica was shattered, the It. Empire in E. Africa was destroyed following a simultaneous advance from the Sudan and Kenya under Gens. Cunningham and Platt, and an It. fleet, which had ventured

out to cut Brit. communications between Alexandria and Greece, was destroyed off Cape Matapan by Adm. Sir Andrew Cunningham. See ITALIAN EAST AFRICA, SECOND WORLD WAR CAMPAIGN IN (1941). The successful Brit. campaign in Libya had for the moment confirmed the grip of Brit. power over the E. Mediterranean; but it was in this region that the Gers. made their first attempt to break out of their encirclement, and Brit. troops had to be diverted from Libya to meet the threat to Greece, to whom Britain had given guarantees. This Ger. thrust towards the Mediterranean was supported by other Axis activities in the Middle E.; but an apprehended Ger. advance across Asia Minor to the Caucasus was thwarted by Turkish fidelity to the Brit. alliance. See further AFRICA, NORTH, SECOND WORLD WAR CAMPAIGNS IN; GREECE, SECOND WORLD WAR CAMPAIGN IN (1941); CRETE, BATTLE OF (1941).

The outbreak of war on the E. front changed the whole aspect of affairs throughout the world. On the Axis side troops from numerous satellite countries were quickly involved in the conflict and, in response to Russian requests, G. B. declared war on those countries. The reaction in G. B. had been instantaneous. Mr. Churchill, broadcasting on the day of the Ger. invasion of Russia, unequivocally faced the simple issue that, notwithstanding differences of political creed, the enemies of Hitlerite Germany were the friends and allies of G. B. and he promised the fullest aid to Russia, though for geographical reasons Brit. assistance could only be in the form of munitions of war. Later in the year disaster came in the Far E. with Japan's entry into the war. H.M.S. *Prince of Wales* and H.M.S. *Repulse* had been sent to Singapore in anticipation of war with Japan to be the mainstay of the Brit. Pacific fleet, but soon after Japan's attack on the Allies had been launched both these capital ships were sunk. Hong Kong was taken by the new enemy by Christmas Day and Brit. Malaya was invaded. Thus 1941 ended with heavy loss in the Far E. theatre of war, and the prospect of still greater losses was to be feared before Brit. and Amer. sea-power could rally and restore the balance.

During the first six months of 1942 Parliament reflected the uneasiness of the nation at a disheartening series of military reverses and disasters. Relations between the gov. and the Commons were often much strained. On his return from Washington in Jan., following a second conference with President Roosevelt, Mr. Churchill found the Commons restive at the continued Jap. advance through Brit. Malaya, and he therefore demanded a vote of confidence, which indeed he obtained after a critical debate of three days by the crushing majority of 464 votes to 1 (Jan. 21). On result of the debate was the decision to appoint a minister of production. A further threat of political crisis developed later after the fall of Singapore and the escape of the Ger. war-ships, *Scharnhorst* (*q.v.*), *Gneisenau* (*q.v.*),

and *Prince Eugen* from Brest through the Eng. Channel. Demands for a reconstruction of the War Cabinet became so insistent that Mr. Churchill yielded to the storm. The War Cabinet at the end of 1941 comprised Mr. Churchill (Prime Minister), Mr. Clement Attlee (dominions affairs and deputy Prime Minister), Sir John Anderson (lord president of the council), Mr. Herbert Morrison (home affairs and home security), Mr. Anthony Eden (foreign affairs and leader of the House of Commons), Mr. Oliver Lyttelton (production), Mr. Ernest Bevin (labour and national service), and the Australian minister Mr. R. G. Casey (minister of state in the Middle E.). The budget introduced in April was for a total expenditure of \$5,286,000,000. In June Parliament approved a gov. plan for the coal industry under which, for the duration of the war, the State assumed full operational control of the mines in order to secure the maximum production, administrative responsibility being vested in a new Ministry of Fuel and Power. Mr. Churchill again visited the U.S.A. in June. In the meantime the Brit. Eighth Army (*q.v.*) was driven out of Libya, and with Rommel threatening Egypt Parliament was again anxious and critical. Mr. Churchill, for the first time, had to meet the challenge of a motion of 'no confidence' in the 'central direction of the war' in the Commons, but the vote of censure motion was defeated by 176 to 25 votes. Mr. Churchill, while admitting the seriousness of the Libyan defeat, effectively defended the central direction of the war; but he took care very soon to visit Cairo and effect a drastic reorganisation of the high command there (*see further* AFRICA, NORTH). His next review of the war situation, delivered in Sept. after his return from Egypt, gave general satisfaction to the House of Commons, and from that time relations between the House and the gov. steadily improved *pari passu* with the improved military situation; for when the king on Nov. 11 opened a new session of Parliament, Rommel was in full retreat, a large Anglo-Amer. expeditionary force had successfully landed in Fr. N. Africa, and the whole outlook in the Mediterranean had changed.

With a great army inactive in G. B., and soon swollen by thousands of troops from the U.S.A., who had been arriving in the country since the turn of the year, there had been increasing popular clamour for some more obvious exertion of Brit. military power in the European theatre of war. This clamour soon took the form of a demand for the invasion of N. Europe in order to open what was called 'a second front'—a clamour motivated by chivalrous desire to lessen the heavy burden laid on Russia, with which since a treaty of alliance in the war and of collaboration and mutual assistance thereafter was concluded in London, May 26. But the real key to the situation was the control of Africa and the Mediterranean, in which sea the devoted is. of Malta alone kept the Brit. flag flying—the one defiant symbol in what was almost a *mare clausum* of the Axis;

and therefore the Allies pursued their destined course in the Middle E. undeterred by this clamour.

In G. B. during this year of impending great events in the military sphere, the planned mobilisation of the last reserves of man-power for the forces and of woman-power to replace the men in essential civil work, foreshadowed the deployment of the full strength of the nation in action against the enemy. But on the other hand the phase of struggle for mere survival was so far modified that already post-war reconstruction began to be discussed, and plans made for rebuilding of blitzed cities and, especially, for the use of land and the location of industry (*see under* TOWN AND COUNTRY PLANNING) and for guaranteeing social security against the fear of unemployment and want (*see* The Beveridge Report, pub. Dec. 1). The year was also notable for a further stage in the hist. of Indian autonomy. The rapid initial success of Jap. arms quickened the desire of G. B. for the removal of the political obstacles to India's war effort, and on March 11 Mr. Churchill announced that the War Cabinet had formulated a plan for the appointment after the war of an elected All India constituent assembly to draw up a constitution on dominion status lines, which plan had been taken to India by Sir Stafford Cripps for negotiation with the political parties there; but in the result the Indian Congress rejected the proposals (April 10).

During the year, although Ger. air activity over G. B. had declined greatly from the weight of the 1910 raids, the Gers., during April-May, carried out a number of rather heavy raids on the cathedral cities of Exeter, Bath, Norwich, and York (Canterbury was attacked in Oct.), doing considerable damage to life and property. The Gers. justified these attacks on cities devoid of war industries, but full of historic monuments, as a reprisal for the damage done to Lübeck, but ignoring the military objectives in that Ger. city. G. B. was now waging more effective war against the Ger. U-boat menace. The combined effect of sea and air patrol was increased destruction of Ger. submarines operating near U. B., which sent them ever further afield in search of their victims (*see also* COASTAL COMMAND). Under the leadership of Air Marshal Sir Arthur Harris the Brit. bomber force began to strike deadly blows at the enemy's war production. Mr. Churchill promised that Ger. cities, harbours, and centres of war production would be subjected to an ordeal the like of which had never been experienced by any country in continuity, severity, and magnitude (*see further under* AIR RAIDS). At the end of the year the R.A.F. was bigger than the combined air forces of Germany and Italy; but commitments were growing even faster than the R.A.F., thereby entailing ever greater demands on production.

In 1943 Mr. Churchill, with the foreign secretary, Mr. Eden, took part in a series of international conferences

at which the allied war plans were concerted, and provision was made for continued collaboration after the war—a collaboration which, in the result, was far from wholehearted. The strain of these journeys on Mr. Churchill was severe, and in Feb. he was seriously ill with pneumonia following the Casablanca Conference, and he suffered a second attack later in the year while in the Middle East, but on both occasions made a good recovery. On May 18, after the successful issue of the Tunisian campaign, Parliament formally expressed its gratitude to

insurance for all classes, for all purposes, from the cradle to the grave,' and later (Nov. 9), at the Mansion House, he said the gov. were formulating plans to ensure that after the war food, work, and homes were found for all. The sixth war budget made no increase in direct taxation, but indirect taxation, mainly on tobacco, liquor, and luxury goods, was increased to yield an additional annual revenue of £10,000,000. The average rate of war expenditure had risen to £15,000,000 a day and up to this time (April 12) the war had cost G. B. £13,000,000,000. In the

the Brit. and allied forces for the brilliant victory in N. Africa. The king visited N. Africa by air on June 12 and subsequently went to Malta on which is had been bestowed the George Cross—being, every where received with acclamation, as indeed was Mr. Churchill when he visited the is. in the following Nov.

With the war progressing favourably, Parliament turned its attention increasingly to post-war policies, particularly in physical and social reconstruction. The gov. accepted (Feb.) in principle the plan for social security expounded in the Beveridge report, and in a broadcast to the nation on March 21 Mr. Churchill, bowing to the spirit of the times, outlined a four-year plan of post-war social policy for execution by a national gov., representing all parties. He said that he favoured 'national compulsory

following Sept. the gov. introduced a scheme for collection of income tax from current earnings, known as PAYE (Pay As You Earn). This scheme, as prepared by Sir Kingsley Wood, Chancellor of the Exchequer, was at first designed to apply only to weekly wage earners, but his successor, Sir John Anderson, extended it to all salaried workers earning up to £600 a year and, later to the whole range of Schedule E taxpayers. The life of Parliament was prolonged by statute into the ninth year.

Probably one reason why the Conservative party, who were well in the majority, suffered so severe a defeat in 1945—but the new session, opened on Nov. 21, aroused criticism on the ground that the king's speech contained no specific promises of early legislation on such subjects as the social security plan and the

future use of land (see on this the references to the Barlow, Uthwaite, and Scott reports under TOWN AND COUNTRY PLANNING). Late in Dec. Mr. R. A. Butler, minister of education, introduced his new Education Bill, designed to supersede all previous Acts and involving a complete recasting of the national system of education (for full details see EDUCATION).

The mobilisation of Britain's manpower reached the peak this year. There were over 33,000,000 registrations of persons between the ages of fourteen and sixty-four. By the end of Sept. some 22,750,000 were in the services, civil defence, the munitions industries, or other paid occupations necessary for the civil life of the nation. In addition more than 1,000,000 women were doing voluntary work of one kind or another, while household work, including the care of 9,000,000 children under fourteen, was the prov. of most of the remainder. Also more than 1,000,000 men and women over sixty-five years of age were in full-time paid employment. A statistical analysis shows that of the 16,000,000 males between fourteen and sixty-five no fewer than 13,000,000 were in the armed forces or in paid employment which had been repeatedly combed to eliminate redundant labour. In the same age groups 7,750,000 women out of 17,000,000 were in either the auxiliary services or in paid employment. Some 700,000 women with domestic ties were engaged in part-time work. Of the single women between eighteen and forty, 91 per cent were either in the auxiliary services or in work, and 80 per cent of the married women under forty-one and without dependent children were also engaged in the war effort. These figures, as justifiably claimed by Mr. Bevin, showed that mobilisation in G. B. was more extensive and more thorough than in any other country, allied or enemy, engaged in the war. But this mobilisation involved too severe combing, notably in the coal-mines and in the cotton industry. The weakening of the labour force in the mines created so serious a problem as to necessitate the unprecedented direction of youths of eighteen to coal-mining as an alternative to military service, and indeed the blow to the industry was so serious that it was one of the factors that contributed to the economic and industrial crisis of 1946-47. For the time being, however, the remarkable war effort of G. B. was eloquently reflected in the mounting scale of the country's air and anti-submarine warfare on Germany. There was indubitably a changed feeling in Germany due partly to the ever growing R.A.F. offensive, formidably reinforced by the Amer. air forces based on Britain, and partly to the fact that, while U-boats were still taking an increasing toll of allied shipping and still increasing in number, yet the destruction of U-boats was proceeding at a still greater proportionate rate.

In a year of impressive military achievements by the allied arms, Parliament was increasingly occupied in discussing and

enacting policies for the post-war period of reconstruction. There was, however, more discussion than enactment inasmuch as the gov. pursued the method of outlining policy in white papers for parl. and press discussion before Bills were drafted. But there was one outstanding piece of legislation, namely the passing of Mr. Butler's (who became the first minister of education under the new Act) Education Act which became law on Aug. 3, 1944 (see EDUCATION). Discussions in medical circles and in the press, lay and professional, on the gov.'s white paper on a national health service continued throughout the year, while discussion on medical education was also founded on the Royal College of Physicians' report on child health and a comprehensive survey of the whole subject by the Goodenough Committee. No legislative enactment on this controversial subject, however, was destined to be passed in the lifetime of this Parliament. The white paper on medical services was followed (May) by a white paper on employment policy, in which the gov. accepted the much-quoted assumptions of the Beveridge report, but fell short of Sir Wm. Beveridge's confident exposition of 'full employment in a free society' by setting forth only the essentials of a policy for maintaining after the war 'a high rate of employment.' In Sept. the gov. announced their proposals for children's allowances, comprehensive social insurance, industrial injury insurance, and reform of public assistance. Parliament gave general approval to these proposals, and a Ministry of National Insurance was estab. under Sir Wm. Jowitt to administer the current insurance schemes and supervise the work of the Assistance Board. For housing the gov. adopted the targets of 250,000 temporary factory-made bungalows and 300,000 permanent dwellings to be erected in the first two years of peace, to be followed by 3,000,000 to 4,000,000 houses in the subsequent ten years. Parliament authorised the spending of £150,000,000 on temporary dwellings. The housing problem, however, was to prove an intractable one both as to immediate needs and long-term programmes and, as to the former, the arrival of the flying-bomb (v.e.) in the summer upset arrangements for an early resumption of building. The labour force engaged on house repairs in the London region had to be augmented from 21,000 to 132,000 men, reinforced by assistance from the Brit. and allied services. The number of houses damaged was 720,000, and of these only 280,000 had been repaired by Christmas. The Town and Country Planning Act, which gave local authorities wider powers to purchase compulsorily land required for the reconstruction of blitzed and blighted areas, became law after an acrimonious passage through Parliament (see TOWN AND COUNTRY PLANNING).

The year's budget made no important changes in taxation, but the chancellor, Sir John Anderson, announced proposals for aiding the modernisation and re-equipment of industry and agriculture

after the war by now and increased tax allowances on new buildings plant, and machinery, as well as in respect of expenditure on research. For the year ended March 31, 1944, expenditure was £5,788,421,000, being £2,749,873,000 higher than revenue and by now the national debt had risen from £8,163,000,000 in 1939 to £17,722,564,000. The great industrial effort behind the forces assured the success of the projected invasion of Normandy on D-Day, the governing date for making the utmost impact on the enemy. On that day (June 6), though the maximum mobilisation of man-power was reached the previous year, the accumulation of armed strength in men and munitions continued. On D-Day there were 4,500,000 men in the armed forces, notwithstanding the casualties in nearly five years of war, while there were now 500,000 women in the auxiliary forces. There were, at the same time, 225,000 men and 56,000 women in full-time civil defence. At the end of the year the gov. decided to increase the combatant strength of the army by 250,000 men and to enlarge the A.T.S. (q.v.) and post units of that force overseas. Comparative statistics establish in fact that at this time more than 2,000,000 women not formerly in industrial employment were mobilised in the war effort, and even this figure is a purely conservative estimate. Large redistributions of man-power became necessary through variations in the aircraft programme, the completion of special equipment for the invasion of the Continent, and for putting back into production shell factories whose output had for some time been surplus to requirements but was now necessary to meet an enormously increased expenditure of ammunition on the W. front and contingent needs in the Far E.

Up to this date more than twice the productive effort of the First World War had been absorbed by the Second World War. During the year many Home Guards (q.v.) served as anti-aircraft gun crews, but the war was now so clearly reaching a favourable climax that the Home Guard was stood down early in the winter. A gov. white paper (Nov.) on the Brit. war effort showed that Britain had mobilised 22,000,000 men and women in the active age groups for direct war service in the forces or in industry—i.e. 69 per cent of the pop. in their age groups. G. B. itself had produced seven-tenths of the munitions supplied to the Brit. Commonwealth, other empire countries had produced another tenth, while the balance came from the U.S.A. From the beginning of the war to the end of 1943 G. B. built 6,750,000 dead-weight tons of new merchant shipping and, in agriculture, the ploughing up of 7,000,000 ac. of grass-land had resulted in halving food imports. Nearly one in three of all houses in the kingdom had been destroyed or damaged, 202,000 were totally destroyed, another 255,000 rendered uninhabitable. At sea nearly 3000 Brit. ships had been sunk. Exports had been reduced to less than a third of the 1938 figure. Direct taxation

had increased from £494,000,000 in 1938 to £1,781,000,000 in 1943, indirect from £582,000,000 to £1,249,000,000. Total war expenditure had now reached the great sum of £25,000,000,000. To pay for imports of war materials the gov. had to sell overseas assets worth £1,065,000,000, while incurring fresh overseas liabilities to the amount of £2,300,000,000. The total casualties to all ranks of the armed forces of G. B. during the war were: killed, 214,723; missing, 53,039; wounded, 277,090; prisoners of war, 180,405. Total, 755,257. Civilian casualties from the beginning of the war to the end of Nov. 1943 were 58,459 killed; 81,154 injured and detained in hospital.

The ending of the war in Europe was quickly followed by the dissolution of the Coalition Gov., and the general election that came soon after resulted in the return of a Labour Gov. with a large absolute majority. This was the third Labour Gov., but the first that held both office and power. Mr. Churchill's Coalition Gov. ended on May 25, 1945, or only a fortnight after Germany's surrender; but previously both the Labour and Liberal parties had decided to withdraw from the coalition, the continuance of which they favoured till the election against Mr. Churchill's suggestion to continue until the war against Japan had been won. The Labour party, however, believed that this suggestion was a device by the Conservative party to derive the maximum advantage from Mr. Churchill's great prestige as G. B.'s war leader through a rushed or khaki election, and their rejection of the proposal proved decisive. Mr. Churchill then resigned and formed a new gov. mostly of Conservative ministers. This 'caretaker' gov. met on May 29 and the election took place on July 5. All parties pledged themselves to the vigorous prosecution of the war against Japan and to the enactment of the great programme of social reform projected by the Coalition Gov. But in the contemplated method of achieving social reform there was a substantial difference reflecting the opposed ideologies of Conservatives and Socialists. For the Labour party put forward an industrial programme for the nationalisation of the coal, gas, and electricity industries, of inland transport services, and of the iron and steel industries. They also advocated public ownership of the Bank of England and the creation of a National Investment Board. The Conservatives stoutly opposed this domestic policy, and the electoral battle was fought mainly on this issue. The Conservatives, however, suffered one of the severest defeats in their whole hist.; for in a House of Commons of 640 members the Labour party won 393 seats as against 166 in the previous Parliament; the Conservatives dropped from 358 to only 189 seats; while the Liberal party, who had put forward 307 candidates, had only twelve elected. Mr. Churchill, having resigned again, Mr. Clement Attlee accepted the king's invitation to form a gov. In the speech from the throne at the opening of the first session, the new

gov. included in their legislative programme proposals for nationalising the coal industry, placing the Bank of England under public ownership, reorganising air transport, and for the repeal of the Trade Disputes and Trade Unions Act; and by the end of the year the Bank of England Bill had been passed and the Coal Nationalisation Bill introduced, while a scheme had been promoted for reorganising civil aviation under three statutory corporations (*see further under AVIATION, CIVIL; BANK OF ENGLAND NATIONALISATION ACT; COAL MINES, NATIONALISATION OF*). There was no equivocation in the matter of socialisation, for on Nov. 19 Mr. Herbert Morrison, leader of the House of Commons, announced that during the lifetime of the present Parliament the gov. would bring under public ownership the electricity supply industry, the gas industry, railways, canals, docks and harbour undertakings, and long-distance road haulage, while road passenger transport would be co-ordinated with the national scheme. A Conservative challenge to the whole policy of the gov. by way of a motion of censure early in Dec. served only to emphasise the strength of the Labour ministry's hold on the House of Commons.

The keynote of life in G. B. in the months following the end of the war was its austerity or poverty, and so far from time bringing any mitigation, this austerity was destined to become gravely aggravated before the end of 1946, gradually rising to a crescendo of the most acute national crisis. The unforeseen sudden end of the war with Japan (Sept. 1945) enabled a somewhat greater total of releases from the forces than had been previously proposed, and by Nov. 30 955,315 men and 147,229 women were discharged to take part in the export drive for increased dollar resources. The financial stringency in Britain, which now made itself felt throughout the whole political and economic system of the country, was influenced largely by the cessation (Sept. 2) of the lend-lease arrangement immediately following the defeat of Japan. Under that arrangement G. B., having paid away her foreign investments to finance the war effort, had converted a great proportion of her industry to munitions and other war supplies, relying on America to feed the people. It was economically impossible to import and pay for the necessities of life pending the outcome of the national effort to restore the British export trade; hence it became urgent to secure a large credit in Amer. dollars to survive the period of reconstruction, and after many weeks of negotiation in Washington a loan of \$1,100,000,000 was arranged, but on such onerous terms—as, for instance, Amer. insistence on the abolition by G. B. of tariff preferences—as to invite grave forebodings of default when repayment should become due.

Early in 1945 Mr. Churchill had met President Roosevelt and Marshal Stalin at Yalta in the Crimea to make plans for the final defeat, occupation, and control of Germany and for eventual co-operation for

peace (Feb. 4-11), and on Mr. Churchill's return to Britain his gov. received a vote of confidence on the Crimea decisions by 413 votes to nil. This conference portended the defeat of Germany. Some four days after the allied forces under E.-M. Montgomery began the Rhine crossings (March 23) the 1050th and last Ger. rocket to reach Britain landed at Orpington—a Parthian dart which seemed to be the prelude to a swift succession of military disasters for Germany and Japan unparalleled in the hist. of warfare. Meanwhile, however, Britain's great war leader, as has been seen, was not destined to continue at the helm after the Ger. surrender, though it may be said that he had done much to sow the seeds of Japan's defeat. While the election result in Britain was awaited Mr. Churchill went to Potsdam (July 17) (*see also POTSDAM AGREEMENT*) for a conference with President Truman and Marshal Stalin, and in the unusual circumstances he asked Mr. Attlee, as leader of the opposition, to accompany him. They left the conference to be in Britain for the declaration of the election results on July 26, and it was Mr. Attlee who returned to the conference two days later as Prime Minister with Mr. Ernest Bevin as his foreign secretary. Thus ended Mr. Churchill's premiership; but for the most part Brit. foreign policy continued unchanged throughout this and the following year.

In the first session of the new Parliament, which lasted for nearly fifteen months, the gov. enacted a great volume of reconstruction legislation besides a large instalment of their own distinctive programme of socialisation. In this session alone no fewer than 'eighty-four Acts were passed, outstanding social measures being the National Insurance Act, a consolidating measure providing also for an extended system of national insurance and also for the making of payments towards the cost of a national health service, and the complementary measure, the National Health Service Act, to establish a national health service for England and Wales; and the National Insurance (Industrial Injuries) Act, which repealed and replaced the former series of statutes on workmen's compensation and made now and better provision for compensation for industrial casualties. The Coal Nationalisation Act received the royal assent in July 1946 and the coal-mines were brought under the control of the National Coal Board. Imperial communications were also brought under public ownership by the Cable and Wireless Bill, as were the processes of investment by the Borrowing (Control and Guarantee) Bill. After most bitter debates in the Commons, the gov. secured the passage of a Bill to repeal the Trade Disputes and Trade Unions Act of 1927 and to restore all enactments and rules of law affected by that Act—a repeal which to many seemed calculated to bring a protracted general strike within the range of possibility. The Commons also debated a motion seeking approval of the gov.'s proposals to transfer sections of the iron and steel

industry to public ownership, but though the motion was carried by the gov.'s great majority, the weight of parl. and outside criticism of the proposals induced the gov. to postpone its Bill, though they averred their determination to carry out their plans in due course. Other Bills to receive the royal assent included the Civil Aviation Bill, to secure the development of air transport by corporations operating under public control; the New Towns Act, to provide for the creation of new towns by means of development corporations; the Atomic Energy Bill, to secure the development of nuclear energy and the control of such development; and the Trunk Roads Bill to reorganise the trunk road system. In the succeeding session projected legislation included a measure to continue conscription from the expiration of the existing scheme of national service, and also a Bill to set up a Ministry of Defence (*q.v.* and see also COMMITTEE OF IMPERIAL DEFENCE). Further nationalisation Bills proposed were those dealing with transport and electricity supply, and yet other Bills proposed dealt with compensation and betterment (see TOWN AND COUNTRY PLANNING), exchange control, company law (see COMPANY AND COMPANY LAW), and agric. policy.

In foreign policy it might have been supposed that the gov. would seek to assimilate its policy or harmonise it as far as possible with the ideals of Russian Communism, and indeed substantial groups of the gov.'s own supporters tabled an amendment to the royal address urging the gov. to renege their foreign policy so as to 'provide a constructive Socialist alternative to an otherwise inevitable conflict between American Capitalism and Soviet Communism in which all hope of world government would be destroyed,' and no fewer than 158 Labour members were against the gov. on this issue and abstained from voting at all, though, naturally, the Conservatives voted with the gov. so that the amendment was rejected by 353 votes to none. On the same day another Labour amendment to the address, tabled by those who opposed the introduction of conscription in peacetime, was defeated by 320 votes to 53. The Bill was eventually passed in 1947, the gov.'s critics suggesting that they had swallowed Labour's traditional hostility to conscription by calling it 'national service.' It was also in this session that the gov. introduced a Bill to terminate, after the death of the present peer and his heir, the pension of £5,000 a year paid since 1806 to the collateral descendants of Lord Nelson.

The output of the coal-mines, which the State took over at the beginning of the year (1947), fell at that time far short of requirements, with the result that industry made a bad start in a year when increased production both for domestic needs and export was essential. This set-back hastened the onset of a long-threatened economic and financial crisis. For the large Amer. loan, the use of which had for more than a year concealed the economic instability of G. B., was rapidly

being exhausted. As well as inadequate home production, two unexpected factors had aggravated the financial position: a large rise in prices in the U.S.A. and the indirect claims made on the loan by foreign holders of sterling, which by the terms of the Anglo-Amer. agreement had been made convertible into dollars. In the effort to restore the balance of trade against the time when G. B. must try to live upon its own income, austerity measures were increased, and, for the first time, bread consumption was limited by rationing; currency allowances for foreign travel were suspended; the basic petrol ration was withdrawn; and the already small supplies of newsprint further curtailed. Sir Stafford Cripps (*q.v.*) was appointed to the new office of minister of economic affairs, with the general responsibility of planning the augmentation and use of the national resources. Soon afterwards he succeeded Mr. Hugh Dalton as chancellor of the exchequer and thus reunited economic and financial supervision at the Treasury. His first duty in this office was to make substantial cuts in plans for capital expenditure so as to resist the inflationary pressure which was largely accountable for the maldistribution and misapplication of both labour and resources. Straitened circumstances at home induced the gov., while establishing conscription (*q.v.*) as a permanent institution, to reduce the duration of military training below the level that the opposition thought wise and that the gov. themselves had admitted to be indispensable until a revolt of some of their supporters had made them change their minds. At the same time the fruition of long-term imperial policies, which had nothing to do with the economic emergency, conveniently tended to reduce certain Brit. overseas commitments. These were the grant of independence to India and Pakistan, of dominion status to Ceylon, and independence to Burma, in each case coupled with the constitutional right to secede from commonwealth allegiance.

Although in the field of foreign affairs—particularly over the problem of the place Germany was ultimately to take in the continental system—mutual recriminations filled the diplomatic hist. of the year, it was commonly agreed by all political parties in G. B. that the national interest was being maintained with high patriotism and ability by Mr. Bevin (see further under EUROPE, *History*). In domestic affairs, however, the antagonism of parties tended to become further exacerbated as the year wore on. The gov. proceeded with its programme of nationalisation, completing legislation to bring all inland transport and the electricity and gas industries under state control (see BRITISH ELECTRICITY AUTHORITY; TRANSPORT ACT, 1947). In the new session of Parliament (Oct.) the gov. deferred their intention to extend nationalisation to the iron and steel industry and, instead, declared preventive war on the House of Lords in the shape of a Bill to amend the Parliament Act, 1911 (*q.v.*). It was proposed to reduce from

two years to twelve months the period during which the House of Lords might delay the enactment of a Bill which it refuses to pass. The opposition strongly resisted this Bill, which however, was read a third time in the Commons (Dec 10), on the ground that it upset the constitutional settlement of 1911 and that nothing in the conduct of the House of Lords in this Parliament justified such a limitation of powers. Among other important measures introduced in the Commons were the Local Government

Andrew of Greece, created duke of Edinburgh on his wedding day.

G. B.'s outstanding achievement in the sphere of foreign affairs in 1948 was the consummation, through Mr. Bevin, foreign secretary, of the idea of a 'W. Union' to counteract the 'cold war' waged by Russia against the peace of Europe. Talks were begun later between G. B., France and the 'Benelux' (qv) countries to secure a voluntary association of their govts to deal with practical economic and military problems and the ultimate outcome of this diplomacy was the signing in Washington (April 5) of the N. Atlantic Pact by all these countries and the U. S. A., together with six other nations (see further under EUROPEAN HISTORY). People in G. B. were always unconvinced that there would be war but for some little time in 1948 they certainly regarded the contingency as possible and saw no limit if it did happen. But they accepted the situation with a stoicism born of past lessons though the surprise and enthusiasm which characterised their attitude in 1914 and the long drawn out agony of anticipation of 1939 were now replaced in 1948 by a fatalism which however, in no way masked their determination.

The Parliament Bill came up for second reading in the House of Lords (Jan 27). The gov. agreed to an opposition suggestion to adjourn the debate for an all party conference on the possibility of an agreed scheme of reform but the conference broke down on the question of the powers to be given to a reformed House. A motion by Lord Salisbury in the Lords for the rejection of the Bill was carried by 177 votes to 81 (June 8). The gov. then decided to resort to the procedure of the Parliament Act, 1911 to carry their new Bill into law. The Bill was passed by the Commons in Sept. A Bill to nationalise the gas industry brought under state ownership more than 1000 statutory and non statutory gas undertakings of which about one third belonged to local authorities. Another controversial measure passed was the Representation of the People Bill which gave effect with variations to the redistribution of Parliamentary seats proposed by the Boundary Commissions (see further under ELECTORATE). The budget introduced by Sir Stafford Cripps in April was designed to produce a nominal surplus of £789,000,000 as compared with the realised nominal surplus of £636,000,000 in 1947-48. Expenditure for 1948-49 was estimated at £2,976,000,000. The budget aimed at a surplus which would more than provide for all the gov's expenditure and leave a balance to counter inflationary pressure, and it also sought to adjust taxation so as to give greater incentives to production. In the course of the year there was a rapid increase in production, coupled with the arrest of the inflationary tendency in the economy. On the overseas account the adverse balance of payments of £650,000,000 in 1947 was reduced to about £120,000,000 and in the latter half of the year achieved an overall balance

Bill to readjust financial relations between the Exchequer and local authorities and to equalise local rating burdens; the National Assistance Bill which finally abolished the old poor law system and completed the structure of the new social service schemes (see POOR LAW, SOCIAL INSURANCE); and the Overseas Resources Development Bill which was designed to establish and equip with borrowing powers up to £16,000,000 a Colonial Development Corporation and an Overseas Food Corporation. Another important constructive measure substantially agreed was that for the reform of the penal law. Thus, the Criminal Justice Act received the royal assent the following year (1948) (see CRIMINAL LAW). It was in this year that the royal family left Portsmouth (Feb 1) for a two months' tour through the British dominions in S. Africa. Princess Elizabeth came of age in April and on Nov. 20, amid universal acclamation, was married to Lt. Philip Mountbatten, son of Prince

in overseas payments. But there remained a formidable deficit on dollar account of no less than £423,000,000 for the sterling area, which could only be carried with the help of the exceptional assistance G. B. had received from the U.S.A. and Canada. Taxation remained as high as ever in 1949 and was even increased in sev. directions, the chancellor admitting that it was impossible to reduce it so long as the defence and social services continued on the existing scale. The estimated surplus in the 1949-50 budget was £469,000,000. An Iron and Steel Bill introduced in the 1948-49 session of Parliament proposed to nationalise the prin. firms engaged in the basic processes of the iron and steel industry, together with their wholly owned subsidiaries. The Bill was read a second time on Nov. 17, an opposition motion for its rejection being defeated by 373 votes to 211. On May 26, 1949, the Bill was given a second reading in the House of Lords, it being the purpose of Lord Salisbury, opposition leader, not to resist the will of the House of Commons in the closing phase of a Parliament's life, but to require that fresh sanction should be sought from the electors before even the preparatory move towards nationalisation were taken (see further under IRON AND STEEL CORPORATION). Altered circumstances induced the gov. to increase from twelve to eighteen months the period of compulsory whole-time military service, and in the debate on the consequent National Service (Amendment) Bill a motion by Labour back-benchers was defeated by 339 votes to 51, the Bill receiving the royal assent soon afterwards. On Nov. 11, 1948, a son, Prince Charles Philip Arthur George, was born to Princess Elizabeth, Duchess of Edinburgh, being, under the Act of Settlement, 1701, second in succession to the throne. In April 1949 G. B. was a co-signatory with the U.S.A., Canada, France, and the Benelux countries of the North Atlantic Treaty, the purpose of which was mutually to guarantee each of the parties against aggression (see EUROPE, History, North Atlantic Treaty).

Great Central Railway was estab. in 1849 as the Manchester, Sheffield, and Lincolnshire Railway. In 1807 an extension was constructed from Annesley in Nottinghamshire to Quainton Road in Buckinghamshire, which enabled the company to bring its line to London by the Metropolitan Railway. After this it was known as the Great Central Railway, with its chief London station at Marylebone. Under the Railways Act, 1921, the G.C.R., in 1923, was merged, together with sev. other independent lines, in the group named the London and N.-E. Railway Company. For later development see L.N.E.R.

Great Charter, *The*, see MAGNA CARTA.

Great Circle, or Tangent, Sailing, was known at least as early as the sixteenth century; for John Davies refers to it in his *Seaman's Secrets* (1591). A navigator who sails along the arc of a G. C. reaches his destination by the shortest route. A 'G. C.' on a sphere is one whose centre corresponds with the centre of that sphere; in the case of the earth the equator and all meridians are imaginary G. Cs. An amateur consulting the map of the world as it is erroneously represented on Mercator's projection would naturally imagine that a ship's shortest course along the 'rhumb' line, that is, the straight line joining the two places concerned, more especially as the graph of the G. C., when plotted on such a map, must of necessity be represented by a curve. But this is not so. On Mercator's map the curve of the G. C. will always come on the polar side of the rhumb line. This explains why the curved course is really the shorter: the difference of lat. is the same for the curved and for the straight tracks, but the former, being on a higher circle of lat., has the advantage of shorter degrees of long. Thus the nearer the voyage is to the polar regions, the greater will be the difference between the tracks. As a matter of fact sailors cannot take advantage of this in the Arctic and Antarctic regions, as other conditions, such as the existence of ice, make navigation unsafe. Thus if they wish to go from Australia to the Cape of Good Hope, they must follow what is called a 'composite' G. C. in order to avoid the dangerous latitudes. In place of the 'vertex', that is, the point on the G. C. track which is furthest from the equator, they must substitute the most southerly lat. they dare touch. In practice it is impossible to keep the vessel always along the G. C.: what happens is that it is steered in a series of courses, which are, roughly speaking, tangents to that circle, and it therefore follows that the greater the number of those courses, or, in other

words the shorter the tangents, the more nearly will the actual course approximate to the theoretical. Thus the ship is never headed direct for her destination till the latter is actually in sight, and traverses the meridians each time at different angles. A vessel steering a rhumb line crosses all meridians at practically the same angle. A rough means of discovering the G. C. is to stretch a piece of string tightly between the places of arrival and departure on the earth's globe, and so locate a few points on the circle: an accurate measurement involves a knowledge of spherical trigonometry.

F. Fall

GREAT DANE

Great Dane, *The*, large dog which became popular in England about forty years ago. It is very muscular and strongly built, but its movements are easy and graceful. It is faithful and trustworthy, and when first introduced into England was a favourite companion of both ladies and gentlemen; but when the order came into force commanding all dogs to be muzzled, this hound, having a will of its own, rebelled against being held in check, and being very strong could not easily be kept under control, so had to be abandoned as a companion. It is now chiefly used as a show dog, but in the Middle Ages it was a sporting dog, and was employed to hunt the wild boar and chase the deer, being very suitable for this owing to its great activity, muscular development, and power. It has been called by various names, 'Ger. boarhound,' 'Great Dane,' 'Ulmer Dog,' or 'German Dogge,' and some say it originated in Germany. In any case, it was very popular there, and Prince Bismarck had a G. D. as companion and owned specimens for sixty years. One of his hounds, Tyras, is said to have attacked the Russian Prime Minister, Gortschakoff, when he was holding a spirited conversation with his master. Tyras was slate coloured, a type very popular in Germany, but the recognised colours for the Eng. show dog are bluish-grey, red, black, pure white, or white with patches of colour. The dog has a long head, which it carries high,

broad muzzle, blunt at the point, a large nose, small eyes deeply set, and very small ears. Its neck is rather long and well arched, the legs strong and straight, terminating in large round feet. The tail is long and has a slight curl at the end, and its hair is very short. The dog should not be less than 30 in. in height, and its minimum weight should be 120 lb.

Great Dividing Range, mt. system in Australia, which extends from N. to S. near the E. coast, then turns W., terminating a little to the E. of the W. frontier of Victoria. The highest summit is 7319 ft.

Great Driffield, mkt. tn. of Buckroso div., E. Riding, Yorkshire, England, in the wolds, 19 m. from Scarborough. It communicates with Hull by the Driffield navigation and R. Hull. There are mills and manufs. of cotton-seed and linseed. Pop. 7200.

'Great Eastern,' great ship planned in 1852 by Brunel and Scott Russell, and which was the largest in existence at that time. It was completed at Millwall in 1857, and was originally intended for the route to Australia round the Cape. In 1859 the ship was launched, but an explosion took place off Hastings, and a trip across the Atlantic had to be postponed. In 1860 the vessel reached New York in eleven days, and from 1860 the G. E. laid some of the telegraph cables across the Atlantic. She was broken up in 1888.

Great Eastern Railway, see under LONDON and NORTH-EASTERN RAILWAY and RAILWAYS.

Greater Punxsutawney, bor. in the Jefferson co. of Pennsylvania, U.S.A., about 62 m. from Pittsburgh. There are flour- and silk-mills, glass and bottle factories, car works, machine shops, and iron foundries. It is the centre of a large bituminous coal and coke region. Farming and stock raising are carried on to a large extent. Pop. 9100.

Great Falls, city in the Cascade co. of Montana, U.S.A., on the Missouri R., about 10 m. from the G. F. of the Missouri, from which it derives its name. It is in the centre of a rich mining dist., and is an important shipping point for wool, livestock, and cereals. Copper-smelting is carried on. There are also railroad shops, flour-mills, and oil refineries. There are large oil wells in the dist. The Missouri R. here drops 365 ft. in 8 m.; there are three dams which provide 165,000 h.p. Pop. 29,900.

Great Farinndon, see FARINGDON.

Great Fenton, see FENTON.

Great Fire of London, second of London's great fires, the first being in 1136 (see under LONDON, History). It occurred during the period Sept. 2-6, 1666. Starting in a bakery in Pudding Lane, in four days it devastated 400 streets and lanes, 13,200 houses, St. Paul's Cathedral, 89 par. churches, the Guildhall and other public buildings, jails, markets, and 52 halls. The area affected comprised 373 ac. within and 63 ac. without the walls, from the Tower to the Temple Church. The loss of property was

estimated at £10,730,500; 200,000 people were made homeless, but casualties were almost negligible. Pepys gives an inimitable description of the fire, which, on Sept. 5, he viewed from the top of Barking steeple and 'there saw the saddest sight of desolation that I ever saw: every where great fires, oyle-cellars and brimstone, and other things burning. I became afraid to stay there long, and therefore down again as fast as I could, the fire being spread as far as I could see it.' He speaks of the danger of walking in the streets 'among the hot coles'; of the glass of Mercers' chapel melted and buckled with the heat like parchment; of a 'poor cat taken out of a hole in a chimney joining to the wall of the Exchange, with the hair all burned off the body, yet still alive'; of popular belief that the fire was due to some plot, some believing that the French had a hand in it; and of a Frenchman who confessed to starting it in a baker's shop having been 'hired for it by a Frenchman of Roane'. In a later entry he gives reasons for attributing it to the Papists, for some 'two or three hundred' ugly poignards to stab people with [were] found in one of the houses rubbish that was burned and said to be the house of a Catholic.

Great Fish Bay, inlet of the Atlantic in Portuguese W. Africa, 20 m. long.

Great Fish River: 1. In Cape Prov., S. Africa, rises in the Sneeuwbergen Mts., and enters the Indian Ocean after a course of 230 m. It is only navigable for small boats owing to the bar at its mouth. 2. Or Back River, in Canada, rises close to Lake Athabasca and flows into the Arctic Ocean. It has a wide estuary, and Montreal Is. stands at its mouth, where relics of Sir John Franklin's expedition were discovered.

Great Gable, mountainous peak of Cumberland, England, near Scafell, with an altitude of 2950 ft. The most impressive views of G. G. are to be had from Ennerdale, Borrowdale, and Wasdale. It is a favourite resort of rock climbers, the prin. pitches being Gable Crag, Kern Knots, and the Napes Needle. From the summit of the mt. there are splendid prospects over nearly all the Lake Dist., and in one direction across the Solway Firth may be seen in clear weather Ireland and the Isle of Man. G. G. since 1923 has belonged to the nation, being the war memorial of the Fell and Rock Climbing Club.

Great Grimby, see GRIMSBY.

'Great Harry,' man-of-war built by Henry VII., the first of any size built in England.

Great Harwood, urb. dist. in the Darwen parl. div. of Lancashire, England, about 3 m. from Accrington. There are collieries in the vicinity, and the manuf. of cotton is carried on. Pop. 11,400.

Greathead, James Henry (1814-96). Brit. engineer, b. at Grahamstown in Cape Colony. He migrated to England in 1859, and became a pupil of Barlow, from whom he learned the shield system of tunnelling which he made use of in the construction of the Thames Tunnel. After

this he devoted his time to the improvement of his 'shield,' and it was used in the tunnelling of the tube railway, later known as the City and S. London. He was also engaged on the Waterloo and City, and the Central London Railways.

Great Kanawha, riv. of N. Carolina, Virginia, and W. Virginia, U.S.A. Rising in the Blue Ridge, N. Carolina, in its upper course it is called the New R. The direction of its course is generally N.W., through ranges of the Alleghenies and along valleys, having a course of over 450 m., while the area of its basin is 10,800 sq. m. It eventually enters the Ohio at Mt. Pleasant, Mason co., W. Virginia, and is navigable for about 100 m. from its mouth.

Great Kingfisher, *see* LAUGHING JACKASS.

Great Lakes, The, fresh-water inland seas of Lakes Superior, Michigan, Huron, St. Clair, Erie, and Ontario, lying between Canada and the U.S.A. They are drained by the St. Lawrence, which flows into the Atlantic, and are navigable for large vessels from the head of Lake Superior to Buffalo, at the foot of Lake Erie, a distance of 1024 m. The greatest area of the lakes is 98,500 sq. m. and they contain, it is estimated, one-half of the fresh water upon the earth's surface. Their elevation varies from 600 ft. (Lake Superior) to 250 ft. in Lake Ontario. Between Lake Superior and Lake Huron is the St. Mary's R., navigable for all its length except for a distance of 1 m., during which the level drops 22 ft. Two canals, a Canadian and a U.S., have been constructed to circumvent this obstruction, which between them give passage to a greater number of ships than does the Suez Canal. The Canadian Sault Ste.-Marie Canal is about 14 m. in length and 150 ft. broad, and has one lock 900 ft. by 50 ft., which is emptied and filled by electric power. Lake Michigan, which lies entirely in the U.S.A., Lake Huron, Lake St. Clair, and Lake Erie are accessible to each other without the use of canals, but the last two, being very shallow, require constant dredging to keep a sufficiently deep channel open. The R. St. Clair connects Huron and St. Clair, the smallest lake, and the Detroit R. connects St. Clair to Erie. Between Lake Erie and Lake Ontario is the Niagara R., 33 m. in length, which has a drop of 326 ft. The new Welland Ship Canal (*q.v.*), opened for traffic in 1932, overcomes this by a series of seven locks, each with a lift of 464 ft. Each lock is 820 ft. by 80 ft. and has a depth of 30 ft. At Port Colborne, on Lake Erie, there is also a guard lock, the longest in the world, being 1380 ft. by 80 ft. The difference of level between Lake Ontario and Montreal along the St. Lawrence is overcome by a series of nine canals, with a length of 42 m. By means of these canals the whole chain of lakes, from Fort William on Superior to Kingston on Ontario, and so down the St. Lawrence to the Atlantic, is navigable to vessels of moderate draught. The lakes are ice-bound for some five months of the year, but for the remainder of the time are thronged by both freight and passenger steamers. Around Lake Michi-

gan and W. of Lake Superior are great grain-growing lands, and the grain-carrying trade on the Lakes is enormous. Both N. and S. of Lake Superior are lands rich in iron; silver, copper, zinc, and gold are also found around its shores. Lead, nickel, zinc, copper, and silver are also found to the N. of Lake Huron, and these two lakes have on their Canadian shores rich forest lands that have given rise to an enormous wood-pulp industry. Large coal-fields are found S. of Lake Erie, and on its N. and E. shores is found a natural gas used for fuel and light. The Niagara Falls, which account for much of the drop in level on the Niagara R., are a valuable source of electric power, both to the U.S.A. and to Canada, the Canadian power plant installed there having a capacity of 522,790 h.p. The lakes are rich in fish of commercial value, whitefish, trout, and herrings being caught in abundance. Pike, pickerel, bass, sturgeon, carp, perch, and eels are also found in different localities. The chief ports on the G. L. are Fort William, Port Colborne, Hamilton, Toronto, and Kingston in Canada, and Duluth, Chicago, Detroit, Cleveland, and Buffalo in the U.S.A.

Great Lever, *see* LIVER.

Great Malvern, *see* MALVERN.

Great Marlow, *see* MARLOW.

Great Northern, The, company which, prior to the 1923 railway amalgamations, formed with the N.-E. and N. Brit. lines the 'E. coast' express route between England and Scotland. It was started in 1846, and owed its origin to the amalgamation of the London and York and Direct N. Railways. In 1923 it was merged, together with several other independent lines, in the London and N.-E. Railway group (*q.v.*).

Great Northern Railway of Ireland, one of the prin. Irish railroads, including the Dublin and Belfast Junction and the Ulster Railway (one of the oldest in the Brit. Isles, opened 1839). The Dublin and Drogheda Railway was also amalgamated in 1875, four other lines being added the next year, and the whole being known as the Great N. Railway of Ireland. It is conducted by methods closely resembling those of Eng. railways. The total length is about 700 m., and like most Irish railroads it has a gauge of 5ft. 3 in. It serves the N. half of Leinster and much of Ulster. The main lines run from Dublin to Belfast; branches connect with Londonderry and Donegal via Armagh, Enniskillen, and Omagh. There are also branches to Dundalk, Drogheda, Navan, and Oldcastle from Dublin, and to Lisbon, Killybegs, and Ballyshannon from Belfast and Donegal. The Great N. is half owner of the Co. Donegal Joint Railway. The head office is at Dublin.

Great Northern Railway Company of the U.S.A. is the most northerly of the great transcontinental routes within U.S. ter. Its E. terminus is St. Paul, which lies over 400 rail m. N.W. of Chicago. By the G.N.R. Seattle on Puget Sound is distant westward from St. Paul some 18,020 m. The total mileage worked by this great railroad is in the vicinity of

8300 m. Its freight traffic in that part of its system adjacent to the Great Lakes is very large, as this neighbourhood supports the greatest wheat traffic in the world. One of the unpleasant facts which the administrators of the great transcontinental lines in America have to face is that practically the whole directional tendency of freight traffic is to the W. seaboard, comparatively little moving in the reverse direction. The company is well and generously equipped with locomotives, passenger and freight cars. Like most of the railway companies in different parts of the world it has felt the pressure from other forms of transport during the past decade and is now directly interested in transportation by road as distinct from railroad vehicles.

Great Oasis of Egypt, see KHARGA.

Great Orme Head, limestone headland of Wales, situated on the E. side of Conway Bay, N. E. Carnarvonshire. There are interesting ruins and a 54-m. marine drive. It has a lighthouse with acetylene illumination and lenses rotated by a gas-pump; the duration of lighting is controlled by a sun-valve, and a pilot jet re-ignites the main burner at sunset.

Great Orme's Head, see ORME'S HEAD.

Great Powers, term of somewhat vague import, connoting the leading states of the world, but when, after the battle of Waterloo, it was first used, it meant only the leading European states—Great Britain, France, Austria, and Russia—whose statesmen were responsible for the peace of 1815. After the Franco-Ger. war of 1871 Germany became one of the chief powers, and later Italy, consequent on the hegemony achieved under Garibaldi. After the advent to power of Hitler, Germany from 1933 to 1941 was the dominant voice in continental politics, while France, which under Briand had been an influential power in the League of Nations, dropped out for a time following her crushing defeat in 1940. Italy, under Mussolini, became a potent factor in the orientation of Mediterranean powers, but after her defeat in N. Africa became a mere satellite of Germany. After Russia's defeat by Japan in 1903–4 the latter gradually became the leading power in the Far E. Almost throughout the last century, however, the U.S.A., though playing next to no part in European politics, was a potential world power. To day the leading powers are the U.S.A., Russia, Britain, and France, while in the E. China has taken the place of Japan.

Greatrakes, Valentine (c. 1629–83), 'touch doctor', b. in co. Waterford, Ireland. He served as a soldier for some years, and was also for a time a magistrate. He believed himself to have the gift of curing the king's evil, and in 1666 pub. a brief account of himself and his cures.

Great Rift Valleys, depression stretching from Palestine to Central Africa. These rift valleys have their origin in the valleys of the Jordan and Dead Sea, extend through the Red Sea, and across Fr. Somaliland and Abyssinia to Lake Rudolph. They then divide, one branch extending in a southerly direction through

Lake Manyara, the other in a westerly direction through the Albert Nyanza, and then taking a southerly course to Lake Tanganyika. Those valleys are parallel cracks in the earth's crust, and in Central Africa have walls between 4000 and 5000 ft. above sea level.

Great Salt Lake, in Utah, U.S.A., is 80 m. long and 32 m. broad, and has an area of from 2000 to 3000 sq. m. It lies 4218 ft. above sea level, and is situated in the E. part of the Great Basin near the foot of the Wasatch Mts. The lake is from 10 to 50 ft. deep, but its depth, like its area, changes greatly. It is fed by the Bear, Ogden, Weber, and Jordan Rs., all of which are too small for navigation, but the lake has no outlet. Its waters contain chloride of sodium, chloride of magnesia, and sulphate of soda to a large extent, and the lake is a popular bathing resort; indeed, owing to the greatness of the sp. gr. of the water the human body will not sink in it. The manuf. of salt is an important industry. Gleaner's salt occurs in large quantities in some parts of the lake. Antelope Is., the largest is., is 18 m. long.

Great Sandy Is., see FRASER ISLAND.

Great Seal of England, see SEAL.

Great Schism, see SCHISM.

Great Slave Lake, large lake in Canada, in the N.W. Terr., about 300 m. long and 60 m. wide. It has an area of 10,000 sq. m., and forms two large bays, McLeod's Bay in the N. and Christie's Bay in the S. It is connected with Arillery Lake, Clinton-Golden Lake, and Aylmer Lake, and the Mackenzie R. flows out from it on the W. It contains trout, salmon, and other fish.

Great Southern Railway of Ireland, one of the longest railways of Ireland, 1121 m. (1913). Originally estab. in 1844 to connect Dublin and Cashel, it now serves the S. of Limerick, all Munster, and part of Connaught. Branches connect with Cork, Waterford, Limerick, and Sligo. The new G.S.R., comprising all the companies in Eire except the Great N. Railway (Ireland), came into operation in 1925.

Great War, The (First World War). For the hist. of the First World War and its causes, see **WORLD WAR, FIRST**; and for detailed reference to European diplomacy and policy both during and after the war, see also under **EUROPE**. For detailed military operations see **FRANCE AND FLANDERS, FIRST WORLD WAR CAMPAIGN IN; GALLIPOLI CAMPAIGN; ITALIAN FRONT, FIRST WORLD WAR CAMPAIGN ON; MACEDONIAN CAMPAIGN (FIRST WORLD WAR); MESOPOTAMIAN CAMPAIGN (FIRST WORLD WAR); PALESTINE CAMPAIGN (FIRST WORLD WAR); RUMANIAN FRONT, FIRST WORLD WAR CAMPAIGN ON; RUSSIAN FRONT, FIRST WORLD WAR CAMPAIGN ON; AFRICA, (GERMAN EAST, CAMPAIGN IN (FIRST WORLD WAR); AFRICA, SOUTH-WEST, First World War Campaign, etc.** For accounts of prin. battles and sieges see also under the various names: **AINNE; AMIENS; ANTWERP; ARGONNE; CAMBRAI; CATEAU, LE; KUT-AL-AMARA; SOMME; VERDUN; YPRES.** For naval operations

generally see **WORLD WAR, FIRST**. *Sovereignty of the Seas*, and *passim*; and for accounts of prin. battles, engagements, or operations in detail, see **DARDANELLES**; **CORONEL, BATTLE OF**; **FALELAND ISLANDS, BATTLE OF**; **'VINDICTIVE'**; **ZEEBRUGGE**. For peace treaty provisions, see *under* the names of the various treaties, a list of which is given under **PEACE TREATIES (FIRST WORLD WAR)**.

Great Western Railway, one of the first built of Brit. lines, was opened from London to Bristol in 1841 at a cost of about £5,000,000. The present W. Region of Brit. Railways corresponds to the system of the former G.W.R., with headquarters at Paddington station. The system stretches from London to Bristol, goes down to Weymouth, and has a boat service to the Channel Is. It also goes to Devonshire and Cornwall, striking away to Barnstaple on the W., to Exeter and Torquay in the S., on to Plymouth, Falmouth, and Penzance, and by boat to the flower-growing Isles of Scilly. The great line, too, makes its way N. to Gloucester, Birmingham, Chester, Liverpool, and Manchester, and runs through S. Wales from Newport to Milford. Its broad gauge was abandoned in 1892.

Great Yarmouth, see **YARMOUTH**.

Greaves, John (1602-52), Eng. mathematician, b. in Hampshire. He was educated at Balliol College, Oxford, and in 1630 was appointed prof. of geometry in Gresham College, London. He was a great traveller, and visited Egypt in 1637 and made a very accurate survey of the Pyramids, of which he pub. a description in 1646. He also collected MSS., especially those relating to astronomy, gems, medals, and other remains of antiquity. In 1643 he was appointed to the Savilian professorship of astronomy at Oxford, but was expelled from both this and the post at Gresham College in 1648 because he was a royalist. Among his writings are *Pyramidographia; or a Description of the Pyramids in Egypt* (1646) and *A Description of the Grand Signors Seraglio* (1650).

Greaves, see **ALMOOR**.

Grebes, diving birds (*Pygopodes*) which usually frequent rivers and fresh-water lakes in the summer and the sea in the winter. They have broad, flat feet, and the toes are lobed and bear separate membranes which are only joined at the base. The wings are short and rounded and there is practically no tail. The legs are placed far back and the birds stand upright like the penguins. The best known Brit. species is the Little Grebe or Dabchick, which is found also in Scotland and Ireland. The Great Crested Grebe, the Red-necked Grebe, the Horned Grebe, and Black-necked Grebe are also found at definite seasons of the year. G. are useful for their plumage, but are so timid that they are extremely difficult to catch.

Grecian Architecture, see **ARCHITECTURE, Greece**.

Greece, European kingdom situated in the S. extremity of the Balkan peninsula.

The Gks. of classical times called themselves Hellenes and their country Hellas. But the appellation Hellenes, designating the inhab. of the peninsula as opposed to barbarians in general, is of a comparatively late origin. In the Homeric epics the Hellenes are a people of Phthiotis in S. Thessaly. The names Græci and Græcia, as universal names for the people and country of G., were used only by the Romans, who extended to the whole country the name of the first tribe they encountered on the Gk. mainland—the inhab. of Dodona in Epirus. In its widest and loosest application Hellas signified in ant. times the abode of the Hellenes, and thus embraced mainland and colonies alike. More specifically, Hellas was the land which, prior to the Macedonian conquests, lay S. of the Cambunian and Ceraunian Mts., and included the following dists.: Epirus, Thessaly, Acarnania, Ætolia, Doris, Locris, Phocis, Boeotia, Attica, and Megaris (in N. G.); and Corinthia, Sicyonia, Phlœasia, Achaia, Elis, Messenia, Laconia, Cynuria, Argolis, and Arcadia (in S. G.). The demarcation of the frontiers of the modern state has been provocative of fierce and protracted contention. In July 1832, by the settlement concluded at Constantinople between Great Britain, France, Russia, and Turkey, the N. boundary line of G. was drawn from the gulf of Arta to the gulf of Volo. The Cyclades, the Is. of Eubœa, and the N. Sporades were included in the kingdom. Great Britain ceded the Ionian Is. in 1861. The proposal of the Berlin Conference in 1880 to transfer to G. Thessaly and S. Epirus was rejected by the Turks. In 1881 the boundary line was drawn from Platamon to Mts. Kritiri and Zygos, whence it followed the R. Arta to its mouth. A slight readjustment of the boundary was effected in 1897, by which G. ceded to Turkey about 578 sq. m. of her N. frontier lands. G. in 1912 had an area of 25,223 sq. m., consisting of continental G. and the Peloponnesus, Eubœa, and the Ægean Is., the Cyclades and the Sporades, and the Ionian Is. of Corfu, Zante, etc. The pop. of this area (1920) was 2,800,164. The Balkan wars, 1912-13, gave G. Macedonia, Epirus, and the Ægean Is. of Crete, Mytilene, Samos, and Chios. The area of the new ter. was 20,617 sq. m. and the pop. 2,648,913. The total area of G. is now estimated at 51,182 sq. m., of which the mainland accounts for 41,328 sq. m., and the Is. for 9854 sq. m. The total pop. according to the census of 1928 was 6,204,700. In 1938 it was estimated at 7,013,000, and on Dec. 31, 1948, at 7,450,000. The pop. of Athens is 393,000, of Salonika (renamed Thessaloniki in 1927) 237,000, and of the Piræus 251,000. A free zone in the harbour of Salonika was in 1923 ceded to Yugoslavia for fifty years. Bulgaria was also given an outlet in the Ægean at the port of Kavalla, joined to Bulgaria by a corridor under the supervision of the League of Nations. Since 1932 there has been a free zone in the bn. of Piræus, covering 192,800 sq. yds. In land, with a frontage on the sea of

2600 yds. and nearly half a mile of railway. The areas and pop. of the geographical divs. of G. are Central G. and Eubœa, 9700 sq. m., 1,601,400; Thessaly, 5200 sq. m., 493,200; Ionian Is., 771 sq. m., 213,000; Cyclades, 1000 sq. m., 130,000; Peloponnese, 8360 sq. m., 1,015,000; Macedonia, 13,361 sq. m., 1,412,000; Epirus, 3688 sq. m., 312,600; Ægean Is., 1517 sq. m., 307,000; Crete, 3232 sq. m., 386,400; and Thrace, 3315 sq. m., 363,900.

Physical features.—The character of the Hellenic race and the influence which it has exerted on the world's hist. have been

of the ridges. The nature of the drainage system is peculiar owing to the unique character of the mt. system. The course of the rivs. is short and torrential, and only the longer streams, such as the Alpheus, Peneios, and Spercheius, possess a perennial water supply. No riv. of G. is navigable. The mts. closely hem in the lake basins, from which the waters find no outlet, except by subterranean passages. G. in her early hist. was subject to severe volcanic action, and in modern times earthquakes are frequent.

Climate.—The mts. have also important effects on the climate, tempering the

P. A. Hutton

THE THEATRE AT DILEPHI, ON THE S.W. SPUR OF MOUNT PARNASSUS IN PHOCIS.

conditioned to a great extent by the geographical configuration of the land and its singular endowments. Occupying the most central position of the ant. world, G. enjoyed easy communication with the Orient and Occident. The is. of the Ægean and Ionian seas were stepping-stones to maritime enterprise. Broken by innumerable harbours, creeks, and bays, the coastline is phenomenal, its total length being out of all proportion to the area of the interior. The determining feature of the country is the mt. system. The great Pindus chain forms the backbone of N. G., and its ramifications interlace the whole area. The mts. of Morea (Peloponnese) are an independent system, and radiate in all directions from the central plateau of Arcadia. It is the partial submergence of these mt. systems that has produced the deep indentations of the coastline of G. and the fringes of systematically grouped is. The basis of these mts. is hard limestone, hence the precision of outline and the parallelism

vehemence of the S. sun and aerating the country with refreshing breezes. The exceptional variety in elevation also effects rapid transitions from heat to cold. Spring in G. is a season of short duration. The Etesian winds blow steadily in the months of early summer, but these are replaced later by the inclement blasts of the sirocco. Autumn is humid and unhealthy, and accompanied in low-lying dists. by visitations of malarial fever. Winter is crisp and temperate.

Flora.—The flora of G. is not so exuberant and varied as that of Italy and Syria. The geological structure, of which limestone and metamorphic marbles are the predominating features, is not favourable to rich vegetation. Four zones are usually recognised: (1) Below 1500 ft.: olives, cypre, myrtle, oranges, dates, almonds, figs, poplar, tobacco, cotton, pomegranates, etc.; (2) below 3500 ft. and above 1500 ft., forest zone: oak, chestnut, etc.; (3) below 5500 ft. and above 3500 ft.: the region of the beech and pine;

(4) above 5500 ft., Alpine zone: small shrubs and mosses.

Religion and Education.—By the terms of the constitution of 1864 the Gk. Orthodox Church, which has some 8,000,000 adherents, was declared the religion of the State, but complete toleration and liberty of worship were guaranteed to all other sects. There were, according to the last census, 35,000 Rom. Catholics, 9000 Protestants, 126,000 Moslems, and 72,800 Jews. The gov. of the Orthodox Church is vested in a permanent council called the Holy Synod, consisting of the metropolitan of Athens and twelve metropolitans, who, during their term of office, must reside at Athens.

All children between the ages of seven and twelve years must attend school, but the law is not well enforced in country dists. For higher studies there are two univs. in Athens and one at Salonika (Thessaloniki); the Athens Polytechnic; an agric. superior school; the School of Fine Arts; and a superior private school of political sciences. The Ministry of Education is also charged with the Service of Antiquities, managed by an archaeological council, which is responsible for the conservation and repair of ant. monuments, the upkeep of museums, and the conduct of excavations. There is a Brit. school of archaeology in Athens, which, with the aid of gov. grants, encourages and carries out scientific research of all kinds (see also below, *Archæology*).

Industry.—Agriculture is the staple industry of G. The chief products are wine, currants, olive oil, and tobacco. Sheep and goats are pastured in great numbers in the peninsula. Peasant proprietorship predominates. The celebrated mines at Laurion in Attica yield iron, manganese, lead, and zinc. Other mining products are magnesite, lignite, sulphur, alum, emery, and baryta. Marble is found in Paros, Attica, Thessaly, and the Cyclades.

Communications.—There are some 1990 m. of railroad, of which 823 are operated by the State. There is a ship canal (4 m. long) across the isthmus of Corinth. There was (1939) an air service, run by a Gk. company, which connected Athens with Drama via Salonika, and Athens and Epirus (Jannina) via Agrinion.

Defence.—Military service in the army is universal and compulsory between the ages of twenty-one and fifty-seven. The normal ann. contingent of recruits is about 50,000. In 1939 the effective strength of the army was 5000 officers and 65,000 other ranks. The Gk. Navy in 1939 comprised two cruisers, twelve destroyers, nine torpedo-boats, four minelayers, and six submarines; but there was at that date a large programme of reconstruction, which, however, was rendered negatory by the war. A Brit. mission arrived in Athens in July 1945, armed by the Gk. Gov. with full powers to reorganise the Gk. police force, *gendarmérie*, and prison service, free from politics.

History.—According to the Gk. historians the earliest inhab. of Hellas were the so-called Pelasgians, but the informa-

tion afforded by the ancients on the subject is scant and vague. There is mention of the name Pelasgian in Homer, but it appears to be merely a tribal name designating the inhab. of Thessaly, Epirus, and Crete. For our knowledge of the inhab. and civilisation of prehistoric G. we are therefore dependent on the more certain witness of archaeology, and in recent years Gk. archaeological evidence has been supplemented to a remarkable extent. Excavations at Knossos (Knossos) in Crete have revealed to us the civilisation of the Minoan age. This civilisation is the oldest in Gk. hist. of which we have knowledge. It flourished about 2000 B.C. Prehistoric Knossos was a city of massive structure in which the fine arts flourished, and had reached a remarkably high stage of development (specimens of Minoan pottery are of exceptional beauty and grace) and in which the art of writing was known. This last fact is of great importance, as until recently the art of writing in G. was supposed to be post-Homeric.

The next age of Gk. civilisation on which archaeology has thrown light is the Mycenaean (c. 1600–1100 B.C.), which was destined to be even greater than that of Argos in the heroic age. The Mycenaean civilisation is revealed to us by excavations on the sites of Mycenae, Tiryns, etc. The characteristic feature of these splendid cities is their massiveness and solidity. Pausanias relates that tradition attributed the building of Tiryns and Mycenae to the Cyclopes (hence the expression 'Cyclopean walls' used to denote structures of this massive type), thus testifying to the gigantic edifices of prehistoric times as contrasted with the masonry of a later date. The jewellery, pottery, and weapons excavated from these ant. cities are of rare beauty. Iron was practically unknown in the Mycenaean age. Its use is more extensive in the Homeric age, and therefore Homeric civilisation is probably post-Mycenaean. But vast invasions swept over G., and a later civilisation displaced this early culture.

In the latter half of the eleventh century B.C. the Dorians ravaged G. They were a coarser, harder stock than the peoples they conquered, but they brought to G. a new vigour and a new robustness, which when toned and harmonised by the finer influences of the land produced that civilisation which is the world's marvel for all time. These great migrations which swept over G. created a congestion of the pop. which was eventually relieved by widespread colonisation. The Aeolian migrations estab. settlements in Lesbos, Tenedos, and the Mysian mainland. The Ionian migrations from N. Peloponnese colonised Chios, Samos, the Cyclades, and the centre of the Lydian coast of Asia Minor. The Dorians also enlarged their frontiers and occupied Crete, Melos, Rhodes, Cos, etc. During the eighth and seventh centuries B.C. great changes took place in Gk. civilisation. Various communities became federated and some states (notably Athens and Sparta) began to exert a formidable supremacy over

their neighbours. Religious union found expression in the institution of *Amphictyons*—the Olympian, Nemean, and Pythian games and the pan Hellenic dictatorship of the Oracles.

Gk commerce began at this time to out rival Phoenician enterprise. In maritime activity the Corinthians were the foremost state. The Aeginetan system of weights and measures was adopted and coinage was introduced from Lydia, two epoch making innovations which are

1 A Il lion

MYCENAE THE 'TREASURY OF ALKIBIADES'. A good example of the beehive tomb in almost perfect state of preservation. The doorway measures 18 ft high by 9 ft wide.

attributed to Pheidon, king of Argos (c. 668 B.C. or 718 B.C.). The former date is corroborated by the recorded fact of his striking money. During this period monarchies were overthrown in most states by oligarchies, which again were displaced by tyrannies. The constitution of Sparta developed by a unique process it continued to be a monarchy, but subordinated all interests to militarism.

In the sixth century B.C. commercial and intellectual development among the Ionians reached its zenith and quickly receded. On the Gk mainland now economic evils made their appearance. The rapid development of mercantile activity caused a violent displacement of occupations, and debtors suffered enslavement. As champions of these

debtors the tyrants in most states first established their power. Thus in Athens Solon attempted to alleviate the distress of the citizens by his famous legislation (594-593), but the real object of his life-work (the confirmation of the political freedom of the Athenians) was reversed when his relative, Peisistratus (q.v.), just ruler though he was, established himself tyrant (q.v.) of Athens (561). In 514, however, Hippias and Aristogiton freed the city from tyrannical government. Cleisthenes in 507, by an equitable distribution of the people in tribes for voting purposes, paved the way for the Athenian democracy. The great work of Cleisthenes was his constitution (510-508), the results of which were not to be ephemeral, they made themselves felt through the whole of the subsequent hist of Athens, and were the foundation on which all succeeding legislatures built.

The fifth century B.C. was the most momentous period of Gk hist for during this period the Persians came into decisive conflict with the Greeks for the domination of the ancient world. Early in the century the Ionians revolted from the 'great king,' Darius of Persia. This ill-organized revolt resulted in the destruction of Miletus and the subjugation of the Asiatic Greeks by the Persians. Athens, being an Ionian city, had sent aid to her trans-Aegean kinsmen and Darius resolved to punish Gk interference and make an example of the Athenian state. The Persian Army destroyed Naxos and Eretria but in Attica the ill-organized hosts of barbarians were no match for the little band of finely trained Attic hoplites (heavily armed infantry) and the plain of Marathon was strewn with the Persian hosts (490). The palm of victory was won for Athens by the genius of her leader Miltiades. Darius heard with consternation of the annihilation of his vast army. In the midst of his preparations for a second invasion he was cut off (486), but Xerxes, his son, mustered battalions of soldiery from all parts of his extensive dominions and the combined force of the Persians were arrayed once more against the Greeks. The overwhelming numbers of the barbarians terrified the Locrians, Locrians and Boeotians into offering earth and water as tokens of submission, but Athens and Sparta stood firm. A small force under Cleombrotus king of Sparta, was dispatched to guard the pass of Thermopylae and kept the countless hosts at bay till through the treachery of the miscreant Mallian Ephialtes, the little body of Spartans was surprised from the rear and was slaughtered to a man (480). But it was again the genius of Themistocles that saved Greece and inspired Athens to seek her own safety and that of all Greece on the sea. In the narrow strait of Salamis the Gk fleet encountered the unwieldy ships of the Persians, and the defeat of the barbarians was so severe that Xerxes resolved to quit Greece, leaving Mardonius, his captain, to complete the campaign (480). In the spring of 479 the Persians devastated Attica and razed Athens, but suffered decisive defeat at

Plataea. In the summer of the same year the united fleets of Athens and Sparta destroyed the remnant of the Asiatic fleet at Mycale near Miletus. Pausanias, the Spartan victor of Plataea, at first led the combined fleets, but the honours and wealth which had fallen to him roused in him ambition. He aimed at becoming tyrant of all G., and was ready to purchase his opportunity by serving the barbarian whose armies he had routed. But the fleet mutinied and put itself at the disposition of the Athenian leaders, Aristoides and Cimon, and the would-be tyrant, stripped of his power, was summoned home to stand his trial. Thus, by the sustained courage of Sparta and the altruistic intrepidity of the Athenians by land and by sea the powers of the E. were broken. In this war, as never before, G. realised her significance, and her sev. states were forced to combine and recognise their true unity. The example of high moral calibre exhibited by the Gk. leaders during the war became a great inspiration in the art and politics of G. The Gks. having expelled the Persian invaders, freed their kinsmen across the Aegean from subjugation to Persia, and received them into alliance.

In 477 Athens formed the Delian League, and the treasury of the armies was estab. in the temple of Apollo at Delos. The cities were required to furnish ships or the equivalent in money towards the maintenance of the combined fleet. The formation of this alliance was the nucleus of the Athenian Empire. Sparta meantime still retained her position as leader of the Peloponnesian confederacy. Thus the Gk. powers, united by the common danger of the Persian invasion, became divided through antagonism of the rival confederacies for the hegemony of G. Within the city of Athens the tides of democracy were rising fast. Themistocles was the champion of this popular movement, first organised by the genius of Cleisthenes. The mantle of Cleisthenes had first fallen on the shoulders of Ephialtes, who diminished the auct. power and prestige of the Areopagus, the pillar of aristocracy (462). By the policy of Pericles this dictatorial court was robbed of all but nominal powers. By the removal of the confederate treasury to Athens and the appropriation of the funds for civic purposes, the relation of the Athenians towards their allies became avowedly autocratic. In the period 458-445 Athens was at the height of her power. There is no knowing where the extension of the Athenian power would have stopped, if the disaster of the Gk. defeat in Egypt—the massacre of Protopolis (454)—had not then intervened to weaken its growth. By the close of 452, through the mediation of Cimon, a truce for five years was made between Sparta and Athens. Freed for the moment from their quarrel with Sparta, the Athenians turned to avenge their rout in Egypt and the Phoenician fleet suffered defeat off Salamis. Cimon, however, d. before the walls of Citium and the expedition, leaderless, returned to Athens and no

further attack was made. Patriotic Boeotians now revolted against their democratic govs., which they regarded as the mere tools of Athens. The Athenians sent Tolmides, with a thousand hoplites, to support the Boeotian democrats, but he was surprised and defeated at the battle of Coronoe. Next the cities of Euboea revolted, desiring to free themselves from their tribute under the Delian confederacy. Nor was this the end of the misfortunes of Athens. The five years' truce with Sparta was expiring and ominous preparations were being made in Peloponnesus. In 460 the young king Pleistoanax and his guardian, Cleandridas, led a great force from Peloponnesus to attack Attica, but, probably through the characteristic venality of the Spartan generals, the expedition came to naught and returned to Sparta. Pericles, with fifty ships, then hastened across to Euboea, which he reconquered. This, however, was the only one of her numerous losses which Athens was destined to recover. Pericles himself shrank from the idea of continuing the contest, and negotiations with Sparta resulted in the Thirty Years peace (445) and in the same year the end of the war with Persia.

The Thirty Years peace, although it was not destined to endure for half its appointed time, gave G. some fourteen years of comparative quiet. At Athens these years coincide with the zenith of the power and influence of Pericles, who was practically the first minister of the republic for the whole period. During this period immediately before the Peloponnesian war, Athens reached the height of her literary and artistic glory. In these years were built the Propylaea or entrance halls of the Acropolis and the Parthenon. In the galaxy of great names of the dramatists Aeschylus, Sophocles, Euripides, Cratinus, and Aristophanes, and the artists Phidias and Ictinus, shine supreme. The beautiful city was a veritable haunt of the Muses.

Samos revolted in 440 over a boundary dispute with Miletus, but was subjugated in the following year and compelled, in accordance with the precedents of Naxos and Thasos, to raze her walls and give up her warships. As late as the year of this revolt, the majority of the allies of Sparta was still in favour of preserving peace with Athens, but shortly afterwards opinion began to change.

The causes which led up to this change of feeling are very various, but in the depth of his heart every Spartan felt a grudge against Athens for having built up an empire which was sufficient to overshadow the ill-defined hegemony which his own city possessed in Peloponnesus. Urged on by the Corinthians, who were envious of the commercial prosperity of Athens, and were indeed virtually at war with her, the Spartans now decided on war (432). The Peloponnesian alliance (Sparta and her allies) then sent a peremptory note to Athens demanding that Athens should 'restore their autonomy to the states of Greece.' Pericles, whose

power at this time had suffered a temporary eclipse, reasserted his mastery over the Ecclesia (assembly of the citizens), and Athens rejected the ultimatum. A few days later the actual outbreak of hostilities occurred (March 431).

The Peloponnesian war was not merely a decisive duel between two rival cities; it became a racial conflict between Ionians and Dorians, and a political conflict between democratic and oligarchic principles. It drained G. of her resources and left her weak and spiritless, an easy prey to the uncorrupted vigour of the barbarians. The war raged from 431 to 404 and ended with the destruction of Athenian power. The chief causes which brought about the final disaster were the unscrupulousness and tenacity of the popular leaders, among whom Alcibiades was chief offender; the quixotic scheme of the Sicilian Empire which resulted in the destruction of the Athenian armament; and the exhausting intestine strife which reached a climax in the outrages of the Four Hundred. The final victory of Sparta was due to an ignominious and traitorous alliance with the Persian Cyrus. The destruction of the Long Walls of Athens and the surrender of her fleet (404), which only two years before had signally defeated Callicratidas at the battle of Arginusæ (no fewer than seventy Peloponnesian ships being destroyed for the loss of fifteen Athenian vessels), mark the final throes of her tragic fall. And the next year, at the battle of Ægospotami (405), 170 Gk. vessels fell into Lysander's hands, with 1000 prisoners, including three of the four Athenian admirals.

It was as champion of Gk. freedom against the despotic presumptions of the 'tyrant' city that Sparta had won the confidence of her allies, but when, at the close of the war, she devoted her victory to private aggrandisement, the forces of disintegration began to act. A combination was formed during the succeeding decade to lay low the power of Sparta, but the efforts of the hostile coalition were abortive, in spite of assistance from the Persians, who overthrew Spartan naval supremacy at Cnidus (394). Sparta, however, once more enlisted Persia among her supporters, and by the peace of Antalcidas became the supreme land power in G. But the price of the peace was the surrender of the cities on the Asiatic coast, nor was the hegemony of Sparta destined to survive. Thebes, under her dauntless leader Epaminondas, suddenly confronted and irrevocably destroyed the Spartan supremacy at Leuctra (371). The subversion of Sparta's ascendancy was a fatal blow to the oligarchic govs. of G., and democracies were re-established in many states. By the restoration of the Messonians Epaminondas further incapacitated Sparta. The domination of Thebes was for the moment indisputable and invincible. But the death of Epaminondas on the field of Mantinea (362) left Thebes without a leader and opened the gates for the

Macedonian invaders. Philip, king of Macedon, a barbarian, fired with the ideals of Hellenism and a staunch believer in militarism, having organised an army on a new basis of the phalanx, awaited an opportunity to interfere in the domestic variances of the rival Gk. powers. As the champion of the Delphic cause he devastated Thebes, sacked Olynthus, and overran Phocis. Bribery here, subduing there, he gradually won over the Gk. states, and even the eloquence of Demosthenes could not arrest the victor's progress. In 338, the victory of Chaeronea made Philip indisputable master of G. It is a strange irony of events that the unity of G., which Athens, Sparta, and Thebes had spilled their life-blood to create, was only realised by the sword of a semi-barbarian king, and at a time when the glory of the country's prime had irredeemably departed.

G. was exhausted as a field of military enterprise, and Alexander, son and successor of Philip, resolved to devote his indefatigable energies to the conquest of the E. Having made an example of defiant Thebes, the Macedonian turned his back upon G. and overran the Persian Empire. He then penetrated into India, spreading effectually the language and civilisation of the Gks. over the conquered lands. His schemes were gigantic. He intended to follow the subjugation of the E. with the conquest of Italy and Carthage, but death interrupted his victorious course. He d. at Babylon in 323, aged thirty-two. No successor was found competent to shoulder the responsibilities of his vast empire, which almost immediately began to disintegrate. The Gk. states, now aware of Macedonia's weakness, made sev. attempts to reassert their independence. The revolt was headed by the Athenians and the Ætolians, but in 322 the insurgents sustained a decisive defeat at Crannon. Antipater, the Macedonian leader, changed the constitution of Athens to an oligarchy, and disfranchised and deported the poorer classes.

Macedonia recovered her prestige under Antigonus Gonatas, who in the Chremonidean war (266-262) once more subdued G. in spite of the formidable opposition of Athens and Sparta. The Achaean League, renewed in 231, became gradually enlarged and consolidated, its main object being the restoration of Gk. independence. Under Aratus, the celebrated Sicyonian diplomatist and irresolute general, Sicyon and Corinth were persuaded to join the league, which soon became the chief political power in G. But the league, now extending its power over Peloponnesus, came into collision with Sparta. A succession of victories by Cleomenes of Sparta prompted Aratus to invite Macedonian assistance, and thus the primary object of the combination, which aimed at replacing Macedonian ascendancy in the Peloponnesus by free democracy, was defeated. During the Social war the Achaean League was assisted by Philip V. of Macedon against the Ætolian League; but now G. had come within the orbit of Rom. expansion and

the wider interests of both parties which were at stake in the second Punic war called for a cessation of hostilities. Philip himself made a treaty with Hannibal (215). Rome in revenge sowed seeds of dissension among Philip's Gk. dependencies, and when Zama in 202 brought the second Punic war to a satisfactory close, she turned her attention to the Gk. delinquents. Philip's forces were utterly crushed by Flaminius at Cynoscephalæ in 197. Peace was made on generous terms, and the freedom of the Gk. cities was proclaimed at the Isthmian games (194). At the battle of Pydna (168) Æmilius Paulus defeated Perseus, the king of Macedon, and brought the Macedonian kingdom to an end.

In 147 the Achæan League made an abortive attempt to throw off the Rom. yoke, but Metellus defeated them at Scarphæa, and Mummius, his successor, made a terrible example of Corinth, dismantling her glorious edifices and transporting her priceless treasures. The Rom. administration in G. was, on the whole, tolerant and beneficial. Gk. ascendancy in thought and letters caused Rome to treat her dependency with exceptional leniency. Peace was, however, broken in 88 B.C. Mithridates, king of Pontus, incited Athens, Achæa, Bœotia, and Laconia to support him against Rome. Archelaus, Mithridates' general, was defeated by Sulla with heavy loss at Chæronea, and Orchomenos (86) and the Gk. cities which conspired against Rome were treated with extreme severity. During the civil war between Cæsar and Pompey the Athenians sided with Pompey, but when Pompey was finally vanquished, Cæsar treated his opponents with his characteristic clemency and generosity. Their gratitude was short-lived, for Athens embraced the cause of Brutus and Cassius, seeing in Cæsar's murderers champions of freedom comparable to her own heroes, Harmodius and Aristogeiton. During the struggle between Octavian and Antony, the Athenians offered their support to Antony, and consequently the victorious Octavian ruled them with a firm hand. Not till the time of Vespasian, however, did the internal administration of Athens suffer fundamentally through Rom. interference. That emperor deprived the Athenians of their gilded show of liberty and brought them under the iron rigidity of Rom. institutions and law. Hadrian, however, entertained a warm admiration and affection for the city, and made a generous attempt to restore the splendour to the citadel of the muses and to revive its literary and artistic genius.

But the work of vandalism had already begun. Incursions of the Goths swept over G., leaving destruction in their train, and the hist. of the Gk. states becomes as shifting sand. In the thirteenth century A.D. Athens fell into the hands of the E. emperor Baldwin. Subsequently it was governed by Delves of the house of Aragon, and at his death it fell into the hands of Bajazet, sultan of the Turks. It was afterwards held by the Spaniards and the

Venetians, but in 1460 the peninsula was entirely subjugated by the Turks. The Venetians invaded G. towards the close of the seventeenth century, recovered Athens, and occupied a considerable portion of the mainland and some of the Is. But the Venetian central power was not strong enough to maintain its control, and in 1718 G. passed once more under the Ottoman yoke. Peter the Great of Russia projected a campaign to free the oppressed states, but did not live to carry out his schemes. The assistance sent by the Empress Catherine was inadequate and ineffectual. The succession of Ali Pasha made the condition of the Gk. people more hopeless than before. In 1814 a society of young Gk. patriots, called the Hetaïria, was formed at St. Petersburg. The objects of this society

This ancient building of the convent of the Panagia, founded in 874, may occupy the site of the Temple of the Graces mentioned by Pausanias.

were ostensibly literary but were really political, and it was this society that was largely instrumental in fanning the flames of rebellion throughout G. The educated classes of Europe, nurtured in the glory of Greece, were increasingly sympathetic. In 1821 Jusuf Pasha defeated the insurgents at Galatz, and in the same year the 'sacred battalion' under the dauntless leader Jordaki was annihilated. But in the Morea the cause of freedom was attended with greater success. In Sept. 1821 a constitution was formulated by the independent party at Missolonghi, applicable to W. Hellas; later a similar constitution was drafted at Salona, embracing the E. states, and in Dec. the constitution of Peloponnesus was framed. In 1823 a final constitution comprehending the whole of G. was adopted by the National Assembly convened at Astro. But the Ottoman powers made a desperate effort to annul the decrees, and in 1825 an Egyptian army, under Ibrahim Pasha, was dispatched to the Morea. In a few months the work of the patriotic party was all but undone, and only the combined intervention of European powers rescued

the tottering standard of liberty. Ibrahim Pasha haughtily repudiated the claims of the powers, and the crisis came when, in the decisive battle of Navarino (Oct. 1827), the allies destroyed the combined Turkish and Egyptian fleets. By the protocol of 1830 G. was declared an independent kingdom and her boundaries were defined. The arrangement was in many respects unsatisfactory; it excluded Acarnania from (Gk. ter. and a great part of Etolia and Thessaly; a Turkish barrier interrupted communications between G. and the Ionian Is., while Candia, Samos, etc., were not comprehended.

The liberated state was at first governed by a national assembly, but the president, Count Capo D'Istria, assumed autocratic powers, and sedition culminated in his assassination. Subsequently the powers offered the throne of G. to Prince Leopold (afterwards king) of Belgium, but the offer was refused. The crown was then given to Otto, son of Louis I. of Bavaria. Throughout his reign discontent was rife, and an insurrection in 1862 resulted in the deposition of the king. George, second son of the king of Denmark, was then chosen king, and the Ionian Is., at that time under Brit. protection, were ceded unconditionally to the kingdom. By the Berlin Congress (1878) G. was promised a modification of her frontier, and in 1881 a readjustment was accepted. G. acquired Thessaly, S. of the N. watershed of the Salambria, and the tract of land bordered by the Arta R. The allocation proved distasteful to the Hellenes, who demanded Crete, and hostilities commenced with Turkey in 1897. The war was short-lived, and disastrous to the Gks., and on the intervention of the powers an armistice was concluded. By the treaty of Constantinople G. was constrained to pay an indemnity, to submit to the readjustment of her frontier, and to accept the control of the powers in financial affairs. Venizelos came to the fore with the movement in Crete to break away from Turkish rule and unite with G. In May 1910 a Cretan assembly was set up and Venizelos became president of the provisional gov. Later in the year he was elected to the Gk. Parliament, and on Oct. 10, 1910, became Premier. He set to work to form a Balkan league strong enough to withstand Turkey. A Serbo-Bulgarian treaty was followed by a Greco-Bulgarian treaty, and in the War of Liberation the strength of the league was proved by the complete collapse of the Turks (see BALKAN PENINSULA; BALKAN WARS). On May 30, 1913, Crete was ceded to G. by the treaty of London, which ended the war between Turkey and the Balkan states. When, however, the alliance was broken by the treachery of Bulgaria, G. received further extensions of ter. by the treaty of Bucharest, which ended the second Balkan war, but in its settlements ignored all ethnographic facts.

In March 1913 King George of G. had been assassinated in Salonika by a fanatic, and was succeeded by his son, Constantine XII. Venizelos endeavoured to re-

organise G. internally, but the outbreak of the First World War in 1914 proved how short-lived had been the hope of a Balkan settlement. At the beginning of the war G. maintained neutrality, since her alliance with Serbia was directed only against Bulgarian aggression. The Ger. emperor endeavoured to secure the co-operation of G., but his appeals to King Constantine as a brother-in-law and a Ger. field marshal failed to move G. from her policy of neutrality. The Gk. Premier, Venizelos, however, was for immediate intervention on the side of the Entente. The differences between king and Cabinet caused Venizelos to resign on March 6, 1915. A general election was held on June 13, and the Venizelist party won 184 seats out of 314. In Aug. Venizelos returned to power on the understanding that G. would aid Serbia against Bulgarian aggression, and G. mobilised and converted her attitude into one of armed neutrality; 150,000 allied troops were promised, but the allied force which landed in Salonika proved to be only 20,000 strong, and the Gks., feeling Venizelos had been duped, distrusted his policy. A new ministry was formed by Zaimis, and the armed neutrality was preserved. (For the campaigns in G. and Macedonia see under SALONIKA and MACEDONIAN FRONT.) But G. only maintained her neutrality with difficulty in the face of Fr. and Ger. pressure. The nation was split between Royalists and Venizelists, and towards the end of 1916 Venizelos set up a provisional gov. at Salonika and endeavoured to recruit a Gk. army to aid the Allies in the offensive which Gen. Sarrail was forced to take against the Bulgarians during Aug. In June 1917 France and Great Britain, who had guaranteed to ensure the Gk. constitution, decided to act in their capacity of 'protecting powers.' Jonnait, former governor of Algeria, was dispatched to Athens to demand the abdication of Constantine. An ultimatum and a display of force secured this, and on June 12 Constantine abdicated in favour of his second son, Alexander, and quitted G. Zaimis formed a gov. at the invitation of King Alexander, while the Provisional Gov. in Salonika ceased to exist.

But Venizelos was soon recalled to power. The former supporters of Constantine were persecuted, and G. definitely entered the war on the side of the Entente. By the treaty of Sèvres (Aug. 10, 1920) G. was awarded practically all Thrace outside Constantinople and a mandate over Smyrna and the hinterland. On Oct. 25, 1920, Alexander d. from the bite of a monkey, and the elections in the following month, on Nov. 14, resolved themselves into a struggle between the Venizelists and the Constantinians. Venizelos was defeated and left G. Rhalles became Premier, and a plebiscite favoured the return of Constantine. The result was that in the war between G. and Turkey over the possession of Smyrna (see GRECO-TURKISH WAR), G. was deserted by the powers, France favouring the Turks. G. was forbidden to attack Constantinople,

and on Sept. 22, 1922, the Turks captured Smyrna. This was followed by the second abdication of Constantine, who retired to Palermo and d. in the following year. The generals Gonatas and Pangalos became Premier and minister of war respectively in a 'revolutionary gov.' Their chief act—the execution of Iliadjanestres, former commander of the forces in Asia Minor, together with five ex-ministers—brought G. into disgrace.

By the treaty of Lausanne, July 14, 1923, G. lost E. Thrace, the boundary between G. and Turkey being fixed at the Maritza R. Shortly after, on Aug. 27, G. was embroiled with Italy over the murder of Gen. Tellini, It. delegate, with the other members of the commission investigating the Albanian boundary, while on Gk. soil. Following an It. ultimatum Corfu was bombarded, and although the Its. were forced by the League of Nations to evacuate Corfu on Sept. 27, G. paid a large indemnity. An unsuccessful counter-revolution against the 'revolutionary gov.' brought the monarchy into discredit, and King George was asked to leave for Rumania. On March 25, 1924, G. was proclaimed a republic, although the king was allowed to retain his title. Later a coalition gov. was set up, with Zaimis as Premier, and on June 2, 1926, after three years of discussion, the constitution was passed.

The republic endured with varying fortunes until 1935, when, following a plebiscite organised by Gen. Kondylis, the monarchy was restored by an overwhelming popular mandate and George II. was recalled to the throne. Prior to these events Venizelos, returned to power in 1928, sought an *entente* with both Italy and Turkey, but the interests of those two countries were too conflicting to allow of any *rapprochement* between them and G., and, after trying vainly to secure the passing of certain anti-Royalist measures, Venizelos resigned in 1932. Zaimis, who had been elected president in 1929, now summoned the Royalist, Tsaldaris, to form a gov. from the Populist party. Later the Venizelists, led by Gen. Plastiras, tried by a *coup d'état* to forestall the restoration of the king, but the rising was short-lived, and both Plastiras and Venizelos fled the country. The king, whose restoration was due not so much to any access of enthusiasm for the monarchy as to the hope that it might end a decade of unsuccessful democratic experiments, insisted, in the interests of national unity, on a general amnesty and a general election. Kondylis, however, demanded the exclusion of Venizelos, but, strangely enough, these mutual rivalries were fortuitously extinguished by the death in 1936 of Venizelos, Kondylis, and Tsaldaris, and Gen. Metaxas became Premier. In the following year Prince Paul, brother of the king and heir presumptive, was married to the Princess Frederika, daughter of the duke of Brunswick and grand-daughter of the ex-Kaiser, a marriage which was not destined to have any effect on Greco-Ger. relations. In this year the 150th anniversary of the birth

of Byron was celebrated in G., the Brit. poet's personality being as greatly revered to-day as when he d. fighting at Missolonghi in the cause of Gk. independence. On the pretext of a Communist revolt Metaxas now set up a virtual dictatorship, Parliament being dissolved and political parties being suppressed, and in 1938 he was made Premier for life. A treaty was signed (April) with Turkey to subsist for ten years, under which each country undertook to remain neutral if one of them were attacked, while each would prevent the transport of troops or munitions through its ter. to any state attacking either of them. At the same time Gk. and Turkish troops entered the Thracian frontier ter., which for fifteen years had been demilitarised under the treaty of Lausanne (q.v.).

In 1939, when Germany was menacing the whole of Europe, Chamberlain, the Brit. Prime Minister, announced that in the event of any action threatening the independence of G. the Brit. Gov. would at once lend the Gk. Gov. all the support in their power—a guarantee which was the more readily given on account of the importance of the Gk. naval bases in the E. Mediterranean. After the outbreak of the Second World War a declaration of friendship between Italy and G. was pub. in Rome (Sept.)—a peculiarly hypocritical move on the part of Mussolini, especially as it was reaffirmed later in the year, though it is to be admitted that its *raison d'être* lay in the suspicions of the Gk. people of Italy's intentions. These suspicions were fully confirmed on Oct. 28, 1940, when Mussolini, evidently confident that the It. army under Graziani, based in Libya, could advance at leisure to the invasion of Egypt, suddenly launched a treacherous attack without a declaration of war across the Albanian frontier into G. He seems to have acted against the advice of his general staff who were naturally averse from risking warfare on two fronts, and to have expected little or no resistance. But when the small Gk. Army proceeded to defend its ter. with sublime courage and tenacity, the world was amazed to see the It. forces hurled back in full retreat. As far back as the previous Aug. It. propagandists had accused G. of breaches of neutrality and of ill treating the Albanian minority in Epirus—the fauiliar technique employed by the dictators when contemplating an attack. On Aug. 15 an It. submarine had torpedoed and sunk a Gk. cruiser, which had been sent to Tinos for the feast of the Assumption. The Gk. Gov. made every effort to avoid a breach, while taking precautionary measures on the Albanian frontier. When, on Oct. 28, Metaxas refused to cede strategic bases in G., seven It. divs. came into action even before the expiration of the ultimatum demanding the bases. Mussolini expected either surrender or a merely nominal resistance, but he found the country united and the Gk. Army full of patriotic fervour. A small contingent of the Brit. R.A.F. had been sent to co-operate with the Gk. defence and, on Nov. 11, while the Its.

were still being pressed steadily back through the Albanian mts., the Fleet Air Arm delivered a crippling blow at the main It. fleet lying in Taranto harbour, thereby reversing the balance of naval power in the E. Mediterranean. The Brit. Gov.'s air and naval assistance had been sent to the Gks. within three days of the It. attack, and the result was that Mussolini found that he had presented the Brit. forces with an opportunity of striking at the It. Fleet from Gk. bases. In the central sector the Gks. practically annihilated an It. div. of Alpini, which had rashly ventured into the wilderness of the N. Pindus. In the N. or Macedonian sector, where the Its. had remained more or less on the defensive, the Gks., quickly realising the truth of the military maxim that he who falls to attack is already half beaten, launched a strong assault towards Koriza. In the S. or coast zone, the only place where the It. penetration into Gk. ter. had been deep, the Its. hastily retreated over the Kalamos R. Under the supreme command of Gen. Papagos the Gk. Army displayed brilliant tactical skill in mt. warfare, turning one position after another by seizing points of vantage which dominated it. They took Koriza on Nov. 22, cut the port of Santi Quaranta on Dec. 6, and, two days later, marched into the strategically important tn. of Argyrokastron. By the end of the year they had conquered nearly one-third of Albania and were approaching Tepelini.

Heavy reinforcements, however, were now reaching the It. armies and for two months the position remained essentially unchanged. In March 1941 the Its. launched a desperate offensive against the Gk. lines, yet no part of the defence yielded ground, and it can hardly be doubted that if the Gks. had had no other foe than the Its. they would have successfully defended their independence; for what they lacked in naval and air power was supplied by the co-operation of Brit. naval and air forces. But in April the Ger. armies crossed the Bulgarian frontier into Macedonia, and though a gallant stand was made by the Gk. forces, aided by a Brit. expeditionary force of some 60,000 men, the odds, both military and political, were so overwhelming that in a few weeks the whole of G. was in Ger. hands and the Brit. forces had been evacuated. (For details of the campaigns see GREECE, SECOND WORLD WAR, CAMPAIGN IN (1941).) The spirit of the Gk. people rose to incredible heights of courage and self-sacrifice in their struggle against Italy and when the Gers., attacked they did not falter. But owing to internal dissension, the Gk. Gov. was by no means steadfast, and certainly deteriorated after the death of Gen. Metaxas (Jan. 29, 1941). The war effort was always hindered by jealousies and suspicions, which caused Venizelist officers above the rank of captain to be excluded from the army, besides sowing doubt among the educated classes generally. There were sev. quarrels in the Cabinet and many prov. governors and officials were pro-Ger. But the Gk. people remained lion-hearted

to the end. From the moment when Yugoslav resistance collapsed the Gk. Gov. seemed to resign itself to defeat. In mid April a depressing report of the military situation given to the Cabinet by Gen. Papagos caused the Premier, Korizis, to commit suicide. Such was the mood to which some of the leaders of the nation had fallen victims. Even when all was lost the Gk. people never wavered in their attitude towards their Brit. allies. The inhab. of little tns. and ports worked with a will to assist the evacuation of the last parties of Brit. forces, while on land the utmost hospitality was shown to stragglers.

King George and his ministers withdrew to Egypt and finally reached England in Sept. Ger. forces entered Athens on April 27 and set up a puppet gov. under Gen. Tsolakoglu. Thereafter ensued a period of dire privation for the cap. and for the whole country. Crops and stores of foodstuffs were requisitioned by the Gers., who issued occupation paper money to the amount of 1,000,000,000 marks to enable their troops to observe the formality of payment. Despite arrangements made by the Allies to get food into G. people were now dying of starvation to the number of 600 a day. It. troops entered Athens on June 25 and formally took over the occupation of the country from the Ger. garrison; but the Gers. continued to control all communications, the coastline, and the aerodromes, besides being in control of Crete. At the end of the first fifteen months of the Axis occupation of G. some 100,000 of a pop. of 1,000,000 in Athens and the Piræus had perished. Guerrilla warfare was waged incessantly throughout 1942, particularly in Macedonia. Other groups operated in the Peloponnese, among them being a number of Brit. soldiers, while in Crete Brit. troops who had not been able to escape were co-operating with the Gk. resistance movement. Sabotage against Axis troops on railways and supply stores was rife despite reprisals. An agreement between Great Britain and the exiled Gk. Gov. was signed on March 1 respecting the organisation and employment of Gk. armed forces, and the two govs. agreed that among the objects of the war were the 'complete liberation of Greece and the re-establishment of her freedom and independence.' Lend-lease agreements were also made between Britain and G., and between America and G. But the following year saw the tragedy of the enemy occupation, with its incidents of famine, oppression, and reprisals, aggravated by the miseries of a people divided against itself.

In the guerrilla warfare differences of political opinion began to undermine the unity of purpose of the various bands. During the iron rule of Metaxas the old cleavage of the people into Monarchists and Republicans, due to the influence of Venizelos (q.v.), had tended to weaken with the restoration of the monarchy; but when the king left G. again, though under force of circumstances, the old animosities were revived against him for having

kept Metaxas in office. The king tried to smooth over differences by issuing declarations promising, when he should return, to consult the will of the people on the political and constitutional status of the country. An attempt to counteract the effects of this strife among the 'Antartes' (irregular bands) on their resistance to the Axis invaders was made by the introduction of Brit. liaison officers into G., and on July 2, 1943, it was announced in Cairo, whither the king had now repaired, that the Gk. guerilla bands had come under the supreme allied command in the Middle E.; but there none the less remained in the Antartes no fewer than five separate organisations, the chief being E.L.A.S. (National Popular Liberation Army) with a strong Communist element; the E.D.E.S. (National Democratic Gk. Army); E.A.M. (National Liberation Front); and all acting in co-operation with the general headquarters in Cairo or purporting to do so. Yet in spite of those feuds between the bands of the Antartes the guerilla struggle against the Axis forces was maintained throughout the year, with the bands in virtual control of the region lying between Thessaly, Macedonia, and Epirus. Fighting reached a peak shortly before the allied invasion of Sicily, when the Gers., believing an allied invasion of G. to be imminent, dispatched four divs. to G. With the collapse of Italy the Gers. revoked the div. of G. into Ger. and It. zones of occupation and resumed control of all communications. On June 21, 1944, the R.A.F. made its first major attack on the Gk. mainland since the evacuation of Crete, the attack being on airfields at Salonika; while the Aimers. bombed an aerodrome near Athens and industrial targets. The differences of political opinion, which early in 1943 had led to armed strife between rival bands of guerillas, were continued into 1944, but during Feb. Brit. liaison officers succeeded in getting their avowed representatives to agree to end hostilities and co-operate in the fight against the Gers. Yet the unrest in the Gk. forces remained and there were mutinies in both the army and navy based in Egypt. Papandreou, leader of the Republican Socialist party, escaped at this time from G. and went to Cairo to urge the cause of national unity. He received from Mr. Churchill a promise of support in his task of directing all Gk. forces against the Gers. A conference in the Lebanon (May) of various Gk. political parties resulted in an agreement or National Charter, but it was not clear how far the delegates could claim to represent their sev. groups. In June the king entrusted Papandreou with the formation of a gov. of national unity, but in the following month the parties drifted further apart. By Oct. the S. areas of G. were nearly free of Gers., although in the N. fighting was still going on between the national bands. On Oct. 14 Athens and the Piræus were occupied by Brit. troops, and on Christmas Day Churchill, accompanied by Anthony Eden, flew to Athens to try to compose Gk. differences and end the fratricidal strife.

By now the Gk. National Gov.'s control inside G. was exercised only through E.A.M. and its E.L.A.S. army and in the Pindus region by the E.D.E.S. force, and in any case was sporadic. Though G. had now been liberated and national belligerent resistance was no longer necessary, resistance had resulted in the grouping of a great many parties—before the time of Metaxas there had been literally scores of amateur political groups—into E.A.M. and that party now remained united as the largest political party. Decisively left wing, it comprised the Communists, the Socialists, the Union of Popular Democrats, the Agrarians, and many others. The fact that E.A.M. was openly against the king's return was responsible for a wave of monarchist feeling among the nationalists or right-wing elements, and E.A.M., favouring a republican form of gov., now pressed for an immediate vote so as to ensure a decision while its armed forces were in existence. On his return to Athens Papandreou enjoyed the undoubted support of the mass of the people, and he clearly sought to form a gov. really representative of most shades of opinion. But armed terrorism stalked through the land, the forces of E.L.A.S. and E.D.E.S. being responsible. The gov., with the support of Lt.-Gen. Sir Robert Scobie, commander-in-chief of the Gk. Army, announced their determination to disband these forces by Dec. 10 and to re-form the Gk. Army to supersede the resistance groups as the regular armed force of the nation. During Churchill's visit there was a demand for a regency under Archbishop Damaskinos (g.v.), and the Brit. Prime Minister asked the archbishop to convene a conference of all parties to test this demand. Churchill having secured the consent of the absent king, Archbishop Damaskinos on Dec. 31 was invested with the royal power pending his regency. Additional Brit. troops were now sent to Athens and street by street the cap. was cleared. The assailants fled, and a truce was signed, though it was evident that the existing authorities in Athens would never work as colleagues with the Communist leaders who had assailed the city and brought so much misery on G. When the truce was signed E.L.A.S. had lost half its strength of 25,000 men. It was averred on good authority that they had played next to no part in resistance to the Gers., being intent mainly on the liquidation of their political opponents. The peace agreement was signed on Feb. 12, 1945. One of its clauses was that a plebiscite should be held to decide finally on the constitutional question, under the supervision of the Allies. But this agreement did not bring political harmony. E.A.M. complained that the entire state machinery was manipulated by Fascists and that the whole resistance movement was being ruthlessly persecuted, while the Communists levelled their attacks against the presence of Brit. troops in G. No fewer than six Cabinets held office during 1945. In Oct., to end the deadlock, the regent,

Damaskinos, himself assumed the office of Premier, but handed over the government to Kanellopoulos, who in his turn gave way to Sophoulis, the eighty-six-year-old leader of the 'liberal' party. The majority of the ministers in this Cabinet, which included Tsouderos, head of the Gk. Gov. in exile from 1941 to 1945, as vice-premier, were old Venizelists. The apparent hopelessness of the political situation had led the archbishop to announce his impending resignation of the regency, but on the appeal of the Brit. and Amer. Govs. and of the new Gk. Gov. he withdrew his resignation (Nov.).

In 1946 in some areas, especially in the N., armed bands continued their activities despite the truce. The Gk. Gov. represented to the Security Council of United Nations their view that these guerrilla forces were supported by G.'s N. neighbours or, in plain language, Russian Communist influence. Probably K.K.K., or the Gk. Communist party, were behind this movement; for their hatred of the W. powers and their attachment to Soviet Russia and to Marxist principles remain undeniable, and they lent themselves readily to foreign exploitation. There were elections in March 1946, but the govts. which resulted from them failed to produce a constructive and economic policy. The explanation of the unhappy state of G. is not far to seek: there was too much confidence in the possibility of solving by force problems which sprang from five years of dictatorship, then four years of Ger. occupation, then a resistance movement in which the people participated as a whole, and lastly a revolution. Gradually, however, in 1946, the Royalist Gks. succeeded in gaining control of the stop-gap gov. and eventually a new plebiscite once again resulted in a majority in favour of the return of the king (see GEORGE II.) who soon afterwards left England for Athens. The Brit. Labour Gov., in 1947, decided that its financial commitments to G. must end after March 31 and further that the Brit. troops would be reduced and eventually withdrawn, and they so informed the United States Gov. President Truman then asked Congress for authority to give immediate economic and financial aid to both G. and Turkey, on the ground that the foreign policy and national security of the U.S.A. were involved, and that the United Nations and its related organisations were not in a position to extend help of the kind that was required. What President Truman plainly saw was that the Gk. Gov. was unable, with its weak army, to cope with the terrorist activities of thousands of armed men who defied the gov.'s authority at various points, particularly along the N. boundaries. Britain, in the throes of an industrial and economic crisis, could no longer sustain the burden of garrisoning and supplying the needs of G., especially as the functions of U.N.R.R.A. were then ending. 'The world is not static,' said President Truman, 'and the *status quo* is not sacred, but we cannot allow changes in the *status quo* in violation of the

Charter of the United Nations by such methods as coercion, or by such subterfuges as political infiltration'—a palpable hint to Soviet Russia, which was seeking to control all other states on her W. border, and even in mid Europe.

In the midst of these preoccupations the king d. suddenly (April 1) of a heart attack and was succeeded by his brother, Prince Paul. Civil war prevailed in G. throughout the next two years or more. Early in 1947 the U.S. Gov. secured the passage of the Gk.-Turkish Bill, the pub. documents relating to which measure indicated the necessity and urgency especially of Amer. aid to G. The U.S. Gov. stated that G. was on the verge of financial collapse; that the Gk. Communist party was determined to impose a Communist regime on the country regardless of the will of the majority and at any cost in suffering; that Russia was giving moral support to the opposition elements in G., and that in view of the extreme weakness of the Gk. Army it was certain that the three N. neighbours of G. could with little difficulty seize a portion of Gk. ter. if they were not deterred by fear of international complications and by the fact of the presence in G. of Brit. troops, whose small numbers, however, precluded them from exercising more than a political and psychological influence. Apart from receiving over £100,000,000 worth of supplies from U.N.R.R.A., the Gk. Gov. had substantial military aid from Britain and the U.S.A. Most of the £132,000,000 advanced by Britain up to May 1947 was spent on military stores, while over half of the credit of £7,000,000 advanced by the U.S.A. went the same way. Nevertheless the year 1947 saw a steady extension of the area of guerrilla fighting, and this caused the U.S. Gov. to establish in Athens an Amer. military staff, representing all three services, and to appoint military advisers to all the larger units in the field. Both moral and material aid, however, continued to reach the forces of the Communist leader, Gen. Markos, from the N. neighbours of G.; while the guerrilla leaders greatly improved upon the political tactics of the K.A.M. and the E.L.A.S. movement of armed resistance during the world war years, combining with these equally improved military tactics. Thus reinforced Markos strengthened his hold on the mountainous country of Epirus, Thessaly, and W. Macedonia, and secured the formation of political organisations in ter. so 'liberated.' Where E.A.M. never succeeded in unifying the political and military leadership of the wartime resistance, Gen. Markos and his fellow Communists had some success in bringing the two together. The fighting of spring and summer (1947) having left the rebel forces intact, they began the intensive organisation of the areas they had acquired since the previous year. At the end of 1947 the Gk. Parliament banned strikes for the duration of the civil war. On Dec. 21 Gen. Markos issued a proclamation announcing that he had set up a 'free Gk. gov.', the members of which were, of course, drawn entirely from the Gk.

Communist party. The following day numerous arrests were made by the Gk. Gov. in Athens. The rebels continued with an all-out offensive against Koritza and the adjoining ter. to establish there their new 'free gov.,' but on Dec. 31 Gk. troops relieved Koritza and the rebels withdrew. On Jan. 7 Britain warned the Yugoslav and Bulgarian Govs. against recognition of the Gk. rebels.

The inability of the Gk. Gov. throughout 1948 to win a decisive victory over the rebels or to control rising prices, or to carry out administrative reforms, much dimin-

ished hopes of the country emerging from its tragic plight. The rebels were now active everywhere and dominated wide areas of Thessaly and the Peloponnesus. In these circumstances the Coalition Gov. of Populists and Liberals under Sophoulis imposed martial law over the whole country, a desperate move which promised little relief in face of the added complication of conflict between the chief political parties. The Liberal party under Sophocles Venizelos seceded in Oct. 1948, their chief motive being that they were deprived of their share in the gov., coupled with their belief, unsupported by any rational argument, that they could govern better than those who were in office. But the truth was that there could be no solution either to G's political or economic troubles without there being an end to the civil war. The Dodecanese Is. had been officially incorporated into the Gk. kingdom on March 7, 1948, and in Aug. a United Nations com-

mittee found that the Gk. guerillas had received aid from Albania, Bulgaria, and Yugoslavia. The rebellion in G. was to some extent interwoven with a long continuing dispute of a quasi-irredentist character, between G. on the one side and Yugoslavia, Bulgaria, and Albania on the other. But even if it were possible to satisfy Gk. claims on Albania in the Epirus and Bulgaria's wish for an outlet to the Aegean, there remained Russia's strategic aim of a Communist G. which was, and is, echoed in a minor key by Yugoslavia's desire for an 'independent'

ished hopes of the country emerging from its tragic plight. The rebels were now active everywhere and dominated wide areas of Thessaly and the Peloponnesus. In these circumstances the Coalition Gov. of Populists and Liberals under Sophoulis imposed martial law over the whole country, a desperate move which promised little relief in face of the added complication of conflict between the chief political parties. The Liberal party under Sophocles Venizelos seceded in Oct. 1948, their chief motive being that they were deprived of their share in the gov., coupled with their belief, unsupported by any rational argument, that they could govern better than those who were in office. But the truth was that there could be no solution either to G's political or economic troubles without there being an end to the civil war. The Dodecanese Is. had been officially incorporated into the Gk. kingdom on March 7, 1948, and in Aug. a United Nations com-

Macedonia, together with the port of Salonika.

In Nov. the General Assembly of the United Nations resolved, by forty-eight votes to six, that the support given to the Gk. rebels by Albania, Bulgaria, and Yugoslavia 'endangers peace in the Balkans and is inconsistent with the purposes and principles of the charter.' A last effort at peaceful settlement failed when negotiations were broken off by the Communist states on the pretext that G. had refused to renounce her claims to N. Epirus. The rebels in the meantime were steadily gaining ground, and continued to be supplied with arms and provided with safe retreats by these states; Yugoslav intervention, however, declined after Tito's expulsion from the Cominform.

Greek Law.—The first written laws in G. did not appear until the development of the Gk. city states; previously the only existing laws had been a floating body of unwritten 'customary' laws. But by the

beginning of the sixth century B.C. every first-class Gk. state, except Sparta, had advanced beyond the stage of unwritten usage.

Owing to the peculiar geographical conformation of the country, Gk. law tended to develop along separate lines in the various states. Consequently there was at no time a common law for G. comparable to the common law of England. Although there were many principles common to all the various codes, such as the marriage law and some provisions in the criminal law, their presence is to be attributed to the common stock of ant. Gk. ideas from which all Gk. laws are derived. The Athenian judicial system, as developed under the democracy of the fifth and fourth centuries B.C., stands inevitably in the forefront of Gk. law, both because of its high degree of development and the influence it exerted over the whole of the Gk. world through the cultural and political supremacy of Athens. It was Draco (c. 620 B.C.) who first codified the mass of unwritten laws into what was intended to be a permanent body of law; but the real basis of Athenian law was laid by Solon, during his archonship in 594 B.C. The code of Solon may be said also to have laid the foundations of Athenian democracy by the formulation of the *isonomia*—equal membership of Assembly and supreme Law Court for all free-born adult males born in Attica. The Peisistratid tyrants preserved the code almost intact, but after their final expulsion Cleisthenes revised it once more, giving it a still further bias towards democracy.

Two main principles govern the complicated structure of Athenian law, both constitutional and civil: first, that all law should be easily intelligible to the ordinary man, and, secondly, that the best guarantee of a pure administration of justice is the common sense and moral instinct of large bodies of ordinary men. For this reason the *dikastai* or jurymen occupy the most prominent place in the Athenian judicial system. Drawn from the ordinary citizens over thirty years of age not under any civil disqualification, these courts of *dikasts*, sometimes reaching 6000 in number, formed both judge and jury; they controlled the appointment and conduct of executions and eventually encroached even upon the sovereign Assembly. Athenian lawsuits fall generally under the headings of *graphai* (public suits) and *dikai* (private suits). These were always initiated by a private individual, the *dikasterion's* function being the purely passive act of judging; it was possible, however, to counter-accuse the accuser who brought an illegal action and to penalise him heavily. The Athenian usually conducted his defence in person; many, however, enlisted the services of a Demosthenes or an Isocrates to compose their speeches for them, and many such speeches are still extant. Athenian justice, like other Athenian institutions, soon became decadent; appeals to the emotions of the jury had

always been a weakness of the system, and corruption and the practice of paying the jury for their services further degraded the Athenian law courts. With the Rom. conquest the Rom. system of law gradually took the place of the Gk. system, which can now only be disinterred with difficulty from extant speeches and inscriptions.

Greek Language.—The ant. Gk. language belongs to the Indo-European group, and was traditionally divided into the four dialects, Æolic, Doric, Ionic, and Attic, roughly in accordance with the different branches of the Hellenic race. Æolic, the dialect of Lesbos, Boeotia, and N. Thessaly, has no great literary importance save as the language in which Sappho and Alceus wrote. Doric, spoken by the natives of the Peloponnese, Locris, Phocis, and the Dorian colonies and is, in the E. and W. Mediterranean, is particularly characterised by the broad 'a' (for 'η') and by a peculiar system of accentuation. It is the dialect of the Gk. choral poetry in general, and is found in the choruses of the Attic tragic writers, as well as in the Sicilian elegies of Theocritus. Ionic, with its sub-dialect epic, was the language of the earliest extant Gk. writers, historians like Hecateus and Herodotus, the Ionian philosophers, most of the elegiac writers, and above all Homer and the other epic poets. The language of Διονυσίου Rhodius and other later epic poets is only a scholarly, and sometimes inaccurate, imitation of the original epic sub-dialect. Attic is sometimes regarded as a sub-dialect of the Ionic, with which it agrees in its having 'η' for long 'a' and in contracting 'ι' into 'ε' and 'ο' into 'ω'. The digamma (Ϝ) has been dropped, as it has, except for the purpose of scansion, in Ionic. As the language of the great Athenian writers, Attic naturally came to supersede all other dialects as the standard of correct classical Gk., through the spreading of Athenian cultural and commercial supremacy throughout the Gk. world. It is the basis of the modern Gk. language. Gk., in its various dialects, had already penetrated to Sicily, S. Italy, France, the Sp. coast, and all round the E. Mediterranean, when the conquests of Alexander the Great made it the universal lingua franca, not only of Asia Minor, but of a good part of the Near E. With the Rom. conquest of the Mediterranean basin the language spread still further, and became the recognised medium of polite intercourse in the Rom. world, much as Fr. was to become later in diplomatic and social circles. When the W. Rom. Empire was submerged beneath the barbarian invasions of the fifth century A.D. Gk. disappeared from the W. world for a thousand years, but lived on as the official tongue of the E. Byzantine Empire until the fall of Constantinople before the Ottoman Turks in 1453. The immigration of scholars into W. Europe, which then followed, added impetus to a movement already begun in Italy for the revival of Gk. studies; and with the Renaissance Gk. was once more reinstated as a learned tongue, though it never again rivalled the universality of Lat. In G. and the

Levant, however, Gk. still lived on as a spoken language, though the passage of time and the intrusion of many Slavonic and Turkish words and forms had wrought radical changes in the old classical tongue. The 'b' sound, for example, has vanished entirely, the letter 'β' now representing a 'v' sound; the grammatical construction has been profoundly modified, particularly in the conjugation of verbs, while the pronunciation of the language has been entirely altered by the conversion of the 'pitch' or 'tonal' accents of classical Gk. into a 'stress' accent.

It is significant that the revival of Gk. nationality at the beginning of the nineteenth century was accompanied and aided by an awakened interest in the anct. Gk. tongue, initiated by the great scholar Koræus. This movement took the form of an attempt to restore the purity of the language as far as possible by the removal of foreign words and constructions. As a result it is now possible to distinguish two types of speech in modern G.—the 'demotic' or popular (spoken by the populace at large) and the 'purist' Gk., the official language taught in the schools and written in the newspapers, a conscious imitation of anct. usage purified as far as possible from intruding foreign words. There is no doubt, however, that the latter is steadily gaining ground, and that soon the country will speak no other language.

Modern research agrees with anct. tradition that the Gk. alphabet has been derived from the Semitic. Indeed it is not difficult to trace the connection between these two scripts. A comparison of the early forms of the letters sufficiently demonstrates their common origin. The phonetic values of the signs are, mainly, the same in both the alphabets, and, still further, the names of the letters and their sequence are the same. Finally while the names of the letters are meaningless in Gk. they are words in Semitic languages. Hence the two alphabets must be related, and as the Semitic is doubtless the earlier the Gk. must depend upon it. When the Gks. took over the Semitic letters they also took over their names.

The date of the adoption of the alphabet by the Gks. is a much vexed question, and various dates have been suggested. In general Gk. tradition assigned the creation of the Gk. alphabet to the Dark Age, and there are many indications that such a date (about the twelfth to eleventh century B.C.), roughly speaking, may be right. This dating has been accepted by many eminent scholars (Kenyon, Hogarth, Bury, Wade-Gery, Lefeld, Szanto, Döringer), while other scholars (Mejer, Kirchhoff, Gercke, Beloch, Dräger) suggested the ninth or even the end of the eighth century (Carpenter).

Was the Gk. alphabet first constructed in one place or in sev.? Some scholars hold that the Gks. received the alphabet from the Semites, 'at several points of contact from whence it was logically diffused among neighbouring cities and their colonies' (E. M. Thompson). Others think that all the local varieties derived from one earlier Gk. alphabet, the creation

of an unknown genius, who must have been a first-rate 'phonetician,' who succeeded in adapting the Semitic purely consonantal alphabet to an idiom belonging to a different linguistic family, and which could not do without vowels. At the same time the Gks. found certain symbols in the Semitic alphabet representing sounds which they did not possess. These were the glottal *aleph* and *he*, the pharyngeal *heth* and *ayin*, and the 'semi-vowels' *waw* and *yod* (see ALPHABET). Four of these Semitic letters (*aleph*, *he*, *yod*, and *ayin*) were made to represent the Gk. vowel sounds *a*, *e*, *i* and *o*, both long and short, the signs for *e* and *o* being also employed for the diphthongs *ei* and *ou* (this continued to be expressed by *o* to a comparatively late period). The Semitic *waw* became the Gk. *digamma* (=the consonantal *u* sound, akin to Eng. *u*); this sound was given up in dialects (e.g. Ionian) in which the letter not being needed was discarded; it survived in other dialects till it became obsolete in classical times, but it continued to be used as the numeral 6. Another form of *waw* supplied the symbol for the Gk. fifth vowel sound, *upsilon*. It was placed at the end of the alphabet following *tau*, but it must have been adopted at the same time as the other Semitic signs, for there is no local Gk. alphabet which is without it. The Semitic *heth* was adopted in the W. branch of the Gk. alphabets (Locris, Eils, etc.) as the rough breathing; at a later stage it was broken up into two signs (— — — — —) to serve

(1) as the rough breathing (*spiritus asper*), indicating the presence of an *h*-sound, or (2) as the smooth breathing (*spiritus lenis*), indicating the absence of the *h*-sound. In the Ionic and Attic alphabets, the aspirate gradually falling into disuse, the *heth*, as Gk. *eta*, was adopted to represent the long *e*. (In the earlier Theraian inscriptions, however, the letter *heth-eta* occurs in both capacities.) At a later stage of development, when the long *o* began to be distinguished from the short *omicron*, the Ionians created the *omega* (which was an augmentation of the *omicron*), and placed it at the end of the Gk. alphabet. The other main adaptations made by the Gks. were (1) the different arrangement of the sibilants; (2) the addition of new consonantal signs, especially the double consonants *phi*, *khi* or *ki*, and *psi*; (3) the disappearance in the E. group (Ionia and Attica) by the fifth century B.C. of the letter *koppa* (Semitic *goph*), which continued to be used as the numeral 90, its place as a letter being usurped by *kappa* (*k*).

The different ways in which these and some other adaptations were carried out permit us to distinguish the various branches of the Gk. alphabet. In practice many little states and different is. had each its own variant, but the Ger. scholar Kirchhoff succeeded in laying down a broad div. of the Gk. alphabets into the E. group (Ionia, Attica, Corinth, etc.) and the W. (Thessaly, Eubœa, Phocis, Locris, Eils, the greater part of the Peloponnesus, etc.). It must, however, be

emphasised that many problems, especially the hist. of the Gk. sibilants, are still involved in obscurity. The original Semitic sibilants and their names appear to have become confused either in the course of transmission to the Gks., or rather in the later internal development. The Semitic letter *zayin* seems to be the only one which was adopted as *zeta* in all the local branches, but its pronunciation in early times is not certain and may have varied throughout the dialects between *z*, *zh*, *dz*, and *dzh*. The Semitic *samekh* (which still existed in the Thera and Etruscan alphabets) was retained, as *zei* with the value of *ks*, in the E. Ionian alphabet, while its name, which became *sigma*, was transferred to the last but one letter of the Semitic alphabet, *shin-sin*. This letter, the prototype of the Gk. classical *sigma*, was one of the two symbols employed to express the Gk. sound *s*. The other symbol (found mainly in Thera, Crete, Phocis, Peloponnesus, etc.) derived from the Phœnician *sade*. These two symbols do not appear together in any Gk. alphabet, but they do in Etruscan. The Gk. additional letters *xi* and *psi* expressed the *x = ks* and *kh* sounds in the W. group, and the *kh* and *ps* sounds in the E. alphabet. The *psi* seems to have been an auct. variant of the Semitic *kaph*.

Gradually, the Gk. local alphabets approximated more and more to one another. In the course of the fifth century B.C. the Ionian, especially the Milesian alphabet, penetrated and was officially introduced at Athens in 103 the year of Euclides's archonship. The other states followed in the course of the fourth century, and by the middle of this century the Ionian-Attic alphabet became the common 'classical' Gk. alphabet of twenty-four letters.

As the Semitic alphabetic scripts were written from right to left, so in the earliest Gk. inscriptions we find the same order followed. Next came the method of writing known as *boustrophedon*, in which the written lines run alternately from right to left and from left to right, like oxen ploughing a field. Early in the fifth century writing from left to right became universal.

While this 'classical' alphabet was always retained, with insignificant variations, as the monumental script, more cursive forms, all of them being developments from the classical letters, were employed in writing on parchment, papyrus, wax tablets, and other soft materials. It is also obvious that not every kind of text will be written in the same way. First of all there is the book in the narrow sense of the word; this was written, as a rule, by an expert scribe in so-called *scriptio continua*; every letter was standing apart, but neither words nor sentences were separated from each other; this writing is known as *majuscula* or *uncial*. Beside it there was the cursive writing in various forms; the letters became rounded and simplified, and there appeared ligatures of two or more signs. Two main types can be distinguished: (1) the cursive of the bureaucracy and of the professional

scribe (as seen in auct. deeds and documents, in petitions, and official letters, etc.); this type later (in the Byzantine period) developed into a very particular kind of fluent, elegant, large writing, in which the vertical element predominated; (2) the individual cursive, which shows a nearly endless variety ranging from the expert handwriting (similar to that of type 1) to the clumsy scribbles of semi-literate people. Gk. MSS., auct. and medieval, numbering many thousands, form one of the main bases of modern civilisation (see *PALÆOGRAPHY*), while the tens of thousands of Gk. inscriptions (see *INSCRIPTIONS*) are of paramount importance for the study of auct. hist. in all its branches.

Letter	Name	Pronunciation
α	alpha	a
β	beta	b (v in modern Gk.)
γ	gamma	g
δ	delta	d
ε	epsilon	e (short)
(F)	digamma	v (disappeared early from the alphabet)
ζ	zeta	z
η	eta	e (long)
θ	theta	th
ι	iota	i
κ	kappa	k
λ	lambda	l
μ	mu	m
ν	nu	n
ξ	xi	x
ο	omicron	o (short)
π	pi	p
ρ	rho	r
σς	sigma	s
τ	tau	t
υ	upsilon	u
φ	phi	ph
χ	chi	ch
ψ	psi	ps
ω	omega	o (long)

The modern Gk. alphabet is slightly different from the auct. script, and the pronunciation of many letters (especially of the diphthongs) differs from that ordinarily used for the auct. Gk.

Greek Literature is conveniently divided into six periods, viz.: (1) Early literature, ceasing about 475 B.C., and embracing epic and lyric; (2) Attic literature, ceasing about 300 B.C., and including the development of drama and prose; (3) Alexandrian literature, ceasing about 146 B.C., and

producing miscellaneous works of a learned and artificial type; (4) Græco-Rom. literature, ceasing about A.D. 520, and occupied mainly with critical and historical treatises; (5) Byzantine literature, ceasing about A.D. 1453, and yielding principally scholastic works; (6) Modern Gk. literature, excelling chiefly in lyric and ballad.

Gk. literature attained perfection in all its branches without extraneous influence, and therefore its hist. affords a unique study of the natural order and development of the different species of poetic and prose composition. The first dept. of Gk. letters to reach maturity was the epic, which arose from selection and unification of loose ballads and folk-songs. This branch of literature may be classified as objective and uncritical. Lyric came next in order of development. In theme it is distinguished by subjectiveness and emotional intensity; in form it makes for artificiality and crystallisation. The lyric epoch was followed by the rise of the Gk. drama. The Athenian drama was democratic and individualistic in outlook. In style its tendency was towards naturalness, and thus, while preserving the character of poetry, it assimilated some of the qualities of prose. Lastly Gk. prose developed; in style it advanced from the accidental rhythms of the early writers to the carefully systematised cadences and metrical graces of the later writers. While anct. Gk. literature developed in many directions it nevertheless maintained throughout its entire career characteristics which reflect the distinctive genius of the Gks. As in her art and in her ethics, the keynote of the literature of G. is beauty and power in restraint. This moderation, which is to be carefully distinguished from mediocrity, is an essential feature of the classical spirit. True Gk. chastity never permitted in artistic conceptions the intrusion of sentimentality, effusiveness, and super-elaboration. There is always perfect harmony and balance in thought and expression, in content and form.

The great epics of G. are the *Iliad* and the *Odyssey*, whose authorship is traditionally attributed to the blind bard Homer, and which were composed about 900 B.C. In eighteenth-century criticism the unity of the Homeric authorship was called into dispute, and a highly composite authorship was assumed. The limits of this article prohibit a detailed discussion of the Homeric question, and it must suffice to say that the *Iliad* and the *Odyssey* were undoubtedly inspired by the folk-songs of the ballad epoch, and that their respective unity of thought and perfection of structure compel us to admit that each must have taken its final form from the magic hand of a great poet. The form of the poems is a cycle of anct. folk-songs, but transfigured and transformed into a new and more transfigured and transformed colonies of songs, but their final form think that impress of Ionic genius. The form of each is written in hexameter verses, of unknown antiquity, and

occurring in most anct. Delphic oracular responses. The so-called 'cyclic poems' continue the epic hist. They complete the story of Troy, but are inferior in conception and design to the Homeric epics.

The poems of Hesiod (fl. c. 735 B.C.), the next great poet in the hist. of Gk. literature, form a striking contrast in subject and treatment to the Homeric epics. The Homeric heroes seem almost to enjoy participation in the blithe life of the gods; the atmosphere is clear, the prospect luminous. The hand of fate does indeed loom over gods and men, but the inevitable decrees are accepted with calm and unperturbed submission. For Hesiod the world is rough and rugged, and the heavens are far distant. Nature is a hard task-mistress demanding of man unceasing toil. Hesiod's gospel is veritably a gospel of work. Xenophanes, Parmenides, and Empedocles, the early natural philosophers, continued the tradition of didactic poetry.

The so-called Homeric hymns do not synchronise with the composition of the *Iliad* and *Odyssey*. They belong to the sixth century, and are probably preludes which were sung by rhapsodists at the recitals of the Homeric epics at the Panathenaea.

Gk. lyric, like Gk. epic and Gk. philosophy, was primarily the inspiration of colonists in Asia Minor, the period of colonisation being marked with phenomenal activity in all spheres of thought and action. The chief lyric species were elegiac and iambic. The distinguishing feature of Gk. elegiac verse is its universal range of application. Thus Callinus (690) and Tyrteus (640) adapt it to martial themes, Mimnermus (620) to erotic, Solon (600) and Theognis (550) to gnomic, and Archilochus (690) and Simonides (530) to funeral. Iambic verse approximates more closely to a colloquial form, and hence is best adapted to a satiric and controversial vein. The instrumental accompaniment which had originally been indispensable to elegiac and iambic verse gradually fell into disuse, and melic verse (or verse inseparable from an instrumental accompaniment) was represented by two new orders, the Æolian and Dorian modes. The Æolian mode was monodic and personal; the Dorian was choral and civic. The greatest achievements in Æolian verse were attained by Sappho; her poetry excels in intensity of passion and beauty of melody. Unsurpassed in the Dorian mode is Pindar, whose odes are inimitable in majesty of thought and grandeur of expression.

Tragedy was gradually differentiated from the dithyramb, a triumphant hymn to Dionysus. Arion and Stesichorus are shadowy names in the early hist. of the dithyrambic chorus, but the name of Thespis brings us to the fringe of hist. Thespis first introduced an actor or answerer (*hypocritès*), and thus dialogue between the leader of the chorus and the actor was now effectuated. Phrynæus, author of the historical plays, the *Capture of Miletus* and the *Phœnissa*, employed

without alteration the dramatic framework invented by Thespis, and no further innovation was made till the daring genius of Æschylus (b. 525 B.C.) startled the Athenian audiences. Æschylus gave to Attic tragedy the form in which we know it. The reforms which are usually ascribed to Æschylus are these: (1) He founded the classical div. of plays at the Dionysia. First were represented three tragedies (*tragoidia*), then followed the 'satyr' play, which had regularly the chorus of satyrs and combined all the humorous elements which hitherto had been more or less scattered over all four plays. The only exception was in the nominally 'satyric' plays like the *Alcestis* of Euripides and the *Inachos* of Sophocles.

SOPHOCLES

(2) He brought in a second actor. This new departure, providing two actors in addition to the leader of the chorus, enabled the dialogue to become more complex, for an actor might take more than one role. (3) He made the dialogue mainly bear the burden of the dramatic action. His chorus, though still playing an independent if somewhat colourless part, is subordinate to the actors. (4) He placed in the rear of the orchestra a wooden booth, the *skênê*, which served as a dressing-room as well as background to the scene of action; and he is said to have invented scene painting. (5) He made the actor sing as well as the chorus, giving him not only monodies, but also a part in a musical dialogue which he conducted with the chorus. An important result of this was that the original Doric rhythms of choric song became modified by the introduction of both Æolic and Ionic solo measures, including the iambic and trochaic. (6) He formed the ponderous tragic style which, until Euripides dared to free himself in part from its conventional fetters, was de-

manded of all writers of tragedy (consult Aristotle, *Poetics*, 10). The leading thoughts in the drama of Æschylus are bold and emphatic. There is a power manifest in the universe which makes for righteousness, and by putting himself in harmony with its tendencies man wins happiness. Through suffering man learns the will of the gods, but an insolent and overbearing attitude brings sorrow even unto the third and fourth generations. To Sophocles (b. 496 B.C.), a younger contemporary of Æschylus, are also ascribed technical improvements in the construction and production of tragedy. Tradition attributes to him the introduction of a third actor, and (by some) the invention of scene painting. The motive idea in the tragedies of Sophocles is less vast than in those of Æschylus. The chief interest in the Æschylan drama is in the ultimate and universal problems; the central issue in those of Sophocles is concerned with individual ethics and psychology. In the elder tragedian man is engaged in a titanic struggle with destiny; the religious conceptions of the younger dramatists have ripened to a mellow loveliness. With the third of the great tragic writers of Athens the dramatic atmosphere has quite altered. The sublime elevation and stately repose have vanished before the ferment of moral perplexity and religious doubt. The aim of Euripides is occasional effect rather than sustained solemnity. Tender sentiment and tempestuous passion reflect the clear rays of spirituality. Instead of the natural being transformed into the supernatural, the supernatural is transformed into the natural. There is discord in the plays of Euripides, a discord between character and environment, between rationalistic thought and mythical tradition, between the movement of the plot and the function of the chorus. These are faults of a transition period, for Euripides was too far in advance of his age to harmonise his thoughts with its artistic conventions. But in his humanity Euripides reaches heights undreamed of by his great predecessors. He sympathises with the slave, the barbarian, and the weak. His portrayal of women is characterised by a tenderness and sympathy that are strangely modern. In the *Alcestis* he abandons the dramatic traditions and even introduces children. If the Euripidean drama, as a whole, is unequal, unsymmetrical, there are nevertheless passages whose loveliness and beauty are unsurpassed by anything in Gk. literature.

Comedy, too, had its origin in the cult of Dionysus. The occasion of harvest thanksgiving gave rise to extempore farces, which in the course of time took literary shape. Aristotle, in the *Poetics*, says that comedy sprang from the phallic choruses of these festivals. Such choruses were probably abusive and derisive, and were directed against such personages as were conspicuous enough to excite the interest of the assemblage. The temperament of the Sicilians was especially conducive to the development of comedy, and in Sicily it first reached

literary excellence and acquired permanent value. Epicharmus of Cos (b. c. 535 B.C.) was the greatest of the early Sicilian comedians. Previous writers had produced the comedy of situation, but Epicharmus created comedy of plot and character. Political satire is, however, absent from Sicilian comedy, which ridicules the type rather than the man. The chorus is altogether absent. Attic comedy falls into three divs.: the Old, the Middle, and the New. The Old Comedy flourished from 450 to 390, and was characterized by broad and undisguised rally of contemporary events and living personages. It was a product of the political independence and fearlessness of the Athenian democracy. As the democratic constitution of Athens waned comedy ceased to be personal. Middle Comedy flourished from 390 to 320. It satirises movements and factions, philosophy, literature, and other contemporary arts; but personal satire and the chorus have practically disappeared. The New Comedy flourished from 320 to 250. It is distinctly a comedy of manners and character; domestic intrigue takes the place of political situation, and the 'sock' is worn by the man in the street instead of the statesman. Aristophanes far eclipses contemporary writers of the Old Comedy. His belief in the high calling of his art saved him from the grotesqueness and coarseness which before his time seemed inseparable from comedy. He was, above all, a patriot, and it is his pride in the ancient institutions and his of his country that impels him to use his ridicule as a scourge against adventitious experiments and innovations in civil government and morality. Conservative in his ethics, he vehemently attacks the disquieting influence and negative teaching of the Sophists. Socrates's intellectual and philosophical empiricism he regarded as a public danger worthy of reprobation and exposure. The charm of his style is unrivalled, except in the Attic idiom of the dialogues of Plato. But Aristophanes is a poet as well as a comedian. Passages of exquisite beauty and sentiment are intermingled with the mockery and the rally. The gradations of the transition from the Middle to the New Comedy are not clearly defined. In some of the plays of Aristophanes the political licence and overt criticism are already abandoned. Thus in the *Plutus* he discards concrete censorship and adopts symbolical farce. For examples of the New Comedy we were for long dependent on the Latin imitations of Terence, but the recently discovered fragments of Menander now afford us a representative body of that dramatist's original work. Menander excels in his delicate delineation of character, the subtle construction of his plot, and the consummate purity of his idiom.

Gk. prose, as is natural, attained complete development at a much later date than poetry. The earliest examples of prose in G. belong to the sixth century B.C., and these are chiefly records and chronicles quite unpretentious in style

and expression. The Ionian philosophers made considerable advances, but their aim also was mainly didactic, and where style is studied it is for lucidity. Herodotus, the historian (b. 484 B.C.), is the first conscious prose stylist. The structure of his hist. is dramatic. His inspiration was the momentous drama of the Persian wars. He traces the conflict of E. and W. up to its great crisis, marking the intricate chain of cause and effect with insight worthy of an evolutionist, but he abandons the role of critical and scientific historian in his acceptance and narration of legends whose value is purely dramatic and artistic. It is the unity of his design and the graphic drama of his narrative that won Herodotus the title of 'the Homer of historians.' In the structure of his sentences Herodotus adopted the loose style. Thucydides (b. 471), the next great writer of hist., is a contrast to his predecessor, both in conception and design. The field of Thucydides's activity is the Peloponnesian war. He wrote when G. was no longer self-assured and buoyant in the glory of victory. She was torn by intestine strife, and was the sport of unprincipled statesmen and generals. The scene presented much food for reflection and moralisation. The hist. of Thucydides is no heroic epic. Inclusive, scrupulous, judicial, the genius of Thucydides as a pure historian is undeniable. He makes no purvey whatever with seductive legends and traditions irreconcilable with a calmer rationality. He sifted evidence meticulously, and indefatigably consulted all available documents relative to his subject. Only in his speeches did he allow himself freedom. These he meant to be true to the spirit and not to the letter. His style, too, is illustrative of his mental character. He builds his sentences on the periodic system, lucid, pregnant, and severe. His idiom is pure and unadulterated Attic. Xenophon (b. c. 429 B.C.) was essentially a man of action. He therefore excels in brilliancy, vividness, and freshness, but both in intellectuality and style he falls far below the level of Thucydides. His finest work is perhaps the *Anabasis*; racy, virile, dramatic, the narrative compels interest, but is neither wholly trustworthy nor convincing. Political economist, historian, philosopher, the range of Xenophon's activities is wide, but he is lacking in intellectual power and thoroughness. Plato (b. 427) is as great a stylist as he is a philosopher, and praise can go no higher. Richness without satiety, grace without elaborateness, and charm without conceit make the dialogues of Plato models of literary excellence for all time.

Though eloquence was appreciated and cultivated in G. as far back as the time of Homer, oratory as a science and art was only first formulated at the time of the Peloponnesian war. The chief reason for the lateness of the development of the rhetorical art is that it depends on the study and cultivation of prose composition, and this, as has been said, matured much later than poetry. It was

in Sicily that the first treatises on rhetoric were written, the demand for such systems being caused by the need of effective speech in the innumerable lawsuits which arose during the redistribution of land on the overthrow of the Syracusan tyranny. Corax (fl. 467 B.C.) and his contemporary, Tisias, were the earliest of the Sicilian rhetoricians, but their theories were rudimentary, consisting chiefly in the differentiation of the various parts of a speech. The argument from probability had a conspicuous place in their method. Gorgias of Leontini, sent from his native city in 427 B.C. as an ambas. to Athens, attracted the admiration of the Athenian audiences by the splendour and brilliance of his oratory, and hence the art was transplanted to Attic soil. The style of Gorgias was florid and luxuriant. The Alexandrian critics selected ten Attic orators as being of the foremost rank. Each orator exemplified a peculiar excellence in style. The perfect harmony and balance of all the excellences of style were attained by Demosthenes (b. c. 384), the greatest of the Attic orators, who blends perfectly the virtues of his predecessors and reproduces none of their excesses. But the secret of Demosthenes's enormous power of eloquence was a moral force generated from the soul and quickening to vital potency the technical graces and devices which he commanded. Alexander, after the sack of Thebes, demanded the surrender of the Athenian orators, and (Gk. liberty and Gk. oratory perished side by side. Robbed of its political significance, oratory in the Macedonian age degenerated into declamation and style into ornament. Asiatic affectation conquered Attic purity.

But the victories of Alexander diffused Gk. letters and Gk. culture over half the world. Gk. became the 'common tongue,' and thus the spread of Christianity was facilitated by the victories of the pagan sword. It was in Egypt that the scattered Hellenic seeds produced the most exuberant growth. Alexandria became the cap. of the intellectual world; but the new Gk. literature was vastly different from the autochthonous literature of free G. The spirit of Alexandria was cosmopolitan and not patriotic. The promoters of the new literature were courtiers and grammarians, and their work is characterised by learning and artificiality. Genuine inspiration and high seriousness are lacking in the poetry of Apollonius Rhodius (222-181), Aratus (fl. 270 B.C.), author of *Phaenomena*, which was very popular in ant. times, Lycophron (285-247), author of an extant poem, *Aspidochelone*, in which the prophetic predicts the fall of Troy, and Callimachus, chief librarian of the famous library at Alexandria from c. 280 until his death in 240. But the Sicilian Theocritus (fl. 270 B.C.), although entitled to the Alexandrian court by the lavish patronage of Ptolemy Philadelphus, never lost the freshness and warmth of sentiment which the rural surroundings of his youth had inspired. His idylls of Sicilian

pastoral life are representations of genuine rustic character and incident, and are clothed in the rich sweetness and charming simplicity of the Doric idiom. Moschus (fl. c. 150 B.C.) and Bion (fl. c. 100 B.C.) continued the pastoral tradition at Alexandria, but though their elegies excel in grace and delicacy, in naïveté and spontaneity, they pale before the Theocritan idyll.

When compared with the literature of free G., that of the Græco-Rom. period is inferior. But though the Græco-Rom. period produced no literary work of the highest merit, it nevertheless gave proof of a vigorous intellectual activity, which is all the more remarkable in face of the national calamities. The historian Polybius (b. c. 204 B.C.), in spite of the immense scope of his work and the wide field of his activities, is a sane and reliable thinker, and the style of his *General History* was much admired, though it exemplified post-classical innovations in vocabulary and phraseology. Plutarch's (b. c. A.D. 46) *Lives* will live on account of their dramatic power. The wit and satire of Lucian (b. c. A.D. 12) are always lively and refreshing. Longinus's (b. c. A.D. 213) work *On the Sublime* shows a singular appreciation of beauty and keenness of critical insight.

The Byzantine literature was purely retrospective and produced nothing of permanent value. Among the historians are Procopius (fl. A.D. 550), Porphyrogenitus (fl. 910), Zonaras (fl. 1120), and Critobolus (fl. 1450). The most famous critics of Byzantium were Photius (fl. 850), Suidas (fl. 950), and Eustathius (fl. 1170).

Neo-Hellenic poetry is chiefly bucolic. The first poet writing in modern Gk. who attained literary eminence was Theodoros Prodromus (fl. 1200). Drimiticos (fl. 1625) wrote a pastoral entitled *The Fair Shepherdess*, which contains passages of touching beauty. In 1824 Laurici made his famous collection of modern Gk. ballads. These spirited verses deal for the most part with the Klephts, who so heroically raised the standard of Gk. independence. In more recent times the patriotic lyrics of Rhigas were praised by Byron. The amorous Anacreontics of Christopoulos have considerable charm and beauty. Adamantios Korais (Diamant Coray, 1788-1833) lived and wrote in Paris. The brothers Soutsos show considerable lyric power. Rangaris is perhaps the greatest of modern Gk. lyricists. The lyrics of Kalvos and Salomos are graceful, but slight. The works of Salomos Palamas may be regarded as the best precursors of the modern school led by Angelos Sikelianos (b. 1883). But foremost among the younger poets is Odysseus Elytis (b. 1912), whose *Orientation* (1939) and *Sun the First* (1943) have attracted the attention of the Athenian literary public. The poems are very difficult to translate, for, like the Sitwells, Elytis relies on the sound of words for their effects, and his poems are also impressionist in their technique. What the Gks. admire in his

work is its pagan exultation in the physical and sensuous joys of life and nature.

Greek Philosophy originated in the Ionian colonies of the E. The cults of the Gk. mainland were essentially local, so the early colonists left their gods behind them in the motherland and settled in their new home with minds free for speculative inquiry. The Ionian philosophers of the sixth century B.C. were principally physicists and cosmologists. They sought to reduce the universe to a first principle or single element. Thus Thales postulated that the origin of all things was water. Anaximander took for his first principle 'the infinite,' which he conceived as being

ZENO

intermediate between the elements. Anaximenes selected air as the primary substance, from which he held the universe was evolved by the processes of rarefaction and condensation. Heraclitus, the last of the Ionian school, adopted fire as his basic element. He was also the originator of the theory that the universe is in perpetual flux. The philosophical teachings of Pythagoras of Samos were of a psychological and religious character. The theory of numbers played an important part in the Pythagorean doctrines. Harmony was built on numbers and was, according to Pythagoras, the key to the universe. Among the religious tenets of the sect the doctrine of metempsychosis had a foremost place and inspired the brotherhood to observe a life of religious asceticism. The Pythagorean philosophy was largely influenced by the Orphic mysteries, in which immortality and spiritual purification were the leading ideas. Xenophanes was the founder of the Eleatic school. He was the first Gk. rationalist, boldly attacking the uncon-

promising anthropomorphism of the Gk. Pantheon. His theory of the universe is based on 'the one' as opposed to 'the many,' i.e. on an essential unity as opposed to an essential plurality. Parmenides is the author of the apothegm, 'The "ent" (ὅν) is, the "nonent" (μὴ οἶ) is not.' He identifies the 'ent' with truth, knowledge, and the 'one.' His disciple Zeno, to disprove 'the many,' invented some famous paradoxical arguments relative to space and time. A reaction followed in favour of 'the many' as opposed to 'the one.' Empedocles held that the evolution of the universe was conditioned by the segregation and aggregation of the four elements under the influences of hate and love. Anaxagoras postulated 'atoms' and a 'governing mind.' Democritus and the atomists conceived the universe as generated from atoms falling in space. They postulated the power of deflection in the atom, and hence made aggregation possible.

The sophistry of the humanists was a complete reaction from the natural philosophy of the physicists. In the teachings of the new school the macrocosm was of secondary importance as compared to the microcosm. Though the Gk. sophists had no doctrine in common, they all based their speculations on an initial scepticism. Their influence was negative rather than positive, destructive rather than constructive. The famous aphorism of Protagoras is characteristic of the sophists' mode of thought—'Man is the measure of all things, of what is, that it is, and of what is not, that it is not.' The empirics of the sophists did not immediately benefit Gk. thought and morality, but they paved the way for the advent of Socrates.

Though Socrates is justly called the father of critical philosophy, he never committed his doctrines to writing. Our knowledge of his theories and principles is derived from two of his disciples—Xenophon and Plato. Formerly Xenophon was regarded as the more trustworthy authority, but in recent years there is evidence of a reaction in favour of Plato. Socrates followed the sophists in basing his theories on a primary scepticism or agnosticism; he was also at one with the sophists in applying empiricism as a final infallible test of all theories. The dialectical method of philosophical inquiry was the invention of Socrates. He himself assumed ignorance, and by deferential interrogation he elicited from some bystander an opinion on the subject he wished to investigate. Starting with this dogmatic assertion of the respondent, he proceeded by a systematic series of questions and answers to lead his interlocutor up to a conclusion inconsistent with his primary proposition. This was the so-called *αἰγνος*, or destructive process; the false opinion has been swept away, and the mind is now unprejudiced for the receipt of a substitute. The new opinion was reached by induction, from the respondent's admissions in a fresh series of interrogations. Most often the subject of this philosophical research was a defini-

tion, and the mass of definitions attained formed Socrates's ethical system. Virtue, he held, consisted in the knowledge of such definitions and opinions; for right action, he conceived, was the logical consequence of right knowledge. Virtue is knowledge and knowledge is the 'good.' The proof and justification of these Socratic axioms were found in utility.

Until recently the doctrines of Plato were treated as a reaction from, rather than a development of, those of his master, Socrates. Plato was regarded as a pure idealist and Socrates was classified as an uncompromising empiricist. The point of departure was the Platonic theory of ideas. But critics are beginning to take another view of the matter. The extremists not only find in the Socratic final definition an adumbration of the Platonic theory of final ideas, but also credit Socrates with the full-fledged theory. Thus the modern tendency is to emphasise Socrates's indebtedness to the abstractions of the Pythagoreans rather than his indebtedness to the empirics of the sophists. But be that as it may, the ideal theory is chiefly associated with Plato's expositions. The Platonic hypothesis is, briefly, that transcending the plural phenomena, which are mutable imperfect, temporal, generated, and opined, there are single ideas which are immutable, perfect, eternal, ungenerated, and known. Beyond the ideas is the idea of ideas, the 'supreme good.' The ideal life is the philosophical life of approximation to, and contemplation of, the ideas. The soul is akin to the eternal ideas; the body is related to the ephemeral phenomena.

Aristotle bodily rejects Plato's theory of ideas. His philosophy is inductive. According to Aristotelean conceptions, it is the species which exists and can be known. From the species his metaphysical and transcendental hypotheses are derived. Aristotle's system of ethics is based on empiricism. Man's chief end is the attainment of true happiness, and happiness consists in an energy of the soul, which accords to virtue. Virtue is of two grades, moral and intellectual. Moral virtue is attained when man's rational being correctly governs his appetitive and emotional being. The prime virtues are nine, of which seven are moral and two are intellectual. The moral virtues are courage, temperance, liberality, munificence, magnanimity, self-respect, and gentleness. These virtues are really 'means' between immoral 'extremes,' e.g. courage is a mean between rashness on the one hand and cowardice on the other. Towards the attainment of these virtues a sufficiency of the world's goods contributes. The intellectual virtues are judgment and wisdom. The highest life consists in the exercise of the intellectual virtues, and is the philosophical life of contemplation. The moral life consists in social action, and is inferior only to the contemplative life.

The Academic school founded by Plato and the Peripatetic school founded by Aristotle are the prin. philosophical orders of G. The minor schools which arose

diverged from the two rival systems and became extravagantly metaphysical or extravagantly material.

Epicurus dismissed the abstractions of the speculative idealist and founded a new philosophy on the sensations of the practical materialist. The senses were regarded as infallible, and the chief good in life was happiness. But happiness is of two kinds. There is exciting carnal pleasure and there is also tranquil mental pleasure. The latter Epicurus pronounced supreme. In his theory of the universe Epicurus revived the atomism of Democritus. All that is is corporeal and composed of atoms; soul itself is but a harmonious combination of finest atoms.

The Stoic school was founded by Zeno; its doctrines are largely eclectic. Antisthenes, an immediate follower of Socrates, had founded the Cynic school, whose chief aim was an austere asceticism. The Cynics taught that virtue was alone worthy, and happiness was madness. A minimum of the world's goods was essential for the practice of the virtuous life. These tenets Zeno at first embraced, but latterly modified with views borrowed from various antithetical systems. The Stoic doctrines gravitated round two central and corresponding ideas—the unity of the macrocosm, or universe, and the unity of the microcosm, or man. The macrocosm was conceived as a living organism governed by intelligence, which underwent transformation from, and re-absorption into, its primitive substance or being. The microcosm also is governed by intelligence, survives death, and attains thereby true being. The basis of Stoic ethics is harmony between the microcosm and the macrocosm. Such harmony is attainable by man when he leads a life of moral virtue. There are no gradations between good and evil. The ideal man of the Stoic philosophy is self-sufficient, free, misled neither by error nor emotion, and in no wise inferior to a god. But while the Stoics emphasised self-sufficiency, they did not neglect the duties of social life. All men, whether Gk. or barbarian, bond or free, were citizens of the world-city of God. The humanity inspired by these doctrines tempered the exclusiveness and rigidity of Gk. patriotism, and brought comfort during the stress of national calamities. Stoicism was in complete harmony with the finer Rom. ideals. Its most beautiful and noble interpretation is the book of *Meditations* by the Rom. emperor, Marcus Aurelius. It was the one lamp which shone in the spiritual darkness of the empire, and no remains of antiquity present a nobler view of philosophical heathenism.

Greek art is conveniently considered under three heads: painting, architecture, and sculpture. The architectural and sculptural remains are considerable and representative, but extant examples of painting are scant, and, for the most part, belong to the periods of immaturity and decline. Specimens of Gk. vase painting are plentiful, but they possess the disadvantage of giving us no adequate idea of the development of the use of

colours. Excavations in Knossos and Mycenae have revealed examples of Gk. vase painting which belong to the millennium 2000-1000 B.C. The vases are exceedingly beautiful in shape, and the painting is of a very vigorous and free type. There are some examples of geometrical and conventional designs, but the finest specimens exhibit free drawings of plants, animals, and human figures, which can bear comparison with the most beautiful products of the Hellenistic age. The Dorian conquests checked the development of Mycenaean or prehistoric Gk. art, and the art of vase painting was arrested with the sister arts. The earliest specimens of Attic art are of the geometric type; the figures are rigid and the balance is laboured. Prior to the sixth century B.C. light red clay was used and the figures were painted in rich black glaze. Lines of physiological and ornamental detail were incised on the black with a fine point. Other colours were frequently superimposed after the firing of the black—notably white and purple. But the effect of these black silhouettes on the light background was always grotesque and not seldom ludicrous. In the sixth century B.C. a complete reversal of this arrangement was effected. The figures were left in the light ground-colour, and the background was superimposed in black glaze. Details in the figures were then drawn in fine lines of glaze. The red-figure vases comprise the most beautiful specimens of Attic vase painting. In the period of the decline white washes were frequent in the red-figure vases and simplicity of design was abandoned for elaborate detail. The Gks. painted their statuary, though surviving examples are extremely rare. In the Acropolis Museum at Athens there was a figure called the 'Hydrophoros' which bore traces of its original paint. This rare treasure was irreparably damaged by Brit. soldiers in 1914. Our knowledge of Gk. mural and easel painting is mainly derived from critical comments scattered through classical authors. There are indeed extant specimens of Gk. prehistoric wall painting found at Mycenae and Knossos, and, like the vase painting of the same period, they show a remarkable beauty of conception and freedom in execution. Polygnotus was the first great Athenian mural painter. He flourished during the inspiring epochs of the Persian wars. He is especially commended for his treatment of human expression and his skill in representing drapery. At the close of the fifth century mural painting was succeeded by easel painting. Perspective was studied more carefully by the younger school, and the effect aimed at was emotional and sentimental. Zeuxis is the representative painter of the period. He was most successful in his delineation of the female figure, especially in the nude. The 'Helen' of Zeuxis in the temple of Hera at Croton was his most perfect achievement. The Attic school was characterised by its free naturalness, and, the representative names are Euphranor and Nicias. Apelles, the greatest of all the anc. painters,

belonged to the Ionic school and flourished about 350 B.C. His works were chiefly portrait painting—a new departure in Gk. art, which flourished under Macedonian court patronage. The ideal element entered into his portraiture, through the addition to his subject of mythological or symbolical motifs. Thus he painted equestrian portraits of Alexander the Great in company with the Dioscuri and leading War in chains behind him. His most famous picture was, however, a mythological subject entitled 'Aphrodite Anadyomene.' It represented the goddess in the nude, rising from the sea and wringing the water from her hair. The descriptions of this picture give us some conception of that peculiar 'charm' by which the ancients characterised the works of Apelles. In conception sentimentality and in treatment super-elaboration vitiate the art of the decline; in subject *genre* paintings predominate.

Prehistoric Gk. architecture (*q.v.*), as revealed to us by excavations in Knossos, Mycenae, Tiryns, and Troy, was of a very massive and substantial type. A characteristic feature was the so-called 'Cyclopean walls' whose giant structure the imagination of the ancients attributed to the Cyclopes. The stone walls of domestic buildings on these sites only reached an elevation of a few feet, the superstructures consisting of wood and cement work. The column had already differentiated itself in Mycenaean architecture.

Mycenaean civilisation disappeared during the general upheaval that followed the Dorian invasion. With these Dorian invaders is connected the differentiation of the Doric order, one of the three characteristic architectural orders of G. The column—the distinguishing feature of these orders, and was itself no doubt evolved from the tree-trunk props of primitive structures. In G. the column was fluted and tapered slightly upwards, thus producing the combined effect of stability and grace. The Doric column is the boldest, simplest, and most impressive. The fluted shaft rests directly on the foundation step or floor with no intervening base, and is capped by a simple square abacus. In the noble beauty and perfect proportions of the Parthenon at Athens (*q.v.*), the Doric order finds its most sublime expression. The architecture of the Ionic order gains in delicacy, but loses in sublimity. The shaft of the column is also fluted, but the flutes, being separated by flat fillets, do not intersect as in the Doric pattern. The shaft rests on a plinth or base, and culminates in the characteristic volute. The finest examples of the Ionic order are the remains of the temple of Nike Apteros and the Erechtheion at Athens, whose chaste beauty and symmetry are incomparable. The Corinthian order is more susceptible to elaboration and embellishment. Tradition ascribes its invention to Callimachus, who drew his inspiration from a votive basket filled with the twining leaves of the acanthus plant. The Corinthian column follows the Ionic in all detail except the capital,

which represents a cluster of acanthus leaves. The finest specimen of the order is the Olympieion at Athens. This order, unlike its sisters, admitted superfluous detail and enrichment, and with variations was almost exclusively adopted by the Romans.

The finest work of the Gk. architects was devoted to the building of temples. These, like those of the Hobs. and other nations, were, for the most part, built upon hill-tops. The primary function of the Gk. temple was to enshrine the statue of the deity. The statue was placed in the main chamber or *naos*, whose great doors faced E., and which was flanked with colonnades. The *naos* was divided into two chambers. The whole was surrounded by an external ambulatory, termed the *Peristyle*, which was also flanked with columns. The temple was frequently adorned both within and without with magnificent sculpture and mural decoration.

Gk. architecture is characteristic of Gk. genius. At its best it is strong but not stern, simple but not plain, noble but not overwhelming; it is beautiful yet chaste, restrained yet powerful, clearly definite yet infinitely suggestive. Here there is nothing in excess, but the realisation of that mean of means, neither too little nor too much.

Gk. sculpture was closely associated with temple architecture. The temples enshrined the statues of their respective gods and the metopes were adorned with the choicest achievements of glyptic art. Faithfulness to nature, combined with the worshipful and dedicatory spirit of idealism, are the essential qualities of Gk. statuary. The ideal and the inspiration came from the gods, whose perfections the Gk. sculptors sought to portray, but the type and model were derived from the palaestra, where Gk. athleticism had moulded the human physique to superb proportions. Thus was the ideal realised and at the same time the real idealised.

Just as the temple column was evolved from the rude tree-trunk that supported the primitive dwelling, so the perfect statue was evolved from a rough-shapen trunk, which represented some deity. Surv. examples of this block type of wooden image existed in classical times. A rough wooden block in the Parthenon was revered as being the most anc. statue of the goddess Athena. Herodotus refers to similar representations of the Dioscuri, and the Hermes busts which stood in classical times at the cross-roads mark the transition stage from limbeck block to perfect statue. In the early stages of the art the pose is simple and the arrangement of the members is absolutely symmetrical, the legs being stiff and close together and the arms hanging straight and rigid. The drapery of these early types falls in stiff perpendicular folds, showing no indication of the form beneath. Muscles and other physiological details are but imperfectly rendered. One of the finest productions of this early period is the famous 'Charioteer' from Delphi (c. 480 B.C.). The stiffness of the drapery and the simplicity of

the pose are indications of the archaic conventions, but the suggestive poise of the head and the slight backward bend of the body give to the attitude a forcible truth which harbingers greater developments. The works of Pythagoras and Myron (fl. B.C. 431) bring us to the very threshold of sculptural maturity. These sculptors were most successful in representing athletic types. The celebrated 'Discobolus' of Myron is a most complex pose, but there are indications of archaism in the lack of suppleness and flexibility.

Phedias, the greatest sculptor of anc. G., was b. about 450 B.C. He thus flourished in the period when G., flushed with her victories over the Persians, realised for the first time her infinite potentialities. It was an age of great inspiration, an age which produced Pindar, Aeschylus, Sophocles, Euripides, and a galaxy of lesser stars. The colossal works of Phedias were the gold-and-ivory statue of Athena Parthenos, the bronze statue of Athena Promachos, and the gold-and-ivory statue of Zeus at Olympia. Unfortunately these statues have all perished. The 'Athena Parthenos' represented the goddess wearing the 'egis', and bearing in her right hand a statuette of victory. In the great bronze statue on the Acropolis the goddess was represented in full armour; the figure dominated the city and was a landmark to ships at sea. Phedias drew his inspiration for his colossal Zeus from Homer's description of the thunderer (*Iliad* i. 527). The power of this statue has this anc. tribute, 'Let the man who is sick and weary of soul, who has suffered much sorrow and tribulation, and whose pillow is visited not by kindly sleep, but stand before the image, and he will, I deem, forget all the terrors and troubles of human life.' Examples of sculpture of the classical period are comparatively rare. They are known to us through Græco-Rom. and Rom. copies. From the sculptures of the Parthenon, however, we derive our first-hand knowledge of the works of Phedias and his school. The E. and W. pediments contained the finest sculptures. The 'Theseus' (of the E. pediment) is a nude figure in repose, yet the very calmness is suggestive of power and potentiality. The so-called 'Three Fates' (also of the E. pediment) is a harmoniously balanced group of singular beauty; the draperies fall in soft and clinging folds exquisitely revealing the physiological details of the figures. The 'Mighty Marbles' (g.v.) (Brit Museum) are from the frieze, and represent the procession of the Pantheonæa. Polycletus of Argos (c. 452-412 B.C.) as an artist approached most nearly to an equality with Phedias. The characteristic feature of the works of Phedias was sublimity; nobility is the distinguishing quality of the works of Polycletus. The massive and splendid figure of the 'Doryphorus' is characteristic. This statue became known as the 'Canon,' as embodying a perfect representation of the ideal human figure.

Characteristic of the transition period is

the 'Eirene with Infant Plutus' of Cephisodotus. The stiff folds of the drapery are archaic survivals, but the sentiment in the poise of the head and expression of the faces are indicative of the coming age of emotion and sentiment.

The representatives of the new school are Scopas, Praxiteles and Lysippus. In this school representations of the human figure and the minor deities predominate.

ΑΠΟΧΥΟΜΕΝΟΣ

After Lysippus

The restraint and repose of the Phidian school have given place to the emotional, the sentimental and the sensational. Scopas was particularly successful in representing action and frenzy. The works of Praxiteles, chiefly representing the minor deities and these in their more sensuous aspect. His 'Cnidian Aphrodite' (copy in Vatican) was a nude figure of the goddess about to enter the bath. It was ranked by the ancients next to the Zeno of Phidias. His statue of Hermes with the infant Dionysus (from Olympia), though exceedingly beautiful

has indications of that softness and sensuality that prevailed in the decline. Lysippus is the last representative of the loftier traditions of Greek sculpture, and he is not guilty of the sentimentality already visible in Praxiteles. His sculpture is rather of the bold, virile, leonine type, as his 'Apoxyomenos' witnesses.

In the third century B.C. the chief centres of Greek art were Pergamum and Rhodes. Exaggeration and sensationalism are characteristic of the schools, exaggeration of muscle and sinews in male figures and of softness and roundness in female figures, sensationalism in the choice of dramatic and harrowing subjects. Representative of the former school is the figure of the 'Dying Gaul' of the latter the 'Laocöon' group. These show great technical power.

In the Graeco-Roman period the art of sculpture is mainly imitative and reproductive. The period, however, produced some beautiful works, inspired by a fine eclectic spirit, if not by creative genius. The loveliest of these are the 'Venus of Melos' (Louvre), the 'Apollo Belvedere' (Vatican), and the 'Diana of Versailles'.

Archæology — The importance of archaeology lies in the fact that it is, with ancient literature, our principal source for study and appreciation of the history and culture of the past from which our thought and institutions have developed. The Greeks of the classical age were not conscious of any debt to former periods and they were but little interested in the past. Thucydides added to his history of the Peloponnesian war a chapter on archaeology, and Pausanias in the second century A.D. was the author of the *Periegesis of Greece*, a work of lasting value for its references to Greek sculpture and the archaic period. In the eighteenth century English travellers brought back works of art belonging to the Hellenistic age. The Society of Dilettanti commissioned architects to make drawings of buildings in Athens and Asia Minor and in 1801 Lord Elgin began his collection. It was not, however, until the liberation of Greece from the Ottoman yoke (1821-29) that anything like systematic excavation became possible. In 1830 the Greek authorities began the task of clearing the Acropolis and this work has gone on until in our own day we have a clear picture of this most famous site not only as it was in the age of Pericles, but also its complete history from the most remote period of its settlement.

Apart from the supremely important architectural evidence thus brought to light, perhaps the two most noteworthy discoveries have been a collection of statues which were damaged and overthrown by the Persians when in 480 B.C. they sacked the city immediately before their defeat at Salamis. These sculptures bore plentiful and bright traces of their original paint. Other finds enabled students to draw up a complete record of Greek vase painting. Greek archaeologists have also made important finds at Epidaurus, where they excavated the theatre and the sanctuary of Asclepius. The latter affords a complete picture of a

spa at the end of the second century A.D. Valuable architectural and epigraphic evidence was brought to light at Thermon, whilst at Lycosura there has been unearthed a colossal group by Darphon (second century B.C.).

Successive Gk. administrations have welcomed the estab. of other national schools of archaeology in Athens, where the Gers. cleared the celebrated theatre of Dionysus and part of the Dipylon cemetery. With their customary application and thoroughness the Gers. also made excavations at Olympia. They revealed the temples and other buildings of the Panhellenic sanctuary, and in doing so unearthed, among other relics, three priceless treasures: the pedimental sculptures of the temple of Zeus, the 'Winged Victory' by Pæonius, and, above all, the glorious Hermes by Praxiteles, the only undoubted original from the hand of that master. Vases from the temple of Hera in Samos throw much light on the hist. of Ionic art; and important architectural finds were made in the Is. of Ægina among the ruins of the temples of Aphrodite and Aphaia.

Of the more important work of the Fr. school mention must be made of that at Delphi, Delos, and Tegea. At Delphi a wealth of architectural remains and inscriptions was found, together with the marble frieze of the Cnidian treasury and the world-famous 'Bronze Charioteer.' Delos yielded the sanctuary of Apollo and the Hellenistic tm. whilst at Tegea were discovered sculptural fragments by Scopas (fourth century B.C.). The Amers. have concentrated their attention principally on sites at Corinth and Argos, but are now undertaking the formidable task of excavating the Agora at Athens.

In G. proper the most important work by the Brit. school has been done at Sparta. It has illuminated the whole hist. and culture of that renowned city. Brit. endeavour will, nevertheless, always be associated mainly with the revelation of Ægean culture in Crete (see MYCENÆAN AGE).

In 1873 Heinrich Schliemann, inspired by his study of Homer, unearthed some epoch-making remains at Hisarlik in Asia Minor. These bore all the evidence of being identical with the Homeric Ilion (Troy). Subsequently at Mycenæ, Orchomenos, and Tiryns he brought to light traces of a high civilisation some 1500 years older than anything hitherto known. After his death his work was continued by Dörpfeld; but the full revelation of Ægean culture, its splendour and significance, was reserved to Sir Arthur Evans. Evans began his excavations at Cnossus (see under CRETE) in 1905. By 1930 he had laid bare an immense palace whose structure and contents revealed a civilisation in the third millennium B.C., in presence of which our own stands humbled.

Archæology, one of the most exacting and exact of sciences, has been hampered in the twentieth century by two world wars. In the first G. was not the victim of modern progress. In the second there

was bitter fighting both on the mainland and in Crete, and it was not to be hoped that the monuments of antiquity would survive unscathed. Generally speaking, however, those of the classical period escaped serious damage. The inevitable destruction was suffered principally by relics of the Byzantine and medieval periods. The Axis occupation of G. lasted from April 1941 to Oct. 1944; and during that time the work of the Ger. Referat für Kulturschutz not only ensured the preservation of many irreplaceable treasures, but also led to some further excavations. The most interesting discovery at this time was an archaic marble sphinx now in the Kerameikos Museum at Athens. Irresponsible plundering by the ignorant was unavoidable, and for this it, troops were mainly responsible. When, however, we consider the turbulent hist. of G. the wonder is, not so much that we have only fragmentary remains of a splendid past, but that the irresistible forces of nature and the ungoverned fury of man have spared anything for the instruction and enjoyment of the present age.

Greece, Second World War Campaign in (1941) (including Ger. invasion of Yugoslavia). The Italian Invasion of Greece.—Mussolini's invasion of G. was

undertaken in the hope of challenging Brit. sea-power in the Mediterranean, and the difficulties which met it from the very outset were due largely to that power. Time was pressing, for Graziani's Libyan army was making no real headway in its attack on Egypt. The duke of Aosta, commanding the It. forces in E. Africa, had seized Kassala with the possible end in view of an advance on Khartoum in co-operation with an attack on the Suez Canal by the Libyan army. But Graziani's ponderous advance was always checked by the threat to his left flank from the sea, and without Aegean bases those in the Dodecanese Is. were useless as a point d'appui for an attack on the Brit. fleet at Alexandria. (See AFRICA, NORTH, CAMPAIGN IN (SECOND WORLD WAR).—*Battle of the Western Desert* (Dec. 1940-Feb. 1941).) In attacking G. Mussolini underrated both Brit. sea-power and Gk. heroism, a major blunder in policy which soon led to resignations by those of the It. general staff who had not shared his bombastic confidence. On Oct. 28, 1940, the It. Gov. sent an ultimatum to Gk. accusing her of tolerating the use of her territorial waters and ports by the Brit. Navy and of permitting the organization of the Brit. secret service in Gk. Is., and they therefore demanded the use of strategic points on Gk. ter. (Corfu, Crete, Epirus, and the port of Piraeus) for use against Britain. Before the ultimatum was due to expire It. forces from Albania attacked Gk. ter., meeting at once with strong resistance at all points.

The main strategy of the Its. in their thrust through the Pindus towards the Kalamos R., was to take Janina and Metsovo so as to open the way to Thessaly. But Gk. skill and valour, aided by familiarity with the difficult wooded and mountainous terrain, and by Brit. air and naval co-operation, thwarted the It. advance before it was more than a few m. over the frontier. Large-scale operations in the regions of Smolika and Gramos in the central Pindus resulted in the utter defeat of the 3rd Alpine Div., although reinforced by cavalry, Bersaglieri, and Fascist militia formations, all of which had long been immobilized in Albania. The Its. had sought to deliver a swift and decisive blow against the Gk. forces under Gen. Papagos by pinning them down with artillery fire and tanks and, at the same time, using the Alpines to cut communications between the Gks. in the Pindus and Epirus sectors by rapid lunges towards Metsovo on the Epirus-Thessaly road. Early in these encounters light Gk. units withdrew after retarding the It. advance; but other Gk. detachments arrived on the scene by forced marches and launched a strong counter-attack, which led to fierce fighting in difficult conditions of weather and food supplies. The Gks. not only broke the thrust through the Pindus so decisively that the Its., fearing encirclement, fled in disorder, but began themselves to advance and, by Nov. 28, they had captured Ersek and thereby cut the main lateral communication. The Its. lost in those opera-

tions some 14,000 men in killed and some 5000 prisoners. Following this debacle Marshal Badoglio, It. commander-in-chief, appointed Gen. Soddu to the command of operations in Albania. Throughout this period Brit. planes had rendered valuable aid by bombing It. positions, aerodromes, troop concentrations, and other targets. The port area of Durazzo was completely gutted by

Koritsa, one of the two It. advance bases. The capture of Ersek had given them a new line of approach, and, though the Its. had the advantage of defensive positions in difficult country, the Gks. had crossed the watershed of the Morava massif by Nov. 21 and taken Koritsa itself. A few days later the victorious Gks. were in Muskopolje and were advancing on Pogradets, which latter place

the R.A.F. and Valona was bombed several times. It. planes made raids on Patras, Larissa, Salonika, Corfu, Corinth, and other cities, but threats to Athens were lessened by Brit. raids on Stampalia Is., the nearest It. air base to the Gk. cap. In the Epirus region the Its. held off impetuous Gk. attacks at Kalpaki until the pressure became too great and they were forced to evacuate the positions they had won at great cost. Meanwhile in the Florina region the Gks., who had crossed the Albanian frontier early in the campaign, were now steadily concentrating on the important position of

fell on the last day of Nov. No great number of prisoners was taken in these later operations, which consisted essentially in innumerable small advances, after desperate resistance and prolonged pauses, followed by the fall of some tn. or vil., in a maze of broken, wooded, and ravined country, which gave its name to the issue of the protracted battle. Permeti, a tn. 15 m. N.E. of Argyrokaastro, fell to them on Dec. 5; but Klisura, an equally important position in relation to Argyrokaastro, held up the Gk. advance for a month. Argyrokaastro was abandoned by the Its. on the fall of Permeti,

but the Gks. could only enter it after the capture of the Albanian port of Santa Quaranta, at the W. end of the lateral road. Argyrokastró was at the S. end of the two It. advance bases and, with its capture, the entire Gk. front was now out of G. and in Albania. To this remarkable success the Gks. owed not a little to the prompt and close co-operation of the R.A.F. and R.N. Tons of shells poured by Brit. ships into Valona proved that Brit. sea-power was a factor in the defence of G. One of the first results indeed of the hazardous It. attack on G. was the extension of Brit. sea-power westward, for, while G. remained neutral, Britain was denied bases in that country. Crete was also occupied as a naval base, thus giving the R.N. a strong grip on the middle Mediterranean. After the fall of Khsura and the small Albanian port of Chimara, 22 m. from Argyrokastró, the next Gk. objective was Topelene. By now, however, It. reinforcements were reaching Gen. Cavallero, who had replaced Soddu in Albania and was now delivering a series of counter-attacks along the whole front. Late in Dec. a Gk. submarine sank some three It. troopships in the Adriatic, involving loss to the Its. of 1500 men of the 1st Alpini Regiment, besides all the artillery of a Tuscan regiment, and both Gk. and Brit. warships held up, though they could not stop the passage of all troops and supplies.

It was now vital to Mussolini that the It. forces should stop the Gks. from further advances in the important Tepelene region. Hitler was now encroaching on all the Balkan countries, with the view of eventually attacking G. from the N., and Mussolini must somehow play for time. Moreover It. prestige demanded a successful reaction to the unbroken triumphs of the Gks. In desperation Mussolini ordered mass assaults on the Gk. positions. Heavy losses had been suffered by the Its., especially on March 10 in their bitter resistance to the Gk. advance on key positions in the Tepelene region, whole battalions being wiped out. Yet on the next day the It. counter-attacks assumed the character of a general offensive. But the Gks. held every position. Successive lines of It. infantry were mown down by machine-gun and artillery fire. On the succeeding day Mussolini flung every available man, gun, and tank into a series of attacks covering the whole Albanian front line from Lake Ochrida to the Adriatic. But nowhere did the Its. make any impression on the Gk. lines. The main It. drive was on a 25-mile front E. and S. of Tepelene and is supposed to have been directed by Mussolini in person. Wave on wave of It. regulars and black-shirts were broken up and three It. divs. were annihilated. The ravines were littered with It. dead and wounded among the latter being Prof. Pellegrini, member of the Fascist Grand Council.

German Invasion of Yugoslavia and Greece.—British Expedition to Greece.—But this repulse of the Its. marked the zenith of Gk. resistance to invasion.

Preparations for a Ger. attack through Bulgaria and Yugoslavia were now in process of completion. Bulgaria's adherence to the Axis having been ratified by the Sobranje, the way was open to Germany to bring pressure to bear on the hapless and divided Yugoslav Gov. During this period Mr. Eden, Brit. foreign minister, and Gen. Dill, chief of the Imperial General Staff, were in Athens endeavouring to organize a Balkan bloc against Ger. aggression. It was hoped that, if Yugoslavia could be induced to resist a Ger. onslaught, Turkey might co-operate with G. and that, with the help of a Brit. expeditionary force drawn from Gen. Wavell's victorious army of the Nile, all these forces might suffice to throw back the Ger. invader. But Ger. military plans were on a much wider scale than was suspected by the Brit. Gov., for even before the Ger. Gov. made their final demands on Yugoslavia, and while Brit. forces were being transported to G., Ger. troops and tanks were being borne across the Mediterranean from Sicily—which the Gers. had controlled for some time—to Tunis and thence, creeping along the coast, were disembarked at Tripoli. Troop-carrying planes were also supplementing the formidable force which, late in March, suddenly made its appearance S. of Benghazi (then in Brit. possession) with a view to the invasion of Egypt. (For antecedent events in Libya see AFRICA, NORTH, SECOND WORLD WAR CAMPAIGNS IN.—*Battle of the Western Desert, Dec. 1940–Feb. 1941.*) On March 25 the Yugoslav Gov., under the regent Prince Paul, concluded a pact with the Axis powers, but, immediately afterwards, a coup d'état was organised by Gen. Simovich, and the youthful king Peter II. assumed the reins of gov. There were popular rejoicings in Yugoslavia over this repudiation of Prince Paul's sacrifice of honour to expediency, but the consequences for the people were likely to be grave, for they were in no position to resist the onslaught of immense Ger. mechanised forces or to defend their cities against air attacks. Germany pursued the same tactics against Yugoslavia as had brought about the downfall of Poland and other countries. Belgrade was laid in ashes by bombers by way of foretaste of Ger. might. Brit., Australian, and New Zealand forces to the number of about 60,000 had, however, been landed in G. in mid March and had taken up strong positions in Macedonia, while heavy Ger. forces were massing in Bulgaria. Two Australian infantry brigades were holding the central position N. of the Vistritza R., the New Zealand troops were extended towards the coast on their right, while the Gks. held the line in the mountains on their left. The Gers. struck on April 6.

Their armies crossed the Bulgarian-Macedonian frontier at sev. points. They began to move up the Struma R. towards Salonika, across the Despoti Dagh in the direction of Drama, across the Rhodope Mts. on Xante, and down the Maritza R. The allies were under the

command of Gen. Wilson. His plan was to delay the enemy and to make his advance in Thrace and E. Macedonia as costly as possible. If too hard pressed he would fall back W. of the Vardar even if that meant the loss of Salonika. On April 8 the Gers. captured Salonika, Skopje (Uskub), and Veles, and so directly menaced the Monastir Gap. In view of this threat a mixed allied force composed of artillery, an anti-tank gun unit, and a machine-gun battalion was posted to the S. of Florina. This force was attacked on April 9. The Gers. sent forward the Adolf Hitler Div., and, outnumbered by twenty to one, a Brit. armoured brigade sustained the brunt of this first tank and artillery attack. It was now evident that the enemy's immense superiority and weight of armour would soon overwhelm them and threaten the flank of Gen. Wilson's whole army. The allied force therefore withdrew to a mt. pass a little to the S. of their original position. The aim of the Gers. was to reach Mt. Olympus, and they now sent up two more divs. to support the crack troops already engaged and the three divs. resumed the onslaught on the Brit. line. Using a new weapon, a 105 cm. gun on tank t.A.V.s and moving under its own power, the Gers. poured thousands of tons of shells on the roads and defences. Following a tremendous bombardment from these guns and bombing from the air, tanks and infantry attacked the pass—the enemy infantry coming on in waves for twenty-seven hours. In this battle the Ger. losses were enormous; but after another four hours of furious fighting they carried the Kozani Pass. By now the Gers. had six divs. deployed N. of Larissa; Yugoslav resistance had collapsed, and they had entered the Monastir Gap and threatened to outflank the Gk. Army in Albania, that in Epirus being already in retreat. Further, the new Anzaco line on Mt. Olympus was in danger. Accordingly, a general withdrawal began from Olympus to the Iallakmon R. and beyond in a N.W. direction.

During the early stages of the Brit. withdrawal the Gers. were using two armoured divs. in addition to motorised infantry against the Allies, whose only armoured force was one Brit. brigade. Thus far the enemy had not shown his air strength over the front line, although he had carried out a series of raids on Gk. ports, especially the Piræus. The Brit. troops saw the first dive-bombers in large numbers on April 13. That marked the opening of an air attack which grew daily more intense until a march of even a few m. on the road between Athens and the front line became a perilous adventure. There were too few Brit. aircraft to carry out regular defensive patrols over the Allies' area, though during the campaign what aircraft were available had delivered many attacks on Ger. lines of communication. Thus the allied troops had to endure bombing by the Gers. with impunity day after day, both on their positions and on their lines of communication. Elason, the vil. headquarters of

the Anzacs, was destroyed by bombs; Larissa, through which the road traffic passed to the front, was wrecked. A further withdrawal began on April 16 in face of the still increasing Ger. weight of numbers. This was the beginning of a movement which halted when the Anzacs occupied a line through Thermopylae in the rugged mountainous dist. at the foot of Mt. Parnassus—a line only 30 m. long as against the former 150 m. front on which the Eng., Anzac, and Gk. forces originally awaited the enemy. There was now the added danger of a Ger. attack from the W. and from the is. of Eubœa to the S., so that it was necessary to place a small mobile force on the is. to prevent the landing of Ger. airborne troops. Australian observers looking down from the Bralos Pass on the plain of Thermopylae saw disheartening evidence of the Ger. superiority in equipment. Field guns were being landed from big Junkers planes, while other planes were fetching load after load of fresh troops. It was evident that the new line could not long be held by the Anzacs in spite of its natural strength. On the night of April 23 no fewer than 450 troop-carrying vehicles were seen moving towards the Anzaco line obviously with a view to attacking it on the W. flank. Ger. troops had also landed on the N. coast of Eubœa, thus presenting a threat from a different point. In these circumstances the Brit. force began yet a further withdrawal and by the end of the month some 43,000 troops had been evacuated from the Gk. mainland.

In this way ended the Brit. attempt to set up a kind of Torres Vedras resting on Mt. Olympus, and the reason why it failed was that under modern conditions this is impossible of achievement unless the defence has local air superiority. It was not the collapse of Yugoslav resistance or the Ger. numerical preponderance in tanks and infantry which caused the failure of the Allies' military plan, though no doubt these were all contributory factors. The campaign was in fact won by the Ger. Air Force. Yet originally they were faced with grave difficulties, such as the paucity of aerodromes in Bulgaria. These they overcame by months of patient work and, at the decisive moment, were able to put into the air at the strategic points a body of planes so large as to seem ubiquitous. Blasting strong points and gun positions in the mts., bombing tanks and transport along the narrow valleys, ceaselessly attacking communications, bases, dumps, aerodromes, ports, and shipping, they gave the Brit. and Gk. forces no respite all day. Could the Brit. forces have been aided by even 100 extra Hurricanes and Spitfires the whole issue of the campaign might have been reversed; but by re-opening the Libyan front and threatening Egypt just when they did, the Gers. were able to reduce the Brit. margin of fighter-plane strength in the Balkans to a figure at which it ceased to affect the issue of the battle. Moreover, owing to the poor aerodrome facilities in Greece, no large R.A.F. force could have been sent.

In the final phases of their resistance to the combined invasion of their country by Gers and Its the Gks exhibited all their traditional courage against tremendous odds. Their valiant army in the Epirus was paralysed by the lack of any thing but improvised transport, for when the Gers had taken Monastir and captured the vital pass to the S of the Epirus army they had in effect cut that army in two. Had the Gks been equipped with modern motor transport they could have fallen back under cover of their artillery as did the Brit forces based on Mt Olympus and indeed might eventually have linked up with the westward spur of those forces. When it became obvious that the resistance of the Gk Army was at an end the Gk Gov requested that the Brit Empire contingent should be withdrawn from Greece. The enemy having by repeated air attacks rendered impracticable the one available good port the Ionian re embarkation had to take place as at Dunkirk from open beaches against continual enemy pressure on land and heavy and successive attacks from the air. All services however played their part in the operation of re embarkation with the result that nearly 80 per cent of the Eng and Anzac troops sent to Greece were safely evacuated to Egypt. The lighter fighting equipment was also taken away but the heavy equipment and transport were lost. Some 3000 men who reached the beaches were not evacuated. These included only a very small percentage of Australians. Also nearly 500 men were lost at sea one destroyer and one transport being sunk by the enemy. Two other transports were also sunk but these had embarked no troops. Australian casualties on land throughout the campaign were between 3000 and 4000. Brit casualties numbered about 6000. The enemy's losses will probably never be accurately known but they could hardly have been less than 50,000. The evacuation which was carried out under the generalship of Gen Sir Thomas Blamey then deputy commander in chief Middle E was unquestionably one of the most magnificent feats of arms in Brit hist. Its final phase was full of exciting incidents and more than once the whole operation came within an ace of disaster. The New Zealand brigade which had helped to hold the position at Thermopylae was withdrawn in order to take up a position near the vil of Kricketuk so as to cover the withdrawal of Anzac troops who had been holding the road to S from Thermopylae. The New Zealanders held this precarious position for two days the men lying close in gullies and among olive groves while Ger dive bombers searched for them ceaselessly. The enemy thinking he had sufficiently prepared the position sent forward infantry in lines and there happened what had happened repeatedly for the previous weeks. The Brit guns waited till the enemy reached a carefully considered stretch of road and then blew some fifty lorry loads to pieces. After that the brigade repaired to the Peloponnese for embarkation but the plan went amiss owing to the daring and well executed attack by 2000 Ger parachutists who descended in the isthmus of Corinth occupied the bridge across the canal and thus threatened to cut off the Brit troops in Attica from the Peloponnese. These parachutists were dropped from quite low altitudes some explosive device being used to open the parachutes so that they alighted within a few seconds of leaving the plane. With each man were dropped

ponnese for embarkation but the plan went amiss owing to the daring and well executed attack by 2000 Ger parachutists who descended in the isthmus of Corinth occupied the bridge across the canal and thus threatened to cut off the Brit troops in Attica from the Peloponnese. These parachutists were dropped from quite low altitudes some explosive device being used to open the parachutes so that they alighted within a few seconds of leaving the plane. With each man were dropped

The picture shows us, also the upper town

other parachutes carrying machine guns so that within a few minutes of the attack being launched the whole area was being raked with heavy machine gun fire. But a warning was sent to the brigade headquarters and the New Zealanders escaped at another point on the coast of Attica. In this way ended the Brit adventure in the Balkans and the Gk defence. One lesson it taught was in the words of Gen Blamey that 'men who were not fully equipped mechanised could not hope to fight fully equipped mechanised troops against whom a rifle was as useful as a bow and arrow'. See also (RIT) BATTLE OF (1941) for details of military operations

in 1944 see under EASTERN FRONT IN SECOND WORLD WAR.

Greek Archipelago, collection of is. in the Aegean Sea, belonging to Greece. There are some 300 of them, and they are divided into the following groups: Euboea (pop. 179,500) and the Sporades, covering an area of 2216 sq. m., the chief is. being Skyros, and the Cyclades (pop. 147 000), covering 923 sq. m.. These latter are of volcanic origin and number some 200, of which the most important are Naxos, Syra, Andros, Milos, Paros, and Santorin (Thira). The is. yield a large output of ores.

Greek Church, more correctly spoken of as E. Church, and described officially as the Holy Orthodox Catholic Apostolic E. Church, is the historical representative of the churches of the ant. E., and consists of fourteen self-governing churches, all of whom possess the same faith, the same bases of worship, and the same principles of government. These are (1) the Ecumenical Patriarchate of Constantinople, (2) the Patriarchate of Alexandria, (3) the Patriarchate of Antioch, (4) the Patriarchate of Jerusalem, (5) the Archiepiscopate of Cyprus, (6) the Church of Russia, (7) the Church of Greece, (8) the Metropolis of Carioviis, (9) the Church of Rumania, (10) the Church of Servia, (11) the Archiepiscopate of Montenegro, (12) the Metropolis of Hermannstadt, (13) the Metropolis of Bukovina and Dalmatia, (14) the Holy Monastery of Smal. All these adopt the doctrinal decisions of the seven ecumenical councils, together with the canons of the Council of Quinisextum or second Trullan Council (692), and entirely reject the pope's supremacy. They express their faith by the Creeds, except that they object to the 'Filioque' clause, saying that the Holy Ghost proceeds from God the Father alone, and believe that their communion is the only true Church of Christ. Moreover they differ from the Rom. Church in that they deny Purgatory and the doctrine of the Immaculate Conception of the Blessed Virgin.

As regards their rites they adopt the Julian calendar, beginning their eccles. year on sept. 1, and have four great fasts, the most strictly kept being Lent, and a number of feasts, which they divide into three classes: great, middle, and lesser days. Easter is 'the feast', then follow sixteen other great feasts, all of which relate to Our Lord or the Blessed Virgin. The middle feasts are those which relate to certain chief saints and apostles, and all the other days are the lesser feasts. The first Sunday of Lent is the feast of Orthodoxy, which was founded in memory of the restoration of the holy pictures after the second council of Nicea; the Sunday after Whit Sunday (our Trinity) is All Saints, and there are two All Saints' days, the Saturdays before Ascension and Whit Sunday. The stronghold and centre of the whole worship is the liturgy, or eucharistic celebration, of which two types are used: that of Basil the Great, recited on fixed days, and that of Chrysostom, which is usual throughout the year. The liturgy of the pro-sanctified or the

'Dialogos' is only employed in Lent. Preaching of the divine word, which formed a part of the worship, has now disappeared, and is only to be found in some Russian churches. There are eleven chief service books, but no compendium like the Rom. breviary, and the service is conducted in 'Old Gk.', or 'Old Slavonic', not in a 'dead' tongue. There is plenty of singing, though no instrumental music, and no images are allowed in churches except the crucifix and icons of the saints. The vestments are numerous and resemble in some respects those of the Church of Rome. Other characteristics of the E. Church are: they baptise by immersion, rarely hear confessions, give Holy Communion under both kinds, confirm by the priest immediately after baptism, ordain by laying on one hand only, crown the spouses at marriage, and anoint not only the sick but even people in good health.

The principles of church government are supported by the holy canons, by the fathers, and by the administrative laws of the emperors referring to the church and completing the canons. According to their principles the head of the Orthodox Church is Christ, and believers other than bishops are divided into two classes, *clergy* (consisting of arch-priests, priests, and deacons) and *laity*. Monastic life, which is an important feature of the E. Church, is a single organism resting upon the monastic arrangements of Basil the Great, reduced to order by means of legal commands of eccles. and political legislation. The monks, except those of the imperial monasteries and those of the *stanoprovia*, are subject to their local bishops. The centre of each church is the bishop, but the basis of administration is the synodal system, all questions on eccles. subjects and discipline being solved in regular or periodically convoked synods. And not only spiritual questions which affect eccles. life are regulated by church law, but also many relations of social life which are bound up closely with those of the church, such as marriage, divorce, etc. The estrangement between the E. and W. Churches was of gradual growth. In the early church there were three great bishops of importance, those of Rome, Alexandria, and Antioch, Rome having some sort of primacy and always vindicating the right of judging appeals against the other patriarchs. The rivalry between the churches seems to have begun when the seat of the empire was transferred from Rome to Constantinople. For this left the head of the Church of Rome free from the interference of the court and meddling statesmen; and this, added to the fact that the E. patriarchates were engaged in violent disputes, did much to increase his power. But it was not to be expected that the pope's pre-eminence would be acknowledged in the E., and to press it upon the patriarchs in times of irritation resulted in schism. Political jealousies aggravated the disputes, and at last the final break came in 1054 when Pope Leo IX. excommunicated

Cerularius and the whole of the E. Church. Though a temporary agreement was reached at the Council of Ferrara-Florence (1438-41) the separation was now final, and the ostensible cause was the introduction of the word 'filioque' into the creed, and it is this addition which was and is still the permanent cause of separation. See R. L. Langford-James, *Dictionary of the Eastern Orthodox Church*, 1923; M. Constantinides, *The Greek Orthodox Church*, 1931; F. Gavin, *Some Aspects of Contemporary Greek Orthodox Thought*, 1936; and J. M. Hussey, *Church and Learning in the Byzantine Empire, 867-1185*, 1937.

Greek Fire, name applied in general to the different kinds of liquid fire employed in the Middle Ages, but specifically used of a preparation of 'wet fire' invented by an architect named Callinicus, who lived in the reign of Constantine Pogonatus (848-85). He is said to have fled from Heliopolis in Syria to Constantinople, and his 'wet fire' was used at Cyzicus to set fire to the Saracen ships. Exactly what the mixture was is unknown, but Lt.-Col. H. W. L. Hime, after a careful study of all available evidence, decided that it differed from the other preparations of the kind in having quicklime as an ingredient which, when mixed with sulphur, naphtha, etc., took fire spontaneously when wetted.

Greeley, Horace (1811-72), Amer. journalist and politician. In 1833, in partnership with a fellow workman, F. V. Story, he pub. the first cheap paper in New York, called the *Morning Post*. This paper failed, and after many adventures with sev. newspapers, G. estab. his reputation as an editor of the *Jeffersonian*, the *New Yorker*, and the *Log Cabin*. In 1841 he founded the *Tribune*, a paper which largely influenced public discussions of the time. He was among the first violently to advocate the emancipation of slaves; it is said that later he influenced Lincoln to issue his proclamation of emancipation. In the Republican Convention of 1860 he was a stout supporter of Lincoln and helped to secure his nomination as president. He pub. many works, among them *Hints towards Reform* (1850); *History of the Struggle for Slavery Extension* (1856); and *Recollections of a Busy Life* (1868).

Greeley, city of N. Colorado, U.S.A., and the cap. of Weld co. It is situated on a trib. of the N. Platte R. in a fertile valley, and is served by the Denver Pacific Railway. There is a trade in flour, lumber, and sugar. Agriculture and fruit growing are carried on, and there are rich coal-mines in the vicinity. Pop. 12,000.

Greely, Adolphus Washington (1811-1935), Amer. Arctic explorer. In 1881 he was appointed to command an Arctic expedition, with the purpose of establishing a chain of thirteen stations about the N. Pole for scientific and meteorological observations. He sailed from St. John's, Newfoundland, in the *Proteus*, with twenty-four men. A detachment of his expedition under Bradwood and Lockwood penetrated to a higher latitude than

any had attained before. G. and his companions suffered extraordinary hardships. Three separate relief expeditions were sent after him; the third, commanded by W. Scott Schley in 1884, arrived at Cape Sabine and found G. and six of his companions out of the twenty-four on the point of starvation; the rest had perished. His scientific records and a valuable collection of specimens were saved. Became major-general, 1906. He installed the first long-distance radio-telegraph, in Alaska, 1900-4. He pub. *Three Years of Arctic Service* (1885); *American Explorers* (1894); *Handbook of Arctic Discoveries* (1896); *Handbook of Polar Discoveries* (1909); *Handbook of Alaska* (1909); *True Tales of Arctic Heroism* (1912); and books on various climates. See G. W. Melville, *In the Lena Delta: the Greeley Relief Expedition*, 1885, and W. Schley and J. Soley, *Rescue of Greely*, 1885.

Green, John Richard (1837-83), Eng. historian. He was b. at Oxford, and educated at Magdalen College School and at Jesus College, where he won an open scholarship. In 1860 he took holy orders and became a curate in London. In 1868 he was appointed incumbent of St. Philip's, Stepney. He studied hist., and at this time wrote frequently for the *Saturday Review*. His health broke down; his views on the teaching of the Church of England changed, and he retired from the church and accepted the post of librarian at Lambeth. He then devoted himself entirely to hist. In 1874 he pub. his *Short History of the English People*, a brilliant picture of the social and economic evolution of Eng. life, in contrast to the usual political histories. This became exceedingly popular. His style is vivid, interesting, and accurate, and he made the reading of hist. a pleasure to thousands who had formerly regarded it as tedious and dry. In 1882 he wrote the *Making of England*, and in 1883 *The Conquest of England*. After his death his wife finished the last-named book. It has been said that *Robert Elsmere*, by Mrs. Humphrey Ward, is partly a portrait of him. Mrs. G. (Alice Stopford) helped considerably in her husband's work and has also written valuable historical works, especially relating to the early hist. of Ireland. See C. Tait, *Analysis of English History based on Green's 'Short History of the English People'*, 1897, and J. (Viscount) Bryce, *Studies in Contemporary Biography*, 1903.

Green, Thomas Hill (1836-82), Eng. philosopher, b. at Birkin in Yorkshire, of which his father was rector; educated at Rugby and at Balliol College, Oxford; elected fellow, 1860. He spent his life in teaching, chiefly as lecturer on philosophy and as Whyte's prof. of moral philosophy, from 1878 till his death. His influence on the philosophy school at Oxford, both during his life and in succeeding years, has been great, and has stamped the final honours examination of Literae Humaniores with his Hegelian and Kantian idealism. His pub. works were few; apart from his introduction to the standard ed. of Hume (T. H. Green and T. H. Grove), his philosophy is stated in the

Prolegomena to Ethics (1833), ed. by H. C. Bradley, and the *Principles of Political Obligation* (1895); his collected works were pub. and ed., with memoir, in three vols., by K. L. Nettlehip. See also W. H. Fairbrother, *Philosophy of T. H. Green*, 1896; H. Sidgwick, *Green's Ethics*, 1902; J. (Viscount) Bryce, *Studies in Contemporary Biography*, 1903; and J. H. Muirhead, *The Service of the State, Four Lectures on the Philosophy of T. H. Green*, 1908.

Green, William Edward, see FRIESE-GREENE.

Greenaway, Kate (1846-1901), Eng. artist and illustrator of books, b. in London. Her father was John G., an engraver and draughtsman. She studied at S. Kensington and at the Slade schools. In 1868 she first exhibited water-colour drawings at the Dudley Gallery, London. In 1873 she began to illustrate for *Little Folks*, and commenced her series of Christmas cards for Marcus Ward; they were full of quaint beauty and charm and became extremely popular. In 1877 she began to draw for the *Illustrated London News*. The charming freshness of her illustrations in her books, one of which, *Under the Window* (1879), sold to the extent of 150,000 copies, made her famous. Her drawings of children, dressed in the style of the early nineteenth century, are full of artistic grace and delicate quaintness. Among her best known illustrated books are *A Birthday Party for Children*, *The Pied Piper of Hamelin*, *Mother Goose*, and *Little Ann*. See M. H. Spielmann and G. S. Layard, *Kate Greenaway*, 1905.

Greenback Party, Amer. political party formed in 1874 which advocated that the circulation of notes by state and national banks should be prohibited, that greenbacks alone should be circulated, and that the whole of the U.S. debt should be paid in greenbacks. It ceased to exist as a party in 1884.

Greenbacks, popular name of the legal tender circulating notes of the U.S.A., so called because the back is printed in green ink. Treasury notes were first issued of necessity to provide funds for the civil war in 1862; there were three of these issues, the first in Feb., the next in July, 1862, and the last in March 1863. The notes soon depreciated in value and fell to 35 cents on the dollar. An Act of March 1878, restoring specie payments, had the effect of fixing the amount then current as the regular circulation, and G. have never fallen below par.

Green Bay: 1. City of Wisconsin, U.S.A., and cap. of Brown co., situated at the head of G. B., near the mouth of Fox R. It is 114 m. N. of Milwaukee and 240 m. N. of Chicago. It is a centre of the lumber trade and has an export trade in shingles, staves, etc. There are ironworks, flour-mills, breweries, etc., and the fisheries are important. There is a good harbour and a steamboat service. Pop. 46,200. 2. Large arm of Lake Michigan, upon which the above city stands. It is 100 m. long and from 15 to 35 m. wide.

Greenburgh, township and vil. of New

York, U.S.A., in Westchester co., situated on the Hudson R., 5½ m. from Yonkers. Pop. 36,000.

Greenbush, or East Albany, tn. of New York, U.S.A., situated in Rensselaer co., on the Hudson R. It is opposite Albany, with which it is connected by a railway bridge. There are sawmills, a tannery, colour works, and manufs. of tools. Pop. 7300.

Greenbushes, post tn. of W. Australia, and also one of the chief tin-bearing dists. of W. Australia.

Green Chafer, see ROSE BEETLE.

Green Cloth, Board of, committee of the Brit. royal household, taking its name from a green-covered table at which it has long been a custom for the board to sit when transacting business, which is to examine and pass all the household accounts. At one time it also had the power to punish offenders within what was known as the 'verge of jurisdiction,' or the precincts of the palace. The board is presided over by the lord steward, and consists of the leading officials of the household.

Greened, Coal-fish, or Saithe, or *Gadus virens*, is a member of the cod-fish family. It is carnivorous and is itself eaten by man, and on the W. coast of Scotland is often caught in great abundance, as it preys on herring. The fish inhabits the seas between the Arctic and the Mediterranean, and is sometimes known as coal-fish from the dark colour of its back.

Greene, Graham (b. 1904), Eng. novelist and editor. He began as a writer of thrillers, with an accent on the character-study of the crook, notably in *Stamboul Train* (1932) and *Brighton Rock* (1938). Later he wrote novels concerned with inner conflict between right and wrong, *The Power and the Glory* (1940) and *The Heart of the Matter* (1948) proving especially popular. His work has been further popularised by the films of *Brighton Rock* and *The Fallen Idol*. He has also been a publisher.

Greene, Henry Plunket (1865-1936), Brit. singer, b. in Dublin; studied at Dublin, Stuttgart, Florence, and London. Was highly successful, both in Europe and in America.

Greene, Maurice (1695-1755), Eng. musical composer, b. in London. He began his musical career as a chorister in St. Paul's Cathedral, becoming in 1718 the cathedral organist. Nine years later he was appointed organist at the Chapel Royal, and in 1730 was elected to the chair of music at the univ. of Cambridge. He was the composer of a great deal of church music, of which the best known works are *Forty Select Anthems* and *Catches and Canons for Three or Four Voices*. He also wrote ser., oratorios, a masque, and a pastoral opera.

Greene, Nathaniel (1742-86), Amer. general, b. at Potowomut in the township of Warwick, Rhode Is. He came of Quaker stock, and was not originally intended for the army, but in 1775, having been for a year in the militia, he was given the command of the Rhode Is. contingent of troops, and joined the Amer. forces at

Cambridge. His able generalship won him Washington's confidence and his promotion was rapid. He took part in many successful engagements, distinguishing himself especially at Trenton and Princeton. In 1780 he was given the command of the S. army, which was opposed to a far superior force under Lord Cornwallis. His masterly strategy during the retreat from Catwaba to the Dan was such that it enabled him not only to survive the two defeats of Guilford Court House (March 1781) and Hobkirk Hill the following month, but eventually to win the victory of Eutaw Springs and drive the Brit. out of S. Carolina. At the end of the campaign he was offered the post of secretary for war, but he refused, and in 1785 he settled on his Georgia estate, Mulberry Grove, where he d. the following year. See *Life of Nathaniel Greene*, by his grandson, George W. Greene (3 vols.), 1867-71, and *Biography* (New York), 1893, by Brig.-Gen. F. V. Greene in the Great Commander series.

Greene, Robert (1560-92), Eng. dramatist and writer, b. at Norwich; it is not certain who his father was. In 1575 he went to St. John's College, Cambridge, as a scholar, where he took his B.A., and in 1583 he became an M.A. from Clare Hall. According to his own account, his life at the univ. was utterly disreputable. In 1585 he married, and deserted his wife after the birth of their child; then he went to London, where he soon became famous as a playwright (all his plays were pub. posthumously) and writer of love fantasies. Before his death he became the slave of every kind of vice and quite dependent on the charity of very poor persons. The story of his death is disgusting yet pitiful. One of his pamphlets, entitled *A Groat's worth of Wit bought with a Million of Repentance* (1592), appears to hold an attack on Shakespeare, part of the quotation being 'In his own conceit the only Shakespeare in a country.' Among his other writings are *Orlando Furioso* (1594) and *The Honourable History of Friar Bacon and Friar Bungay* (1594). His *Pandosto, the Triumph of Time* (1588) formed the foundation for Shakespeare's *Winter's Tale*. In 1599 was produced his *Alphonsus, King of Arragon and George-a-Greene, the Pinner of Wakefield*. His works are filled with wit and charming romance and contain much good verse. G. showed popular taste in imitations of Marlowe, but so awkwardly that his *Alphonsus* and *Orlando Furioso* seem like parodies. His comedies are full of magicians, kings, and courtiers worked into unity by a background of romance. His *Friar Bacon* and *James IV.* If a far cry from Shakespeare at all events point the way to *A Midsummer Night's Dream*. See C. Collins, *Plays and Poems*, with introduction (2 vols.), 1905.

Green Earth, mixture of magnesian, ferrous, and aluminous silicates of uncertain composition found in cavities and veins of basaltic igneous rocks. It is evidently a secondary product resulting from altered pyroxene, amphibole, etc., and may resemble serpentine or chlorite.

Glauconite is a form of it met with in some of the sandstone of the Cretaceous system.

Greenfield, city of Massachusetts, U.S.A., and the cap. of Franklin co. It is situated near the R. Connecticut, 34 m. N. of Springfield. There are manufs. of cutlery, tools, and machinery. Pop. 15,600.

Greenfinch, or **Green Linnet** (*Ligurinus*, or *Chloris*), common European bird, to be found also in parts of Asia and in New Zealand; it is also an occasional visitor to Palestine. It abounds in the Brit. Isles, having a preference for wooded districts. The cock is one of the brightest coloured of the common Brit. birds, its plumage being of a light yellowish-green, with the breast of yellow.

Greenfly, see *APHIDÆ*.

Greengage, name given to a certain kind of small round plum, grown especially for dessert. It is less hardy than some kinds, and requires shelter and a good deal of care in cultivation, which follows the same lines as those of the plum.

Greenheart, or **Bibiru**, the popular name given to the species of Lauraceæ technically known as *Nectandra Rodnei*. It is a native of America, and is a tree which yields a useful timber; the bark is employed for medicinal purposes. The term of G. is also applied to *Calyptranthes* (*Hydranthea*), a species of Myrtaceæ, and to *Colubrina ferruginea*, a species of Rhamnaceæ.

Greenhithe, eccles. par. and vil. of N.W. Kent, England, situated on the Thames, 2½ m. N.E. of Dartford. It was the starting point of the ill-fated Franklin expedition in 1845. There are chalk quarries, a trade in lime and cement, brick-fields, and market gardens. Ingress Abbey, which formerly belonged to Dartford Abbey, was occupied by Queen Caroline. Pop. 3500.

Greenhouse, see *GHATHOUSE*.

Green Howards, see *YORKSHIRE REGIMENT*.

Greenland, is. continent belonging to Denmark, the larger part of which lies within the Arctic circle. It is bounded on the E. by the N. Atlantic and the Norwegian and G. seas, with the Denmark Strait dividing it from Iceland. On the W. Davis Strait and Baffin Bay separate G. from Baffin Land. Cape Farewell is the most southerly point, 59° 45' N. The length of G. is about 1650 m., and at the northerly part, where it is widest, the breadth is about 700 m. Its total area is about 830,000 sq. m. of which only about 50,000 are free from ice. The interior is covered with a vast glacier of ice and snow, deep enough to bury the mts. and fill the valleys. This inland stretch of ice rises to 9000 ft. and more, leaving only occasional isolated rocks uncovered. The glacier slopes gradually down to the coast, discharging icebergs, which float down the Atlantic and travel S. of Newfoundland. The Humboldt Glacier on the N.W. coast is the largest in the world, having a breadth, where it reaches the sea, of 80 m. The coast is indented with deep fjords, and numerous small is. lie close to the land. Of these

Disco is the largest, having an area of 3005 sq. m.; native iron is found here, also coal of a poor quality. Graphite is also mined. The only other mineral of any economic importance is cryolite, found and worked at Ivigtut in the Arsuk fjord on the S.W. coast. The climate varies a great deal from bright sunshine to dense snow and fog; in the warmest month, July, the temp. is about 46° F., and in the coldest month, Jan., it may drop to -36° F. and below, while inland it may descend to -90° F. The climate on the E. coast is more Arctic than on the W., and the land

continues, and the sealing is very important. Narwhal and walrus are also caught. The pop. in 1945 numbered 21,384 (Europeans 569; natives, 20,815). The trade is only with Denmark, it being a monopoly of the Dan. crown since 1774. The prin. exports, which in 1939 amounted to 8,461,000 kroner, are seal and whale oil, fox, bear, reindeer, and seal skins, elderdown, feathers, and cryolite. The imports from Denmark were valued at 3,537,000 kroner.

For purposes of government the country is divided into two inspectorates, Godthaab and Godhavn, ruled by two governors responsible to the board at Copenhagen. Each inspectorate is divided into dists. These dists. have a chief settlement and various outlying hunting stations, of which there are about sixty. Trading is carried out on a system of the gov., giving low prices for the produce, and selling European necessities at the smallest possible rate. The inspectors are magistrates as well as trade superintendents, but crime is very rare. The Dan. inhab. usually live in houses built of imported wood, covered with pitch, while the Eskimos dwell in huts built of stone and turf, entered by a little tunnel. Godhavn, on Disco Is., about half-way up the W. coast, is the cap., but Sydproven in the far S., with a pop. of 901, is the largest settlement. Other settlements are Upernivik, which until Knud Rasmussen founded a trading station at Thule (Kap York) was the most northerly vil. in the world, Umanak, Jacobshavn, and Christianshaab, all within the Arctic circle, Sukkertoppen, Godthaab, Frederikshaab, Ivigtut, and Julianehaab. There is only one settlement, Angmagssalik, on the bleak E. shore.

The hist. of G., as we know it, began in 982, when the Norwegian Eric the Red sailed from Iceland to find the country which one Gunnbjorn declared he had seen and stayed at. Eric discovered the country and called it G., hoping by this name to persuade people to colonise there; two colonies were formed, one called Osterbygd, in the dist. of Julianehaab, and another in the dist. of Godthaab. Remains of these Northmen and numerous ruins have been found. Christianity was introduced in A.D. 1000 by Lell Eriksen; the colonists built twelve churches and a monastery. For four centuries the Norse colony thrived, but by the beginning of the fifteenth century intercourse with the motherland, owing to increased Arctic ice and to epidemics and civil disturbances in Scandinavia, ceased entirely. The fate of the unfortunate colonists is unknown, but when in 1585 John Davies visited G., he found it to be inhabited only by Eskimos. It was recolonised early in the eighteenth century by Hans Egede. From 1261 to 1814 G. belonged to Norway, after which it became Dan. Sev. Arctic explorers have visited G. The first person to give a trustworthy account of the coast was the Scottish whaler, Capt. Wm. Scoresby, in 1822. After this sev. other expeditions of exploration were made by

L. W. Hutchinson

THE PARSONAGE, JACOBSHAVN

more deeply covered with snow. The plant life of G. is of the Arctic type. There are no forests; the dwarf willow and birch are the chief trees; flowering mosses flourish, and the yellow poppy, certain saxifrages, a heath, a rhododendron, an azalea, harebells, camphors, and numerous other flowers blossom abundantly in some dists. during the two months of summer. Gardening is difficult, but in the S. a few vegetables are grown, chiefly radishes and turnips. The chief wild animals are the white polar wolf, the polar bear, the polar fox, the Arctic hare; and the reindeer, although hunted to extinction in the S., still abounds in the more northerly dists. There are sev. varieties of birds, among them the eider-duck, gullmoot, and the ptarmigan. The fisheries are very important, including cod, caplin, halibut, sea trout, etc. The whaling industry, though not as flourishing as formerly, still

Gers., Danes, and Englishmen. Nansen, in 1888, travelled along a part of the coast. In 1905 the duke of Orleans's expedition discovered that the furthest N.E. point was an is. In 1930-31 two exploration parties, one Eng. under Watkins and a Ger. one under Dr. Wegener, wintered in G. A party of the Oxford Univ. Exploration Club left for G. in 1933 to carry out meteorological and glaciological work. In June 1930 a party of Norwegian sea-captains proclaimed the 'annexation' of part of the N.E. coastal region. Denmark formally took control of Thule (pop. 300) in 1937, for, although Denmark exercised suzerainty over the whole of G., the little settlement of Thule had been in a distinctive position since its discovery by Rasmussen, who set up there a sort of local gov. through a 'Council of Hunters.'

ESKIMO WOMEN

F.N.A.

The very extensive harbour of Færingshavn, 32 m. S. of the cap. of S. G., was opened up in the same year. By a defence agreement, signed on April 9, 1941, the U.S. Gov., in order to protect the *status quo* in the W. hemisphere, acquired the right to construct and operate landing fields, seaplane facilities, and radio and meteorological installations. The agreement explicitly recognises the sovereign rights of Denmark in G. See H. Egede, *Description of Greenland*, 1740; H. Rink, *Danish Greenland*, 1877; H. Mohn and F. Nansen, *The First Crossing of Greenland*, 1890; Knud Rasmussen, *Greenland by the Polar Sea*, 1921; J. W. Bilby, *Among Unknown Eskimo*, 1923; M. Vahl, *Greenland*, 1928; Isobel W. Hutchison, *On Greenland's Closed Shore*, 1930; I. N. Krabbe, *Greenland, its Nature, Inhabitants, and History*, 1930; and V. Stefansson, *Greenland* (New York), 1942. **Greenland Sea**, that part of the Arctic Ocean lying between Spitzbergen on the N. and Greenland and Jan Mayen on the S. In places it is 1,500 fathoms in depth, and its greatest width, between Norway and Greenland, is 700 m. The temp. is variable.

Greenlaw, small tn. of S. Berwickshire, Scotland, on the Blackadder. Antiquarian remains have been found, in-

cluding a camp and sev. cairns. The chief manu. are woollens and agric. implements. Pop. 908.

Greenlet Island, is. of Canada, situated in the strait of Belle Isle. It was proposed that here should be the landing-place of a Canadian Atlantic cable, extending from Clew Bay in Ireland.

Green Linnet, see GREENFINCH.

Green Mountains, range of mts. in Vermont, U.S.A., a part of the Appalachian system. Highest peak, Mt. Mansfield.

Green Mountain State, see VERMONT.

Greenock, municipal and police burgh and seaport tn. in Renfrewshire, Scotland. It is situated on the S. bank of the Clyde and is 23 m. by rail W. of Glasgow. The tn. stretches along the water for nearly 4 m. and the harbour works are extensive, including the Victoria and Albert harbours, the James Watt dock, and the Garvel graving dock. The tn. possesses some fine public buildings, notably the municipal buildings, in the style of the 18th. Renaissance, with a tower 265 ft. high; the co. buildings (1807), which also possess a tower 112 ft. high; the custom house (1818) in classic style, with Doric portico; the Watt Institution, founded in 1837, containing the public library (1783); the Watt scientific library, founded by the inventor in 1816; and the statue of James Watt by Sir Francis Chantrey. The Watt Engineering, Navigation, and Wireless Telegraphy School stands on the site of the inventor's bp. adjacent to the municipal buildings. The N. par. church, a Gothic building dating from 1591, and re-erected at the Esplanade, contains windows by Wm. Morris, Burne-Jones, and Rossetti. The churchyard was the resting place of Burns's 'Highland Mary', whose remains were reinterred in G. cemetery and the monument also removed there. The grave of John Galt, the novelist, is in the Inverskip Street burying ground. The chief industries are shipbuilding, marine engineering, sugar refining, rope spinning, cask and case making, manu. of chemicals, worsted spinning and knitting factory, and other industries. G. is divided into nine wards, has a tn. council of twenty-seven members, and returns one member to Parliament. From 1940 until 1915 the Free Fr. naval base was at G. and there is a memorial, which is a prominent landmark from the estuary, at the Lyle Road, to the men of the Free Fr. forces who gave their lives in the battle of the Atlantic. The tn. was subjected to aerial attacks by the enemy, the worst being on the nights of 5th-6th and 6th-7th May, 1941, when much property was destroyed and many lives lost. Pop. 79,000.

Greenore, watering place of Co. Louth, Ireland, situated on Castlingford Lough. It has a steam-packet service and golf links. G. affords beautiful scenery, and has a raised beach, about 10 ft. above sea level. Pop. 300.

Greenough, George Bellas (1778-1855), Eng. geologist. He was one of those who founded the Geological Society of London, of which he was the first president. He pub. *A Critical Examination*

of the *First Principles of Geology* (1819) and the famous *Geological Map of England and Wales*, in six sheets, and a geological map of India.

Greenough, Horatio (1805-52), Amer. sculptor, b. at Boston. He evinced a taste for art while still at Harvard, and designed the Bunker Hill monument. In 1825 he went to Rome and became a pupil of Thorwaldsen. The Amer. Gov. selected him to execute the colossal statue of Washington which was unveiled in 1843 in the city of that name, and later he executed a group representing the struggle between the Anglo-Saxon and Indian races, 'The Rescue.' The gallery of the Boston Athenaeum contains a bust of Lafayette by him, and the 'Medora' and 'Venus Victrix.' See H. T. Tuckerman, *Memoir of Horatio Greenough* (New York), 1853, and letters ed. by F. B. Greenough, 1887.

Green Point, suburb of Cape Town, Cape Prov., S. Africa.

Green River: 1. riv. of the U.S.A. It forms one of the two great streams which ultimately form the Colorado. It rises in the Wind R. Mts. in W. Wyoming and joins the R. Grand. It has a total length of about 720 m. and flows through deep canyons, which it cuts out for itself through the rocks of the Uinta Mts. 2. Another Amer. riv., which is the largest trib. stream of the Ohio. It rises in Kentucky and joins the Ohio near Evansville, Indiana. Length 300 m.

Greenroom, waiting-room built close to the stage of a theatre for the use of actors and actresses during the intervals of a play. Actors suffer from 'stage glare' caused by the artificial lighting of a theatre, and the colour green is a good antidote to this affection of the eyes, therefore the waiting-room walls were coloured green; hence the name. See *The Green Room Book* (a directory of prominent people connected with the stage, pub. annually), also *The Secret History of the Greenrooms . . . in the Three Large Theatres, 1790-93* (vol. I., Drury Lane; vol. II., Covent Garden; vol. III., The Haymarket).

Greensand, so named from the colour of some of its beds due to the presence of glauconite, consists largely of the internal casts of the chambers of Foraminifera. It was divided by Webster (1824) into Upper G. and Lower G.; the former in the Upper Cretaceous system (*q.v.*) and the latter in the Lower, being separated from one another by the Gault. The terms are unsatisfactory, and the name *Pectian* is now frequently applied to the Lower, which is more often yellow or brown than green, while the Upper with Gault forms the *Selbornean*. The Lower G. can be traced in England at intervals from the Isle of Wight, through Dorsetshire and Oxfordshire, to Lincolnshire, but it largely centres on the Weald. The Upper G. in England is deposited on a V-shaped area from Kent and Sussex to Dorsetshire, back to Norfolk, with a continuation in Lincolnshire and Yorkshire. Many local names exist for G. In Surrey the deposit is known as firestone and hearth-

stone, in Hampshire as malmstone. The scythestones and whetstones known as Devonshire bats come from the Upper G., while the concretions of carbonate of lime from the Lower are used in the manuf. of cement. Other products are glass sands and Fuller's earth. In the Weald important correlations exist between these deposits and local scenery, vil. sites, and industries.

Greensboro, Amer. city of N. Carolina, U.S.A., situated in Guilford co., of which it is the cap. There are three colleges here, viz. G. Female College (1846), Bennett College, and the State Agric. College. The surrounding country produces tobacco and fruit, and the tn. is noted for its cotton-mills and blast furnaces. There are also lumber mills, terra-cotta works, and manufs. of machinery. Pop. 50,000.

Greensburg: 1. City in the co. of Westmoreland, Pennsylvania, U.S.A., situated in the centre of a coal-mining dist., and is slightly less than 30 m. E.S.E. of Pittsburgh. It manufs. glass, iron, and steel. Pop. 16,000. 2. Amer. city in Decatur co., Indiana, U.S.A., 47 m. S.E. of Indianapolis. Its chief industries are flour-milling, quarrying, and lumber. It is a farming and stock dist. Pop. 8,000.

Greenshank (*Totanus canescens*), bird of greenish colour, which belongs to the sandpiper class. It is migratory, leaving Great Britain at the end of July and reappearing at the end of April. It is found principally in the N. and W. of Scotland.

Green Sickness, see CHLOROSIS.

Greenstone, name formerly used quite generally for weathered igneous rocks, e.g. basalt, gabbro, diabase, etc., in which a development of chlorite or serpentinite had caused them to become dark green. The term has now been replaced by more definite names dependent on actual analyses. See GREEN EARTH.

Greenville: 1. City and co. seat of Washington co., Mississippi, U.S.A., on the Mississippi R., 76 m. from Vicksburg. It is in the centre of a large cotton-producing region, and its industries are largely connected with that staple. Pop. 15,000. 2. City and co. seat of Darke co., Ohio, U.S.A., on G. Creek, 35 m. N.W. of Dayton. It is the trade centre for a large and fertile agric. dist., producing cereals and tobacco. Hero Gen. Wayne concluded the treaty of G. with the Indians, 1795. Pop. 7,000. 3. Parl. bor. in Mercer co., Pennsylvania, U.S.A., about 52 m. S.E. of Erie. The trade of the tn. is considerable, as it is the commercial centre of a large section of Mercer co. and nearby places in Ohio. The coal, oil-fields, and stone quarries in the vicinity add to its industries. Pop. 9,000. 4. City and co. seat of G. co., S. Carolina, U.S.A., 100 m. N.W. of Columbia. It is in the centre of an extensive cotton-growing and cotton-manufacturing dist., and its chief industry is therefore connected with that staple, but it has also carriage and wagon works, ironworks, and flour-mills. Pop. 35,000. 5. City and co. seat of Hunt co., Texas, U.S.A., about 50 m. N.E. of Dallas. It is a trade centre for a rich agric. dist., and

is also an important cotton market. Pop. 12,407.

Greenwell, Dora (1821-82), Eng. writer. She became known as an essayist and a writer of religious poetry. She was compared, because of her religious feeling and expression, with Thomas à Kempis and Fénelon. In 1869 she pub. *Carmina Crucis*, and in 1871 *Colloquia Crucis*. She pub. her essays (1866) and a *Life of Lacordaire* (1867).

Greenwich, Duke of, see CAMPBELL, JOHN.

Greenwich: 1. Parl. bor. in the co. of London, situated on the Thames some 4 m. S.E. of the city of London. It is situated on the S. side of the riv. and there

though since 1873 a Royal Naval college, occupies the site of an ant. royal palace called G. House, which was a favourite royal residence as early as 1300. It was, however, granted by Henry V. to Thomas Beaufort, duke of Exeter, and in time passed to Humphrey, duke of Gloucester, who gave it the name of 'Placentia'. It reverted to the crown in 1447 at his death, and was enlarged by Edward IV., by Henry VIII., who made it one of his prin. residences, by James I.; and by Charles I., who built the 'Queen's House' for Henrietta Maria. It was occupied by the Protector during the commonwealth, and after the restoration by Charles II., who had it pulled down. He, however, started to

GREENWICH HOSPITAL
17th cent. engraving.

are two tunnels under the riv. which connect it with the N. side. One is for foot passengers, and the other, called the Blackwall Tunnel, is used by vehicular traffic passing to the India docks. The tn. is celebrated for its hospital and for the observatory, now (1949) in process of removal to Hursley, Sussex. The observatory is built on the point through which passes the first meridian G. time, which is telegraphed each day to all parts of Great Britain, is the standard time. The observatory stands in lat. 51° 21' 38" N. The bor. returns one member to Parliament. Pop. 72,600. 2. Amer. tn., Fairfield co., Connecticut, U.S.A. situated on Long Is. Sound, about 30 m. N.E. of New York. It was settled in 1610, is a well-known health resort, and contains the villas of many wealthy New York business men. Putnam Cottage, the headquarters of Gen. Putnam in 1778-79, is situated here. There are paper mills and foundries. Pop. 35,500.

Greenwich Hospital, as it is still called,

erect another building, which was granted, in the reign of William III., as an asylum for disabled seamen of the navy. The most notable rooms of the hospital are a chapel with rich marble-carved work, and a painting by West of the shipwreck of St. Paul, and a spacious hall, 106 ft. long and 56 ft. broad, which is decorated with representations of sea fights, statues, portraits, and relics of naval heroes. Formerly 2700 retired seamen were boarded in the hospital, but now the building is utilised for the Royal Naval College, the greater number of the seamen residing with their friends and receiving pensions for personal use. The management of the revenue is vested in commissioners under the Admiralty.

Greenwich Royal Naval College, naval school estab. by the Admiralty for the purpose of giving special technical training to intending officers of the British naval services. It occupies the greater part of the Royal Hospital at G. The college is open to students for the navy, The Royal Marines, the Indian Marines,

the Merchant Service, and all sides of naval education are cultivated. A course of naval construction is taken; the subalterns of the Royal Marines take this course here as part of their qualifying training.

Greenwood, Frederick (1830-1909), Eng. journalist, *b.* at London. He began life in a printing house, but his contributions to various periodicals gained him a reputation, and in 1862 he became, with G. H. Lewes, joint editor of the *Cornhill*, and sole editor in 1861. In this paper he pub. his novel *Margaret Denzil's History*. In 1865 he became first editor of the *Pall Mall Gazette*, which soon acquired a powerful influence upon Conservative politics. It was due to G. that Great Britain bought the Khedive's shares in the Suez Canal (1875). In 1880 when the *Pall Mall* changed into the hands of a Liberal proprietor, G. resigned and accepted the editorship of a new paper, the *St. James's Gazette*, over which he ruled for eight years. In 1891 he launched the *Anti-Jacobin*, which, however, was unsuccessful. He continued to exercise his influence in the political sphere by contributing to such papers as the *Westminster Gazette*, *Cornhill*, *Blackwood*, *Pall Mall*, etc. His chief pubs. are *The Law's Verdict* (1893) and *Imagination in Dreams* (1891). See memoir in *Blackwood's Magazine*, Jan. 1910.

Greenwood: 1. Co. tn. of the co. of the same name in S. Carolina, U.S.A. Its chief manufs. are cotton and cotton-seed oil. There is a military institute and a women's college. Pop. 13,000. **2.** Cap. of Leflore co., Mississippi, U.S.A., about 90 m. N.E. of Vicksburg. It manufs. cotton, drugs, furniture, and has saw-mills, canneries, and wood-working plants. Pop. 14,700.

Greenwood of Holbourne, Sir Hamar Greenwood, first Viscount (1870-1918), Brit. statesman, *b.* at Whitby, near Toronto, Canada. Educated at public schools at Whitby and at Toronto Univ. Settled in England in 1895. Called to the Bar by Gray's Inn, of which he became a bencher (1917). K.C., 1930. In Canada he had been an enthusiastic follower of Laurier and the Liberal party and, in 1900, he was offered the chance of standing for Grimsby in the Liberal interest but declined. In 1906, however, he entered Parliament as member for York city; defeated, 1910. Later member for Sunderland (till 1922). Acted for a time as parl. secretary to Mr. Churchill at the Board of Trade. In 1919, after active service in the war, he was appointed under-secretary at the Home Office and later moved to the Dept. of Overseas Trade. A year later he was appointed to the difficult post of Irish secretary. Here his task was to restore order in which he had some measure of success and to find some responsible persons who might be prepared to accept such form of treaty as, in fact, ultimately received legislative sanction. Within two years his task was finished and there was no further need for the office of chief secretary. He was thus the last in the long line of Irish secretaries who had sought with some

partial successes and many failures to achieve the impossible in Dublin Castle, and he had the satisfaction of bringing about the acceptance and final passing of the treaty that at length set up a form of home rule in Ireland and estab. the Irish Free State. G. was essentially an imperialist, and in later years came to find that his sympathies lay with the Conservative party, and he sat for Walthamstow in the Conservative interest until 1929, when he was raised to the peerage.

Greet, Sir Ben (1857-1936), Eng. actor-manager, *b.* in London, son of Capt. Wm. G., R.N. Educated at Royal Naval School, but became a schoolmaster and then an actor, joining a stock company at Southampton. First appearance in London was as Caius Lucius in *Cymbeline* at the Gaiety, 1883. Went into management in 1886 and revived the practice of giving Shakespeare's plays outdoors, and had sev. companies of 'Woodland Players.' In 1895 he produced a number of plays for the Shakespeare Festival at Stratford-on-Avon. From 1890 to 1902 he toured in America with his own company, which included H. B. Irving, Mrs. Patrick Campbell, Robert Lorraine, Dorothea Baird, Sybil Thorndike, and Leon Quartermaine. He co-operated with W. Poel, the founder of the Elizabethan Stage Society, and together they produced the old morality play *Everyman*. He was engaged at the Old Vic from 1914 to 1918 during which time he produced many of Shakespeare's plays, including *Hamlet* in full. From 1924 to 1926 collaborated with W. E. Stirling in producing plays in France and in establishing in Paris an Eng. theatre for the production of classics, 1925-27. Joined Sydney Carroll's open-air theatre in 1933-35.

Greetland, tn. and par. of W. Riding of Yorkshire, England, situated some 2 m. S.W. of Halifax. Pop. 4,000.

Grégoire, Henri (1750-1831), Fr. statesman and ecclesiastic, *b.* near Lunéville and educated for the church. He was by nature a democrat and quickly identified himself with the Tiers État, taking a prominent part in the chief movements of the revolution. He became the constitutional bishop of Loir-et-Cher. As such he aspired to remain true to Christianity and the Church until the Concordat with Rome was made. This event caused him to leave the Church, outside which he remained until his death. He pub. *L'Eglise gallicane* and, early in his career, *Essai sur la régénération de l'église*. See his *Memoires* (with a biographical note by H. Carnot, 1831), and studies by P. Bohringer, 1871, and A. Pouget, 1905.

Gregor, William (1762-1817), Eng. scientist and clergyman, *b.* in Cornwall and educated at Bristol and Cambridge Univs., where he became a fellow of St. John's and entered holy orders. He was always an enthusiastic amateur scientist, and, though he preferred to settle in a remote vil. of Cornwall, he soon acquired a world-wide reputation as a metallurgical chemist through his analysis of such complex substances as topaz, uranium,

mica, and wavelite. But it is for his discovery of titanium that his name is chiefly remembered. It was in a Cornish valley that he found a black sand, now known as 'ilmenite,' which had peculiar magnetic properties. Treating this with sulphuric acid G. obtained a yellow solution which, when heated with powdered charcoal, yielded a slag which contained titanium. G., however, did not isolate the pure metal, succumbing to tuberculosis before he could carry his investigations further.

Gregorian Calendar, see CALENDAR.

Gregorian Chant, see PLAIN-SONG.

Gregorio, Paparschi, see INNOCENT II.

Gregorio, Rosario (1753-1809), It. archaeologist, b. at Palermo. He was educated for the church, took holy orders, and became prof. of theology at Palermo. He was commissioned by the king to superintend the opening of the tombs in his native city. He afterwards studied Arabic, and pub. in this tongue a hist. dealing with Sicily under the Arabs (this work was also issued in Lat.). In 1789 he was made prof. of public rights in Palermo Univ. His greatest work is *Considerazioni sulla storia della Sicilia dai tempi dei Normanni sino al presente* (1806-16), but he also pub. many old chronicles.

Gregorovius, Ferdinand (1821-91), Ger. historian, b. at Neldenburg and educated at Königsberg. After spending some time as a teacher he finally took up his residence in Italy where he soon made the hist. of that country his special study. The result of his long-continued residence in Rome was the pub. of his great work, *Geschichte der Stadt Rom im Mittelalter* (1859-73), which has been trans. into Eng. and It. and deals with the hist. of Rome from about the year 400 to the death of Pope Clement VII. in 1534. It is written in marvellous detail and traces the hist. of the empire and the papacy during that time, showing that the connection between the two was greater than was usually imagined. His other works include *Geschichte der Kaiserin Hadrian und seiner Zeit* (1851); *Lucrezia Borgia* (1876); *Die Grabdenkmäler der Päpste* (1881); and *Geschichte der Stadt Athen im Mittelalter* (1849). See J. Honig, *Gregorovius als Dichter*, 1914, and *Gregorovius als Geschichtsschreiber*, 1921.

Gregory, St., called 'The Illuminator' (c. 240-c. 322), was of the royal race of the Arsacids. His father, Anak, murdered the king of Armenia, for which crime the whole family was destroyed except G., who was rescued at the age of two years by his nurse. She brought him up as a Christian at Caesarea in Cappadocia. About 286, while doing mission work in Armenia, he was thrown into a pit where he was kept for fourteen years, but on healing King Tirdat of an affliction he was released and became head of the Armenian Church, which flourished under his care. He d. in a cave about 322. See E. Malan's trans. of *Verba of Matthew's life*, 1868.

Gregory, St., of Nazianzus (c. 329-389), doctor of the Ec. Church, b. at

Arianzus, near Nazianzus, in Cappadocia. A contemporary of Emperor Julian the Apostate of Athens. Appointed by St. Basil, bishop of Sasima, as a protest against the encroachment of the Emperor Valens in church matters. G. did not reside in his see long, but took up in 379 the task of reconciling to the Nicene faith the city of Constantinople, then Arian. His opponents succeeded at the Council of Constantinople in driving him from the see of that place, because he belonged to another diocese. His work had been accomplished, and he retired to Nazianzus, where he d. He left many poems, orations, and epistles. His works have been pub. by Hervagius (1550) and by the Benedictines (1778-1840). See monographs, Ullmann (Eng. trans., 1857) and Lénoit (1877).

Gregory, St., of Nyssa (c. 331-after 394), a younger brother of Basil, bishop of Caesarea. He was a speculative theologian and wrote *Twelve Books against Eunomius*, *Ten Syllogisms*, *Hexameron*, etc. See complete eds. of his works in J. P. Migne's *Patrologia Graeca* (xv.-xxviii.) (new ed., 1855-61). See also studies by J. Kupp, 1834, S. Heyns, 1835, J. Siskler, 1857, and E. Fleury, 1930.

Gregory, St., of Tours (538-91), Frankish historian, b. at Avern (now Clermont-Ferrand) in Auvergne. He is chiefly remembered as the author of *Historia sive Annalium Francorum libri X*, which covers a period from the creation of the world to the end of the sixth century, and is of great value to the student of early European hist. See the ed. by Arndt and Krusch (1885). His complete works may be found in J. P. Migne, *Patrologia Latina*, lxxi. See G. Kurth, *Origine de Tours*, 1878, and M. Pattison, *Essays*, i., 1869.

Gregory Thaumaturgus, St. (c. A.D. 210-70), apostle of Christianity in Pontus, b. at Neocaesarea, in Pontus, where he became a disciple of Origen. He was consecrated bishop of his native tn. in 240. His treatises, including a *Confession of Faith*, and a *Panegyric* on Origen, may be found in A. Galland, *Bibliotheca graecolatina veterum Patrum*, iii., and in an ed. by J. A. Bengel, 1722. See V. Rysell, *Gregorius Thaumaturgus*, 1880.

Gregory, name of sixteen popes:
(*Gregory I.* (c. 590-604), surnamed the Great, was b. in Rome about A.D. 540. He entered a monastery (c. 575), and became one of the seven reglary deacons of Rome. Pelagius II. appointed him 'apocrisiarius' at Constantinople (c. 579-c. 586), and on his return to Rome abbot of St. Andrew's Monastery. On the death of Pelagius he was unanimously elected pope and consecrated Sept. 3, 590. He showed remarkable ability and wisdom in his administration of the church. He sent Augustine to christianise Britain, reconciled Spain to the faith, and abolished simony among the clergy of Gaul. He regulated the services and ritual, and reformed and standardised the chant. His works, comprising many homilies and letters, are important sources for church and profane hist. of the time, and are printed in J. P. Migne's

Patrologia Latina (vols. lxxv.-lxxix.) and in folio (4 vols., 1705); they include *Moralia*, *Regula pastoralis liber*, and *Dialogorum liber*. See E. Fleury, *Hellénisme et christianisme: St. Grégoire et son temps*, 1931; and studies by E. Kollet, 1889; J. Barmby, 1892; F. A. Gasquet, 1904; H. Grisar, 1904, 1892; F. H. Dudden, 1906; and Brocher, 1941.

Gregory II. (715-31) was b. at Rome in 669. He sent Boniface as a missionary to Germany and did all in his power to promote Christianity among the heathen. By his conflict with Emperor Leo the Isaaurian concerning sacred images as well as on the question of heavy taxation, he greatly increased the political power of the popes.

Gregory III. (731-41) was b. in Syria. He excommunicated the Iconoclasts; he was unsuccessful in his attempt to obtain the help of Charles Martel against the Lombards.

Gregory IV. (827-44) recognised the supremacy of the Frankish emperor, and sided with Lothair in his quarrel with Louis the Pious. He instituted, it is said, the feast of All Saints.

Gregory V. (996-99). During his pontificate John XVI was set up as an anti-pope (996-91).

Gregory VI. (1045-46) bought the pontificate from his godson Benedict IX., and was deposed on a charge of simony in the following year. Hildebrand (afterwards G. VII.) accompanied him to Germany, where he d. in 1047.

Gregory VII. (1073-85), formerly Hildebrand, was b. at Soana, in Tuscany, about 1021, and was educated in the monastery of St. Maria, on the Aventine, and afterwards at Cluny. He accompanied Leo IX. to Rome (1049), and entered holy orders. He succeeded Alexander II. as pope, and laboured to remedy the evils that existed within the church. He aroused the imperial displeasure for prohibiting the abuse of investiture, and was formally deposed by Henry IV. in 1076, whereupon G. inflicted a sentence of excommunication and ultimately made him submit to a humiliating penance at Canossa in 1077. In 1080 Henry again deposed G., proclaimed in his place the anti-pope Clement III., and laid siege to Rome (1081-84). G. was relieved by Robert Guiscard, and withdrew to Salerno, where he d. See studies by J. W. Bowden, 1846; W. Stephens, 1886; P. E. Villenain (Eng. trans., 1873); A. Vincent, 1896; A. Mathew, 1910; and A. J. Macdonald, 1932.

Gregory VIII. (*Alberto de Mora*, Oct. 21 to Dec. 17, 1187) was b. in Benevento. He made peace with Henry VI. and reconciled the Pisans and the Genoese. He d. at Pisa while inaugurating a new crusade to recover Jerusalem.

Gregory IX. (*Ugolino dei Segni*, 1227-1241) was b. of noble family at Anagni, and studied at Paris and Bologna. He excommunicated Frederick II. for refusing to take part in the crusades, absolved him in 1230, but again excommunicated him in 1239. The emperor marched on Rome (1241), but (i. d. before the siege began. He made rules against the here-

tics and systematised the Inquisition. See his letters in *Monumenta Germaniae historica*, 1883, and studies by P. Balan, 1872-73; J. Felton, 1886; and L. Zarncke, 1930.

Gregory X. (*Tebaldo Visconti*, 1271-76) was b. at Piacenza in 1208. During his pontificate a temporary union was brought about between the Gk. and Rom. Churches, and the constitution of the conclave was determined upon (1274).

Gregory XI. (*Pierre Roger*, 1370-78) was b. at Limousin in 1330. He reformed the monastic orders, tried to make peace between England and France, and at the earnest entreaty of St. Catherine of Siena transferred the papal see from Avignon back to Italy (1377).

Gregory XII. (*Angelo Cornaro*, 1406-15) was b. of noble family at Venice about 1327. He opened negotiations with the anti-pope, Benedict XIII. (1408), but on his creation of new cardinals, his former cardinals left him, and both popes were deposed (1409) in favour of Alexander V. G. retaliated by banning Benedict and Alexander as schismatical, but was banished from Naples in 1411 and sent in his resignation to the Council of Constance (1415). He became cardinal-bishop of Porto, and d. at Recanati in 1417.

Gregory XIII. (*Ugo Buoncompagno*, 1572-85) was b. at Bologna in 1502. He took part in the Council of Trent (1562-1563). He denounced heresy, helped the Irish against Elizabeth, subsidised Philip II. in his wars against the Netherlands, and supported the Catholic League in France. He promoted the work of the Jesuits, and estab. the Collegium Germanicum in Rome. On Feb. 24, 1582, he brought about the reform of the calendar.

Gregory XIV. (*Niccolò Sfondrato*, 1590-1591) was b. at Cremona in 1535. He was under the influence of Philip II., and excommunicated Henry of Navarre.

Gregory XV. (*Alessandro Ludovisi*, 1621-23) was b. at Bologna. He founded the Congregation of the Propaganda, and helped Ferdinand II. in the Thirty Years war.

Gregory XVI. (*Darlotommo Cappellari*, 1831-46) was b. at Belluno in 1765. He entered the order of the Camaldolese, and later was sent to Rome and created cardinal. He was a great patron of learning and spent money lavishly on architecture. He wrote *Il Trionfo della Santa Sede* (1799). See life by Sylvain, 1889; also N. Wiseman, *Recollections of the Last Four Popes*, 1853, and F. Nielsen, *History of the Papacy in the Nineteenth Century*, 1906.

See also L. Ranke, *History of the Popes*, 1879; L. Pastor, *History of the Popes* (Eng. trans., 1899); M. Creighton, *History of the Papacy*, 1899; and H. K. Mann, *Lives of the Popes*, 1902-10.

Gregory, name of a Scottish family, distinguished in mathematics and medicine.

James Gregory (1638-73), native of Aberdeen, and educated at the grammar school and Marischal College of that city. He invented the Gregorian reflecting telescope, described in his *Optica Promota*

(1663). While studying at Padua Univ. he pub. *Vera circuli et hyperbolæ quadratura* (1667); *Geometria Pars Universalis* (1668); and *Exercitationes Geometricæ* (1668). He was elected F.R.S. and prof. of mathematics at St. Andrews (1699) and Edinburgh (1674).

David Gregory (1661-1708), nephew of above, b. in Aberdeen. He was appointed prof. of mathematics at Edinburgh (1683-1691), and Savilian prof. of astronomy at Oxford (1691-1708). He was a friend and admirer of Newton. Chief pubs: *Exercitatio Geometrica de Dimensione Figurarum* (1681); *Astronomia Physicæ et Geometricæ Elementa* (1702); and an ed. of Euclid (1703).

John Gregory (1742-73), grandson of James G., b. at Aberdeen. He studied medicine at Edinburgh and Leyden, becoming prof. of medicine at Aberdeen (1755) and at Edinburgh (1766-73). His works include *A Comparative View of the State and Faculties of Man* (1765) and *Elements of the Practice of Physic* (1772); his collected works were ed. by Tytler (1788).

James Gregory (1753-1821), son of John G. and a native of Aberdeen. After studying at Edinburgh, Oxford, and abroad, he became prof. of medicine at Edinburgh (1776). He wrote *Conspectus medicinæ theoreticæ* (1788) and *Literary and Philosophical Essays* (2 vols.), 1792.

William Gregory (1803-58), son of the preceding. He became prof. of chem. at Glasgow (1837), Aberdeen (1839), and Edinburgh (1841). He was among the first to advocate Liebig's theories in Great Britain, and trans. Liebig's *Principles of Agricultural Chemistry*, 1855. He also wrote *Outlines of Chemistry* (1845) and *Elementary Treatise on Chemistry* (1853). Consult A. G. Stewart, *The Academic Gregorians* (Famous Scots series), 1896.

Gregory, Isabella Augusta, Lady (1852-1933), Irish playwright and theatrical patentee; youngest daughter of Dudley Perce, of Roxborough, co. Galway. Married, 1880 as his second wife, Sir Wm. Henry G., a former M.P. for Dublin city and co. Galway. In the last years of the nineteenth century she was foremost in founding a national drama in Ireland, and in 1904 she obtained a patent for the Abbey Theatre—the present home of that drama. Wrote many one-act plays, including *The Workhouse Ward*, *The Gael Gate*, *The White Cockade*, and *Dave*. Rendered Irish sagas into the Irish dialect of Eng. and also made adaptations from Molière. She did much to preserve Irish folk-lore. With Yeats and Synge she was one of the leading figures of the older generation of dramatists in the modern Irish theatre. In 1916 she began to incorporate her records, diaries, and personal memoranda into a series of private journals, which eventually reached a total of forty-two typewritten vols., pub. as *Lady Gregory's Journals, 1916-1930* (1946) and ed. by Lennox Robinson. It is an informed commentary by one who possessed an original creative genius of her own and a flair for detecting and encouraging genius in others.

Gregory, Sir Richard Arman (b. 1861), Eng. astronomer and scientist, b. at Bristol. He was educated at an elementary school and at evening classes, and later studied at the Royal College of Science. Here he met H. G. Wells, with whom he was associated until Wells's death in 1946. He was editor of *Nature* from 1919 to 1939. Knighted in 1919 and created a baronet in 1931. He has been president of many scientific and educational societies, and is a fellow of the Institute of Physics and of the Royal Astronomical Society. The culmination of his career was his election as president of the Brit. Association for the Advancement of Science (1940-46). In 1893 he was joint author, with H. G. Wells, of *Honours Physiology*. His book *Religion in Science and Civilization* (1910) is a masterly analysis of the whole process of civilisation. On the same theme is his *Gods and Men* (1949). Other pubs.: *British Scientists* (1941); *Science in Chains* (1911); and *Education in World Ethics and Science* (1941).

Gregory, Lake, large salt lake in S. Australia, E. of Lake Eyre.

Greif, Martin (1839-1911), pseudonym of Friedrich Hermann Frey, a Ger. dramatist. He was b. at Speler and educated at Munich. His lyrics, which are beautiful and full of noble sentiment, are collected in *Gedichte*, 1868, and *Neue Lieder und Märcen*, 1902. His dramatic pieces include *Nero* (1877); *Marino Falieri* (1879); *Konradin* (1888); *Agnes Bernauer* (1894); *General York* (1899), and *Schiller's Demetrius* (1901). *Hans Sachs* (1866, recast 1891) appeared under his own name.

Greifenberg, see GRYFICE.

Greifenhagen, see GRYFINO.

Greifswald, tn. in Pomerania, Germany, about 3 m. from the Baltic and 70 m. N.W. of Stettin. It is situated on the r. b. of the navigable Ryck, 2½ m. above its mouth. It was founded by some Swedish traders about 1241. There is a fine old church and some late Gothic gabled houses. The Univ. was founded in 1456 and owns some famous tapestry. There are iron foundries and railway carriage works. During the greater part of its hist. it was a Swedish tn., and only became Ger. in 1815. Pop. (1939) 40,000.

Greisen, substance resembling pale granite, from which it differs by the absence of felspar and biotite. It consists essentially of quartz and muscovite, the latter, which has a pearly lustre, giving it a silvery appearance. Accessory minerals are topaz, fluor spar, apatite, etc. Containing small amounts of tin oxide, it is worked as a source of this metal in Cornwall, Saxony, and Tasmania.

Greiz, tn. in Thuringia, Germany, situated about 50 m. from Leipzig, and is in the middle of the White Elster valley. Its manufs. are cashmeres, merinos, and other fabrics, and there are large dye-works. Pop. 39,900.

Grenada, is. of the W. Indies which belongs to Great Britain, situated at the southernmost point of the Caribbees. It is 21 m. in length and about 12 m. in breadth, and has an area of 13.3 sq. m.

The is. is volcanic, having many craters, the highest of which is St. Catherine, which is about 2750 ft. The climate of G. is equable and healthy, but the rainfall is usually excessive, being often more than 200 in. per annum. The is. is practically free from hurricanes. The maximum mean temp. is 90° F., and the minimum 68°, but in the mts. it falls below 60°. The cap. of the is. is St. George's (pop. 6000) situated on a very fine harbour. It was estab. by the Fr. in 1705, when it was called Fort Royal; it received its present name during the administration of Governor Robert Melville (1764-71) when an ordinance was passed substituting Eng. for Fr. names. In St. George's Church, which was built soon after 1763, are tablets erected in 1799 to the memory of the victims of the Brigands' war (see below). Gov. House stands on rising ground overlooking the tn. and harbour. It was built in 1802-7 and modernised in 1887 and 1902. A favourite excursion from St. George's is the drive to the Grand Etang (Large Pond), a freshwater lake 2½ m. in circumference and 1740 ft. above sea level and occupying the crater of an extinct volcano. Other tns are Grenville or La Baye on the E. of the is., Charlotte Town or Gouyave (2500), and Hillsborough (100). Columbus discovered G. in 1498 on his third voyage, when he was hastening back to his colony on Española after finding and naming Trinidad. Some say that he named the is. Ascension, others that he named it Conception; no one knows when it received its present name. The Spaniards left it alone, partly because there was no gold there and partly on account of the Caribs. In 1651 du Parquet, Fr. governor of Martinico (Martinique), attracted by the fertility of the is., tried to induce the Caribs to part with the is. by presents of knives, hatchets, and brandy, but in vain. He thereupon erected a fort, fighting broke out, and the Caribs were soon reduced to less than a hundred, the last fugitives being driven to a rock overhanging the sea whence they leapt to their death. This spot, Le Morne des Sauteurs, is on the N. coast and retains its name to-day. A few years later du Parquet sold the is. to the Comte de Cerillac for about £2000, who installed as his governor a man whose oppression resulted in his being tried and shot on the top of the hill on the Grand Etang road. Cerillac in his turn sold the is., and for the next ten years, 1661-74, it was owned by the Fr. W. Indian Company, and then devolved on the Crown. The Eng. seized it in 1762, at the time of Rodney's first cruise in the W. Indies, but the Fr. recaptured it in 1779. Three years later Rodney's great victory over de Grasse (see SAINTS, BATTLE OF THE) recovered the is., and it has been in Brit. hands ever since. One of the prin. events in the hist. of G. is the Brigands' war in 1795. This was really a rebellion, instigated by the revolutionary fanatic, Victor Hugues of Martinique, and was the last Fr. attempt to recover the is. The rebels, led by Julien Fédon and inflamed by Fr. revo-

lutionary doctrine, committed great excesses, among which was the massacre of Lt.-Governor Home and some forty-eight Brit. subjects. The rising was suppressed in 1796, the Royal Black Rangers showing great gallantry against odds in the investment of the rebel camp on Port Royal Hill. In 1766, when the four is., G., Dominica, St. Vincent, and Tobago, were formed into the gov. of G., a general council was set up for them by the first governor. Later the other is. became separate colonies from G., while Tobago was ceded to France. There was another period in which the is., though retaining its own legislature, came under the authority of the governor-in-chief of Barbados. But in 1885 G., St. Vincent, St. Lucia, and Tobago were grouped together as the Windward Is., and the situation to-day is that there is one governor in common for the is. constituting the Windwards (now G. and the Grenadines, St. Lucia, St. Vincent, and Dominica), who resides in G. and is represented in the other is. by administrators. G. was under the old colonial representative form of gov. from 1766 to 1875. The massive and highly prized 45-lb. silver mace appeared on the table of the House of Assembly for over a century, but in 1876, when G. was proclaimed a crown colony, the mace was taken away and only reappeared in 1931 when the new legislative council with elected members was opened. The chief crop is cocoa; sugar and rum were formerly the chief industries, but now not enough sugar even for local needs is produced. The chief exports are cocoa, nutmegs, mace, raw cotton, and lime oil. There are elementary and secondary schools. Carriacou, the largest of the Grenadines, is attached to G. for administrative purposes. Pop. (estimated 1947) 72,800. See D. G. Garraway, *The Insurance, 1795-6, 1877, and The Grenada Handbook and Directory* (ann.).

Grenade, ball of iron which is made hollow and filled with explosive material. By means of a lighted fuse the ball is exploded. Hand-Gs. were at one time carried by soldiers and thrown amongst the enemy, hence the term grenadiers. Gs. played an important part in the Jap. attacks on the trenches at Fort Arthur in 1904. Both Germany and Great Britain had adopted Gs. just before the outbreak of the First World War; the former had a rifle G. and the latter a 'stick' G., both exploding on impact. Germany, however, was well supplied, whereas Great Britain, in common with her Allies, was forced to improvise Gs. from condensed milk tins and similar receptacles. Many varieties were invented during the First World War, the best known on the Allies' side being the Mills (see also BOMBS). This was fitted with a time fuse connected with a lever held in position by the hand and made to operate only when the G. had been thrown. This pattern was modified for use as a rifle G. Nearly every pattern had a cast-iron segmented body which split up when the G. exploded.

Grenadier, originally a soldier trained

to throw hand-grenades, who had to be distinguished by his height and strength. Subsequently the word was applied to a member of the first company of a battalion. It is now used only of the G. Guards, formerly the first regiment of foot guards.

Grenadier Guards ranks as the first regiment in the Brit. Army, though of later date than the Coldstream Guards (q.v.). The G. G. date from 1855, in which year a royal regiment of guards, raised by Col. Russell at the Restoration as a body-guard for Charles II., were combined with Lord Wentworth's regiment formed in 1656, the combined unit being styled the First or Grenadier Regiment of Foot Guards. The G. G. fought at Namur in 1695; at the siege of Gibraltar, 1704-5; in all Marlborough's great battles; at Dettingen, Egmont-on-Zee; with Moore at Corunna and with Wellington in the Peninsula and at Waterloo. In the Crimean war they were at Alma, Inkerman, and Sevastopol; in Egypt at Tel-el-Kebir and Suakin and at Khartoum; and in the S. African war with Methuen at Modder R. On the outbreak of the First World War the 2nd Battalion of the G. G. joined Gen. Sir John French's 'Contemptible Little Army' and took part in the famous retreat from Mons and the battles of the Aisne and the Marne. At the end of Oct. 1914 it defeated the renowned Prussian Guard in their many efforts to break the Brit. line and reach the channel ports. The 1st Battalion landed at Zeebrugge on Oct. 7, 1914, and took up a position in the Ypres sector. In March 1915 it distinguished itself at the battle of Neuve Chapelle. The 3rd Battalion went overseas in August 1915, and the 4th Battalion joined it later in the year. In the summer of 1915 the battalions of Foot Guards at the front were formed into a Guards Div. under the command of Lord Cavan. In the 1915 battle of the Somme the 1st Battalion made a great name for itself by its gallant conduct at the action at Les Boeufs. The prin. operation in which the G. G. took part in 1917 was the breaking up of the Ger. offensives in July and Aug. on the Yser Canal. The successes gained here drew a message of admiration and praise from the king. In Nov. they moved further S. and took part in the attack against Cambrai (q.v.) in which the 4th Battalion earned the special thanks of the G.O.C. 40th Div. for advancing to his support at Bourlon Wood (q.v.) across the open, which was under heavy shell fire. From Jan. to March 1918 the G. G. were in the Arras sector (see ARRAS, BATTLE OF) and felt the full force of the great Ger. breakthrough. By the time the Allies' counter-offensive was launched in Aug. all battalions had been reorganised and re-equipped. In this offensive the 1st Battalion gained further laurels by the capture of St. Leger and at the crossing of the Canal du Nord. In the latter operation Viscount Gort was twice wounded, his gallant conduct winning for him the V.C. After the armistice the Guards Div. formed part of the Army of Occupation in Germany. In the

Second World War the G. G. fought on the W. front and as part of the Eighth Army (q.v.) in N. Africa and Italy. They were equally conspicuous in the battle of Flanders and at Dunkirk (1940), where their former leader, Viscount Gort, was now commander-in-chief (see GORT, VISCOUNT). On the It. front the G. G. were in action all through the bitter fighting of the autumn of 1943 up to the battles on Monte Cassino, and in 1944 they were at the Anzio beachhead. As part of the Brit. Guards Armoured Div. the G. G. were in the heavy fighting in the Nijmegen area in 1944 and in many of the battles of the 21st Army Group both W. and E. of the Rhine in 1945. See P. Forbes and N. Nicolson, *The Grenadier Guards in the War 1939-45*, 1949.

Grenadines, chain of small is. belonging to the W. Indies, in the Windward group. They extend between St. Vincent and Grenada for 60 m., and are of volcanic origin. Carriacou, Union, and Canaguana are the largest, and they yield coffee, cotton, sugar, and indigo. Pop. 6770. See also GRENADA; ST. VINCENT.

Grenelle, suburb of Paris, France, on the Seine, famous for its artesian well, which supplies water to the upper part of the city. The well has a depth of 1704 ft. and a temp. at the bottom of 82°-85° F.

Grenfell, Bernard Pyne (1869-1926), Eng. Egyptologist, b. at Birmingham, son of John Glanville G.; educated at Clifton College and at Queen's College, Oxford. In 1894 he began excavations in Egypt, and, in collaboration with A. S. Hunt, pub. his important discoveries of aet. papyri, including *Sayings of our Lord* and *New Sayings of Jesus*. A fellow of the Brit. Academy, and from 1908 prof. of papyrology at Oxford Univ. His pubs. include *The Revenue Laws of Ptolemy Philadelphus* (1896); *An Alexandrian Erotic Fragment* (1896); and, in conjunction with A. S. Hunt, *The Geneva Fragment of Menander* (1898); *The Amherst Papyri* (1900-1); *The Tebtunis Papyri* (1902); and *The Hibeh Papyri* (1906).

Grenfell, Francis Wallace, Baron (1841-1925), Brit. general, b. in London. He was educated at Blandford, and entered the army in 1869, attaining the rank of captain in 1871. He served in the Kaffir war, 1878, and in the Zulu war, 1879. During the war in the Transvaal, 1881-82, he served as assistant quartermaster-general under Sir Evelyn Wood. He distinguished himself in the Egyptian war, fighting at Tel-el-Kohir in 1882. He took part in the Nile Expedition, 1884; and was sirdar of the Egyptian Army, 1885-92. He commanded the operations at Suakin, 1888, and won the battle of Toski, 1889. From 1894 to 1897 he was at the War Office as inspector-general of auxiliary forces. In the latter year he again took command in Egypt, and he was commander-in-chief and governor-general of Malta, 1899-1903. He commanded the 4th Army Corps, 1903-4, and the forces in Ireland, 1904-8. He was created first Baron G. of Kilvey in 1902, and made field marshal in 1908.

Grenfell, George (1849-1906), Eng. explorer and missionary, *b.* at Lanced in Cornwall. In 1874 he went to Kamerun under the Baptist Missionary Society, and with Comber explored the country. Four years later he went to the Congo to make an extensive survey, and in 1885 explored the Ubangi R. During 1891-92 he served on a commission as a delegate of the Congo Free State to determine the boundary line between that country and the Portuguese ter. See Sir H. Johnston, *George Grenfell and the Congo*, 1908, and G. Hawker, *Life of George Grenfell*, 1909.

Grenfell, Julian Henry Francis (1888-1915), Eng. soldier and poet, *b.* in London, eldest son of first Baron Desborough. He was educated at Summer Fields, Eton, and Balliol College, Oxford. He passed, 1910, into the army, first of all univ. cadet, and went to India to join the 1st Dragoons with which corps he went to S. Africa, 1911. He served in Flanders in First World War. Twice mentioned in dispatches, and received the D.S.O. *D.* from wounds, May 26. He was over 6 ft. tall, full of enthusiasm and vague ideals, which embraced religion and a love of war. In the year of his death he had written the sounding poem *Into Battle*. See T. Sturge Moore, *Some Soldier Poets*, 1919.

Grenfell, Sir Wilfred Thomason (1865-1910) ('Grenfell of Labrador'), Brit. medical missionary, whose name is inseparably associated with the development and well being of Labrador, a desolate and barren country where disease was rife and living precarious. *B.* at Parkgate, Cheshire; educated at Marlborough and Oxford; studied medicine at the London Hospital, being house surgeon to Sir Frederick Treves. First visit to Labrador began with a cruise as medical missionary with the Royal National Mission for Deep Sea Fishermen, and in 1892 he went to Labrador as permanent medical missionary. His valuable pioneering work there greatly improved the lot of the local fishermen. His schemes for the development of Labrador grew far beyond the means of the mission, so he organised lecturing tours in Britain, Canada, and the U.S.A., until eventually, largely with Amer. support, the International G. Association was founded with an endowment of over £200,000. He built hospitals, nursing stations, orphanages, schools, and stores in Labrador. He owned and operated steamships and yaws in connection with his various hospitals, and was himself surgeon-in-chief and master of a hospital steamship which cruised the coasts of Labrador. In 1912 he opened the King George V. Seamen's Institute, the foundation stone of which was laid by the king by electric message from England. In the First World War he was with the Harvard surgical unit in France. Essentially of the pioneering temperament, the effectiveness of his work was enhanced by an attractive and strongly individual personality. Eloquently voiced the charms of Labrador both by word and pen. Among his numerous works are *Vikings of*

To-day (1895); *The Harvest of the Sea* (1905); *Labrador: the Country and its People* (1909, new ed., 1922); *Autobiography of a Labrador Doctor* (1919); *Labrador Looks at the Orient* (1928); and *The Romance of Labrador* (1934). In 1920 he was awarded the gold medal of the National Academy of Social Sciences of America, and in 1930 the Livingstone gold medal of the Royal Scottish Geographical Society. See J. B. Mathews, *Wilfred Grenfell: Master Mariner*, 1924, and F. J. Waldo, *Grenfell: Knight-errant of the North*, 1924.

Grenfell, William Henry, first Baron Desborough of Taplow (1855-1945), son of C. W. G., M.P. Was educated at Harrow and Oxford. A great all-round athlete at school and at the univ.; he also twice swam Niagara. He represented Salisbury in Parliament in 1880, 1885. He was returned M.P. for Hereford in 1892, but resigned, and later represented the Wycombe div. of Buckinghamshire in the Conservative interest. *G.* was a member of the Tariff Commission of 1901, and was president of the Central Association of Volunteer Regiments. Chairman of committees on policy, and on freshwater fish, and of the Thames Conservancy Board, father of Julian G., the poet.

Grenoble (anc. Gratianopolis), former cap. of the Dauphiné, now a first-class fortress and chief city of the dept. of Isère in S. France, 60 m. S.E. of Lyons. Its bishopric was founded in the fourth century; there are many interesting buildings, including the fifteenth-century cathedral of Notre Dame and the Gothic Palais de Justice. The tn. has a univ. of three faculties, with a magnificent library. The chief manu. are kid gloves, liquors, paper, cement, hats, and artificial flowers, and considerable trade is done in walnuts, grain, and cheese. Silk-spinning and iron-founding are also carried on (see A. Prudhomme, *Histoire de Grenoble*, 1888). An Amer. flying column reached *G.* on July 23, 1941, only eight days after Brit., Amer., and Fr. forces landed in S. France. Pop. 102,100. See further under WESTERN FRONT IN SECOND WORLD WAR.

Grenville, George (1712-70), Eng. statesman, educated at Eton, and Christ Church, Oxford. He sat in Parliament as member for Buckingham from 1741 till his death. After having held various offices he became secretary of state, 1762; first lord of the admiralty, 1762-63; chancellor of the exchequer, first lord of the treasury, and Prime Minister, 1763-1765. His ministry is especially remembered for the prosecution of Wilkes and the passing of the Amer. Stamp Act, 1765. See *The Grenville Papers*, 1852-53.

Grenville, Richard, see TEMPLE, EARL.
Grenville, or Greyville, Sir Richard (c. 1511-91), famous Eng. seaman, of an anc. Cornish family. He commanded Raleigh's exp. flt. to Virginia in 1585-1586, and was in command of the *Revenge* in the fight with the Sp. fleet off Flores in the Azores, and *d.* on board the enemy's flag-ship, *San Pablo*. See Sir Walter Raleigh, *The Truth of the Fight about the*

Iles of Azores, 1591; G. Markham, *The Most Honourable Tragedie of Sir Richard Grinville, Knight*, 1595; J. Froude's essay in *Short Studies on Great Subjects*, 1867; Tennyson's ballad, *The Revenge*; and A. L. Rowse, *Sir Richard Grenville*, 1948.

Grenville, Richard Plantagenet Temple Nugent Brydges Chandos, see BUCKINGHAM AND CHANDOS, DUKE OF.

Grenville, William Wyndham, Baron (1759-1831), Eng. statesman, son of George G. He was educated at Eton and Christ Church, Oxford, and entered Parliament as member for Buckingham in 1782. He became secretary to his brother Earl Temple, then lord-lieutenant of Ireland, and paymaster-general of the army under his cousin, Wm. Pitt. He was appointed in succession Speaker of the House of Commons (1789); secretary of state for the home dept. (1789); and foreign secretary (1791). Pitt and his colleagues resigned office in 1801, on George III.'s refusal to pass the Catholic Emancipation Bill. G. formed part of the short-lived 'Gov. of all the Talents,' 1806-7. He ed. Chatham's letters to his nephew (1804) and wrote *Nugae Metricae* (1824). See E. D. Adams, *Influence of Grenville on Pitt's Foreign Policy*, 1901.

SIR THOMAS GRESHAM

Gresham, Sir Thomas (1519-79), Eng. merchant, founder of the Royal Exchange. He was apprenticed to his uncle, Sir John G., a London mercer, and in 1513 was admitted a member of the Mercers' Company. He held the post of 'king's merchant' in Antwerp from 1551 to 1567. For a short while he acted as Queen Elizabeth's ambas. at Brussels (1559). During 1566-71 he erected the Royal Exchange on the model of the one in Antwerp, and left a large sum of money to endow a college with seven lectureships. His house in Bishopsgate Street was converted to this purpose, and in it lectures were given from 1567 to 1768. See Dean Burgon, *Life and Times of Sir Thomas Gresham* (2 vols.), 1839, and C. Unwin, *Studies in Economic History*, 1927.

Gresham's Law was first so called by Macleod in 1857, on the understanding that the principle 'bad money drives out good' was first expounded by Sir Thomas Gresham to Elizabeth in 1558. Early economic writers, such as Copernicus, had, however, already explained it. The principle is that the worst form of currency will be most used in circulation and the more valuable tend to disappear. Thus, if there are two metals in circulation, the one which costs least in production will predominate. The law also applies where there is debased coinage in circulation with full-weight coinage, and metallic currency with inconvertible paper money.

Gresset, Jean Baptiste Louis (1709-77), Fr. poet and dramatist, b. at Amiens, where he was brought up by Jesuits, whose society he later joined. In 1731 he pub. his delightful poem, *Vert Vert*, of a convent parrot, but owing to the ridicule which the poem poured on monks and nuns G. was expelled from the society. His reputation was made, and he returned to Paris, where he pub. a second poem, *La Châtelaine*, followed by *Carême impromptu* and *Lytrix rituel*. He produced a tragedy, *Edouard III.* (1740), and two comedies, *Le Méchant* and *Sidnet* (1745). He was admitted to the Academy, 1748. See A. A. Renouard's ed. of his poems, 1811, and the lives by St. Albain Berville, 1863, and by Jules Vague, 1894.

Greta Hall is situated in the Vale of Keswick, Cumberland, and consists of two houses under one roof. Coleridge took up his residence (1800-3) in one half, and in 1803 Southey occupied the other till his death in 1843.

Gretna Green, vill. in Dumfriesshire, Scotland, 9 m. N.N.W. of Carlisle. It was formerly notorious for the clandestine marriages which were, after the abolition of Fleet marriages (1754), held here, as being the nearest place within the Scottish border line. In 1856 a law was passed requiring one of the parties to reside in Scotland for three weeks previously. In the 'blacksmith's shop' case, at the court of session, Edinburgh (1939), in which Lord Russell rejected the claim of the partners of the blacksmith's shop and Gretna museum to the exclusive use of the name 'blacksmith's shop' as a description of the premises, the judge affirmed that the legend or belief as to irregular runaway marriages being performed in bygone days by a blacksmith as the so-called priest, or in a smithy, was unfounded in fact—a belief which, without doubt, has led to many of the G. marriages. A collision between two passenger trains and a troop 'special' occurred here on the Caledonian Railway on May 22, 1915, involving 227 deaths. See P. O. Hutchinson, *Chronicles of Gretna Green*, 1844, pp. 2800.

Grétry, André Ernest Modeste (1741-1813), Fr. operatic composer; comedy was his forte, and his efforts in this direction won for him a very wide contemporary reputation, which has, however, diminished considerably, although he is regarded by musical historians as the originator

of the modern type of Fr. comic opera. His operas number about fifty, the best being *Le Tableau parlant* (1769); *L'Amant jaloux* (1778); *Le Caravane de Cairo* (1783); and, perhaps his finest achievement—certainly his most popular one—*Richard Cœur de Lion* (1784). See studies by J. E. Bruy, 1931, and J. Sauvenier, 1934.

Greuze, Jean Baptiste (1725–1805), Fr. genre and portrait painter, b. at Tournus, near Mâcon, in Burgundy; studied in the Academy at Paris. His first picture, 'Le Père de famille expliquant la Bible à ses enfants,' was so good that his teachers doubted whether it was his sole production. His success, however, was followed up, and he won great popularity, especially for his pretty heads of young girls. He was elected to the Academy in 1769. His chief works are 'Aveugle trompé' (1755); 'La Jeune Fille à l'agneau'; 'La Jeune Fille qui pleure le mort de son oiseau,' etc. See life by C. Maclair, 1905, and E. Pilon, *Greuze, peintre de la femme*, 1912.

Greville, Charles Cavendish (1794–1865), Eng. diarist; educated at Eton and at Christ Church, Oxford. He became private secretary to Earl Bathurst and clerk of the council in Admiralty (1821–60), during which time he made excellent use of his opportunities for studying court and political life. He left his journal to Henry Reeve, with the request that it should be pub. soon after his death. Accordingly instalments appeared in 1875, covering the years 1820–37; in 1885, covering 1837–51; and the third portion, 1852–60, in 1887. These memoirs are of great value to students of nineteenth-century hist.

Greville, Sir Fulke, Lord Brooke (1554–1628), Eng. poet, b. at Beauchamp Court, Warwickshire. He was educated at Cambridge and Oxford, and travelled abroad; entered the court of Queen Elizabeth in 1577. He was a friend of Sir Philip Sidney, whose life he wrote (posthumously pub. in 1652). G. wrote a tragedy, *Mustapha*, in 1609, some sonnets, and a considerable number of laboured didactic poems. He was chancellor of the exchequer from 1614 to 1621, and was killed in a quarrel with his serving-man. See A. Grosart, *The Friend of Sir Philip Sidney*, 1894, and his ed. of *Greville's Collected Works*, 1870.

Greville, Henry, see DURAND, ALICE.

Grévy, François Paul Jules (1807–91), president of the Fr. Republic, b. at Montsou-Vandrey, Jura. Became an advocate in 1837. In 1848 he was elected by the republicans of his dept. to the Constituent Assembly, of which he became vice-president. He vigorously opposed the second empire under Louis Napoleon. In 1868 he was returned as deputy for the Jura and was elected president of the National Assembly in 1871. On the resignation of Marshal MacMahon in 1879 he was elected president of the republic. In 1885 he was re-elected for a further period of seven years, but, on the discovery of his son-in-law Daniel Wilson's dishonest traffic in the decorations of the Legion of

Honour, he was obliged to resign office. See his *Discours politiques et judiciaires*, ed. by L. Delabrouse (2 vols.), 1888, his life by A. Barbon, 1879, and A. Dansette, *L'Affaire Wilson et la chute du Président Grévy*, 1936.

Grey, Albert Henry George, fourth Earl (1851–1917), Brit. administrator; b. Nov. 28, the son of Gen. Hon. Charles G. He was educated at Harrow and at Trinity College, Cambridge, and entered Parliament as Liberal member for S. Northumberland in 1885. He succeeded his uncle in the earldom, 1894. In 1896–1897 he was administrator of Rhodesia, where he was associated with Cecil Rhodes. He was director of the Brit. S. Africa Company 1898–1904, and lieutenant of Northumberland, 1899–1901. He succeeded the earl of Minto as governor-general of Canada, 1904–11. He pub. *Hubert Hervey, a Memoir* (1899).

Grey, Charles, second Earl (1764–1845), Eng. statesman, b. at Fallodon, Northumberland, and educated at Eton and Cambridge. In 1786 he was returned by Northumberland to Parliament in the Whig interest; he vigorously opposed the policy of Wm. Pitt, associating himself with Fox, Burke, and Sheridan as one of the managers of the impeachment of Warren Hastings. On Burke's supporting the gov. in declaring war upon France during the revolution, G. remained faithful to his leader. He was one of the founders of the Society of the Friends of the People, and asserted that Parliament did not represent the nation. He moved the impeachment of Pitt (1797), and took part in the secession of the Whigs as a protest against his policy. On the formation of the Fox-Greville ministry, he was appointed first lord of the Admiralty (1806) and, on the death of Fox, foreign secretary and leader of his party. During his ministry Wilberforce's Act abolishing African slavery was passed (1807). In that year his ministry retired and he led the opposition till 1830, when he became Premier and first lord of the treasury. During this term of office the great Reform Bill went through all its readings, and passed the House of Lords in 1832. In 1834 he resigned office on the Irish question, and retired from public life. See his *Correspondence with William IV.*, 1867; *Correspondence with Princess Lieven*, 1890; and the life, written by his son, Charles Grey, 1861.

Grey, first Viscount, Edward of Fallodon, Lord Grey (1862–1933), Eng. statesman, the grandson of Sir George G. Gladstone's colleague. He was educated at Winchester and at Balliol College, Oxford, and entered Parliament in 1885, representing Berwick-on-Tweed as a Liberal. During the Rosebery administration (1892–95) he was appointed under-secretary for foreign affairs. From 1905 until 1916 he was secretary for foreign affairs, and received for his distinguished services the K.G. in 1912. He was largely responsible for the successful conclusion of the negotiations following the Balkan war of 1912–13, at the termination of which the peace of London was signed in 1913. As

foreign secretary during the fateful months of July and Aug. 1914 he strove to avoid the disaster of the First World War. He believed in the efficacy of conferences in settling disputes, whether local or international, and had demonstrated their success. That he failed to persuade Germany in 1914 to similar recourses was due to the determined aggression of the German war lords, which was calculated to override the pacific counsels of the ablest statesmen of any time. In 1915 he was raised to the peerage as Viscount G. of Faldon, and retired from the Foreign Office on the fall of the Coalition ministry. During his long term of office he had shown an unswerving devotion to the highest conceptions of honourable conduct. Indeed he has been criticised for his aloofness from those suave veiled artifices which are claimed to be necessary to diplomacy.

In 1918 he went to the U.S.A. as ambassador until Jan. 1920, during which period he issued his pamphlet on the League of Nations. Ever since, in 1916, he had informed President Wilson through Col. House (q.v.) that the existence of a permanent European conference during 1914 would have made the First World War impossible, his ardour for settlement of problems by a league or union had increased, and he became an enthusiastic member as soon as the League of Nations was formed. From 1920 to 1924 he held the leadership of the Liberal party in the House of Lords. In 1925 he pub. his reminiscences under the title of *Twenty-five Years*. In 1928 he was elected Chancellor of Oxford Univ., and in the same year suffered a bereavement in the sudden death of his wife, whom, as Lady Glenconner, he had married in 1922. Falling sight handicapped his later years. In spite of his undoubted gifts he was never happy in parl. life, he lacked the disposition which enjoys the fray and the prominence. His other interests were angling, in which he was an acknowledged authority, tennis, at which he was a past champion, and wild bird sanctuaries. Author of *Fly-fishing* (1899); *Faldon Papers* (1926), and *Charm of Birds* (1927). A mural plaque on the wall of the Foreign Office commemorates his name, as also the acquisition of Ross Castle for the nation. See H. Lutz *Lord Grey and the World War* (trans.) 1928, and C. M. Trevelyan, *Grey of Faldon*, 1937.

Grey, Sir George (1799-1882), Eng. statesman, the nephew of Earl G., the Liberal statesman. He was b. at Gibraltar, and was educated at Oriel College, Oxford. He represented Devonport in Parliament from 1832 to 1847, and became under-secretary for the colonies in 1831. He was appointed judge-advocate (1839), chancellor of the duchy of Lancaster (1841), and, during Russell's ministry, home secretary. (1848). He was not a brilliant speaker but showed much practical ability during the Chartist riots and the Fenian activity in Ireland. Under Lord Palmerston he was home secretary (1855), chancellor of the duchy of Lancaster (1859), and home secretary again in 1861. See memoirs by M. Creighton, 1884.

Grey, Sir George (1812-98), governor of New Zealand. He was b. at Lisbon, and educated at the Royal Military College, Sandhurst. He entered the army in 1829, and attained his captaincy in 1837, when he sent in his papers. From 1837 to 1840 he explored the N.W. region of Australia for the Royal Geographical Society, publishing the results of his travels in *Journals of Discovery in Australia* (1841). In that year Lord John Russell appointed him governor of N. Australia. He reduced the public expenditure, and showed such wisdom in his government of the young colony that in 1846 he was sent as governor to New Zealand, in order to conciliate the Maori

LADY JANE GREY

chieftains, who were at the time in open rebellion. He succeeded in establishing peace and won the admiration of the natives. In 1854 he was appointed governor and commander-in-chief of the Cape of Good Hope, and had to use all his tact and firmness in allaying the discontent left after the Kaffir war. In 1858 however, the Colonial Office objected to some measures of G., who thereupon resigned office. Feeling in his favour was high at the Cape and he resumed office. In 1861 he was a second time sent to New Zealand to bring the native war to an end. He resigned in 1867 on some point of difference between himself and the Colonial Office, and entered the New Zealand Legislature in 1874, becoming premier in 1877. He advocated many reforms, including manhood suffrage, and had great influence with all parties. His pub. include *Polynesian Mythology* (1855) and *Proverbial Sayings of the Ancestors of the New Zealand Race* (1858). See lives by W. Ross, 1892, and J. Collier, 1909.

Grey, Henry George, third Earl (1802-1894), Eng. statesman, b. at Howick, in

Northumberland. As Viscount Howick he entered the House of Commons, became colonial secretary (1846-52) in Russell's Cabinet, and pub. a defence of his colonial policy, entitled *Colonial Policy of Lord John Russell's Administration* (1853). He also wrote weighty letters to *The Times*, and an *Essay on Parliamentary Government as to Reform* (1858), and edited his father's *Correspondence with William IV.* (1887).

Grey, Lady Jane (1537-54), 'nine days' queen' of England and great-granddaughter of Henry VII. She was b. at Brndgate in Leicestershire. In 1553 the duke of Northumberland forced her into marrying his fourth son, Lord Guildford Dudley. On the death of Edward VI. she was proclaimed Queen Jane on July 10, 1553. Meanwhile Mary advanced upon London and Northumberland was too faint-hearted to oppose her. On July 19 Jane found herself a prisoner in the Tower, and on Feb. 12, 1554, was beheaded on Tower Hill on a charge of high treason. She was an exceedingly accomplished scholar, was well versed in feminine arts and was of a happy and gentle disposition. See J. G. Nichols's ed. of *The Chronicles of Queen Jane*, 1850; J. A. Taylor, *Lady Jane Grey and her reign*, 1908; and R. Lacey, *The Nine Days Queen*, 1906.

Grey, Zane (1875-1939), Amer. author, b. at Zanesville, Ohio. Educated, Zanesville High School and univ. of Pennsylvania. Practised as dental surgeon in New York, 1898-1901; after that lived by literature—chiefly novels. Pub. more than fifty vols. Sport and the wild west, both of which he understood, form the staple of his writings—from *Betty Zane* (1904) to *Raiders of Spanish Peaks* (1938).

Greyfriars, church in Edinburgh which dates back to the fifteenth century. It was the scene of the betrothal of the Prince Royal of Scotland (afterwards James IV.) to Cecilia of England, 1471; and the National Covenant was first subscribed here, 1638, when the aggressive measures of Charles I. roused to arms the whole of Scotland. The church was desecrated by Cromwell's soldiers in 1650, and in 1679 its burying-ground was used as a prison for some of the unhappy Covenanters, the Martyr's monument bearing witness to the fact. A new church, since denominated New G., was built in 1721. Among distinguished incumbents was Wm. Robertson, the eminent historian, who was appointed in 1761. Sir Walter Scott, who from youth to manhood attended Old G., in his novel *Guy Rannering* introduces this old church and relates how, when Col. Mannering came to Edinburgh to consult Councillor Pleydell, the latter conducts him to 'the Greyfriars, to hear our historian of Scotland, of the Continent, and of America preach.' Old G. was destroyed by fire in 1845, but has since been repaired at a considerable cost. Its burying-ground contains the tombs of George Buchanan, George Heriot, Allan Ramsay, James Borthwick, Duncan Ban MacIntyre, and Sir Walter Scott's family.

Greyhound, breed of dogs of great antiquity, found from the earliest times in

E. Europe and Asia, while many Egyptian monuments are ornamented with unmistakable representatives of the modern G. They are characterised by their long and narrow muzzles, slight build, and elongated limbs, and small ears falling at the tips, but they differ greatly in the length of their hair. They hunt almost entirely by sight, the sense of smell being defective. The long, slender skull points to affinity with the wolf. The Eng. G. is the best known of the group, and has sometimes been regarded as the parent of the others. It can readily be distinguished from all other dogs by its slender form, smooth hair, and rat-like tail, as well as by its comparatively large size. It is thoroughly adapted for extreme speed, the long tail being used as a balance for the body during quick turns, while the slender limbs with wire-like muscles give the

L. Fall

GREYHOUND

greatest possible length of stride and offer the least possible resistance to the air. The favourite colour is a uniform sandy or pale grey tone, but the colour is of very little importance in comparison with the capacity for speed. The It. G. is kept purely as a pet and is a miniature of the Eng. variety; its proportions are most elegant and its speed considerable, but it is so delicately made that it is almost unable to pull down even a rabbit. The eyes are larger and softer than in the Eng. type, and the most valued are a golden-fawn in colour. The Scottish deerhound is a larger and heavier variety of the Eng. G., with rough and shaggy hair; it used to be employed both for coursing and deer stalking, and the twofold use has given rise to different strains of the breed. The Irish wolf-dogs are now extinct, but seem to have had characteristics of the G. Other varieties are the Grecian, Persian, and Russian Gs., and sev. oriental types characterised by their silky hair. See H. Edwards Clarke, *The Modern Greyhound*, 1948.

Greyhound Racing, term generally used to describe a race of greyhounds in pursuit of a mechanical hare. Coursing (q.v.) is also a form of G. R. The sport first became popular in America, and then rapidly spread to other countries, though

It is claimed that the use of mechanical devices for greyhound races was practised in England long before the Amers, popularised it. By means of a clever device a mechanical imitation of a hare is made to move around a track, and as it passes the starting post the competing hounds are simultaneously released. The races are usually over distances of about a quarter to a third of a mile, and as there is little chance of the dogs overtaking the 'hare,' the contest becomes a competitive race between the dogs. During 1926-27 this racing became extraordinarily popular in Great Britain, attracting not only the attention of sporting men, but also of company promoters. Complaints arose that many of the methods of fraud, which the Jockey Club had more or less successfully countered during many years on the horse-racing course, were practised with impunity in G. R., there being no body whose authority was sufficiently well recognised to prevent such attempts. These difficulties, however, were met by the use of more careful methods at the better-managed tracks and by the establishment of the National G. R. Association, under the control of a committee of persons who issued rules based on and similar to the regulations the Jockey Club insists upon in horse racing. This association issues licences to the proprietors of tracks, and although there is no necessity for the owners of a track to apply for a licence nor abide by the rules, the advantages of doing so are obvious. There are now race-tracks in nearly all the large Brit. cities, the best known in London being at the White City, Harringay, Wembley, and Wimbledon. The Totalisator (q.v.) has been installed in most places.

Greymouth, tn. and seaport of New Zealand at mouth of Grey R. in Westland Prov. It is the prin. centre of the W. coast of the South Is. for railway and tourist traffic. In the surrounding dist. the prin. industries are gold mining in all its phases, coal mining, and timber milling. As a result the export of coal and timber makes the port one of the busiest in New Zealand in point of tonnage. Its bar harbour has an average depth of 24 ft. at high water on the bar at ordinary spring tides, with an average depth of 22 ft. in riv. at high water. The bar has a public library, many hotels, a raccourse, recreation grounds, aerodrome, golf links, and tennis courts. The prin. industries of the tn. are brick works, foundry and engineering works, brewery and dairy factory. Pop. 9200.

Greynville, Sir Richard, see GRENVILLE. Greys, Scots, famous Scottish regiment, and the only surviving distinctively Scottish cavalry regiment. It dates its origin from the religious troubles in Scotland during the reign of Charles II., when, owing to the growing opposition of the persecuted Covenanters, the Scottish Gov. deemed it advisable to increase its military strength. Accordingly three troops of Dragoons were raised in 1678 for the standing army, three more being added in 1681, when the whole six were regimented as the 2nd Regiment of

Dragoons, known later as the S. G., from the colour of the tunic. Their first colonel was the original commanding officer of the first troop, Sir Thomas Dalziel, the strange enthusiast who never cut his beard nor altered the fashion of his uniform from the time of the execution of Charles I. The regiment served in Flanders under William III. from 1694 to 1697, and in all Marlborough's famous battles. At Ramillies they assisted in the capture of the Fr. Régiment du Roi with its colours. They fought at Sheriffmuir and at Fontenoy, and won fame at Waterloo for an heroic charge. After Waterloo came a long spell of inactivity, but in the Crimea they earned the special commendation of Sir Colin Campbell for their part in the charge of the Heavy Brigade at Balaklava under Sir John Scarlett. They were also in the Egyptian war 1881-83, and in the S. African war 1899-1902. In the First World War the S. G. were in the cavalry operations during the Mons retreat and in the subsequent advance from the Marne to the Aisne. Afterwards they fought more often as dismounted troops in the Ypres area, notably in the bitter fighting of Oct. 1914 around Gheluvelt. They were also among the troops which defended Hill 60, and in the fighting at Messines and Wytschaete, and on the Somme, both as mounted and dismounted troops, in the final Ger. offensive of 1918. In the Second World War the S. G. fought on the W. Front.

Greytown: 1. Called also San Juan del Norte, tn. and port of Nicaragua on the Caribbean Sea, at the mouth of the San Juan R. It is a port of call for mail packets, and monopolises the import and export trade of the country. The prin. exports are bananas, coconuts, tortoiseshell, mahogany, india-rubber, and hides. The harbour, once very fine, is now badly silted up. A vast breakwater has been erected pending the construction of a Nicaragua canal. Pop. 2500. 2. Tn. of Natal in the Umvoti valley, 65 m. S.W. of Pietermaritzburg. Pop. 1700.

Gribble (*Limnoria terebrans*), tiny Crustacean isopod, which rolls itself up like a woodlouse. It is common in European seas and has also been found in other parts of the world. It is disastrous to the timber of ships, burrowing into the superficial layers of wood and reducing them to a spongy mass which is easily washed away, thus exposing fresh layers to penetration. The damage done, however, is visible on the surface and is therefore less likely to reach serious proportions without being noticed than that caused by the shipworm (see TEREDO).

Griboyedov, Alexander Sergievich (1795-1829), Russian poet and dramatist, b. at Moscow. In 1828 he became minister-plénipotentiaire to Persia, but in 1829 the populace of Tiflis, inflamed against the Russian embassy, attacked the house and assassinated the minister. G. began his literary work with a comedy, *The Young Spouses*, in 1816, but his great work, *Gore of una*, or *Misfortune from Intelligence* (Eng. trans. 1857), a satirical comedy upon Russian society, was re-

jected by the censorship and was not published until 1833. He left unfinished a romantic drama, *A Georgian Night*.

Grid, Map, see MAPS; NATIONAL GRID.

Grid System, network of conductors of electrical power estab. over Great Britain to connect the generating stations and facilitate the transfer of power at high voltages from one dist. to another. Power is transmitted at 132,000, 66,000, or 33,000 volts, and is reduced to lower voltages in the areas where it is to be used. Overhead transmission lines supported by pylons are used in open country, but in tns. the insulated conductors are carried underground.

Grieg, Edvard Hagerup (1843-1907), Norwegian composer and pianist, *b. at*

EDVARD GRIEG

L. N. A.

Bergen, descended from an Aberdonian who left Scotland in 1779; his musically gifted mother, Gesine (*née* Hagerup) was descended from the Montrose family of Christie. Went to the Conservatoire of Leipzig for his musical education (1858-1862). When he returned from Germany he met Richard Nordraak, who was collecting and editing folk-songs, and it is in G.'s songs that we hear for the first time the music of the N. His Opus I, *Four Piano Pieces*, written during his last years in Leipzig, shows clearly that Schumann and Chopin were his ideals. Then followed sev. of his masterpieces: in 1865 the piano Sonata (Opus 7) and the violin Sonata in F (Opus 8); in 1868 he wrote what is perhaps his best composition, the piano Concerto in A minor (Opus 16)—a work instinct with beautiful themes, characteristic rhythm, and original harmony. In 1871 he founded the Musical Society in Christiania, of which he was for some years conductor. During that period he wrote his first *Lyric Pieces*,

the violin Sonata in G (Opus 13), the chorus *Landkjending*, and the music to Bjørnson's *Sigurd Jorsalfar*. In 1874 G. was invited by Ibsen to write music to *Peer Gynt*. At the same time he wrote his second great piano work, the *Ballade* in G minor (Opus 24). At Loftus in Hardanger, whither he had now moved, he wrote four new masterpieces, the string Quartet in G minor (Opus 27), Album for male voices (Opus 30); *Den Bergtekne* (Opus 32); and *Vinje Songs* (Opus 33). Norwegian folk-melodies are the basis of his songs to the text of the poet A. O. Vinje. In 1880-82 he was leader of the Musical Society Harmonien in Bergen and produced further great works, including the famous *Holberg Suite*. Other dramatic works, besides the *Peer Gynt* music, include *Scener av Olav Trygvason* (Opus 50) and a melodrama *Bergliot* (Opus 42). By the eighties G. had become a world-renowned master. In 1888 he conducted for the first time in London and Birmingham, and in 1889 in Paris, and no doubt it was the *Peer Gynt* music that opened the way for him. G.'s music is intensely national in character and is mostly lyrical. His works for pianoforte solo include a great number of lyric pieces. In chamber music he wrote two indifferent string quartets. Of his three sonatas for violin and piano two rank among his finest achievements. Of his numerous songs the settings, particularly of Hans Andersen and Bjørnson, are exquisitely poetic. The *Lyric Pieces* are character-sketches in the spirit of Schumann, fresh in melody and with a sonorous ring. As examples may be mentioned Opus 12 (with *Folk-Song*); Opus 43 (with *Erolik*); Opus 57 (with *Nostalgia*); and Opus 68 (with *Evening in the Mountains*). G. married (1867) his cousin Nina Hagerup, a fine vocalist who with rare art brilliantly interpreted his songs. See E. Closson, *Edvard Grieg et la musique Scandinave*, 1892; G. Schjelderup, *Edvard Grieg og hans værker*, 1903; H. T. Finck, *Edvard Grieg*, 1906; E. Ekgen, *Edvard Grieg i Norge: Musikhistorie*, 1921; R. H. Stein, *Grieg*, 1921; and G. Abraham, *Grieg*, 1948.

Grierson, Sir George Abraham (1851-1941), Irish scholar, authority on the languages of India, *b. at* Glenageary, co. Dublin; eldest son of George Abraham G. L.L.D. Educated at Shrewsbury and at Trinity College, Dublin, where he was Hindustani and Sanskrit exhibitioner. He was appointed a member of the Indian Civil Service, 1873, and after holding various gov. offices became director (1898-1903) and superintendent of the Linguistic Survey of India. His monumental *Linguistic Survey of India* (1899-1901) is the first complete and correlated account of the many languages of the Indian sub-continent and its N. confines, and in it are described and classified 179 languages and 544 dialects. The work has been the means of effecting an extraordinary change in the linguistic teaching of the Indian univs. He also made a close study of the religions, folk-lore, and mythology of India. Among his other publs. are *A Handbook to the Kaithi*

Character (1881, 1889); *Seven Grammars of the Bihari Dialects* (1883-84); *Bihar Peasant Life* (1885, with some valuable illustrations); *Modern Vernacular Literature of Hindustan* (1889); *The Salsatya of Bihari* (1896); *Essays on Kashmiri Grammar* (1899); *Piscata Languages of North Western India* (1906); and *Manual of the Kashmiri Language* (1911). K.C.I.E., 1912; O.M., 1928.

Grierson, Sir Robert (1655-1733), Laird of Lag, was the great persecutor of the Covenanters. He was especially active in helping to put down conventicles, and in enforcing the Test Act, using all kinds of severity to gain his ends. He succeeded, in fact, in making his name a byword for all that was cruel. He was also one of those to condemn the Wigtown martyrs. In 1685 he was made a Nova Scotia baronet. After the revolution he was sev. times fined and imprisoned. He is the original of Scott's *Sir Robert Redgauntlet*. See Lt.-Col. A. Fergusson, *Laird of Lag*, 1885.

Griesbach, Johann Jacob (1745-1812), Ger. biblical critic, b. at Butzbach in Hesse-Darmstadt. The great work with which his name is associated is his critical version of the text of the N.T. (1774-75), the most remarkable feature of which was his div. of the MSS. into three groups: (1) the Alexandrine recension; (2) the Lat. or W. recension; (3) the Byzantine or E. recension. His other works are *Synopsis Evangeliorum* (1774-75); *Populare Dogmatik* (1779); and *Opuscula Academica* (ed. J. Gahler) (1825). See also *BIBLE*. See life by F. Kothe, 1812.

Griesheim: 1. Small mkt. tn. of Hesse, Germany, about 5 m. W. of Darmstadt. Pop. about 7000. 2. Small tn. of Prussia, in the prov. of Hesse-Nassau, situated on the Main, about 4 m. W. of Frankfurt-on-the-Main. Pop. 7800.

Griffin, Gerald (1803-40), Irish novelist and dramatic writer, b. at Limerick. After great hardships he succeeded with *The Mayday*, an opera entirely in recitative, in bringing himself into public notice. His tragedies were entirely unsuccessful, but he attained great popularity by the *Holland Tide Tales* (1827), followed by *Tales of the Munster Festivals* (1827) and the fine novel *The Collegians* (1829), which Dion Boucicault adapted for the stage under the title of *The Colleen Bawn*. Among his other novels are *The Invasion* (1832); *Tales of my Neighbourhood* (1835); *The Duke of Monmouth* (1836); and *Talis Qualis*, or *Tales of the Jury-room* (1812). In 1838 he joined the Society of the Christian Brothers at Dublin, whence he removed to the N. monastery, Cork, where he d. of typhus.

Griffin, city of Georgia, U.S.A., 40 m. S. of Atlanta, and the cap. of Spalding co. Here is situated the state agric. experiment station, and there is an important cotton and fruit trade. Pop. 13,200.

Griffin, or Griffon, mythological beast used in architectural decoration and as a charge in heraldry (q.v.). It is the oldest and most common of the outlandish monsters used as heraldic devices, having the hinder parts of a lion with the fore-

parts, head and shoulders, wings and forelegs of an eagle. When the head alone is borne it can be distinguished from that of the eagle by the long tuft under the beak and the pointed ears. The G. segreant is supposed to have been taken as a quartering by the family of Montague at a very early date. The evidence for this statement is as follows. Sir Simon, first Lord Montague (d. 1318) quartered azure a G. segreant Oz in the Falkirk Roll, 1298 (Marl. MS. 6589, ff. 9, 9b). This is one of the earliest extant examples of a quarterly coat. He bore the same in the Carlawerock Roll, 1300 (Cott. MS. Calig. A. xviii., ff. 23b-30b), and on his counterseal attached to the Baron's letter to the pope in 1301 (Birch, Cat. Brit. Mus. Seals, No. 11851). It was not borne by any of his descendants.

Griffith, Arthur (1872-1922), Irish patriot; b. in Dublin; son of Arthur G. printer. Educated at a Christian Brothers school in Dublin. Became a compositor. Joined the Gaelic League when it was formed; also the Celtic Literary Society and the Irish Republican Brotherhood. Went to S. Africa, 1896, became a surface worker on the Rand. Returned to Dublin, 1898. With Wm. Rooney he estab. the *United Irishman* weekly in 1899, and on Rooney's death in 1901 he became its sole director. It was an unprofitable, brilliant, literary paper. G. at length left the I.R.B., and began to preach a policy of passive resistance to Brit. rule in order to obtain dominion status for Ireland. In Oct. 1902 an organisation based on his policy, and called Cumann na Gaedhal, was founded — with the watchword 'Sinn Féin' (pronounced, approximately, *Shin Fane*), or 'We ourselves'; i.e. other words, Direct Action: it soon became the name of the party. The movement progressed rapidly in Dublin; it was slower in taking hold of the country. Label actions and other incidents caused repeated changes in the name of the paper G. directed. In 1906 it became *Sinn Féin*, which for a little while was a daily. Next it was *Éire*. On the rise of the Irish Volunteers as a counter-stroke to the Ulster Volunteers, G. was active on their side, and assisted in the gun-running at Howth in July 1914. *Éire*, suppressed, was succeeded by *Scissors and Paste*. Although G. took no part in the rising of Easter 1916, he was interned with the leaders of that revolt at Frongoch, Wales. In July 1917, when he and they were again at liberty, de Valera was elected leader of Sinn Féin, on the motion of G. G.'s paper came out again as *Nationality*, and again as *Éire Óg* (Young Ireland). While they were undergoing a term of imprisonment in 1918 de Valera and G. were elected president and vice-president respectively of an Irish republic. The terrorist period of the Black and Tans followed. G. was again in prison in 1920. During de Valera's absence in America, 1919-20, he was head of the republic and had a prominent share in the settlement of the Irish question in 1921. He was elected first president of the Irish Free State (q.v.). When Dáil

Elreann had declared for the treaty, G. had the task of suppressing the rebellion of irreconcilables. Just when he had succeeded in this he fell in a faint when leaving a private hospital in Lower Leeson Street, Dublin; he was carried back and d. there an hour or so later, Aug. 12. He wrote no book; but a pamphlet of his, *The Resurrection of Hungary* (1905), must have stimulated the national movement in Ireland.

Griffith, William (1810-45), Eng. botanist, b. at Petersham, Surrey. His first public work appeared in Dr. Wallich's *Plantae Asiaticae rariores* in 1832; in the same year he was appointed assistant-surgeon in the service of the E. India Company. His most important papers were pub. in the *Transactions of the Linnean Society*, and his books, *Icones Plantarum Asiaticarum*, *Itinerary Notes, Palms of British East India*, and *Notulae ad Plantas Asiaticas*, were pub. by J. MacClelland after G.'s death.

Griffon Bruxellois, toy dog of terrier extraction bred in Belgium, with a rough coat, the smooth dog of the same breed being the 'petit Brabançon.' It was introduced into England in 1895. The points of the G. B. are: general appearance intelligent, sprightly, robust, and compact; head large and rounded, covered with rather coarse, rough hair; ears semi-erect when not clipped; eyes very large and black; eyelashes and eyebrows finished with long stiff black hair, nose short, black, surrounded with hair and converging upwards to meet the hair round the eyes; lips edged with a black moustache; chest rather wide and deep; legs of medium length and very straight; tail upwards, colour red; hair and wiry coat; weight, small size, maximum, 5 lb., large size 10 lb.

Grigoresco, Nicolae Ion (1838-1907), Rumanian painter, b. near Titu, N.W. of Bucharest. He became famous during the Russo-Turkish war (1877-78) by his fine military pieces, notably 'The Storming of Smârdan,' which is in the tn. hall at Bucharest, and 'Provision Transport in Bulgaria,' in the museum of Bucharest. His portrait of 'Carmen Sylva' is a fine, spirited achievement.

Grigoropoli, tn. of the Ukraine, in the region of Kherson. It is situated on the Dniester R., 80 m. N.W. of Odessa. There is a trade in wine, fruit, and tobacco, and fine leather is manufactured. Pop. 9000.

Grilling, see under COOKING.

Grillparzer, Franz (1791-1872), greatest dramatic poet of Austria, b. at Vienna. In 1813 he was appointed a clerk in the Lower Austrian revenue administration. In 1818, through the influence of the minister of finance, he was appointed poet to the Hofburg Theatre, and was promoted to the Hofkammer (Exchequer). In 1832 he was made director of archives of the Hofkammer, from which he retired with the title of *Hofrat* in 1856. He first attracted attention by his tragedy *Die Ahnfrau* (1817), a 'fate-drama,' in the trochaic measure of the Sp. drama. In 1818 appeared *Sappho*, a drama in the classic spirit of Goethe's *Tasso*, followed by the trilogy *Das goldene Vliess* (1821),

comprising *Der Gastfreund*, *Die Argonauten*, and *Medea*, all noble pieces of work, modern in sentiment, and classical in design. His historical tragedies *König Ottokars Glück und Ende* (1823) and *Ein treuer Diener seines Herrn* (1826) first brought G. into conflict with the censor, a struggle which helped to embitter all this period of his life. With *Des Meeres und der Liebe Wellen* (1831), a dramatization of the story of Hero and Leander, he returned to the classical themes and the style of *Sappho* with an even greater measure of the Sp. grace of expression, which he borrowed mainly from Calderon. *Der Traum, ein Leben* (1831) is his technical masterpiece and the first of his dramas without a tragic ending. His only attempt at comedy, *W'eh dem, der Lügt* (1838), in spite of its brilliance, failed to meet the popular taste and disgusted him for ever with the Austrian theatre. Three unpublished tragedies, *Die Julia von Toledo*, *Ein Bruderzwist in Habsburg*, and *Libussa*, were found among his papers after his death. Although essentially a dramatist, his lyric poetry is of fine quality, and he left one prose masterpiece, *Der arme Spielmann* (1818). See H. Laube, *Franz Grillparzers Lebensgeschichte*, 1881; A. Ehrhard, *Franz Grillparzer*, 1900; G. Pollak, *F. Grillparzer und the Austrian Drama*, 1907; H. von Hofmannsthal, *Grillparzers politische Vermächtnis*, 1915; and F. Stori, *Grillparzer und Kant*, 1935.

Grilse, see SALMON.

Grimald, Nicholas (1519-62), Eng. poet and theologian, b. in Huntingdonshire and educated at Cambridge. He became a probationer fellow of Merton College, Oxford, in 1541 and chaplain to Bishop Ridley in 1547. His connection with Ridley led to his imprisonment, and he is said to have escaped only by recanting. It was at Ridley's desire that G. trans. Laurentius Valla's book, the alleged *Donation of Constantine*, also Ptolemy's *De geogr. Basilienensis Concilii*. He is best remembered by his contributions to Tottel's *Songes and Sonettes* (1557), although for some reason thirty of his forty poems were suppressed in the second ed. His poetry was modelled on Surrey's, but is inferior to it. There are two Lat. tragedies of G.'s still extant: *Archipropheta sive Johannes Baptista* (1548) and *Christus redemptus* (1543); and trans. of Cicero's *De officiis* and Virgil's *Georgics*.

Grimaldi, Francesco Maria (1619-63), It. Jesuit and natural philosopher, b. at Bologna. He wrote a valuable work entitled *Physico-mathesis de Lumine* (*Coloribus, et Iride allicque annexis* (1665), which contains accounts of numerous experiments relating to the interferences of the rays of light. This phenomenon of interference was at the time enunciated as a proposition: 'That a body actually enlightened may become obscure by adding new light to that which it has already received.' He was also the discoverer of 'diffraction' of light, afterwards designated 'inflection' by Newton, who also corrected his theories of the different refrangibilities of the rays.

Grimaldi, Giovanni Francesco (1606-80), It. architect and landscape painter, surnamed 'Il Bolognese' from his bp. He was a relative and pupil of the Caracci. He became architect to Pope Paul V., and was employed by Cardinal Mazarin and Louis XIV. upon architectural designs and fresco-painting in the Louvre.

Grimaldi, Joseph (1779-1837), the most famous of Eng. clowns, b. in London, the son of an It. actor. His father was nearly seventy when G. was b. and tradition has it that he beat his son unmercifully in the course of training him for the stage. He first appeared at Sadler's Wells as an infant dancer in 1781, and in the same year he took part in the pantomime at Drury Lane. When G. was nine his father d., and in the circumstances G. was allowed to act both at Drury Lane and at Sadler's Wells on the same evening. When he was fifteen Drury Lane paid him £3 a week and Sadler's Wells £4; yet he still found time to help in an uncle's butcher's shop. When nineteen he married the daughter of one of the proprietors of Sadler's Wells, but she died very soon afterwards. Four years later he married a Drury Lane actress. His health gave way at the peak of his fame and he was a cripple by forty-five. Finally he was dependent on charity. His greatest success was in *Mother Goose* at Covent Garden in 1806; a part which he constantly revived until his last performance in March 1828. G. was a creative artist, whose humorous effects were achieved by ceaseless labour and thought. See his memoirs, ed. by Charles Dickens, 1838.

Grimm, name of two brothers, distinguished Ger. philologists and storyologists, both b. at Hanau, and fellow students in law at Marburg Univ.

Jakob Ludwig Karl (1785-1863) began his literary career at Paris (1805) as assistant to Prof. Savigny, a celebrated Ger. juriconsult, the founder of the 'historical school' in Germany. This work enabled G. to gain valuable insight into the 'scientific method' he later pursued in his investigations of the Teutonic languages, which led to his becoming the founder of scientific philology and to his epoch-making discovery known as *Grimm's Law* (q.v.), enunciated in his *Deutsche Grammatik*, the greatest philological work of the age. While librarian at Wilhelmshöhe and then at Kassel he was able to carry on his favourite studies of philology and of old and medieval Ger. poetry. In 1811 he pub. his first work in the latter subject, *Ueber den Aldeutschen Meistergesang*. During 1827-37 he was lecturer in the Ger. language, literature, and antiquities at Göttingen Univ. Later he became lecturer at Berlin Univ. His *Kinder- und Hausmärchen*, collected and pub. with his brother, made fairy-tales popular throughout Europe, and gave rise to the investigations which estab. the modern science of *Folklore*. The brothers G., in their quest for old stories, went to medieval MSS. and folk-books and, above all, took down from dictation what Ger. peasants remembered of the old tales. Of

all the people from whom they collected stories it was Frau Katherina Viehmann who is most remembered. She was the wife of a tailor of Niederwehren, near Kassel, about fifty-five when the brothers first met her, and in the words of Wilhelm, 'retains fast in mind those old sagas, a talent which, as she says, is not granted to every one.... She recounts her stories, thoughtfully, accurately, with uncommon vividness and evident delight.' The first collection of their book of tales was pub. in 1812 (new complete ed. trans. by Margaret Hunt, illustrated by Joseph Scharl, 1949). His *Deutsche Rechtsaltertümer und Mythologie* treat of the society and religious superstitions of Central Europe in the Middle Ages. G. stands out among scholars for his stupendous learning and disinterestedness.

Wilhelm Karl (1786-1859) was assistant librarian at Kassel and prof. extraordinary at Göttingen. At Berlin he collaborated with his brother. He wrote independently *Die Deutsche Heldensage, Kämpfe, Lieder*, and many treatises on Ger. literature and antiquities. See also trans. of their works by L. Crane, 1882, and M. Hunt, 1884, with an introduction by A. Laug. See E. Tonnies, *Les Contes des frères Grimm*, 1912.

Grimm, Friedrich Melchior, Baron von (1723 1807), witty Ger. writer, b. at Ralswiek and educated at Leipzig. In 1749 he made the acquaintance of Rousseau, and became closely associated with the Encyclopedists. In the musical war between the partisans of Fr. and It. music G. sided with the latter and wrote in their defence a witty pamphlet, *Le Petit Prophète de Boehmschbroda* (1753), followed by *Lettres sur la musique française*. On becoming secretary to the duke of Orleans he wrote, in conjunction with Diderot and Abbé Ragnol, literary bulletins containing acute criticism on Fr. literature. In 1776 he was appointed minister to the Fr. court by the duke of Gotha, and in 1795 as minister of Russia to Hamburg by the Empress Catherine. His *Correspondance littéraire, philosophique, et critique* was published in 1812.

Grimms, tn. of Saxony, Germany. It stands on the l. b. of the Mulde and is about 17 m. S.W. of Leipzig. Here is the Fürstenschule, a school founded in 1530. The people are chiefly engaged in the manu. of iron goods and in agriculture. Pop. about 12,200.

Grimmelshausen, Hans Jakob Christoffel von (c. 1625-76), Ger. author, b. at Gehlhansen in Hesse-Cassel. As a boy he was kidnapped by Hessian soldiers, and becoming a soldier himself fought on the imperial side in the Thirty Years war. At the end of the war he settled at Renchen in Baden, and entered the service of the bishop of Straßburg, becoming *Schultheiss* (magistrate) of Renchen in 1665. He devoted his leisure to literature and pub. sev. remarkable novels. In 1669 he pub. *Der abenteuerliche Simplicissimus*, a work which is modelled on the picaresque romances of Spain and is largely autobiographical in its descriptions of the stirring scenes of the hero's child-

hood. Among his other works are *Simplicianische Schriften; Die Erzbetrügerin und Landstörzerin Courasche* (c. 1669), *Der seltsame Springinsfeld* (1670), and *Das wunderliche Vogelneest* (1672). His satires and gallant novels, modelled on *Cyrano de Bergerac*, such as *Dietwald und Amelinde* (1670), are very inferior to *Simplicissimus*. See *Simplicissimus* (ed. by A. von Keller, 1854, and H. Kurz, 1863-64).

Grimm's Law, important phonetic law which states the changes in the consonants of words in the course of their development from the Primitive Indo-European language into Low and High Ger. The various languages of the Indo-European family show that, as they developed from the original language, each into its own special form, their consonants and vowels underwent change according to a certain

The most important consonant changes by which Primitive Ide developed into Germanic are summed up in the formula known as G. L., from the Ger. philologist Jacob Karl Ludwig Grimm (1785-1863), who first worked out the law, although it was not he who discovered it, this law being already suspected by the Dan. philologist Rasmus Christian Rask (1787-1832). It is now known that G. L. was stated by Grimm in a form no longer admitted as exact. This law, which takes into account the 'permutation of consonants' of the first shifting, states that the Indo-European *bh, dh, gh* (the 'voiced aspirates') ultimately became in Germanic *b, d, g* ('voiced stops' or 'media'), that *b, d, g* became *p, t, k* ('unvoiced stops' or 'tenues'), and that *p, t, k* became *f, þ, h* ('unvoiced spirants'; the *h* is like *ch* in *loch*).

Sanskrit	Greek	Latin	Gothic	Old High German	German	English
<i>bh</i>	भ्रष्टर	frater	brōþar	bruder	Bruder	brother
<i>dh</i>	ρुθρῶς	ruber	rauds	rōt	rot	red
<i>gh</i>	στίγνῶτι	—	steigun	stigan	steigen	stye
<i>b</i>	—	tribus	þaúr	dorf	Dorf	horp
<i>d</i>	δαμάω	domare	tamjan	zamjan	zähnen	taine
<i>ð</i>	ἴανυ	genu	knlu	knlu	Knie	knee
<i>p</i>	πάδα	pēs	fōtus	fuoz	Fuss	foot
<i>t</i>	τρεῖς	tres	þreis	dri	drei	three
<i>k</i>	καμπά	capere	hafjan	heffan	heben	heave

law. Knowing this law, the philologist can take a word from an early Ide tongue and say beforehand in what form that word will be found in any one of the languages descended from it in Sanskrit, Lat., Gk., or Germanic. The vowel or consonant of the word will have undergone a regular and known metamorphosis. He could predict, for example, that *bhrātr* in Sanskrit would be in Gk. φρατήρ, in Lat. frater, in Gothic brōþar, in Ger. Bruder, and in Eng. brother. The Germanic languages which Grimm investigated differ from Primitive Ide much more in their consonants than in their vowels, and these consonants it is with which G. L. is concerned. The Primitive Germanic system of consonants is best seen in Gothic, the most ariet. of the Germanic languages, in Early Low Ger., and in Early Scandinavian. The Primitive Ide consonantal system is seen, with little deviation, in Sanskrit, Gk., Lat., Lithuanian, Old Slavonic, and Old Celtic. The Germanic languages underwent their characteristic changes at two more or less definitely marked epochs. The first, known as the *First Consonant Shifting*, took place in prehistoric times, the *Second Consonant Shifting* belongs to the fifth, sixth, and seventh centuries. In the latter certain Primitive Germanic consonants underwent a change as the words in which they occurred entered the High Ger. dialects. A word beginning with a *t* in Gothic, for instance, would change this *t* for a *s* (pronounced *ts*) in High Ger. (Gothic, which underwent only the first consonant shifting, is the best representative of the Low Ger. and Scandinavian dialects; Old High Ger. the best representative of the other divs. of the Germanic languages.

The Amer. philologist Wm. Dwight Whitney believes that these changes, so arbitrary in appearance, have a physiological basis. They arise in the course of what Max Müller calls 'dialectic growth,' similar to that instanced in the word *vat*, in wine-vat, which is the O.E. form of the N. Eng. *fat*, a vessel, and in such a dialectal change as that of *he lieth* into *he lives*, where the aspirate dental *th* becomes *s*. See R. Morris, *Historical Outlines of English Accidence* (London, 1872, revised by L. Kellner (London), 1895).

Grimsby, seaport in Lincolnshire, England, on the S bank of the Humber, 15 m. S.E. of Hull, and the largest fishing port in England. In 1860 the total number of fishing vessels using the port was 60 (sailing) and the fish sent by rail 96,840 cwt.; in 1880, following dock improvements, the figures were 587 sailing vessels and 938,620 cwt.; in 1909 the total number of vessels was 608 (29 sailing and 579 steam) and the fish dispatched amounted to 3,519,300 cwt. The present fishing fleet comprises 350 steam trawlers, the largest of which are over 1000 tons dead weight. G. trawlers fish as far afield as the Faroes, Iceland, Bear Is., and the White Sea. The three fish docks cover 64 ac. of water and the pontoon or covered fish market, 1½ m. long, has overall access to the railway for handling and dispatching catches. The ann. average value of fish landed at G. was, before the Second World War, between £3,000,000 and £4,000,000. In 1945 the 2,143,455 cwt. of fish landed were sold for £7,953,038. Ancillary industries to the fishing fleet include ship repairing and shipbuilding, marine engineering, net, rope, and twine making, box making and cooperage, ice

manuf. and cold storage, fish salting and curing and processing, preparation of fish meals and fertilisers, and ship's husbandry. While G.'s staple industry is fishing, there are other well estab. industries in the tn.: these include saw-mills, animal foods and medicines, biscuits, bituminous paints, brick tiles and clay-ware, chemical products, flour, iron and alloy castings, jam and preserves, light cars, paper and newsprint, plastics, wood-work, and furniture.

There are many fine old buildings, including a par. church and some interesting Rom. remains. The first tn. hall, a substantial 'mud and stud' structure built by the burgesses in 1394, stood for nearly four centuries until 1780, when it was replaced by a brick building which was demolished in 1863 and the present tn. hall erected on a new site. The site of the par. church of St. James is still marked by the three St. Mary's Gates, W., S., and E. St. James was entirely rebuilt, probably between 1190 and 1225, in the prevailing Early Eng. style. A drastic 'restoration' was carried out in 1718, when the transepts became a thoroughfare from High Street to Deansgate, and mayoral elections took place in the building. Finally in 1858 Canon Ainslie, as vicar, began the work of true restoration, which was carried on by his successors up to 1928. The church was bombed by Ger. planes on July 11, 1943, but the solidity of the work of the medieval builders as a whole withstood the blast. Of Willow Abbey, which stood $\frac{1}{2}$ m. to the S. of the church, hardly a vestige remains. The present free grammar school dates back to the Tudor period, when Edward VI. granted a charter for its foundation or its re-foundation, as there was already a school there in the fourteenth century. Friargate Crossing, by its name, is an indication that the Austin Friars had a house there. The Franciscans, Grey Friars, had their house in what is now Haven Street, the home of Gervase Holles, the seventeenth-century antiquary. The Templars had a preceptory in Bargate. Notable institutions are the College of Further Education, a centre of co. college activities; the Technical Secondary School; the G. Nautical School (1922), which replaced the Fishery Institute of 1879 and which has five main depts.: senior navigation, junior nautical, marine engineering, marine cookery, and deep-sea fishing; and the School of Art (which is also the home of the N. Lincolnshire Art Society). There are also a free public library and a mechanics' institute.

The name of G. is of Dan. origin, meaning 'Grim's town.' The story of Havelok and Grim, first related by Peter of Langtoft, a late thirteenth-century writer, is purely legendary. The story goes that Grim or Gryme was a poor merchant who rescued a baby whom he found deserted by the wayside. He brought him up and later found that he was the son of a Danish king, Birkabeen (no such king is known), by whom he was richly rewarded, and so founded the tn. of G. in memory of his foster son. Evidently the facts are that one of the leaders of the invasion or of the

early settlers bore the not uncommon name of Grim and bequeathed it to his Eng. home. The actual recorded hist. of G. began in 1087 with the Domesday survey, when the township was divided between Odo, bishop of Bayeux, Ralph de Mortemer, and Drew de Beurero. Richard I. held a meeting here (as recorded in the Black Book of the Admiralty) probably in April 1194, which indicates that it was then the main port on the Humber. King John granted its first charter for fifty-five marks of gold. In 1319 Edward II. granted a charter allowing the burgesses to hold two fairs and to have their own jail and assizes. The prosperity of G. in the Middle Ages did not continue uninterrupted. Frequent references to the silting up of the haven and the consequent decay of the tn. occur throughout Tudor and Stuart times. The first change for the better came in 1800 when the new dock was opened under an Act of Parliament for enlarging and improving the haven. In 1849 Prince Albert laid the foundation of the Royal Dock, the outcome of the amalgamation of the old G. Haven Company with the Manchester, Sheffield, and Lincolnshire Railway Company which extended the line to G. in 1848. After the opening of the Royal Dock in 1852 the spectacular rise of G. began, when the fishing industry was started with a few trawlers, and the corporation laid out roads in the E. marsh. During the next half-century G. became the foremost fishing port in the world. In 1912 a new commercial dock was opened at Immingham, 6 m. up riv., to relieve the congestion in the docks at G. and the new fish dock, a development that was retarded by the First World War, was eventually opened in 1934. In the Second World War G. was a naval base of some slight importance, and on some twenty-eight occasions missiles were dropped on the tn.; but the losses were comparatively slight—124 civilians killed and 517 premises destroyed. Churches, schools, and the tn. hall were damaged, the public library partially demolished, and many business premises damaged or destroyed by fire. The tn. returns one member to Parliament. Cleethorpes, $3\frac{1}{2}$ m. S.E. of G., is a well-known health resort. Pop. (estimated), 86,000. *See* G. L. Alward, *The Sea Fisheries of Great Britain and Ireland*, 1932, and M. Graham, *Fish Gale*, 1943.

Grimsel Pass, situated in the Bernese Alps, Switzerland. It is over 7000 ft. high, and leads to the valley of the Aar, being crossed by a carriage road. At the foot of the pass is the G. Hospice. It was here that the Fr. were victorious over the Austrians in 1799.

Grimspound, relic of an anct. stronghold on Dartmoor, Devonshire, near the vil. of Hanilton Down. It consists of a score of stone huts within a stone wall about 5 ft. high. It is said to be an example of an Early Bronze Age vil. camp-dwelling, and is a unique specimen.

Grimthorpe, Edmund Becket, Baron (1816-1905), a famous authority on architecture and horology, was the designer of

Big Ben, the great Westminster clock. He was b. at Carlton Hall, near Newark, educated at Eton and Cambridge, was called to the bar, and became a Q.C. in 1854. He was for some years a leader of the parl. bar. He was much interested in architecture, designed sev. churches, and was responsible for restoring St. Albans Cathedral.

Grin, Henri Louis, see DE ROUEMONT. **Grindal, Edmund** (1519-83), Eng. divine; a prebendary of Westminster under Edward VI.; lived on the Continent during Mary's reign, embracing the teaching of Geneva; returned on Elizabeth's accession. Bishop of London, 1559; archbishop of York, 1570; of Canterbury, 1575. His Puritan sympathies were not shared by the court and he declined to suppress private meetings of the clergy for scriptural study, and he was accordingly sequestered. Writings and life were printed by the Parker Society, 1853.

Grindelwald, vil. situated in the canton of Berne, Switzerland, and in the Bernese Oberland. Here are the upper and lower G. glaciers, and the beauty of the spot attracts a large number of visitors. It is connected by rail with Interlaken and Lauterbrunnen. Pop. 2400.

Gringore, or Gringois, Pierre (c. 1475-c. 1514), Fr. poet and dramatist, b. at Caen. He began his literary career by writing allegorical and moral poems, afterwards writing for the stage, his works containing satires on the politics of the time. He was for many years a member of the Enfants sans Souci, a theatrical company of Paris, and in his comedies attacked all people of all ranks, including the pope. His latter years were spent in the service of the duke of Lorraine, during which time he wrote religious poetry. His chief works are *Le Jeu du Prince des Sots* (1511), in which he satirised Pope Julius II.; *La Chasse du cerf des cerfs* (about 1520); *Le Mystère de Saint-Louis* (about 1524); and *Heures de Notre Dame* (1524). See E. Badel, *Pierre Gringore*, 1892.

Grinnell, city of Iowa, U.S.A., in Poweshiek co., 55 m. N.E. of Des Moines. Manuf. include carriages, flour, gloves, etc. Pop. 5000.

Grinnell Land, E. central part of Ellesmere Is. in Arctic America, a mountainous, mainly ice-covered tract, where foxes and reindeer are found. Kennedy Channel and Kane Basin separate it from Greenland.

Grinstead, East, tn. in the co. of Sussex, England, just over 30 m. to the S.E. of London and about 14 m. N.E. of Horsham. Here are situated Sackville College, founded 1608, and the St. Margaret sisterhood. It has a fine old parish church. Pop. 11,400.

Griqualand East, dist. of Cape Prov., S. Africa, lying to the S. of Natal. It has an area of over 7500 sq. m. It is part of the Transkeian Terr., which, although they contain many European farms in certain dists., mainly in G. K., are for the most part a native reserve, the Europeans in the majority of rural areas being almost exclusively traders. Adam Kok,

the Griqua chief, originally settled here, bringing with him 15,000 Griquas in an historic trek over the Drakensberg during which the Griquas were constantly harassed by warlike Basutos (see Carol Kirkby's *Zulu Journey*). Since 1875 under the administration of Cape Prov. The chief tn. is Kokstad. Pop. about 270,000 (European pop. 8000).

Griqualand West, situated to the N. of Cape Prov., is bounded E. and S. by the Orange R. and N. by Bechuanaland. In 1870 a party of prospectors discovered the rich ground afterwards known as Natal Kopje, which marks the start of the diamond industry in S. Africa. This ter. was proclaimed in 1871 as the crown colony of G. W., and a sum of £90,000 was paid to the Orange Free State by way of compensation. From this time people flocked to the colony and the population to 50,000 in the first year, though it was of a very 'floating' character. In 1880 G. W. was incorporated with the Cape Colony, which was merged in the Union of S. Africa, 1910.

Griseida, fictional character whose conduct typifies wifely obedience. She was a very beautiful Piedmontese peasant girl wooed by the marquis of Saluzzo. She became his wife, and to assure himself of the worth and the stability of her character he put her to the severest ordeal, through all of which she passed successfully. After which, confidence completely restored, they were reconciled and happy. The origin of the story was Boccaccio's *Decameron*. Petrarch also used it and Chaucer in his *Clerkes Tale*. In all parts of the Continent versions of it are found and it has formed the subject of sev. plays, Fr., Ger., and Early Eng.

Grisi, Giulia, or Julia (1811-69), famous It. soprano prima donna, b. at Milan. She studied under Giacomo Giacomelli, and made her first public appearance there in the part of Emma, in Rossini's *Zelmira*. She visited Florence, Paris, and London, winning universal fame. Sev. operas were written especially for her, including Bellini's *Puritani*; but the role in which she obtained her greatest triumphs was that of Norma. In 1856 she married Mario, a tenor, and toured with him in America. The tour was not a success and she returned to Europe. Her triumphs, her friendship with Théophile Gautier, and her peaceful old age are recorded in the life by Lafar (1948).

Gris Nez (Fr. 'grey ness'), cape in the dept. of Pas de Calais, France, is the point on the Fr. coast nearest to Britain. It is midway between Calais and Boulogne, and opposite Dover.

Grisons (Graubünden), largest canton of Switzerland, is bounded on the E. and S. by the Tyrol and Lombardy. It is a wild mountainous dist. intersected by narrow valleys. It includes the upper valley of the Inn, the three main sources of the Rhine, and sev. glacier groups. The valleys are fertile and cattle rearing and agriculture are the chief pursuits of the inhab. Iron, lead, and copper are found in small quantities and there are mineral springs. The name (from Graubünden,

the Grey League) is derived from the grey coat worn by the people of the canton who formed a league in the fifteenth century to resist the tyranny of the nobles. The cap. is Chur, and Davos, St. Moritz, and Arosa are popular pleasure resorts. Area 2746 sq. m. Pop. 128,200.

Grits, coarse sandstones, often very impure. Examples occur in the Greywackes and the Torridonian sandstones of Scotland and Wales. Millstone grit is the fourth member of the Upper Carboniferous series and is situated between the Lower Coal Measures and the Pendleside group. It varies from 4000 ft. thick in Lancashire until it becomes very unimportant in Scotland. In S. Wales it consists of sev. layers, the top of massive sandstones termed 'Farewell Rock' by the miners, because no workable seams of coal lie below it. Pennant grit of the same dist. is a hard grey felspathic sandstone, cut as a freestone and used for building purposes. Kinderscout grit, so named from the Peak of Derbyshire, is the lowest div. of the Millstone grit of that area, while Rosslyn sandstone of Scotland is still another local development.

Grivegnée, tn. of Belgium and suburb of Liège, 2 m. to the S.E. of the city, on the R. Ourthe. There are coal-mines and important iron works, foundries, and manufs. of earthenware. Pop. 18,400.

Grizzly, see **BRAY**.

Groat (from the Dutch, 'great' or 'thick'), name applied in the Middle Ages to all large thick coins. The Eng. G. was first issued in 1351 and discontinued in 1662. It was a silver coin equal in value to fourpence. In 1836 a coin of similar value was struck, the fourpenny piece.

Grock (b. 1880), modern clown, whose real name was Adrien Wettach, b. at Reconvilier, son of a Swiss watchmaker. He early sought work in a circus, doing everything and anything, being by turns first fiddle, pianist, cashier, mime, and acrobat—but always the philosopher with a yearning for music. He is remembered by many for his diminutive fiddle, his quaint antics with a grand piano, his thin dwindling shanks, and generally unique drollery. He is said to have amassed a considerable fortune by his performances. See M. Willson Disher, *Clowns and Entomimes*, 1930.

Grodek, a tn. in Galicia, Ukraine, 16 m. W.S.W. of Lvov, is a great flax-growing centre. Pop. about 13,000.

Grodno: 1. Formerly also *Gardinas*, a region of the Byelorussian S.S.R., formerly Lithuania. It is low and marshy, and there are extensive pine forests. The prin. rivers are the Niemén, Bug, and Narev. Rye, flax, hemp, barley, and potatoes are grown; the chief industries are cloth, leather, bricks, and tobacco manufs. 2. Tn., cap. of above, on the Niemén, 80 m. S.S.W. of Vilna. It contains two castles, one dating from the twelfth century; the other, quite modern, was turned into a military hospital. Here the second partition of Poland was arranged, 1793, and in 1795 it was taken over by Russia. The fortress of G. was taken by the Gers. in 1939. In Chernyakhovsky's advance

across the Niemén (July 1944) his left wing joined with Zakharov's right in a converging move on G., and the fortress fell to the Red Army on July 16 after a three-day fight. Pop. 50,000.

Groggy Lameness, see **NAVICULA DISEASE**.

Groin, architectural term signifying the angular curve made by the intersection of two arches; when the intersecting arches have the same diameter and height, the G. is said to be regular; when one is semi-elliptical and the other semicircular, the G. is irregular. In Gothic architecture the Gs. are always ribbed.

Grolhier, Jean, Viscount d'Agulsey (1479-1565), Fr. bibliophile and connoisseur of book-bindings, was b. at Lyons. He entered the diplomatic service under Francis I. and spent some time in Milan and Rome. There he gradually collected a unique library of richly bound vols., devoting a great part of his fortune to it. In 1675 the collection was sold publicly, realising very high prices. Part of it is in the National Library, Paris, and a few vols. are in the Brit. Museum.

Grolhier Club was founded in New York in 1884 with the object of encouraging the art of bookmaking. Lectures and exhibitions are given, and a number of works have been pub. by it. It has a library and reading-room.

Groningen: 1. Most N. prov. of the Netherlands, bounded N. by the North Sea, S. by the Drenthe, E. by Hanover, and W. by Friesland. It is very low and includes much reclaimed marshland. The soil is fertile and well cultivated, and agriculture is the prin. industry of the people. On the coast fishing and ship-building are carried on. Pop. about 147,400. 2. Cap. of the prov. of G., on the Hunse, 92 m. N.E. of Amsterdam, is the most important tn. in the N. of Holland. Connected by canals with the Dollart and (Ijsselmeer) Zuider Zee, it forms a good centre for trade. It possesses a univ., botanical gardens, a museum, and tn. hall, and is well laid out. The chief industries are linen and woollen manufs., tobacco, and boat-building. G. was occupied by the Gers. in 1940. Ger. resistance in N. Holland collapsed before the advance of the Canadian Army (April 1945), the Gers. at G. surrendering on April 16. Pop. 131,000.

Gronovius, name of a family of scholars who settled in Holland. They were of Ger. extraction, their name being Gronov, of which the above is a latinised form. The prin. members of this family were:

Johann Friedrich Gronovius (1611-71), b. at Hamburg. He was at first a prof. at Deventer (1642), and afterwards at Leyden (1658). His knowledge of the classics and of antiquities was profound. He ed. Livy, Tacitus, Plautus, Cicero, and the works of many other writers.

Jacobus Gronovius (1645-1716), son of the preceding, was b. at Deventer. He also was a great scholar, and was first a prof. at Pisa and then at Leyden from 1679 till his death. His chief work was *Thesaurus antiquitatum Graecorum* (1697-1702), although he ed. sev. of the classics.

Abraham Gronovius (1694-1775), son of the preceding, was librarian of Leyden Univ.

Johann Friedrich Gronovius (1690-1700), brother of the preceding, was a botanist and writer of *Flora Virginica* (1739-43) and *Flora Orientalis*, (1755).

Lorenz Theodor Gronovius (1730-77), son of the preceding, was the author of *Museum Ichthyologicum* (1751-56) and *Zoophylacium Gronovianum* (1763-81).

Groome, Francis Hindes (1851-1902), Eng. author, son of Archdeacon G. of Suffolk. By 1877 he had embarked on a literary career, and is especially known as a student of gipsies, their life, language, and customs. G. wrote *In Gypsy Tents* (1880); *Gypsy Folk-Tales* (1899); and ed. *Borrow's Lavengro* (1900). He was one of the founders of the Gypsy Lore Society, and joint-editor of its jour. from 1888 to 1891. Other works are *A Short Border History* (1887); *Two Suffolk Friends* (Archdeacon G. and E. Fitzgerald) (1895); and the novel *Kriegspiel* (1896).

Groot, Huig van, see GROOTJUS.

Groote Eylandt, in. lying off the N. coast of Australia in the gulf of Carpentaria. It is about 40 m. long and 40 m. broad.

Groote, Schuur, a local residence of the prime minister of the Union of S. Africa. It is 3½ m. from Cape Town, near Rondebosch, and was formerly the home of Cecil Rhodes, to whom there is a memorial. It was originally, as its name tells, a 'big barn' owned by Jan van Riebeck and was restored for Rhodes by Herbert (later Sir Herbert) Baker.

Gropius, Walter (b. 1883), Ger. architect, b. in Berlin, son of Walter Adolf G., architect. Educated at Technical High School, Munich. Started work with Peter Behrens, Ger. architect. Practised privately in Berlin from 1910 to 1914 and from 1928 to 1931. Director of (Grand Ducal Academy of Art, Weimar (1919) and of the (Grand Ducal Saxon School of Affiliated Arts, Weimar, which he fused as the Staatliches Bauhaus or School of Architecture, with courses of art, science, and technology and which became celebrated for achievement in abstract art, functionalism in architecture, and experimentation in glass, metals, and textiles as materials (see further under ARCHITECTURE, Modern Architecture). In 1925 the school was transferred to Dessau to buildings designed by G. He resumed private practice, in London, in partnership with Maxwell Fry, 1934-37. Prof. and chairman, School of Architecture, Harvard, U.S.A., from 1938. Practised in partnership with Marcel Breuer in Cambridge, Massachusetts, 1937-40. Adviser to new Bauhaus, Amer. School of Design, estab. in Chicago in 1937. Member of Amer. Institute of Architects since 1938. Pubs.: *Staatliches Bauhaus* (1923); *Internationale Architektur* (1925); *The New Architecture and the Bauhaus* (1935); and *The Bauhaus, 1919-28* (1938).

Gros, Antoine Jean, Baron (1771-1835), Fr. painter, b. in Paris, was the son of a miniature painter. He studied first at David's studio, and afterwards travelled in Italy, where he became acquainted with

Napoleon Bonaparte, having been introduced by Josephine. He was given an official position by Bonaparte and became a military painter. In 1824 he was made a baron by Charles X. for his paintings in the Panthéon. He afterwards gave up the romantic style of painting and turned to the classic style. In this, however, he seems to have been unsuccessful, and committed suicide by throwing himself into the Seine. His best pictures are 'Bonaparte at the Bridge of Arcole'; 'Napoleon Visiting the Plague-stricken at Jaffa'; 'The Battle of Eylau'; 'The Meeting of Charles V. and Francis I.'; and among his works in the classic style, 'Hercules and Diomedes.' See studies by G. Dargenty, 1887, and H. Lemoullier, 1905.

Grosart, Alexander Balloch (1827-99), Scottish ecclesiastic and writer, b. at Stirling. He was a student at Edinburgh Univ., and in 1856 was appointed Presbyterian minister at Kinross. In 1865 he became minister of Prince's Park, Liverpool, and of Blackburn in 1868, giving up the ministry in 1892. His chief work was done in his editing of Elizabethan literature. He pub. the Fuller's Worthies Library, consisting of thirty-nine vols. (1868-76), and in the latter year began the Chertsey Worthies Library, both of which pub. included the works of many authors, among them George Herbert, Sir Philip Sidney, and Abraham Cowley. In addition to these he ed. the works of writers such as Edmund Spenser (1882-84); Samuel Daniel (1885-96); and a number of others. See O. Smeaton, *A Great Elizabethan*, 1899.

Grosbeak, name applied to some of the species of the family Fringillidae, belonging to the order Passeriformes, and including the various kinds of finches. In these birds the beak is stout and very much developed. Among the species may be mentioned the Pine G. (*Pyrrhula enuchator*), found in the regions of the N., and the Hawfinch (*U. anthracinus vulgaris*), occasionally found in Britain.

Grose, Francis (c. 1731-91), Eng. antiquary, b. at Greenford in Middlesex. He was at first a draughtsman, and exhibited his architectural drawings at the Academy, and from 1755 to 1763 was Richmond herald. He spent a large part of his time in antiquarian research, and during this time became acquainted with Robert Burns. His chief works are *Antiquities of England and Wales* (1773-87); *Classical Dictionary of the Vulgar Tongue* (1785); and *Antiquities of Scotland* (1789-91).

Grosnays, or **Grosnyl**, see GROZNY.

Grossenhain, tn. of Saxony, Germany, to the N.W. of Dresden, and on the R. Röder. It is noted for the manuf. of woolen goods, hosiery, and machinery. Pop. 14,600.

Grosseteste, Robert (c. 1175-1253), bishop of Lincoln, b. at Stradbroke in Suffolk of humble parentage. He was educated at Oxford and Paris. He became chancellor of Oxford Univ. and rector of the Franciscans in that tn. After holding the offices of archdeacon of Northampton and then of Leicester, he

became, in 1235, bishop of Lincoln. While holding this office he carried on a dispute from 1239 to 1245 with the Lincoln chapter, finally gaining his point—the right of visitation. He also stood up for the rights of the Church against the State, thus involving himself in disputes with Henry III., and for his own Church against that of Rome, thereby coming into conflict with the pope. See F. S. Stevenson, *Robert Grosseteste, Bishop of Lincoln*, 1899.

Grosseto: 1. It. prov. in Tuscany. It is a mining and agric. dist., but is very barren and unhealthy in parts. Area 1735 sq. m. Pop. 177,000. 2. Tn. of

Polytechnic as an entertainer, with comic songs and sketches at the piano. In 1877 he began a successful career as actor in *The Sorcerer*, later playing in many other Gilbert and Sullivan operas, and winning especial distinction as the admiral in *Pinafore*. He was with the P'Oyly Carte company at the Savoy from 1881 to 1889, and then resumed his individual recitals for a time. He played in *His Excellency* (1894); *Young Mrs. Yarde* (1898); and *The Gay Pretenders* (1900). Again resuming his recitals for some years, he finally retired in 1909. His writings include *The Reminiscences of a Society Clown* (1888); *The Diary of a Nobody*

THE GROSSGLOCKNER FROM THE SOUTH

Schuldnacht, Graz

Italy, cap. of the above prov., about 40 m. S.S.W. of Siena. In the Second World War the cloisters of the cathedral were razed, but the main building was undamaged; the Chelliana Library was wrecked, but most of the valuable books had been removed to safety. Pop. 26,000.

Grossglockner, mt. of the Alps (12,460 ft.), the culminating peak of the Hohe Tauern on the borders of Carinthia, Salzburg, and the Tyrol, Austria. First ascended in 1800.

Grossglogau, see GLOGAU.

Grossgörschen, vil. of Saxony, Germany, situated S. of Lützen. The battle of Lützen, in 1813, is often styled the battle of G.

Grossi, Lodovico, see VIADANA.

Gross-Lichterfelde, tn. and com. of Germany in the prov. of Brandenburg. It forms a suburb of Berlin, and is situated about 6 m. from the city. Pop. 48,000.

Grossmith, George (1847-1912), Eng. actor and public entertainer, son of a journalist. In 1866 he was a reporter for *The Times*, but soon gave it up for the stage. In 1870 he made his debut at the

(with his brother, Weedon G., 1894); *Cups and Saucers*; and various songs.

Gross-Moyeuivre, see MOYEUVRE-GRANDE.

Grosswardein, see ORADEA MARE.

Grosz, George (b. 1893), Ger. painter of the ultra modern school, who, recognising in the political development of Hitlerite Germany an imminent threat to his life, emigrated to the U.S.A. in 1932, and was subsequently naturalised. To-day he is considered one of the leading Amer. painters. In Germany his Hogarthian art, with ruthless and acid cynicism, satirised militarism, capitalism, the bourgeoisie, and the reactionary powers represented by the generals, the big industrialists, the Prussian Junkers, and the Church. Became leader in the school of Ger. expressionism known as the 'new objectivity.' From 1933 he and his work disappeared into oblivion so far as the majority of Gers. were concerned and his paintings were among those condemned in Hitler's exhibition 'Degenerate Art.' His 'Ecce Homo'—Christ on the Cross wearing a gas-mask and army boots—

brought him in the late twenties, and long before Hitler, to face a tribunal on a charge of blasphemy. Works belonging to the Amer. phase of his art include 'Even Mud has an End,' a work symbolic of tortured mankind. In 'Glory's Last Ride' the apocalyptic rider, War, has not been more impressively delineated since Dürer. Apart from these drawings, which belong to his most mature works, his output in America includes landscapes, still lifes, portraits, studies of animals and plants, all painted with love for his models and with masterly skill. He has a studio near New York. See study by M. Itay, 1927, and I. Hoffbauer (ed.), *George* (Gross, 1919).

Grote, George (1794-1871), eminent Eng. historian and politician, author of a standard work on Greece. He was educated at Charterhouse School, and after spending thirty years of his life as a banker and ten as one of the members of Parliament for London, he retired from Parliament in 1831 and from business in 1843 to give his whole time to literature. He was, with Bentham and Mill, one of the group of 'philosophical' radicals whose principles he actively supported in Parliament; he was one of the chief advocates of the ballot. G. criticised Mitford's *History of Greece*, attacking its anti-democratic deductions, which he held to be based on misconception. His own *magnum opus* regards the gov. of Athens as that of an idealised democracy. G.'s *History of Greece*, characterised by deep learning and the method of the 'philosophical' historian, superseded Mitford's and even the more scholarly work of Thirlwall. He wrote also *Plato and other Companions of Socrates*, and an unfinished work on Aristotle. See life by Mrs. G., 1873.

Grottefend, Georg Friedrich (1775-1853), Ger. orientalist and classical philologist, educated at Göttingen. Was director of the Lyceum at Hanover. G. is most famous for contributing to the decipherments of old Persian (cuneiform) inscriptions. His *Neue Beiträge zur Erläuterung der persopolitanischen Keilschrift* appeared in 1837; *Neue Beiträge zur Erläuterung der babylonischen Keilschrift* (1840). Other works are *Anfangsgründe der deutschen Poesie* (1815); *Rudimenta linguae Umbrae* (1835-38); *Rudimenta linguae Oscae* (1839); *Geographie und Geschichte von Aethiopia* (1840-42). He also revised C. Wenck's *Lateinische Grammatik* (1823-1824) and contributed to the *Encyclopaedia* of J. Ersch and J. Gruber (1818). See works of A. H. Sayce on *Ancient Monuments* (1881-94).

Grotesque (It. *grotesco*, from *grotesca*, style of painting found in anc. crypts, *crypta*, or *grotto*), in art a capricious and incongruous style of decoration, in which human figures, animals, flowers, and fruit are all fantastically mingled in wild confusion. This style was used in the thirteenth century, and rediscovered during excavations made in the baths of Titus. It was very popular in the Renaissance period, but soon became debased. G. has come to be applied to any fanciful combination of ideas, or to any

extravagant and absurd representation or appearance. See also ARABESQUE; CARICATURE. See Florio's Dictionary, 1598 and 1611.

Groth, Klaus Johann (1819-99), Ger. poet, b. at Heide in Schleswig-Holstein and educated at Tondern. He wrote lyric and epic poetry, and although his poems do not reflect the expression of Ger. country life as well as those on his own, on whom he modelled his own, nevertheless he has gained for himself a place among the Ger. poets. His chief works are *Quickborn* (1852); *Drei Platt-deutsche Erzählungen*; *Vertella* (1855); and *Volk-leben in plattdeutschen Gedichten* (1857). See lives by G. Seellg, 1924, and H. Schneider, 1930.

HUGO GROTIUS

Engraving after a picture by M. J. Muvvelt.

Grotius, Hugo, otherwise known as **Hulst van Groot** (1583-1645), celebrated Dutch jurist, b. at Delft and educated at Leyden. Leaving here he entered the diplomatic service and was for a short time in service with an embassy to England. He became pensionary of Rotterdam and supported the Arminians in their religious controversies. This gained for him the hatred of Prince Maurice, and he was arrested and condemned to imprisonment for life. By the aid of his wife he escaped and took refuge in Paris. Here he was granted a pension by Louis XIII. (1621). He distinguished himself in every branch of literature and diplomacy. In 1625 he issued his celebrated work on international law, *De Jure Belli et Pacis*. He became the ambas. of Sweden at the Fr. courts, and later proceeded to Stockholm. Return. from here he died at Rostock. He wrote much on theology, hist., and law, whilst as a poet he pub. some good verse both in Lat. and Dutch. His tragedy, *Adamus Eve*, was one of Milton's sources. He annotated the

Bible, 1641-46. Other works: *De Feritate Religione Christiana* (1627) and *Annales de Iebus Belgicis*, his best historical work (1657). See life by G. Butler, 1827; and studies by A. Hély, 1875; D. de Bruyn, 1894; and Vreelans (Eng. 1918). See also J. Ter Moulen, *Concise Bibliography of Hugo Grotius* (Leyden), 1925, and J. Huizinga, *Wyc der Kulturgeschiede*, 1930.

Groton, tn. in the U.S.A., co. of New London, Connecticut, on the R. Thames. Its chief industries are connected with engineering and tobacco. In 1781 the tn. played an important part in the Amer. War of Independence, but the garrison was massacred. Pop. 4700.

Grotta del Cane ('Grotto of the Dog'), cave near Naples and bordering on Lake Agnano. The cave is filled with carbonic acid gas fumes of great strength. The name was given because little dogs when sent into the cave were almost suffocated, but revived on being taken out.

Grotte, Sicilian tn., 13 m. N.E. of the tn. of Girgenti. It is the centre of the sulphur mining industry. Pop. about 11,000.

Grotzisk (Ger. Gratz), tn. of Poland in the prov. of Poznan.

Grouchy, Emmanuel, Marquis de (1766-1847), Fr. general who was b. in Paris. He first saw active service with the revolutionary armies in La Vendée. He was second in command of the army which was sent to invade Ireland, and was able to land in Ireland, although he accomplished little. He next proceeded to Italy, where he helped Joubert. He showed great courage and ability during the battles of Eylau, Friedland, and Wagram, and was in command of the bodyguard of Napoleon during the Russian campaign. He fought at Leipzig, and covered the retreat of Napoleon to Paris. He was among the first to welcome Napoleon on his return to France. He fought and defeated Blücher at Ligny, but misjudged that general's tenacity of purpose. After attempting to hold together the Fr. armies after Napoleon's second abdication, he fled to the U.S.A. He returned in 1819, and was restored to his rank in the Fr. army in 1831. His memoirs (5 vols.) were pub. by his grandson.

Ground Annual, in Scottish law an interest in land in the nature of an ann. rent or perpetual annuity. It is of two kinds: (a) Feu duties arising out of church property parcelled out in lordships erected by the crown, such feu duties being the interest retained by the lords of erection after resigning their superiorities to the crown. The feu duties became perpetually payable because the crown never rendered any consideration (q.v.) for the power to redeem them. (b) Rents reserved for building lots in burghs where subseus are prohibited. Such G. A. is in the nature of a real burden laid on the lands of a fixed ann. payment in lieu of price, and is usually accompanied with a personal obligation on the part of the building speculator that he and his representatives in a sale will not get rid of the G. A.

Ground-base, in music, a bass, consisting of a few notes or bars, unceasingly

repeated, and each time accompanied by a new or varied melody. See Beethoven's *Sonata pathétique*, Opus 13, first movement, *molto allegro*.

Ground-ice, see ANCHOR-ICE.

Groundling (*Cobitis taenia*), fish of the loach variety. It is rarely found nowadays, but occurs in Eng. waters occasionally. It is very small.

Ground-nut, Earth-nut, or Pea-nut, leguminous vegetable which can be grown as an ann. crop on light soils in almost any tropical or sub-tropical country. So far as the Brit. Colonial Empire is concerned production is centred chiefly in E. and W. Africa, but small quantities are also grown in Malaya, Mauritius, Hong Kong, and St. Vincent. As well as being used as an oil-seed it is used as a foodstuff not only as a staple in the countries of production but also as a dessert nut in European and Amer. countries under the name of pea-nut or monkey-nut. In Kenya, Uganda, and Tanganyika Gs. are one of the subsidiary native food crops. In W. Africa the G. is one of the most important products both for local consumption and for export. In Nigeria the production is centred in the extreme N. of the protectorate. Before the Second World War exports had risen to as much as a third of a million tons valued at over £1,000,000. They are the second most valuable Nigerian export. In the Gambia Gs. are an important native foodstuff and almost the only export crop, exports in 1937 being of the order of 70,000 tons. In the Gold Coast and Sierra Leone Gs. are a native foodstuff of secondary importance and exports are negligible. Only a few hundred ac. are under Gs. in Hong Kong, the Malay States, and Mauritius, cultivation in these dependencies being solely for local consumption. The G. is exported in two forms, 'undecorticated,' i.e. in the shell, and 'decorticated.' The shell, which represents about a quarter by weight of the nut, is commercially of negligible value. The oil extracted from undecorticated nuts is used mainly in the manuf. of edible commodities, such as margarine and salad and frying oil, while the oil from decorticated nuts is used in soap-making as well as for edible purposes. No available statistics of production as opposed to export are available for most African countries or China, in both of which areas Gs. are grown extensively for local consumption. One reliable estimate of world production in 1939, disregarding production for internal consumption in Brit. W. Africa and China, is about 4,775,000 tons, of which 3,414,000 tons would be available for export. Of the quantities which enter into world trade nearly three-quarters are produced in India. Of the whole Indian crop less than a quarter is normally exported in the raw form, but there are also Indian exports of G. oil, and if the equivalent in raw material of this oil is taken into account about one-third of the whole Indian crop can be regarded as grown for export. The oil content of the G. varies in different varieties. In some it is as high as 48 per cent, but not the whole of

this can be extracted, and allowing for this fact, for the lower proportion of oil in certain varieties and for the fact that the oil content has to be reduced by a quarter in the case of undecorticated nuts, an average figure of 36 per cent may be used for calculating the oil content of Gs. On this basis the oil equivalent of 3,414,000 tons of nuts is 1,229,000, to which must be added 40,000 tons which is produced in those countries which have facilities for extracting oil.

Tanganyika Ground-nuts Scheme.— This scheme was launched early in 1947 in the hope of securing a harvest which would give Britain ample supplies of margarine, oils, and fats, at a time when there would continue to be a world shortage in these commodities. The White Paper on the scheme envisaged a minimum of 600,000 tons of oil-seeds, rising to an annual production of 800,000 tons by 1950-51. With this target in view the gov. decided to spend £25,000,000 on the clearing of 3,500,000 ac. in the Kongwa, Urambo, and S. areas of Tanganyika in the course of six years. But up to the spring of 1949, with a third of the allotted time gone, £20,000,000 had been expended, while not more than 75,000 ac. had been put into cultivation. Of these over 25,000 ac. had been cleared but not rooted, and over 20,000 were open land which did not need much clearing. The fruit of two years' endeavour, in fact, amounted to less than 30,000 ac. The average yield of the 1948 harvest, originally estimated at 750 lb. of Gs. per acre proved to be less than 500 lb. The gov. then decided that the scale of the scheme should be cut down without, it was claimed, any loss in the yield of oils and fats. In the light of experience the corporation formed to operate the scheme now believed that they could produce 600,000 tons of oil-seeds from some 2,000,000 ac. At Kongwa just over 50,000 ac. were (1949) under cultivation—25,000 were Gs., 20,000 sunflower, and 2000 maize and other experimental crops. At Urambo, where the scheme was at an earlier stage,

500 ac. were (March 1949) under Gs. and 2700 under sunflower. The minister of food, who was responsible for the scheme, maintained in his reply in the House of Commons to critics of the scheme (March 13, 1949) that the necessary tonnage could be obtained from the reduced area by altering the rotation of crops so as to grow sun-flowers instead of grass during part of the time that the soil was being rested. Development of the Kongwa area, which was started first, might have to be restricted and more effort put into the W. area of Urambo, and into the S. area, which was likely in the end to be the largest of all. The principle was accepted that in developing the S. area ports, railways, and housing must be completed before ambitious agric. expansion were attempted. Both the time and the cost of the scheme were therefore likely to be double the estimates made in the original White Paper, but it was suggested by the gov. in 1949, with some optimism perhaps, that the course of world economic conditions, and of prices, might double the earnings in the same way as they had doubled the difficulties. There could be only one reason for abandoning the scheme now that the country was so deeply committed, and that would be proof that it were agriculturally impracticable. The best opinion, after bitter trial and error, was against so pessimistic a conclusion, although admitting that faulty methods of cultivation could still lead to grievous consequences. See *An Economic Survey of the Colonial Empire*, H.M.S.O., 1940. See also W. K. Hancock, *Survey of British Commonwealth Affairs*, vol. ii. part ii., 1942, and Richenda Scott and Daryll Fordo, *The Native Economics of Nigeria*, 1946.

Ground Pigeon, pigeon of the Peristerine family. It has longer legs than the usual type of pigeon. Turtle doves belong to this family.

Ground Rent, rent reserved by a landowner to himself in consideration of allowing buildings to be erected on his land. The customary arrangement in speculative building operations is for the landowner not to grant a lease at all until the buildings or part of the buildings are completed, but to enter into an agreement with the builder to reserve a total G. R. on his land to be subsequently apportioned to the houses as and when they are completed. As each house or integral building is completed the landowner grants a lease in which he reserves the G. R. on the site covered by such house or building. The interest of the builder in the land therefore ends with the sale of the houses built, unless, as often happens, he buys the G. R. himself. As the builder thus drops out of the transaction, the liability on the covenants becomes severable, each purchaser being liable only for breaches in respect of his own lease and house.

Groundsel (*Senecio vulgaris*), herb of the Compositae order. It ranks as a weed and bears yellow flowers. Sometimes given to cage birds, especially canaries, which like the leaves. But it should not

be given; it contains a poison which is cumulative in its effects on the liver.

Group Captain, rank of an officer commanding a number of squadrons in the R.A.F., equivalent to that of an army colonel or naval captain.

Groups, **Theory of**, study in higher mathematics which deals, not with actual quantities, but with operations. (Certain operations in elementary work are familiar, e.g. multiplication, the squaring of a number, the rotating of a figure about an axis, and differentiation. If A is any operator which operates on any quantity F , the result is usually expressed AF . If A operates again on the result, this becomes A^2F or A^2F ; if again, A^3F , and so on. When the result of two successive operations in any order leaves the subject of the operations unchanged, the operators are then said to be *inverse*. The successive application of an operator and its inverse is known as the *identical* operation. Thus if X and Y are two such inverse operators, $XYF = F$ and $YXF = F$; $\therefore XY = 1$ and $YX = 1$, and hence it is found convenient to write X^{-1} for Y . Thus $XX^{-1} = 1$ and $X^{-1}X = 1$. Thus the result of the inverse operation of X on F is $X^{-1}F$, and the result of a second operation is $XX^{-1}F$, and so on. Let A, B, C be three operations capable of operating on the same set of objects, of which the result of any two in any order equals the third, e.g. $AB = C$, then A, B, C and their inverses are said to form a group. And generally any number of such operations of which the result of the successive application of any two is equivalent to a third form with their inverses a group. The number of operations in a group may be finite or infinite. When it is finite the number is called the order of the group. For example, $A^2, A, 1, A^{-1}, A^{-2}$ form a group, which in this case is said to be cyclical.

Grouse and Grouse-shooting. $G.$ is a name which is in the exact sense applicable to all the members of the sub-family Tetraoninae; as commonly used the word refers only to the Red $G.$ In addition to this species the Black $G.$ (*Tetrao tetrix*) and the Wood $G.$ (*T. urogallus*) are found in Great Britain; these are better known by the names respectively of blackcock and Capercaillie, and reference should be made to articles under those headings. Among the other species of $G.$ may be named the Pinnated $G.$ (*T. cupido*), peculiar to America; the Dusky $G.$ (*T. obscurus*), which inhabits the Rocky Mts.; the Canadian $G.$ (*T. canadensis*), found in Canada and the U.S.A.; the Hazel $G.$ (*Bonasa sylvestris*) of N. Europe; and the Ruffed $G.$ (*B. umbellus*) of N. America. The Sand $G.$ (*Pterocles*) and the Prairie Hen (*Syrhaptes*), which are found in the Asiatic tablelands, constitute another family (the *Lerocillidae*). For the White $G.$ (*Lagopus mutus*, or *vulgaris*) see under PTARMIGAN. The Red $G.$ (*L. Scoticus*), also called the Moorcock or Moor-fowl, is considered to be a variety of the Willow $G.$ (*L. albus*), which is found in N. Europe, Asia, and America. It is found in the N. of England, particularly in Yorkshire,

Lancashire, Derbyshire, and Durham, in Wales, Ireland, and the Scottish Is., and in most abundance in the Highlands of Scotland. The species is peculiar to the above-mentioned localities, and differs from the other members of the same genus in the fact that it does not turn white in the winter. $G.$ -shooting, as generally used, refers exclusively to the Red $G.$, and under that heading the habits, etc., of the bird will be treated.

Grouse-shooting.—The Red $G.$ is monogamous; the pairing takes place early in the spring. The female lays from five to fifteen eggs, which require twenty-four days to hatch. The young birds are strong and hardy after the first fortnight, which is a somewhat critical period. The prin. enemy of the birds is the $G.$ disease (*Strongylus perforacilis*), an epidemic disease which occasionally causes great ravages among the birds, and in a very bad season will practically preclude shooting over the moors affected. All through the summer the young birds follow the parent birds; in the autumn they 'break up' until the winter, when they come together again in flocks (known as 'packs'), numbering, on the average, about thirty or forty, though sometimes as many as sixty are found. In order that a $G.$ moor should furnish an abundance of birds, the latter must have a good supply of food and drink. The first requisite for a moor is therefore an abundant supply of pure water, and as the young shoots of the heather and wild ling form the chief food of the birds at certain seasons, the heather must be made to produce such shoots. This is effected by skilful periodical burning of the heather in tracts, as old heather will not provide the required shoots. There are two methods of shooting $G.$, over dogs or by driving. The former method, usually only practised on small moors, is impossible after the birds have begun to pack. The most important thing in $G.$ -shooting over dogs is the direction of the wind. When a $G.$ is disturbed it will fly down the wind, and if the sportsman is also coming down the wind, his chance of a good shot will be small. If the $G.$ is made to breast the wind as it rises, it will turn and fly down the wind as soon as it has a sufficient velocity, and as it turns there will be the best chance of a shot. A moderate breeze blowing across the line taken by the shooting party is the best, and the most favourable weather is clear and sunny. If the weather is wild and wet, the best of dogs and shots do not stand much chance of a heavy bag. The dogs used are pointers or setters, the former being better if there is a plentiful supply of birds, otherwise the latter. The $G.$ are driven towards hidden butts or batteries, in which are the guns and which are situated about 80 yds. apart. It is obvious that upon the site of the butts depends much of the success of the shooting. The beaters are spread out in the form of a crescent, and are provided with flags to show the line of flight. The flanks must be well protected, the usual line of flight of the birds and the peculiarities

of the dist. must all be taken into account. The birds are shot as they fly towards the butts; their flight is so very rapid that it requires a first-class shot to kill with both barrels. From Dec. 11 to Aug. 11 (inclusive) is the 'close time' for G.; 'the Twelfth' is the abbreviation by which the opening of the season is generally known. For G. diseases see the papers of Prof. Young in the *Proceedings of the Natural History Society of Glasgow* (T.P. 225), and Dr. Klein's work on the subject. See *Grouse Shooting*, 1893; T. Cank, *Forty Years Mingled in Game, Fur, and Feather*, 1891; and M. Stephens, *Grouse Shooting*, 1899.

Grove, Sir George (1820-1900), Eng. writer, b. at Clapham, London, who is principally remembered for his contributions to the literature of music. He was at first an engineer, and spent his early days in the W. Indies. In 1849 he became secretary to the Society of Arts and later to the Crystal Palace. Here he was largely responsible for the institution of those concerts which have done so much to promote the education of the Brit. public in music. In 1868 he became editor of *Macmillan's Magazine*, and between the years 1879 and 1889 he ed. the *Dictionary of Music*. He was the first director of the Royal College of Music, and was knighted on his appointment. See F. G. Edwards, *A Biographical Sketch of Sir George Grove*, 1897, and C. L. Graves, *The Life and Letters of Sir George Grove*, C.B., 1903.

Grove, Sir William Robert (1811-96), Brit. scientist and lawyer, b. at Swansea; he was educated by private tutors and at Brasenose College, Oxford. He was called to the Bar in 1835, and then for a time devoted himself to scientific studies. He invented a voltaic cell that is called the G.'s cell, and by this, and by an anticipation of the methods of electric lighting, he made a great name for himself in the realm of science. He pub. in 1846 a book called *Correlation of Physical Forces*. In 1866 he was president of the Brit. Association. His legal work had not been neglected, and in 1853 he became a Q.C., and was later made a judge of the court of common pleas.

Grove's Cell, see CELL, VOLTAIC.

Growler, fish found chiefly in the fresh waters of N. America. It usually measures 2 ft. or more, and is allied to the perch family (*Percidae*). This fish is edible.

Growth always denotes increase. Applied to mental processes it means increase in ability to think and to reason, and in knowledge. Applied to nations or ideas, G. denotes progress or development. The term may also signify the result of the process of G., e.g. in describing cancer as a malignant G. Generally G. is increase in material, but this increase is acquired in very different ways by living and inanimate things. The G. of inanimate substances, such as crystals, proceeds by the addition of similar chemical material to the exterior, whereas living organisms grow by taking food within them, using it for the synthesis of various compounds, or breaking it down for the liberation of

energy. Organic G. has been defined in various ways—as increase in volume, as a change of form, and as increase in bulk; but it is now generally accepted as an increase in the material constituting an organism. This increment may be accompanied by change in volume, but the two are not necessarily concomitant. The increase in material of an organism is equal to the difference between the amount of food synthesised and that broken down, that is, to the difference between anabolism and katabolism. If the result be positive, what is generally understood by G. has taken place; if the result be negative, a decrease in material or reduction will be indicated, and some of the lower animals, such as Planarians, can be induced by starvation to diminish to about one-tenth of their normal size. When they are fed positive G. again takes place. Sev. scientists regard G. as an autocatalytic reaction, in which the rate of change is increased by one or more of the products of the reaction acting as catalysts. Other investigators consider that although certain reactions concerned with G. are autocatalytic, other complex factors also enter into the process, and consequently the autocatalytic theory is only partial and not applicable to G. as a whole.

See S. Minot, *The Problem of Age, Growth, and Death*, 1908; C. M. Child, *Senescence and Rejuvenescence*, 1915; W. D'Arcy Thompson, *On Growth and Form*, 1917; T. B. Robertson, *The Chemical Basis of Growth and Senescence*, 1923; J. L. Smith, *Growth*, 1932; and M. B. Metiraw, *Growth*, 1935.

Groyne, see under COAST PROTECTION.

Groynes, The, see CORUSA, LA.

Grozny (Grosnaya, Grosnyi), tn. of modern growth on an affluent of the R. Teruk in the G. region (Daghestan) of the R.S.F.S.R., in the N. Caucasus. It has refineries of petroleum. A pipe line connects it with the Caspian Sea. Russia draws 14 per cent of her oil from G.'s oilfield. The region is rich in gold, silver, lead, iron ore, etc. In the Second World War the Ger. invaders in 1942 made desperate efforts to capture the oilfield of G. By Aug. they had overrun the Maikop field and thereby jeopardised the more important field of G. By Aug. 24 they were within 85 m. of G. and by the 26th they had reached the Mozdok region on the very edge of the G. oilfield. But the Russian defences held firm and the Gers. were eventually driven back. See further under EASTERN FRONT IN SECOND WORLD WAR. Pop. 172,400.

Grub, George (1812-92), b. in Old Aberdeen and educated at the univ. there, where he ultimately became prof. of civil law. His great work was *The Ecclesiastical History of Scotland* (1861), which was written from the Anglican point of view. See life by Walk. r. *Three Churchmen*, 1893.

Grub, term applied to the larvae of coleopterous insects. It is also erroneously given to the maggots or larvae of Diptera, which differ from the true Gs. in having no distinct head, and to the caterpillars or larvae of Lepidoptera, which

differ in having rudimentary legs. The G. of a bee or beetle generally has a distinct head but no legs. The so-called sheep-grub is the larva of the gad-fly, which sometimes deposits its eggs in the nostrils of animals.

Grubenhagen, old principality of Germany. It was in the prov. of Hildesheim and formed part of the kingdom of Hanover, being divided into two dists.—the E. and W.—having the Harz Mts. as a dividing line. The chief tn. was Elmbeck, situated on the Ilm. Pop. about 80,000.

Gruber, Johann Gottfried (1774–1851), a Ger. author and historian, was b. at Naumburg. At Weimar he enjoyed for a time the friendship of Goethe. He became a prof. at the univ. of Wittenberg. With Prof. Ersch he ed. the *Allgemeine Encyclopädie der Wissenschaften und Künste* (1818), a work which he continued after Ersch's death. He also wrote *Geschichte des menschlichen Geschlechts* (1805), and works on Herder, Wieland, and Klopstock; and ed. the *Allgemeine Literaturzeitung*.

Grub Street, now called Milton Street in honour of the poet whose home was near it, was famous in the seventeenth century for the reason given in Dr. Johnson's interesting definition in his *Dictionary*: 'Originally the name of a street near Moorfields in London, much inhabited by writers of small histories, dictionaries, and temporary poems, whence any mean production is called *Grub Street*.' The name has also been applied, since this time, as a collective term to struggling hack writers.

Grudziadz, see GRAUDENZ.

Grun, Anastasius, see AUERSBERG, COUNT OF.

Grun, Hans, see BALDUNG, HANS.

Grunberg (Polish Zielona Gora), tn of Poland in Lower Silesia, 33 m. from Glogau. It is noted for manufs. of woollens, machinery, and straw hats, and the vine was cultivated to a large extent, and wine and champagne exported. It was here in the Second World War that the two Russian marshals, Konev and Zhukov, linked forces on Feb. 16, 1945, in the final drive to Berlin. Pop. 25,300.

Grundtvig, Nicolai Frederik Severin (1783–1872), Dan. antiquarian, poet, preacher, and reformer, b. at Odby, Zealand, and educated at Copenhagen. He was pastor of Frøsto from 1821 to 1822, when he became chaplain of the Church of the Saviour, Copenhagen. In 1825 he made a vehement protest in his *Kirkens Ujævnle* against 'rationalism' in the church. This raised a storm of bitter controversy, and G. was deprived of eccles. office. He championed the cause of civil and religious freedom, advocated the separation of church and state, and helped to bring about many reforms. As a member of the *Folkething* he collaborated in the drawing up of the Liberal constitution of 1849. He was reinstated and made a bishop in 1861. G. studied and wrote upon the ant. Norse traditions and trans. the *Saga Grammaticus*, and *Snorri Sturluson* (1818–22) and the *Heimskringla*. He pub. a vol. of the ant. popular songs of

Iceland, *Popular Danish Songs*, collected among the Dan. peasantry who sang them to him, *Kort Begreb af Verdens Kronike i Sammenheng*, sev. vols. of poems, and a system of philosophy, *Mind and Liberty*. See lives by J. Kalfan, 1877; M. Holmström, 1917; and E. Lehmann, 1929.

Royal Danish Embassy

GRUNDTVIG CHURCH, COPENHAGEN

Grundtvig, Svend Hersleb (1821–93), son of the preceding, a Dan. philologist. His greatest work is *Danmarks gamle Folkeviser* (1853–83), in which are reproduced the ant. texts of popular songs, together with their subsequent forms collected orally.

Grundy, Mrs., the name given to an imaginary character, who may well be described as the presiding deity of Eng. respectability. She appears first in Eng. literature in a play called *Speed the Plough*, where she is continually referred to as an authority on the proprieties. Her name has become a household word, but is used now with a contemptuous connotation.

Grundy, Sydney (1818–1914), Eng. dramatic author, b. at Manchester. He practised as a barrister for a few years, but became known as a successful playwright. His first play, *A Little Change*, was produced at the Haymarket Theatre in 1872, and in 1887 he made a great success with *The Bells of Havermere*, written with H. Pettitt. His other comedies include *A Whole Lot* (1889); *A Fool's Paradise* (1889); *Sowing the Wind* (1893); *An Old Jew* (1894); and *A Bush of Violets* (1894, taken from Feuille's *Montjoie*). The most successful of his adaptations was *A Pair of Spectacles* (1890, taken from

Les Petits Oiseaux of Labiche and Delacour. Others were *A Marriage of Convenience* (1897); *Business is Business* (1905, from Mirbeau); and *The Diplomats* (1903).

Gruner, Wilhelm Heinrich Ludwig (1801-82), Ger. engraver, b. at Dresden. He became the director of the Royal Museum at Dresden, and made a great name for himself as an engraver of many fine lt. masterpieces. In 1850 he pub. *Specimens of Ornamental Art and The Terra-cotta Architecture of North Italy* (1867).

Grünwald, Matthias (1460 or c. 1475-80-1528), Ger. painter, b. at Würzburg. His real name was Matthias Neithardt, or Gotthardt. He is first mentioned in 1501 in the archives of Soligenstadt, near Aschaffenburg. From 1508 to 1511 he was court painter to the archbishop of Mainz, Uriel von Gemmingen, and after 1514 to the elector of Mainz, Albrecht von Brandenburg. He was active also as an engineer (fountains, etc.) and as an architect. In 1526 he was working in Frankfurt-on-Main, and in 1527 in Halle. His 'Christ mocked' (c. 1503), painted on a pine panel, is in the Alte Pinakothek, Munich. See studies by H. A. Schmid, 1911; W. Roltz, 1924; F. Knapp, 1935; and M. Brion, 1939.

Grunting Ox, see YAK.

Grus ('the Crane'), S. constellation near Aquarius and Pegasus Australis, introduced by sixteenth-century mariners. Near by are the constellations of Indus and Phoenix, on either side.

Grusenber, Mikhail Markovitch, see BORODIN.

Grutli, or Rutli, meadowland of Switzerland, situated in the canton of Uri, near Lake Lucerne. The Swiss League was founded here against Austria by the peasant leaders, Stauffacher, Arnold, Melchthal, and Walter Furst. The meadow is now the property of the State, having been purchased by the schoolchildren of Switzerland. See J. C. F. von Schiller, *U d'chm Tell*, li. 2.

Gruyère, dist. and tn. of Switzerland in the canton of Freiburg and 16 m. S.W. of that tn. It is noted for its cheese. The cap. of the dist. is Bulle. Pop. (tn.) 1500.

Gryfice (Ger. *Greifenberg*), tn. in prov. of Pomorze, Poland, situated just over 40 m. N.E. of Stettin; manufs. bricks, machines, and stoves. Pop. 9300.

Gryfino (Ger. *Greifenhagen*), tn. in the prov. of Pomorze, Poland, situated 12 m. S.S.W. of Stettin; great centre of the cattle trade. Pop. 8900.

Gryllidae, name of a family of Orthoptera, belonging to the section Saltatoria, and typified by *Gryllus*, the cricket genus. All members of this family are characterized by a cylindrical body, long, slender antennae, and, in the females, a long curved ovipositor. There are sev. genera, which are widely distributed, (*G. domesticus*, the common house-cricket, being found in the old world and in N. America. The name grasshopper is often applied to *G. campestris* and *Artemobius sylvestris*, two species of field-crickets.

Gryllus, genus to which the crickets belong. This order is distributed all over the world, but there are only four Brit. varieties.

Gryphius, Sebastian (1493-1556), printer, b. at Reutlingen in Swabia. He settled at Lyons in 1528, and from that date onwards printed about 300 books, including Heb., Gk., Lat., It., and Fr. He was especially distinguished for the beauty of his Gk. and Heb. types, and his Fr. and Lat. books are still highly esteemed. Among the most noted of his works are the fine Lat. Bible of 1550 and Dolet's *Commentarii linguae Latinae*.

GUACHARO

Guacharo, or Oil-bird (*Steatornis caripensis*), first found at Caripe in Venezuela. It constitutes the family Steatornithidae, but is allied to the Nightjars. It is about the size of a crow, and lives chiefly in caverns near the sea.

Guadagnini, name of a family of violin makers in Italy. Lorenzo, who between 1695 and 1724 resided at Milan among other places, was a pupil of Stradivarius. His son, Giovanni Battista (1711-86), resided at Milan and Turin, both of them making instruments which are among the best of their kind.

Guadalajara: 1. Prov. of New Castile, Spain, bounded N. by Segovia, Soria, and Saragossa, E. by Teruel, S. by Cuenca, W. by Madrid. It is watered by tribs. of the Tagus, and yields agric. produce. Silver is found in the dist., and pottery is manufactured. It was in this prov. that the It. mercenaries of Mussolini were heavily defeated by Sp. republican troops in the civil war (1936-39) (see under SPAIN, History). Area 4676 sq. m. Pop. 179,000. 2. Cap. of above on the Henares, 33 m. N.E. of Madrid. Among its chief buildings are the palace of the Mendozas and the Pantheon containing their tombs, the cloister of San Jancisco, and a military engineering academy. There are textile and flour-mills, and some serge and flannel are manufactured. Pop. 12,000. 3. Cap. of Jalisco state, Mexico, 380 m. N.W. of Mexico city, with which it is connected by rail, and situated 5000 ft.

above sea level. Founded in 1530 by Sp. aristocrats, second largest city of the republic. Estab. originally as a base for exploration up the W. coast, it soon outgrew its rival, Santiago de Compostela, usurping its privilege as seat of the W. see. A few years after G. was first settled by conquistadores it was made the cap. of a rich and fertile region long known as the kingdom of New Galicia. The city prospered and by 1810 its pop. had reached 60,000. Many of its fine buildings were considerably damaged in an earthquake of 1818. During the following decades it suffered the desolation and stagnation of the War of Independence, but with peace prosperity returned. With the advent of the first Amer. locomotive (1888) the city's importance as a commercial and industrial centre was assured. Since then G. has steadily prospered, but it has never lost the charming old-world atmosphere of its Sp. colonial days which have left on it their indelible imprint. G. is a trade and rail centre and the terminal of the S. Pacific W. coast route. The city is large and handsomely laid out; the main plaza is a promenade in the centre of the city, flanked by the gov. palace and cathedral, and by adjacent arcades. Anct. orange-trees border the plaza which is planned as an old-fashioned garden. Elements of Sp., Moorish, and Hellenic architecture form a curious blend in the old gov. palace built in 1643 with loopholes and fortress-like windows. It was in this building that the patriot priest Hidalgo wrote part of his *Declaration of Independence*, 1811. G. is the seat of an archbishop. The cathedral is the most outstanding example of the transitional style in Mexico. Begun in 1618, a series of later reconstructions through three centuries has resulted in a building which includes Gothic, Tuscan, Arabic, Mudéjar, Corinthian, Byzantine, and Doric elements. It contains an 'Assumption' by Murillo. The little church of Santa Monica is noted for its elaborately decorated façade. Other notable churches are the Santuario de San José de Gracia, the church of Jesus Maria, San Felipe Sanctuary of our Lady (Guadalupe), and the Mexicallizgo Church. The museum and library are housed in an anct. seminary, which building, constructed in 1700, is one of the finest examples of eighteenth-century architecture on the Amer. continent. It contains a remarkable collection of outstanding Sp. and Mexican paintings. The Degollado Theatre is a graceful building in the neo-classic style. Facing it is the temple of San Agustín, typical of the city's older architecture. The Univ. of G., one of Mexico's chief centres of intellectual activity, is noted for its murals by Orozco. There are manufs. of cotton, woollens, pottery, metal wares, glass, and confectionery. Pop. 206,800.

Guadalaviar, riv. of E. Spain, which rises in a small lake in the Sierra of Albaracin. Its course, amidst beautiful scenery, is generally S. and S.E. for 180 m. until it reaches the Mediterranean Sea at Valencia.

Guadalcanal, one of the largest and most

important of the ls. of the Brit. Solomon Is. Protectorate; lies just N. of lat. 10° S. and is crossed by long. 160° E. It is 100 m. long by 34 broad. It is mountainous for the most part and has a grand system of peaks rising to 8000 ft. The high land at the S., where the big hills occur, is 'the home of mystery' (Ivens). In these hills, tradition says, there are wild men or ogres, the Mumuu, with long hair and stumps for feet. G. has dense forests, but extensive areas are devoid of trees, being clothed with a tall green mantle of grass, growing to a height of 6 ft. This grass extends over the plains and up into the mts., but the watercourses are lined with scrub and timber. Many streams of G. consist, in ordinary weather, of dry beds of stone and sand, water appearing only at a rock outcrop in the bed. A brilliant yellow orchid (*Dendrobium*) grows freely on the ls. G. contains evidence of having been upraised more than once and it would seem from the raised beaches, common round the coast, that the upheaval is still going on (Knibbs). The natives are Papians of a dark colour and are superstitious. The practice of *tele* or *hela* (= 'ghost', 'incarnation') seems to be connected with the cult of ginger as a thing possessing magical powers. The gov. has endeavoured, but with indifferent success, to put an end to the superstition of *tele*, which is really a sort of witchcraft. Rattan-woven shields, ornately decorated, were once a feature of local craftsmanship. The shin-bone spear, generally 11 ft. long or more, was a formidable weapon, the spear-head being carved from a human tibia; but they are very rare indeed to-day, and none has been made for many years. The prin. tns. are Aola and Lunga, both on the N. coast. G. was discovered in 1568 by Alvaro de Mendana, and was named by the Spaniards. Mendana intended to settle on it in 1593 but on that occasion he could not locate it. G. was the scene of a protracted campaign against the Jap. who landed powerful forces there in the summer of 1912. Amer. and Australian forces were landed soon afterwards. The Jap. were driven out by early 1943, having lost nearly 9000 men in killed or captured in the land fighting and many more in the sinking of ships, besides a large number of aircraft. See W. G. Ivens, *Melanesians of the South-East Solomon Islands*, 1927, and S. G. C. Knibbs, *The Savage Solomons*, 1929.

Guadaleazar, tn. of Mexico in the state of San Luis Potosí and 40 m. N.E. of that place. There are noted mines of quicksilver in the vicinity. Pop. 12,500.

Guadaluquivir (anct. *Betis*), riv. of Spain. It rises in the Sierra del Pozo Morena, and at first flows N.E. and then alters its course, assuming a S.-westerly direction through Andalusia, entering the Atlantic about 20 m. N. of Cadiz. It is navigable as far as Seville, below which tn. it divides, forming the ls. of Isla Mayor and Isla Menor. It is about 350 m. long.

Guadalupe: 1. Riv. of Texas, rising in Kerr co., and flowing into the bay of San Antonio. It is about 230 m. long. 2. Com. of Mexico, in the state of Zacatecas,

and situated 10 m. S.E. of the tn. of Zacatecas, with which it is connected by rail. Pop. about 8800. 3. Tn. of Uruguay, see CANELONES.

Guadalupe Hidalgo, tn. of Mexico, situated between 2 and 3 in. N. of Mexico. It is the site of a church which is much visited by pilgrims, and it was in this tn. that the treaty was made between the U.S.A. and Mexico in 1848, giving New Mexico and Upper California to the U.S.A. Pop. 5500.

Guadarrama, Sierra de, range of mts. in Spain, separating Madrid and Segovia, and situated between the Douro and the Tago. The highest points in the range rise to about 8700 ft. Among them may be mentioned Sierra de Ayllon and the Pico de Penedara.

Guadeloupe, Is. of the W. Indies and a Fr. colonial dependency. It is really formed of two Is., Basses-terres and Grande-terre, separated by the Riviere Salée. Basses-terres is of volcanic formation, the largest volcano being Soufrière (a common name in W. Indian Is. connoting any sulphurous mt.), while Grande-terre is comparatively flat. The climate is hot and the soil fertile, producing sugar—the prin. crop—cereals, coffee, cassava, yams, vanilla, cotton, and potatoes; while Basses-terre is covered with large forests. The dependencies of G. are Marie Galante (q.v.), St. Barthélemy (q.v.), Démarade (q.v.), Les Saintes (see SAINTS, BATTLE OF THE), and part of St. Martin (q.v.), all of coral formation. The Is. is ruled by a governor, assisted by a privy council, and is represented in the Fr. Parliament. The cap. is Basses-terre, to the S.W. of the Soufrière, situated near rugged and remarkably beautiful country. It dates from 1613, but its glory has departed with the development of Pointe-à-Pitre on Grande-terre. The latter is a picturesque tn. (pop. 41,000) of well-built houses which are mostly of stone with upper storeys of wood, many painted in gay colours. It has a cathedral in Place de l'Église, and also a fine harbour, and is the prin. commercial centre. Iron and lime phosphates are to be found in the dependencies, also calcareous stone quarries in Grande-terre. The Is. was discovered by Columbus in 1493, but no colony was founded until Duplessis and de l'Olive landed in 1635 and took possession in the name of France. In 1759 it was taken by the Eng., but recovered by the Fr. In 1763, at the end of the Seven Years war. In 1794 Pointe-à-Pitre and Basses-terre were captured by an expedition under Sir Charles Grey and Sir John Jervis (who was later created Earl St. Vincent), but two months later the notorious Victor Hugues, commissary of the convention, landed at Gosier and drove the Eng. from their positions. Jervis returned and compelled the Fr. to surrender; but Hugues rallied his followers and inflicted a defeat on the Eng., after which Jervis re-embarked his forces and withdrew. After the withdrawal of Grey and Jervis in 1794 some 300 Fr. royalists who had assisted them were guillotined or shot by Hugues. On Pointe-à-Pitre on June 5, 1794, took place

the five-hour sea-fight between the *Blanche*, under Capt. Robert Faulknor, known as the Undaunted, and a Fr. frigate *Pique*, Faulknor being killed as he was lashing the bowsprit of the *Pique* to his own ship for the second time (see Sir A. Aspinall, *A Wanderer in the West Indies*, 1928). In 1810 the Eng. again seized the Is., but it was restored to France in 1814. In the following year it was again taken by the Eng. after the battle of Waterloo and administered by them on behalf of the legitimate gov. of France until 1916, when a Fr. gov. took over control. There are good roads but only one small railway. A regular steamboat service is carried on by both Fr. and Eng., and there is a telegraph and telephone service on the Is. A wireless station was opened at Desbrelan in 1918. There are good educational facilities, both public and private elementary schools being estab. Pop. 304,200.

Guadiana, riv. of Spain, the Zancara, which rises in the prov. of Cuenca, being its head stream. Not far from the Zancara are the lakes known as Los Ojos. The G. flows westward through La Mancha and Extremadura to Badajoz, where it assumes a southerly direction forming a boundary between Spain and Portugal. The riv. is about 500 m. long, its chief tribs. being the Javalón, Zújar, and Ardila.

Guadix, city of N. Spain in Granada, situated on the R. G. There are mulberry plantations, and in the vicinity are the warm mineral springs of Guacra. It contains a cathedral and the ruins of an old Moorish castle. Pop. 16,000.

Guaduas, tn. of Colombia, S. America, situated 45 m. N.W. of Bogotá, in the dept. of Cundinamarca, over 3000 ft. above sea level. Pop. 12,900.

Guagua, tn. and com. of the Is. of Luzon, Philippine Is. It is situated in the prov. of Pampanga. Pop. 10,500.

Gualdo Tadino, com. of Italy in the prov. of Perugia, situated about 58 m. from Ancona, on the road leading to the Furlo Pass. It possesses a noted cathedral. In the vicinity Totila was defeated by Narses in 552. Pop. 11,000.

Gualeguay, tn. in the prov. of Entre Ríos, Argentine, about 8 m. from Porto Itiz. Pop. about 16,000.

Gualeguaychu, riv. port in the prov. of Entre Ríos, Argentine, situated on the R. G., about 9 m. from its confluence with the Uruguay. Trades in meat extracts. Pop. about 20,000.

Guam, Guahan, or Gualan, largest and most S. of the Ladrone or Mariana Is. Magellan is said to have discovered the Is. in 1521. It was ceded by Spain to the U.S.A. in 1898 and therefore did not come under the Jap. mandatory control of the rest of the Mariannas Archipelago which had been sold by Spain to Germany in 1899. It is maintained as an Amer. military outpost. The Is. is 30 m. long, from 1 to 8½ m. broad, and has an area of some 205 sq. m. The surface is mountainous and the coast surrounded by coral reefs. The best harbour is Apra on the W. coast. The products of G. are maize, sweet potatoes, taro, copra, rice, bananas,

citrus and other fruits, papayas, sugarcane, breadfruit, cassava, and coco-nuts. The native inhab. of G., the Chamorros, are classified among the Micronesians. G. was captured by the Jap. on Dec. 12, 1941, and retaken by Amer. forces on Aug. 10, 1944. Agaña, the seat of naval government, was destroyed during the reoccupation. It is being rebuilt on the same site, which is about 8 m. from the anchorage in Apra harbour. The port of entry is Piti. It is closed to foreign vessels of war and commerce except in special cases. There is a gov. radio station on the is. Commercial and gov. transportation by ship is available at regular intervals. The governor of G. is a rear-admiral appointed by the Amer. President, and he is also the senior naval commander of the 'trustee' is. in the W. Pacific area. He and his staff constitute the executive, and the Guamanian congress form the legislature. The congress is elected biennially and its powers are similar to those of an Amer. state legislature. The judiciary comprises an is. court, a justice court, besides a court of appeal. Elementary education is compulsory. In 1947 there were 8400 pupils in twenty-two elementary and three high schools and there is also a teachers' college. The educational standards are stated to be equal to those of the more advanced states of the U.S.A. Pop. 22,000. *See* W. H. Haas (editor), *The American Empire. A Study of the Outlying Territories of the United States*, 1940; L. Thompson, *Guam and its People*, 1911; and F. M. Keesing, *The South Seas in the Modern World*, 1942.

Guamo, tn. of Colombia, situated to the S.W. of Bogotá. Pop. about 11,000.

Guan, bird belonging to the family Gracidae, sub-family Pelelopinae, native of Central and S. America. These birds are characterised by bare throats and wattles. They are gregarious birds, and are usually to be found in forests. Their colour is olive-green or brown, and sev. of the species are capable of being domesticated.

Guanabacoa, tn. of Cuba, 3 m. E. of Havana. It is built on high land and is well provided with public buildings. It is connected by rail and motor road to Havana, of which it is a residential suburb. There are medicinal springs in the tn. Pop. about 19,000.

Guanacaste, prov. of Costa Rica, including the peninsula of Nicoya. The surface of the prov. is covered by large forests, and is well provided with land suitable for grazing. The cap. is G. or Liberia. Pop. (prov.) 90,100; (tn.) about 8000.

Guanaco, wild species of the camel family, the llama and alpaca being the domesticated varieties. It is of a reddish-brown colour, and is a native of S. America, found particularly on the Andes and generally living in herds.

Guanajay, tn. in the prov. of Pinar del Rio, Cuba. It lies 35 m. S.W. of Havana and is noted as a health resort. Pop. about 6000.

Guanajuato: 1. State of Mexico, bounded

on the N. by San Luis Potosí, on the S. by Michoacán, on the W. by Jalisco, and on the E. by Querétaro, with an area of about 10,950 sq. m. This state lies in the central plateau of Mexico, and its surface is very mountainous, the Sierra Gordo and Sierra de G. being the highest ranges. The chief riv. is the Rio Grande (de Lerma), and the cap. G. is exceedingly rich in minerals. The silver-mines are of the greatest importance, being worked since the Sp. conquest. Pop. (1940) 1,046,400. 2. Cap. tn. of the state of G., situated to the N.W. of Mexico. This city consists of a number of vills. placed round the mines, and being on uneven ground has steep and winding streets, well-built houses, and a generally oriental appearance. Among its chief buildings are the Alhondiga, a cathedral, mint, univ., and theatre. In addition to the silver and gold mines which are near, G. manufs. pottery, chemical, and other articles. Pop. 20,000.

Guanare, cap. of the state of Zamora, Venezuela. It is noted for its trade in cattle. Pop. 11,000.

Guancabellia, *see* HUANCAVELICA.

Guanches, or **Guanchos**, race originally found in the Canary Is. They were finally conquered by the Spaniards about the end of the fifteenth century, and at the present time are nearly extinct. The character of their skull—low forehead and projecting jaw—shows a likeness to the Cro-Magnon race of France, while their language and inscriptions point to a connection with the Berbers of N. Africa. *See* S. Berthelot, *Antiquités Canariennes ou annotation sur l'origine des peuples qui occupèrent les îles fortunées depuis les premiers temps jusqu'à l'époque de leur conquête*, 1879.

Guanes, tn. in Cuba, situated in the centre of flourishing tobacco, cotton, and coffee plantations. It is 120 m. S.W. of Havana in the prov. of Pinar del Rio. Pop. 10,500.

Guanine ($C_5H_7N_5O$), highly nitrogenous base containing the uric acid nucleus found in guano and other animal products. It forms a white insoluble powder which is converted by nitrous acid into xanthine, a substance present in tea.

Guano (derived from the Peruvian word *huano*, dung), excrement of certain sea-fowl, e.g. gulls, cormorants, and penguins, together with other animal remains such as feathers and bones. It is used largely as a manure, its value as such depending on the fact that it is a general fertiliser yielding all the constituents of plant food in a condition that can be readily assimilated. The chemical composition is extremely complex and varies according to the locality and age of the deposit. The main constituents are nitrogenous (uric acid) and phosphatic (calcium phosphate) compounds, together with various potassium and ammonium salts and a nitrogenous substance, guanino (q.v.). The most highly nitrogenous and therefore most valuable G. (containing nitrogen from 13 to 14 per cent. and phosphoric acid to the same amount) has been imported since 1840 from the Chincha Is. off Peru. In Peru the G. deposits now belong to the gov. and exports have been

forbidden since 1941. According to Bous-singault, one ton of this is equal to about thirty tons of farmyard manure or cow-dung. The best supplies of G. are now practically exhausted, and low quality grades are now 'fortified' with ammonium sulphate. Natural G. is one of the prin. exports of Seychelles. There are large deposits of phosphatic G. in Ocean Is. (Gilbert and Ellice Is. Colony) and the colony is almost entirely dependent on their exploitation. Whale G. is a fertilizer containing about 84 per cent of ammonia and 21 per cent of tribasic phosphates of lime.

Guantanamo, tn. in the chief coffee-growing dist. of Cuba, 13 m. N. of Caimanera, its port, and 49 m. E. of Santiago de Cuba. One of the four naval stations ceded to the U.S.A. by Cuba in 1901. Exports sugar and lumber, and has a good harbour. Pop. (1913): City, 42,423; municipality, 91,737.

Guapal, or **Rio Grande**, riv. in Bolivia rising in the dept. of Cochabamba. Trib. of the Mamore, into which it runs after a circuitous course of 550 m.

Guarani, **Guaranys**, or **Guaranies** ('warriors'), S. Amer. aborigines, one of the chief groups of S. Amer. Indian tribes, who lived between Parana R. and the Atlantic. The name is also applied to a great linguistic family Tupi-G., which formerly occupied Paraguay, Uruguay, and Brazil, with branches also in Bolivia and Peru. These numerous tribes were distinguished by the same language and similar customs. They cultivated the manioc and other plants, and had developed various peaceful arts. They were usually friendly with the whites and easily subdued. The modern pop. of Paraguay are largely descendants of the G. and the Spaniards with whom they intermarried. The Jesuits estab. important missions among them. The G. language has Mongolian characteristics, and was early adopted by missionaries as the *lingua geral*. See Martius, *Ethnographie und Sprachenkunde Amerikas*, 1867; Brinton, *The American Race*, 1891; and M. S. Bertoni, *La Civilización Guaraní*, 1922.

Guarantee, or **Contract of Suretyship**, promise to be collaterally responsible for the debt or default of another person, the prin. debtor. It is to be distinguished from an indemnity (q.v.) because no liability arises until the prin. debtor has made default. A G. is within the Statute of Frauds (see FRAUDS, STATUTE OF), and hence is unenforceable unless evidenced by writing; but the writing need not contain any statement of consideration (q.v.) given to the surety in return for his ft. The practical effect of this is that a surety cannot be successfully sued if he can prove that there has been no consideration, but that where consideration has been given, it is no defence that it is not stated in writing. A valid contract of suretyship must be made with the creditor, and the guarantor must be under no liability in the prin. contract. It seems now to be settled law that a surety cannot compel the creditor to sue the debtor before having recourse to him, for the creditor can sue

the surety without even informing him of the debtor's default. Any fraudulent concealment or wilful misrepresentation on the part of the creditor inducing the G. will entitle the guarantor to repudiate the G., and if the creditor alters the terms of the G. without the consent of the surety, the latter is discharged, as also if he takes a new security from his debtor in substitution for the original security. On payment of the debt the surety has the right not only to recover from the prin. debtor the full amount of the debt with interest, and costs reasonably incurred in disputing the claim, but to be subrogated to all the rights, equities, and securities given by the prin. debtor to the creditor. A discharge in bankruptcy of the prin. debtor or the acceptance by the creditors of a scheme of arrangement does not release from liability a person who was surety for his debts (Bankruptcy Act, 1914). See T. Hewitson, *Suretyship*, 1927.

Guarantee Associations, associations or insurance companies which issue policies guaranteeing the assured against the default or insolvency of his debtors; or, specifically, fidelity policies or bonds to guarantee the assured against dishonesty of a servant or employee. Contracts to issue such policies are within the Statute of Frauds (see FRAUDS, STATUTE OF), and must therefore be in writing. In the case of fidelity bonds the employer must disclose to the G. A. any knowledge he may have respecting previous defalcations on the part of the employee whose integrity is the subject of the policy of bond. It is a defence to an action on a fidelity policy that the assured has been negligent in supervising the employee. If during the currency of a fidelity policy the employee is guilty of any dereliction of duty justifying his dismissal, the assured must give notice to the G. Association, even although the conduct of the employee has given rise to no claim upon the policy. Speculation or gambling on the part of the employee must also be disclosed where the policy contains a condition to the effect that the employer must give notice on becoming cognisant of such fact. Guarantee policies against insolvency or default of debtors must be distinguished from ordinary contracts of guarantee (see GUARANTEE). Full disclosure must be made as in the case of fidelity bonds, whereas in ordinary guarantees such disclosure is not essential. The G. Association is discharged from liability, generally speaking, if the creditor consents to any alteration in the liability of the debtor.

Guarayos, aborigines of S. America. They are found chiefly in the forest land of Bolivia. They have never been fully civilised, and all attempts to bring them under the permanent influence of civilisation have been frustrated by their fierce and barbarous habits. They cultivate maize and plantains.

Guard, National, see UNITED STATES, Army.

Guarda, name of a fortified tn. and dist. in Portugal. The dist. forms part of the prov. of Beira. It is situated just over

70 m. N.E. of Colmbra. It has a bishop's palace, cathedral, and old castle. Pop. (dist.) 294,100; (tn.) about 6000.

Guardafui, N.E. extremity of E. Africa, situated at the S. entrance of the gulf of Aden.

Guardi, Francesco (1712-93), Venetian painter. His greatest works are to be found in the Manfrini Palace at Venice. He was a pupil of Canaletto, whose style he followed closely. See lives by G. Fiocco, 1923, and M. Tinti, 1930.

Guardiagrele, city in the prov. of Chieti, Italy, 18 m. S.W. of Ortona, and possessing mineral springs. The fourteenth- and fifteenth century church of San Francesco and the church of Santa Maria Maggiore were badly damaged in the battles of 1914. Pop. 8000.

Guardian, in Eng. law the person who has the legal control of another, usually a minor or a person of weak intelligence, and who also has the management of his property. A child's natural G. is the father or mother, but when they are dead one or two Gs. are generally appointed by will. A G. may therefore be such by nature, e.g. the parent or parents or other ancestor, or by statute; or a judicial G., appointed by the chancery div. of the high court. The powers of the G. are much the same as those of the parent (see PARENT AND CHILD). A G. is appointed by the court when disputes arise; and it is to the chancery court that a G. can appeal if in a serious difficulty with his ward. In Scotland a G. is termed a tutor. The consent of the G. is necessary for the marriage of an infant ward, unless the court dispenses with it. A different kind of G. was the person elected to look after the administration of the Poor Law. There was a board of Gs. in each union of parcs, but these boards were abolished in 1929 when their duties were assigned to Public Assistance Committees appointed by the co. and co. bor. councils. See POOR LAW.

Guardian's Allowances, see under NATIONAL INSURANCE ACT (1916).

Guards, Board of, see POOR LAWS.

Guards, Dragoon. Prior to the First World War there were seven regiments of D. G.: the 1st (King's), 2nd (Queen's Bays), 3rd (Prince of Wales's), 4th (Royal Irish), 5th (Princess Charlotte of Wales's), 6th (Carabiniers), and 7th (Princess Royal's). After the war the progress made in mechanisation (q.v.), combined with the need for economy, resulted in the amalgamation of many of the old cavalry regiments and eventually in their conversion into armoured car or tank units.

All the old regiments of D. G., except the 7th, were raised at the time of the Monmouth rebellion of 1685. The 1st (King's) acquired their title 'King's' in 1746. They fought, as did most of the other regiments of D. G., in Marlborough's campaigns, also in the S. African War, and at Ypres and Ieper in the First World War. The Queen's Bays fought at the battle of the Boyne as the 3rd Regiment of Horse, and their present name was given in the time of the Seven Years'

war. In the First World War they fought at Mons, Le Cateau, Néry, Gheluvelt, and at various points in the Ypres salient. The 3rd D. G., the old-time 4th Regiment of Horse, fought under Marlborough as 'Wood's Horse' and received their title, 'Prince of Wales's,' in 1768. Besides taking part in Marlborough's campaigns, they fought in the Peninsular battles; and, in the First World War, at Hollebeke, Klein Zillebeke, and Gheluvelt in the first battle of Ypres, and in 1915 took part in combined cavalry operations in the second battle of Ypres. The Royal Irish D. G., raised in 1697 as 'Arran's Cuirassiers,' received their present name in 1788, and fought with distinction at Balaklava and other Crimean battles, and at Tel-el-Kebir. In the First World War they are credited officially with being the first Brit. troops to come into contact with the Gers., charging and routing a column of Uhlans at Jemappes on Aug. 20, 1914. They also fought at Mons and at various places in the Ypres sector. The 5th D. G. were the former 2nd Green Irish Horse of 1717; they also fought in Marlborough's battles, and in those of Wellington. In the First World War they were at Le Cateau, Néry, and Ypres. The Carabiniers, formerly the 8th Regiment of Horse, became the 3rd Irish Horse in the '45 rebellion and the Carabiniers in 1788. Besides taking part in Marlborough's campaigns, they fought in the Afghan war of 1879 and at Paardeberg in the S. African war. Like other regiments of cavalry, their fighting in the First World War was mainly in the capacity of infantry in 1914, notably at Gheluvelt. The 7th D. G. were raised in 1689 by the first duke of Devonshire to support the Protestant cause during the revolution. At the battle of the Boyne they fought as Schomberg's Horse. After Marlborough's battles their commanding officer was the famous Joan Louis Lord Ligonier (q.v.). Their other battles prior to the First World War included Dettingen and Tel-el-Kebir. In the First World War they were at the battle of the Somme, 1916, being especially prominent in the stiff fighting around Bazentin and Longueval.

Mechanised, and fighting as units of the Royal Armoured Corps, all the D. G. regiments won new honours in the Second World War. The 1st King's D. G., in action in the first Libyan campaign, served in the W. Desert and Tunisia until the destruction of the Axis armies in N. Africa. In Italy they led the fighting advance of the Fifth Anglo-Amr. Army into Naples. They also fought as infantry. In Dec. 1914 they went to Greece to restore public order in Athens and Attica. The 2nd D. G. (the Queen's Bays) served in the W. Desert and in Tunisia with the Eighth and First Armies. They fought in the Knightsbridge battles, the withdrawal into Egypt, and at El Alamein. In the pursuit to Tunis they were part of the armoured desert wing whose surprise turning movement drove the enemy from his Mareth defences. They were continuously in action in the lt. campaign between the spring of 1944 and the early

summer of 1945. The 3rd D. G. (the Carabineers) were the only tank unit in the garrison of Imphal (Burma), besieged by the Jap. In the summer of 1944. Some of their tanks climbed slopes of over 35 degrees, and, after the Jap. failure, mounted the Chocolate Staircase to Tiddim and fought their way up Kennedy Peak, 8500 ft. high. Crossing the Chindwin and the Irrawaddy they helped to capture Mandalay, Prome, and Rangoon. The 4/7th D. G. were among the first armoured troops to land in Normandy in June 1944. They were engaged in the heaviest fighting of the Caen-Falaise battles until mid Aug. The first armour across the Seine, they fought at Arnhem, and, in the following Feb., were the first Brit. troops to link up with the Amers. against the Ger. counter-offensive in the Ardennes. They crossed the Rhine with the 51st Highland Div. and supported the 3rd Brit. Infantry Div. in the capture of Bremen. From 'D' Day until the end of the war they destroyed 100 Ger. tanks and many self-propelled guns and machine-gun posts. The 5th Royal Inniskilling D. G. also landed in Normandy among the first armoured troops. They were in action continually during the Caen battles from mid June until late Aug. In the sweep from the Seine to the Scheldt they drove from the neighbourhood of Amiens to the region of Ghent in three days. After crossing the Rhone they led the way into Mannheim.

Guards (Household Troops) (from Fr. *garde*). G. form the oldest part of estab. armies, in fact it is probably from the G. that the army, as we know it, is derived. Formerly it was customary for the sovereign to depend upon the national levy for his soldiers, but gradually there grew up the nucleus of a standing army in the formation of bodies of personal G. for the king. In England these took the form of the house carles, a body probably first brought into England by Canute. Hist. gives us many examples of G. playing an important part in the affairs of their country. In this respect we may mention the house carles of Harold who d. almost to a man round his body at Hastings, the Swiss G. of Louis XVI., who perished defending their king, and the Old Guard of Napoleon, the veterans upon whom he depended when all else had fallen. These are but a few examples. The G. of the king at the present time may be distinctly divided into two groups: the first, those gentlemen and retainers who form a purely *personal* bodyguard, and secondly those regiments which are brought into closer contact with the sovereign than usual, but who form part of the active army as well. To the first div. belong the Honourable Corps of Gentlemen-at-Arms, the Yeomen of the Guard, together with the Royal Company of Archers, who form the King's Scottish bodyguard. The two former owe their origin to the Tudor monarchs. The oldest of all these bodies is the Yeomen of the Guard, founded by Henry VII. Next came the Honourable Company of Gentlemen-at-Arms, founded at the accession of Henry

VIII. The Scottish Company of Archers was founded by Act of the Privy Council of Scotland during the reign of Charles II. The second section of G. consists of certain regiments from the active army. These, again, may be divided into two sections: the Household Cavalry and the Foot G. The Household Cavalry was founded at the Restoration. There are three regiments of Household Cavalry which were originally at the Restoration the King's Troop, the Queen's Troop (formerly the Lord-General's Troop), and the Duke of York's Troop. Later the name of the Life G. was given to the first two troops (1685) and finally was raised a third troop, known variously as the Duke of York Blues, the Royal Horse G. Blue, and the Royal Horse G. (the Blues) (*see* **LIFEGUARDS**). The Foot G. of the Household Troops consist of five regiments, the Grenadiers, the Coldstreams, the Scots G., the Irish G., and the Welch G. *See also* under the names of the regiments.

Guardship, name applied to a ship which is posted at some port to act as guard. Usually she is the headquarters of the various coastguard dists. and is stationed at a certain point with a nucleus crew. The crew can easily, however, be brought up to strength, and can then proceed immediately to action. The name of guard boat is also applied to a boat which sails round an anchored fleet at night in order to see that proper watch is being kept. Formerly the term was applied to that ship of the fleet which received the men from the press-gangs.

Guarico, name of a state of Venezuela. It was formed in 1901 from a portion of the state of Miranda. It has an area of about 25,500 sq. m., and its cap. is San Juan. Pop. 135,000.

Guarini, Giovanni Battista (1537-1612), It. poet, b. at Ferrara, and remembered for his drama, *Il Pastor fido*, which he wrote under the influence of Tasso. The poem has been trans. into Eng. *See* monograph by V. Rossi, 1886.

Guarino (c. 1370-1460), It. scholar, b. at Verona. He is chiefly remembered for having helped to establish the texts of many of our classics. He trans. Strabo and some of the lives of Plutarch. *See* life by R. Sabbadini, 1891.

Guarneri, surname of a famous It. family of violin-makers who lived and worked at Cremona:

Andrea Guarneri (1626-98), pupil of Nicholas Amati, whose marriage he witnessed in 1641. Many of his violins are of the Amati pattern, but are inferior to those of his master; his 'cellos possess fine acoustic properties.

Giuseppe Guarneri (1666-1739), son of Andrea G., introduced a narrow-waisted and more boldly curved instrument, with the sound-holes set lower down, and in its power of sound is superior to his father's.

Pietro Guarneri (c. 1690-1728), second son of Andrea G., introduced greater width between the sound-holes; his varnish was of exquisite gold and paler tints.

Pietro Guarneri (c. 1725-60), son of Giuseppe G., who produced some very fine instruments.

Giuseppe Antonio Guarneri (1683-1745), nephew of Andrea G., and greatest genius of the family. His violins are of bold and massive build, with grand sonority of tone, and some of his finest date from about 1740. See A. E. Brinckmann, *Von Guarini bis B. Neumann*, 1932.

Guarroman, tn. in prov. of Jaen, and 28 m. N. of tn. of same name, Spain. A lead-mining centre. Pop. 3,500.

Guastalla, anct. city of N. Italy, situated on the R. Po, about 20 m. N.E. of Parma. It has a cathedral and a school of music. It is the seat of a bishop. Pop. 13,000.

Guatemala: 1. Republic of Central America. The name is probably of Aztec origin and is said to mean 'land of the eagle' in its original form of Quauhtemalan. It is bounded by Mexico, Brit. Honduras, Honduras, and Salvador, with the last-named of which states G. united in 1945. Salvador formed part of the Sp. royalty of G. until 1821 and the two countries have the same language and religion. It is divided into five regions, the lowlands of the Pacific coast, the volcanic mts. of the Sierra Madre, the plateaus N. of these, the mts. of the Atlantic versant, and the plain of Peten. It is richly watered and there are sev. extensive lakes. The bird life of the country is rare. The climate is healthy, save on the coast, where fever is prevalent. The rainfall in the cap. is 67 in. per annum. The country is rich in minerals, but owing to lack of transport mining is little developed; other important products are coffee, honey, bananas, sugar, wheat, cotton, rubber, timber, maize, and chicle gum. Important cattle estates exist upon the Pacific coast and cattle and hides are exported besides the above mentioned products. No part of Central America contains a greater diversity of tribes. There are eighteen languages spoken. The chief tn. is G. la Nueva. The prevailing form of religion is Rom. Catholic, but the state recognises no distinction of creed. No convents or monasteries are allowed. For the white and mixed pop. military service is compulsory. The republic was set up in 1839, having been a part of the Central Amer. confederation for eighteen years. The existing constitution was promulgated in March 1945. A single-chambered national assembly or Congress has the legislative power. Its members are chosen for four years by direct popular vote; one-half are renewed every two years, and deputies are not eligible for re-election until one term has elapsed. The President is elected for six years, and re-election is forbidden for a period of twelve years. President Ubico's term, expiring in 1937 was extended to 1949 by a plebiscite in 1935, and a constitutional amendment, in 1941. However, there was a rebellion in 1944 which overthrew him, and under the new constitution the ban on immediate succession is explicit, the right of rebellion in its defence being expressly sanctioned. All males over eighteen, and literate females over the same age, are enfranchised. Nine executive depts. conduct the administration under the President. The assembly

consists of deputies for each 50,000 inhab.; it declares war, governs national finance, and controls concessions. There are some 720 m. of railway. There is direct communication with the U.S.A. and Mexico, and a line is now open into Salvador. There is also an electric line from San Felipe to Quezaltenango. Road-making has increased of more recent years and there are excellent roads radiating from G. city. There are eight wireless stations. There are regular mails to England and the U.S.A., and small steamers and motor boats ply on the rvs. and lakes. Air mail and passenger service connect G. city with Quezaltenango, Tegucigalpa, San Salvador, Panama, and Mexico city.

E.N.A.

GUATEMALA: INDIANS BOARDING A LAUNCH AT SAN LUCAS TALIMON

Atitlan volcano is seen on the right.

Archaeologists have brought to light remains of three civilisations, described by the late Dr. T. T. Waterman, of the National Museum of Guatemala, as (1) Zapotec (or Aztec); (2) Maya (older than Zapotec); (3) a nameless culture older than either. Interesting ruins of anct. settlements with mounds and pyramids are found in the coast region of W. G., not far from the railway line connecting G. City with the port of San José. Valuable archaeological work has been done by the staff of the National Museum in G., but a great deal of new exploration is desirable. In addition to large architectural works much eroded by rainfall and masked by vegetation, there are other relics, notably fragments of pottery and chips of obsidian. Scattered over the sites are large building stones of volcanic material, beautifully squared and dressed. Some of the buildings bear colossal heads, carved in stone, and apparently used to ornament facades. At Badi and Pantaleón there are carvings of marked artistic merit.

The Maya remains near Quiriguá may be compared with those still nearer to the Honduras border at Copan. Others exist northward in the remote Potén dist. at Tikal and, westward, at Chaculá (Izhuatenco). The monuments at Cotzumalguapa (S. of Escuintla), at Mitla (Jutiapa), at Utatlán (Quiché), and Tecpán are later (*South American Handbook*).

G. was conquered by the Spaniards under Pedro de Alvarado between 1522 and 1524. On G.'s 'claim' to the ownership of Brit. Honduras see *BRITISH HONDURAS*. Pop. 3,285,000 (with Salvador 5,115,000) (60 per cent Indians). Chief tns.: G. city (q.v.), Quetzaltenango (30,000), Cobán (27,000), and Zacapa (18,000). Chief seaports are San José de G. and Champerico on the Pacific and Livingston and Puerto Barrios on the Atlantic side. See also SALVADOR.

2. Cap. of the republic G. (sometimes written G. la Nueva and formerly Santiago de los Caballeros de G.), until 1821 cap. of the Sp. captaincy-general of G., which comprised Chiapas in Mexico and all Central America except Panama. G. is built more than 5000 ft. above sea level, in a wide table-land traversed by the Río de las Vacas, or Cow R., so called from the cattle introduced here by Sp. colonists in the sixteenth century. The edge of the table-land is marked by deep ravines. Beyond it are lofty mts., the highest peaks being on the S., where the volcanic summits of the Sierra Madre exceed 12,000 ft. It has a station on the transcontinental railway from Puerto Barrios on the Atlantic (190 m. N.E.) to San José on the Pacific (75 m. S. by W.) and to Champerico via Retalhuleu. Connection is made at Ayutla with the National Railways of Mexico. It is three times the size of any city in the republic and has a corresponding commercial superiority. Its archbishop is the primate of Central America (excluding Panama). Like most Sp.-Amer. tns. it is laid out in wide and regular streets which are often planted with avenues of trees, and it has large suburbs. Though usually only of one storey, the houses are solidly and comfortably constructed. Many of them have large gardens and courts surrounding them. In 1918 a severe earthquake destroyed many of the public buildings, but in the business quarter many fine new buildings have been erected. The chief of the open spaces is the Plaza Mayor which contains the cathedral, built in 1730; then there are the archiepiscopal palace, the gov. buildings, the mint, and other public offices; and the more modern Reforma Park and Plaza de la Concordia, now the favourite resort of the inhab. A Univ. was estab. in 1918. There are a number of schools for both sexes, besides hospitals and an orphanage. Many of the prin. buildings in the place were originally convents. In 1858 a theatre was founded which is one of the best in Central America. A museum founded in 1731 is maintained by the Sociedad Economica, which in various ways has done great service to the city and to

the country. There are a couple of fortresses, the Castillo Matamoros, built by Rafael Carrera, and the Castillo San José. Water is brought from a distance of about 8 m. by two old aqueducts from the tns. of Mixco and Pinula, but municipal improvements to the drainage and water supply have been made. Fuel and provisions are largely supplied by the Pokoman Indians of Mixco. The general prosperity of G. has secured for it the name of the Paris of Central America. A new highway through Antigua to San José was opened in 1925. The foreign trade up to the Second World War was largely controlled by Gers. who owned one-third of the coffee plantations. Pop. 177,000. See D. Fife, *Guatemala and the States of Central America*, 1913; J. V. Mejia, *Descriptive Geography of the Republic of Guatemala*, 1922; E. Ferguson, *Guatemala*, 1937; C. L. Jones, *Guatemala: Past and Present*, 1940; J. Muñoz and A. B. Ward, *Guatemala, Ancient and Modern*, 1940; and V. W. von Hagen, *Maya Explorer: John Lloyd Stephens and the Last Cities of Central America and Yucatan*, 1947.

Guatemala Antigua (old G.) is situated 20 m. S.W. of the present cap., 5000 ft. above sea level. It was once a splendid city, but it has been destroyed sev. times by earthquakes. In the eighteenth century it had a pop. of 40,000, a Univ., and over 100 churches and monasteries. The present tn. is surrounded by picturesque coffee estates. Pop. 10,000.

Guatusos, aborigines of Central America, a S. branch of the Chorotegans, whose home is in Costa Rica. They are generally a peaceful race, and still retain their primeval tribal arrangements and their independence.

Guava, or *Psidium Guajava*, species of *Myrtaceae* found in tropical America. It is a tree which bears white flowers, followed by a succulent edible yellow fruit which is often used in making jellies and preserves. The black G. is *Guillarda argentea*, a species of *Rubiaceae*.

Guayana, tn. of Puerto Rico. The tn. is situated in the centre of the cane-growing industry, and has a large trade in molasses, sugar, and rum. Pop. about 15,000.

Guayaquil, chief port of Ecuador, S. America. It is the cap. of the prov. of Guayas and is 40 m. from the mouth of the riv. of that name. The climate is extremely unhealthy, and the tn. is badly built. The newer part of the tn. where the wealthier residents live is far better than the old. The streets of the old tn. are dirty and badly paved. Much improvement has been made in more recent years; the sanitation is modern and the conditions of public health are satisfactory from May to Dec. The tn. is the seat of a bishop, and has a cathedral, a bishop's palace, a Univ., a technical school, and three theatres. The chief exports are cacao, Panama hats, cotton, tobacco, and coffee. It has also shipbuilding yards, steam saw-mills, foundries, machine shops, and breweries. The snow-capped peak of Chimborazo can sometimes be seen from

the city. There was a Ger.-owned bi-weekly air service between Quito and G. before the Second World War, but it was suspended in 1911. There is an Amer. air service from Cristobal to G. There is a wireless station. Pop. 136,000.

Guayaquil, Gulf of, inlet of the Pacific Ocean on the W. coast of S. America.

Guayas, stretch of ter. on the S.W. coast of Ecuador forming a prov. of that country. The land is generally low-lying and is extremely fertile. The chief products are coffee, tobacco, sugar cane, and rice. Area 11,500 sq. m. Pop. 441,600.

Guaycuru Language, see under SOUTH AMERICAN NATIVE LANGUAGES.

Guaymas, Mexican seaport situated on the gulf of California in the state of Sonora. The chief exports are pearls and silver ore. The climate is unpleasant in summer. Sea-fishing is good. Pop. 15,000, including a number of Chinese.

Guayra, La, see LA GUAYRA.

Gubat, small port on the E. coast of Albay prov., Luzon, Philippine Is. Exports copra and hemp. Pop. 16,500.

Gubbio, city of Central Italy, 27 m. S. of Urbino in the prov. of Perugia, delightfully situated on the slopes of the Apennines. It has a picturesque medieval appearance with its thirteenth-century cathedral, a communal palace of the fourteenth century, and many old convents and churches. G. was celebrated for its majolica ware, which is still imitated in a few factories. The famous Euginine Tables (q.v.) are kept here. The cathedral roof was damaged in the Second World War, but the tn. itself suffered little damage. Since its incorporation in the duchy of Urbino (1384) the pop. has dwindled from 30,000 to 6000.

Guben (Polish Gubin), walled manufacturing tn. of Poland (formerly Prussia) on the Neisse, 28 m. S. of Frankfort-on-the-Oder. Industries: woollen, linen stuffs, hats, machinery, earthenware, dolls. Pop. 13,900.

Gubernatis, Angelo de, see DE GUBERNATIS, ANGELO.

Gubin, see GUBEN.

Gudalur, see GUDALORE.

Gude, Hans Fredrik (1825-1903), Norwegian painter, pupil of the Düsseldorf Academy (1841) and prof. there (1851). He went to England (1862), and became prof. at Karlsruhe arts school (1861) and at Berlin Academy (1880-1901). He is perhaps the finest Norwegian landscape painter, and won numerous medals in Europe and America. Among his chief works are 'Early Morning in the Mountains of Norway', exhibited 1873; 'A Scotch Landscape', exhibited 1878; 'Bridal Procession on Hardanger Fjord' (1848); 'Calm Sea'; 'Fishing by Night'; 'Fishermen Landing'; 'A Viking Ship'; 'After the Storm'; 'Harbour of Christianity' (1884). See J. B. Atkinson, *Art Tour to the Northern Capitals of Europe*, 1873; L. H. S. Dietrichson, *At H. Gude's Liv og Værker*, 1899.

Guden-Aa, chief riv. of Jutland, Denmark, about 80 m. long. It flows N.E., joining the Cattedag by an estuary 1 m. wide, about 16 m. N.E. of Randers.

Gudgeon, cyprinid fish of Europe and N. Asia. Rarely exceeds 7 in. in length. Has a barbel on each side of jaw, and is greyish, with dark blotches. It prefers clear streams with gravelly bottoms.

Gudrun, or Kudrun, heroine of a Middle High Ger. thirteenth-century epic (author unknown), the Ger. *Odyssey*, next important in early Ger. literature to the *Nibelungenlied*. She was the daughter of King Hettel of Hegelingen (Friesland). The epic deals with legends mainly of the North Sea coasts and Normandy. E. Martin's ed. (1902) is the best modern one. There are modern Ger. versions by C. J. Simrock (1813); G. Freytag (1888); and others. See also Wilmann, *Die Entwicklung der Kudrundichtung*, 1873.

Guebres, **Guebres**, **Gabers**, or **Ghebres** (Persian *ghebr*; cf. Ghaour), name (meaning infidels) applied in Persia to the adherents of the anc. religion, Fire-worshippers, Zoroastrians, or Parsis. They number about 8000 or 10,000, and call themselves Beh-Dinans ('those of the Good Faith'). See E. Tylor, *Primitive Culture*, II, 1871.

Guebwiller (Ger. Gebweiler), tn. of Haut-Rhin, France, at the mouth of the Illmenenthal, at the E. foot of the Vosges. It has a twelfth-century church in the Transitional style and a fourteenth-century Dominican church. Its manufs. include soap, brick, cotton, and woollen goods, and machinery. Pop. 10,000.

Guedalla, Philip (1889-1914), Eng. biographer, educated at Rugby and Balliol College, Oxford. Practised law for some years. First made his mark with *Supers and Supermen*, a vol. of biographical essays (1920). This was followed by *Lives of Palmerston*, *Wellington*, and *Gladstone*, all highly individual contributions to the hist. of the nineteenth century. In *The Hundred Years* (1936) he depicted the century from the accession of Victoria and in its sequel, *The Hundredth Year* (1940), he gave a vivid impression of the events of that year as a turning point in modern affairs. During the Second World War he pub. a penetrating sketch of Mr. Winston Churchill and a study of Brit. air strategy in the Middle E. (commissioned by the Air Ministry), which was pub. on the day of his death. His great interest in Lat. America was shown by his visits there and by his books *Conquistador* (1927) and *Argentine Tango* (1932). As a traditional Liberal G. was a warm supporter of the liberating principles which his studies taught him represented the most continuous of all the streams of Eng. hist. and law. His chief works are important contributions to historical scholarship and are based on research into original documents, though his books are addressed as much to the average cultivated reader as to the specialist. They are perhaps characterized by too great a fondness for ephraim, and the stylistic exuberance of the Lytton Strachey method of biography, but he had a flair for detecting in a chaos of historical records, the salient personality and the truly significant events; and with the aid of a strong imagination could convey his view of hist. through a series of impressive

portraits and episodes handled with rare intellectual integrity. Besides the above works he wrote *The Partition of Europe, 1715-1815* (1914); *The Second Empire* (1922); *Bonnet and Shawl* (1928, essays on Victorian women); *The Queen and Mr. Gladstone, 1845-1879*, 2 vols. (1933); *The Hundred Days* (1934); *Idylls of the Queen* (1937); and *The Two Marshals*, (1943), a study of Bazaine and Pétain.

Guelderland, or **Guelders**, see **GELDERLAND**.

Guelder-rose, or *Viburnum Opulus*, beautiful species of Caprifoliaceae, a marsh shrub common to N. Europe and to Britain. The petals are large, and when cultivated the flowers are nonger; because of its white balls of flowers the G. is also called the snowball tree.

GUELDER-ROSE

Guelph, surname of the Brit. royal family of the house of Hanover. It was superseded in 1917, during the First World War, by Windsor.

Guelph, co. tu. of Wellington co., Ontario, Canada, on the R. Speed, 60 m. from Toronto and 28 m. N.W. of Hamilton. Known as 'the Royal City' from its name. On Canadian National and Canadian Pacific Railways. Founded by John Galt, the Scottish author, in 1827, in the centre of a rich agric. dist.; in the same year the settlers organised the first 'agric. society' in Upper Canada, and later the city became the site of the ann. Ontario prov. winter fair. The famous Ontario Agric. College was inaugurated in 1874 and the Ontario Veterinary College later. Associated with the veterinary college is the Macdonald Institute of Economics for Women. The city has a beautiful park, twenty churches, a fine public library, and two hospitals. The manufs. include iron and steel, textiles, rubber, woodwork, carpets, felt, clothing, soaps, stoves and furnaces, and electric washing machines. Pop. 23,000.

Guelphs and Ghibellines. Those names are the Italianised forms of the Ger. words 'Welf and Waiblingen', although one tradition says that they are derived from Guelph and Gibel, two rival brothers of Pistoia. Another theory derives Ghibelline from Ghibello, a word used by the Sicilian Arabs to translate Hohenstaufen. A more popular story tells how, during

a fight round Weinsberg in Dec. 1140, between the Ger. king Conrad III. and Welf, count of Bavaria, a member of the powerful family to which Henry the Lion, duke of Saxony and Bavaria, belonged, the soldiers of the latter raised the cry 'Hie Welf', to which the king's troops replied with, 'Hie Waiblingen,' this being the name of one of Conrad's castles. The rivalry between Welf and Hohenstaufen, of which family Conrad was a member, was anterior to this event, and had been for some years a prominent fact in the hist. of Swabia and Bavaria, although its introduction into Italy, in a modified form, dates from the time of the It. expeditions of the Emperor Frederick I. Chosen Ger. king in 1152, Frederick was not only nephew and heir of Conrad, he was related also to the Welfs; yet although his election abated to some extent the rivalry between Welf and Hohenstaufen in Germany, it opened it upon a larger and fiercer scale in Italy. During the period covered by Frederick's It. campaigns his enemies became known as Welfs, while his partisans seized upon the term of Waiblingen or Ghibelline, and the contest between the two parties was carried on with a ferocity unknown even to the inhab. of S. Germany. The story of the contest between Guelph and Ghibelline is nothing less than the hist. of Italy in the Middle Ages. At the opening of the thirteenth century the contest was intensified by the fight for the Ger. and Imperial thrones between Philip, duke of Swabia, a son of Frederick I., and the Welf, Otto of Brunswick, afterwards the Emperor Otto IV. A fight waged in Italy as well as in Germany. Then, as heir of Philip of Swabia, Frederick II. was forced to throw himself into the arms of the Ghibellines, whilst his enemies, the popes, ranged themselves definitely among the Guelphs, and soon Guelph and Ghibelline became synonymous with supporter of pope and emperor. After the death of Frederick II. in 1250, the Ghibellines looked for leadership to his son, the Ger. king, Conrad IV., and then to his natural son, Manfred, whilst the Guelphs called the Fr. prince, Charles of Anjou, to their aid. The combatants were nearing exhaustion, and after the execution of Conrad in 1268 this great struggle began to lose force and interest. Guelph and Ghibelline were soon found representing local and family, rather than papal and Imperial, interests. In the fifteenth century the two names began to die out of current politics. When Louis XII. of France conquered Milan at the beginning of the sixteenth century, the old names were revived. The Fr. king's supporters were called Guelphs and the friends of the Emperor Maximilian I. were referred to as Ghibellines. The Guelph party meant the burghers of the consular coms., the men of industry and commerce, and the Ghibelline party meant the men of arms and idleness. Dante was a Ghibelline and Petrarch was a Guelph.

See bibliographies of **GERMANY, History**, and **ITALY, History**; and V. Vitale, *Dominio di Parte Guelphi in Bologna, 1280-1327*, 1901; C. Poulet, *Guelphs et*

Ghibelines, 1920; R. Plattoli, *I Ghibellini di Prato*, 1866-80, 1930-31; C. Troya, *Del veltro allegorico di Dante*, 1932; G. Fasoli, *Guelph e Ghibellini di Romagna, 1280-81, 1936*; and G. C. A. Evola, *Mistero di Graal e la tradizione Ghibellina dell'impero*, 1937.

Guenever, see GUINEVERE.

Guenons, see CERCOPTHICUS.

Guérande, picturesque old Fr. tn., situated 47 m. W. by N. of Nantes in the dept. of Loire-Inférieure. It is near the sea and has a handsome medieval church. Pop. 6100.

Guercino, Il ('squinny-eyed'), the nickname of Giovanni Francesco Barbieri (c. 1591-1666), It. historical painter, b. at Cento, in Ferrara. A self-taught genius, who formed his style, successively, after Caracci, Caravaggio, and Guido. His masterpiece, 'St. Petronilla' (1622) was painted for Gregory XV. and later was placed in the Capitol.

Guéret, tn. in France cap. of the dept. of Creuse, which grew up round an abbey founded in the seventh century. Pop. 10,100.

Guerrillas, name given to bands of armed men who carry on an irregular warfare on their own account. They belong peculiarly to Spain, and in 1808-14 they fought against the Fr. Some joined Wellington and rendered him service, but when peace was concluded formed themselves into robber bands. Guerrilla warfare was dealt with at the Hague Conference in 1899, and the rules made were reaffirmed in 1907. G. played a prominent part throughout the Second World War as well as in Ethiopia, during the It. invasion, and in the Sp. civil war. In Russia, where they were more generally known as 'partisans', they operated, despite savage reprisals, behind the advancing enemy with considerable effect, and notwithstanding hardships they were able to hold out almost indefinitely. Partisans also played an important part in N. Italy in 1943 in bringing about the final overthrow of Mussolini. Under the name of the *Maquis* G. co-operated with the Anglo-Amer. invaders in 1944 in a way which brought the warm commendations of Gen. Eisenhower (q.v.). In the closing stages of the Second World War, and afterwards, G. of varying political parties waged a bitter intestine war until well into 1947. See further under GREECE, *History*.

Guérin, Georges Maurice de (1810-39), b. at La Cayla, Languedoc. His *Reliques*, letters, poems, etc., were pub. in 1860, ed. by G. S. Trébutien; to this ed. appeared as preface the famous critique of Sainte-Beuve, who regarded him as a spiritual kinsman of Bernardin de Sainte-Pierre. Although not wholly devoid of a tendency to morbid sentimentalism, his writings are remarkable for their exquisite appreciation of the pagan beauty, the harmony and pathos of Nature. The best picture of G. is to be found in the *Journal* of his sister, Eugénie G. See M. Arnold, *Essays in Criticism*, 1866, and Naomi Royde Smith, *The Idol and the Shrine*, 1949.

Guérin, Pierre Narcisse, Baron (1774-

1833), Fr. historical painter, b. in Paris. He studied under Regnault. In 1799 he exhibited his 'Return of Marcus Sextus,' in which he reached the highest point of his art. In 1803 he received the cross of the Legion of Honour, and in 1816 was appointed director of the Fr. school at Rome. His chief works are 'Hippolytus and Phædra' (1802); 'The Revolt of Cairo' (1806); 'Pyrrhus and Andromache' (1810); 'Aeneas and Dido' (1817); 'Clytemnestra' (1817); 'Ulysses'; and 'Death of Marshal Lannes.'

Guernsey, second in size of the Channel Isles, lies 30 m. from the coast of Normandy. It is triangular in form, with an area of 25 sq. m., and its surface slopes from S. to N. The climate is mild and healthy, and the soil, when manured, is very fertile. The chief crops are tomatoes under glass, luxury fruits such as melons, grapes, and figs, also early vegetables and flowers, all of which are extensively exported. The is., too, produces a famous breed of cattle, renowned for the richness of the milk; also a special sort of granite almost unrivalled for paving. The chief tn. is St. Peter Port. At the end of June 1940, after the collapse of France, G. and the other Channel Is. were completely demilitarised, the troops withdrawn, and large numbers of the civilian pop. arrived in Britain, while everything of value to the enemy was removed. On the same evening Ger. aeroplanes bombed and machine-gunned the is., 23 persons being killed and a number injured. Afterwards the Gers. took possession of the is. and heavily fortified it. It was liberated in 1945. At the latter end of the year a committee of the privy council, led by the home secretary, visited the is. for the purpose of considering the constitution and making recommendations that might be considered by the states of the is. with a view to bringing their auct. laws into line with modern ideas. After long and considered study the is. decided to adopt most of the suggestions. Pop. 40,300. See further under CHANNEL ISLANDS.

Guernsey Breed, see under CATTLE.

Guernsey Lily, or *Nerine Sarniensis*, Cape plant belonging to the order Amaryllidaceae. The flowers are of a delicate rose-pink, flecked with gold. It is now grown in many variations of colour.

Guerrazzi, Francesco Domenico (1804-1873), It. author, b. at Leghorn. His first pub. work was *Battaglia di Benevento* (1827), an historical novel which is remarkable for its exquisite expression; his *Assedio di Firenze* was written while he was in prison at Ponto-ferato, 1834. This is perhaps his most important work, and tells of the downfall of the republic of Florence. In 1848 he became a minister, and in 1849, when the grand duke of Tuscany fled, he was proclaimed member of the provisional gov., and subsequently dictator. After the restoration, however, he was banished to Corsica. His other works are *Isabella Orsini* (1845); *Apologia*, his defence (1852); and *Beatrice Cenci* (1854).

Guerrero, coast state of Mexico, between the R. de las Balzas-Mexcala and the

Pacific. It is very mountainous, and has great mining potentialities, the minerals found here being silver, gold, mercury, lead, iron, coal, sulphur, and precious stones. The agric. products are cotton, coffee, tobacco, and cereals. Cap. Chilpancingo; chief port Acapulco. Pop. 732,900.

Guesclin, Bertrand du (c. 1320-80), constable of France, b. in Brittany. He was of a persistent and turbulent character, and was renowned for his prowess even when a boy. He fought for Charles de Blois at Vannes in 1342, when he was contesting for the dukedom of Brittany, and

de l'homme, he was sentenced to five years' imprisonment, which he avoided by going abroad. When he returned to France under amnesty in 1876 he was a Marxian Socialist. He founded *Egalité*—the first collectivist paper to appear in France. The International Socialist Congress at Amsterdam, 1904, resolved, at G.'s instance, that Socialists must not participate in a capitalist gov. But G. himself—usually in the Chamber from 1893—joined the Viviani Cabinet on the outbreak of the First World War, and remained a member (without portfolio) till Oct. 1915.

ST. PETER PORT, GUERNSEY

E.N.A.

distinguished himself against the Eng. at Rennes, 1356, and Dinan, 1357. In 1359 he took Molun and freed the Seine from the Eng., and in 1361 won the battle of Cocherel against Charles the Bad, but was taken prisoner by Sir John Chandos at Auray. On being released he fought against Pedro the Cruel, but was defeated and taken prisoner by the Black Prince, 1367. Being ransomed he defeated and captured Pedro in 1369, and in 1370 was made constable of France by Charles V., with the result that in a few years nearly all the Eng. possessions were in the hands of the Fr. See E. V. Stoddard, 1897.

Guesde, Jules (really Mathieu Basile Guesde) (1845-1922), Fr. Socialist leader, b. in Paris. At first an official in the Ministry of the Interior (1863). For a series of articles in his paper, *Les Droits*

Guest, Lady Charlotte, afterwards Schrieber (1812-95), daughter of the ninth earl of Lindsay, was famous as a collector of fans and china. She presented some fine china and earthenware to the S. Kensington Museum. She pub. sev. vols. containing pictures of her most notable fans and the playing cards of all nations, as well as sev. old Welsh MSS., one of which, *Mabinogion*, was pub. in 1849.

Guest, Edwin (1800-80), Eng. historical writer, b. at King's Norton, Worcestershire. He was educated at King Edward VI.'s Grammar School, Birmingham, and Caius College, Cambridge, and was made a fellow of Caius in 1824. His first pub. work was the *History of English Rhythms*, in 1838, the second ed. of which appeared in 1882 ed. by Prof. Skeat. G. was practically the founder of the Philological

Society, and was secretary in 1842. His writings are of great value in the study of Rom.-Brit. hist. and include 'On Julius Caesar's Invasion of Britain' (*Archæological Journal*, vol. xxi.) and 'The Campaign of Aulus Plautius in Britain' (*Archæological Journal*, vol. xxiii.), etc.

Gueux, Les, or The Beggars, name assumed by the malcontents who opposed the introduction of the Inquisition into the Netherlands. They formed themselves into an association in 1565 and presented a petition to the regent, Margaret of Parma; 1566. The regent being at first afraid, one of her councillors asked her what she had to fear from 'beggars' (*gueux*). The word was remembered and the party adopted it. They maintained a vigorous warfare against Philip II. for some time, but were finally suppressed by the duke of Alva. 'The Beggars of the Sea,' under Count de la Marck, did much damage to the Sp. fleet and captured Briel in 1572, a victory which ultimately resulted in the independence of the Netherlands in 1648.

Guevara, Antonio de (c. 1490-1545), Sp. theologian and historian, b. at Viscaya. His early years were passed at the court of Isabella, but in 1528 he entered the Franciscan order and subsequently became historiographer and court-preacher to Charles V. In 1529 he pub. his *Dial for Princes*, a didactic novel professing to be a life of Marcus Aurelius. This work has been trans. into Lat., It., Fr., and Eng., and reprinted sev. times in Sp. He also wrote *Lives of the Ten Cæsars* (1539) and *The Golden Letters* (1539-45)—the latter has also been trans. into all the prin. languages of Europe. G. had considerable influence upon the Sp. prose of the sixteenth century, and his bombastic style may be compared with the euphuism of Lyly, who may have taken G. as his model.

Guevara, Luis Velez de (1570-1644), Sp. dramatist and novelist, b. at Ecija in Andalusia. He practised as an advocate for some years, but came under the notice of Philip IV. and was appointed court chamberlain. He wrote a great number of plays, of which *Reinar despues de morir*, *Mas pesa el rey que la sangre*, *La Luna de la Sierra* are the best; but he is chiefly famous for his fantastic novel, *El Diablo cojuelo* (The Limping Devil), (1641) which is the basis of Le Sage's *Diable Boiteux*.

Guglielmi, Pietro (1727-1804), It. musical composer, b. at Massa Carrara. He studied under Durante and produced his first operatic work at Turin in 1755. In 1762 he went to Dresden to conduct the opera there, and some years afterwards appeared in London. In 1793 he became musical director at the Vatican. He was a writer of operas, both comic and serious, as well as of oratorios and orchestral pieces. His best operas are *La Didone*; *Enea e Lavina* (1785); *I Due Gemelli* (1789); *La Pastorella nobile*; and *La Bella Pescatrice* (1789).

Guiana, see BRITISH GUIANA; DUTCH GUIANA; FRENCH GUIANA.

Guibert of Nogent (1053-1124), historian and theologian, b. at Clermont-en-Beauvoisis. In 1104 he was chosen head

of the abbey of Nôtre Dame de Nogent-sous-Coucy. His autobiography (Eng. trans. by C. Swinton, 1928) contains some very fine pictures of the customs of his day. He also wrote a hist. of the first crusade, *Gesta Dei per Francos* (ed. by H. Hagenmayer, 1890).

Guicciardini, Francesco (1483-1540), celebrated It. historian and statesman, b. at Florence of a noble and illustrious family. Educated at the univs. of Ferrara and Padua. He wished to follow an eccles. career, but his father checked the ambition, declaring that the church was too corrupt to receive any of his sons. The youth then turned his attention to law, and at twenty-three was appointed to read the Institutes in public. Soon after he became betrothed to the daughter of Alamanno Salviati. He was entrusted with an embassy to the court of Ferdinand the Catholic. Thus he entered upon the real work of his life as a diplomat and a statesman. He was ambitious, a time-server, and a place seeker. In 1515 Leo X. took him into service and made him governor of Reggio and Modena. In 1521 Parma was added to his rule; and in 1523 he was appointed vice-regent of Romagna by Clement VII. These rendered him virtual master of the papal states beyond the Apennines. In 1526 Clement gave him still higher rank as lieutenant-general of the papal army. In 1531 he was advanced to the governorship of Bologna. After the murder of Duke Alessandro in 1537, he espoused the cause of Cosimo de' Medici, who, displaying the genius of his family for politics, dismissed him, and he retired in disgrace to his villa, where he spent his last years in the composition of the *Scoria d'Italia*. See A. Rossi, *Francesco Guicciardini e il governo Fiorentino*, 1896-99, and V. Luciani, *Francesco Guicciardini and his European Reputation*, 1936.

Guicowar, see GAEKWAR.

Guide-books have not long been in existence. The first were *Ebel's Anleitung für Switzerland*, 1793; *Boyce's Belgian Traveller*, 1815, and Mrs. Mariane Starke's *Directions for Travellers in Italy*, 1820; but the most famous writer of a guide-book is Wordsworth, whose *Guide to the English Lakes* was pub. in 1822. In 1836 Murray pub. his handbook for Holland, Belgium, and N. Germany, and this was followed by Baedeker's *Ger. guide to Holland and Belgium*. Baedeker's (*G.*) are pub. in many languages. Other notable *G.* are those of Yvonne, for France, Gell Fels, for Italy, Tonsberg for Norway, as well as those pub. by A. and C. Black, Ward, Lock & Co. (Illustrated Guide Books), Stanford (Tourists' Guides), Macmillan (Highways and Byways), Adams (Bradshaw's Illustrated Handbooks), and Muirhead's (Blue Guides).

Guides, regiment of the Indian Army recruited mostly from Sikhs and Pathans with Brit. officers. Trained for int. warfare on the N.W. frontier of India.

Guides, Girl, see GIRL GUIDES.

Guidi, Carlo Alessandro (1650-1712), It. poet, b. at Pavia. He is important as being the chief founder of the academy

called *L'Arcadia*. He is essentially a lyric poet, his songs being written with singular force and charm. The most beautiful perhaps is *Alla Fortuna*. He also wrote *Amalasunta in Italy* (1681) a lyric tragedy, and *Daphne* and *Endymion* (1681), two pastoral dramas.

Guidi, or Guido, Tomaso di Giovanni di, see MANACCIO.

Guido d'Arezzo, or Guido Aretinus (c. 990-1050), musician of the eleventh century. He was a monk in the Benedictine monastery of Pomposa, where he taught singing; he is, rather doubtfully, credited with the invention of the musical stave, the use of which he certainly encouraged. He introduced the names *ut*, *re*, *mi*, *fa*, *sol*, *la* for the first six notes of the scale, adopting them from a hymn in honour of St. John the Baptist. He is also said to have introduced the *F* clef. His doctrines are explained in *Micrologus* and *Antiphonarium*.

Guidonian Syllables, see ARETINIAN SYLLABLES.

Guido Reni, commonly called Guido (1575-1642), It. painter, b. at Calvenzano, near Bologna. He studied under Denis Calvaert, but afterwards entered the studio of the Caracci, one of whom he accompanied to Rome. Here he came under the influence of Caravaggio, and also began to study the works of Raphael, and soon afterwards painted 'Aurora preceding the *Chariot of Apollo*,' which is usually considered his greatest work. He also painted 'St. Cecilia'; 'The Crucifixion of St. Peter'; 'St. Michael'; and 'Ariadne and Fortune' while in Rome. He spent some time in Naples in 1621, and began his famous picture the 'Nativity,' and also visited Bologna and the other ins. of N. Italy. As a painter he is remarkable for the purity of his colouring and his dramatic force, while as an engraver he was bold and free in execution; and his works in this direction are as graceful as his paintings. It was only in his later years that his work declined, and this was owing to rapidity of execution.

Guienne, or Guyenne, largest of the anc. provs. of France, which in the twelfth century formed with Gascony the duchy of Aquitaine. It came into the hands of the King when Henry II. married Eleanor of Aquitaine, but was finally united to France by Charles VII. in 1451.

Guildford, municipal bor. and cap. of Surrey, England, 30 m. S.W. of London, reached by two branches of the railway. It is situated in a beautiful rural area on the R. Wey in a gap in the N. Downs, bounded to the W. by the Hog's Back and to the E. by the Merrow and Dorking Downs. Its growth as an urban and market centre has endowed it with many fine buildings, the most important being the Edward VI. or Royal Grammar School, the magnificent Tudor Hospital of the Blessed Trinity, founded by George Abbot, archbishop of Canterbury, in 1619, and the fine seventeenth-century guildhall with its projecting clock. An inscription over the gate attributes the foundation of the Royal Grammar School to Edward VI., in 1552, but the real

founder was Robert Beekingham (d. 1528), though Edward VI. augmented its endowment, and the present building was begun about 1551. There was a guildhall in the time of Edward III., probably on the site of the present building. This latter was considerably enlarged in 1588. In the hall, which is used as a court room, are pictures of Charles II. and James II. by Lely, and of William III. and Mary II. attributed to Riley. The bronze standard corn measures were presented by Queen Elizabeth. In the old oak-panelled council chamber is an excellent portrait of James I. by Paul van Somer, a portrait of Vice-Adm. Sir Richard Onslow receiving the Dutch flag after the battle of Camperdown, by John Russell, R.A., the G. artist, and many other pictures of well-known men. The tn. is dominated by the ruined Norman keep, which dates from the twelfth century and was once part of a private royal residence. The oldest church, St. Mary's, dates from Saxon times and contains some medieval wall paintings. Gradually enlarged in successive periods, it completely surrounds the slender tower, which dates from an earlier period, probably as far back as the time of Edward the Confessor. G. cathedral, in course of erection, is only the third entirely new Anglican cathedral to be built in England since the Reformation. In 1927 Winchester diocese was found to be too large for administration as one unit, and was therefore divided into three—Winchester, Portsmouth, and G.—and since that year the church of the Holy Trinity has served as the pro-cathedral pending the building of the cathedral, the foundation stone of which was laid by the archbishop of Canterbury on July 22, 1936. The cathedral, designed by Edward Maufe, is on a magnificent site on Stag Hill, given by the earl of Onslow. The internal length from the W. doors to the E. end of the Lady Chapel will be 365 ft., height of vaulting, 68 ft., tower, 157 ft. high, seating capacity, 2000. A church has stood on the site of the Holy Trinity pro-cathedral church since the twelfth century, but in 1740 the old tower fell, necessitating rebuilding. In the S. chapel is the tomb of Archbishop Abbot, which survived the calamity of 1740. Its clock has an unusual set of chimera, varying each quarter of an hour. Other churches are St. Nicholas on the W. of the riv. crossing, built in 1875, and St. Martha's on a hill which was known as Martyrhill so named from the tradition that early Christian martyrs suffered there, but the church is dedicated to St. Martha.

The origin of the name G. is not certainly known. Some relate it to the 'guild' and the 'ford' over the riv., but the tn. existed before the guild and it is more likely that the name was derived from the riv., which is said to have been called Gll or Guilou, or Wiley as it was called in A.-S. times. A very anc. name for the place was Astolat, famous in Arthurian romance. The first certain information is in the will of Alfred the Great, A.D. 900, when he bequeathed the

tn. to his nephew Ethelred, on whose death or rebellion it reverted to the Crown. From 978 G. was the seat of the royal mint and coins struck here in A.-S. times still exist. Long before the erection of G. castle the A.-S. kings constantly visited the tn. A keep was built towards the eleventh century and in Norman days a succession of the Plantagenet kings resided there. Henry III., who visited G. over a hundred times between 1215 and 1272, granted the tn. the right to have its own bor. magistrates. The earliest reference to the Dominican friary of G. is in 1268, when it was founded by Queen

part played by the G. wool staplers and cloth workers in the hist. of the tn. The sixteenth and seventeenth centuries were connected with the three brothers Abbot, inhab. of the tn., the children of a humble clothworker. George Abbot (mentioned above), the chief of the three, rose to be archbishop of Canterbury in 1611; Robert became bishop of Salisbury, and Maurice lord mayor of London; all three were pupils of the G. Grammar School. The G. corporation has had a continuous existence from the time of the mayor of 1413 to the present day. It has maintained a considerable amount of state,

Valentine & Sons Ltd. Dunder
THE RIVER WY AT GUILDFORD

Eleanor. It was in this friary that Prince Henry, son of Edward I. and Eleanor and heir to the throne, d. (1274). The name survives in Friary Street. In its time the friary was an important place with a library containing many books and MSS. In 1539 it surrendered to Henry VIII's commissioners for the dissolution of the smaller monastic houses. The earliest known charter of G. was dated 1256 and its charter of incorporation dates from 1283. The first mention of a member of Parliament is in Edward I.'s reign in 1291. A mayor is alluded to in 1377 following the last of the seneschals who formerly governed G. There were other charters in 1256 and 1341 giving G. the power of holding assizes, freedom from toll, and an ann. fair. In 1489 a charter from Henry VII. reaffirmed the earlier charters. The elaborate coat of arms of G., granted in 1485, commemorates the

using not only its very early mace but a very fine one presented in 1663 and a superb gold chain of office given by the high steward in 1673. The aldermen's privilege of wearing the royal scarlet dates from the grant by James II. in 1686. The loss of one member of Parliament came in 1868 and of the second in 1885, so that G. lost (until 1918) the privilege of sending its own member to Parliament. Pop. 47,000. See G. C. Williamson, *Guildford in the Olden Time*, 1904.

Guildhall, important public building of London, the place of assembly for various courts (court of common council, court of aldermen, chamberlain's court). Originally begun in 1411, the building was partly destroyed by the fire of 1666, receiving its later form in 1789, with George Dance for architect. It has an auct. crypt (see W. J. Loftie, *London City*,

1891). It is famous for civic conclaves and banquets, being first used for this purpose in 1500, when Sir J. Shaw gave the lord mayor's feast (see F. G. H. Price, *Guildhall*, 1886). The great hall of the lord mayors of London was burned in the Ger. fire-raid of Dec. 29, 1940. The famous library of the G. was damaged, but less seriously than the hall; the art gallery was undamaged. Some fifteen fire-bombs which fell on the G. had been dealt with promptly by the A.R.P. staff, but sparks from the locked and unattended church of St. Lawrence Jewry were carried to the G. roof, doing most of the serious damage. Many valuable pictures and other articles had, however, previously been removed. In a general sense G. is the hall where guilds and corporations usually meet, corresponding to a tn. hall.

Guilds, or Gilds. The origin of G. which played so important a part in medieval city life, dates back to very early times, when small family groups, united solely by kinship, became merged in larger communities. We find among the A.-S. 'frith-gilds' associations of freemen for mutual aid. London had a union of such societies, with the 'Kewthengild' at their head, and there were 'Thano-gilds' at Cambridge and Canterbury. Even before the Norman Conquest the lthsmen or shippers' gild of London had considerable importance, but religious and merchant G. only came into prominence later, as trade and wealth increased. The former often undertook a good deal of secular work, acting as benevolent and insurance societies, and sometimes providing roads, bridges, and schools. The *gilda mercatoria* became in many instances so important that some historians have asserted that the 'gild merchant' formed practically the municipal gov., but this does not seem to be correct. Burgesses might or might not be gildsmen, and the gild did not govern the bor. But each controlled its own trade, having within its proper area a monopoly granted by charter. In time the craftsmen grew jealous of the traders and formed G. of their own, master-craftsmen often belonging to both fraternities. As early as 1180, under Henry II., eighteen such G. were fined for having been formed without special permission. Merchant G., especially in the larger cities, gradually found themselves supplanted by the new order, and by the end of the fourteenth century the craft G. were victorious. They were as great monopolists as their predecessors, every 'misterie' being a close corporation, with very strict rules against competition, and also as to the hours of labour and the amount and quality of the work. These misteries held charters from the gov., and were assigned distinctive liveries; from them are descended the livery companies of to-day. Before long the craft G. themselves subdivided, the journeymen setting up companies of their own to contest the question of hours, wages, etc., with their masters, thus becoming the forerunners of modern trade unions. The contest was much fiercer in Germany than in England, as the merchants there had

organised themselves on very autocratic lines, and the struggle was not merely for improvement of labour conditions, but for general liberty. Most craft G. had religious associations, each having its own chapel and patron saint. In England those were abolished under Edward VI. See also COMPANIES, LIVERY. See J. Smith, *English Gilds*, 1870; L. Brentano, *Die Arbeitergilden der Gegenwart*, 1870; W. J. Lottie, *London*, 1887; C. Gross, *The Gild Merchant*, 1897; G. Unwin, *The Gilds and Companies of London*, 1908; and S. Kramer, *English Craft Guilds*, 1927.

Guild Socialism, Brit. variant of syndicalism (q.v.). The movement was begun in 1906 under Hobson and Penty to bring about the restoration of the medieval guild system on modern lines. The trade unions were to be organised as guilds to control their respective industries after they were nationalised. In 1915 the National Guilds League was formed and many trade unions joined it. Five years later the National Guild Council was formed and a building guild was organised to carry out an ambitious plan, formulated by the council to erect houses. The collapse of this scheme ended the league, which was dissolved in 1925. See G. D. H. Cole, *Guild Socialism Restated*, 1927.

Guilford, Earl of, see NORTH, FREDERICK. **Guillaumat**, Adolph (1863-1940), Fr. general, b. at Bourgneuf. Pupil at St. Cyr, 1882-84. Rose to colonel by 1900; in that year wounded in Boxer rebellion, Tientsin. Prof. St. Cyr. 1903; at school of war, 1906. Director of infantry, 1912. Brigadier-general, 1913. Commanded 33rd Div., 1914, Marne and Argonne; general first Army Corps, 1915, Verdun and Somme; Second Army, Verdun, freed position Aug. 20, 1917. Superseded Gen. Sarrail, chief of allied armies of Orient, Salonika, 1917; governor of Paris when beset, July 1918; commanded Fifth Army on Aisne in Oct. Member Superior Council of War, 1919. Commander of Rhineland army from 1924. Minister of war 1926.

• GUILLEMOT

Guillemots (*gull* and *mew*), genus of diving birds of the auk family (Alcidae), and the genera *Cephus* and *Uria*. There are about eight species in the Arctic and

N. temperate zones. The common or 'foolish' guillemot (*Uria lomvia*) breeds in Britain. The bill is long and straight, the wings and tail short, the feet three-toed and webbed, the legs being placed very far back. In colour G. are mostly brownish-black on top and white underneath. The dark throat becomes white or mottled in winter. They build no nests, but breed on rocky coasts. One pear-shaped egg is laid at a time. They are numerous round Flamborough Head (Yorkshire), the eggs being sought after chiefly for their albumen, which is used to clarify wine and in the preparation of patent leather. The black guillemot (*Cephus grylle*) is less common but found in N. Scotland, and is smaller. A third Brit. species (*U. Bruennichti*) is rare.

Guillim, John (c. 1565-1621), Eng. heraldic official, educated at Oxford. He was Rouge Croix pursuivant at the College of Arms for most of his life. He was editor of *A Display of Heraldrie* (1610) (reprinted 1721), from Doan Barkham's collections, according to Dugdale and Wood (seventeenth century). Ballard, Bliss, and Moule think it was chiefly G.'s own work. See Fuller's *Worthies*, 1662; J. Duncumb, *Herefordshire*, 1904-12; A. & Wood, *Athenae Oxoniensis* (ed. by A. Bliss, 1813-20), II.; and T. Moule, *Bibliotheca Heraldica: Notes and Queries* (2nd series), VI.-VIII.

Guillotine, instrument for inflicting capital punishment, introduced into France at the time of the revolution. It consists of two upright posts surmounted by a cross-beam and grooved so as to guide an oblique-edged knife, the back of which is heavily weighted to make it fall swiftly and with force, when the cord by which it is held aloft is let go. Some say that the machine was invented by the Persians, and previous to the time when it became known by its present name it was used in Scotland, England, and various parts of the Continent. In a museum in Edinburgh there is still preserved the 'Maiden,' as it is called. Until 1850 there existed in the forest of Hardwick, in England, a mode of trial and execution called the gibbet law, by which a felon convicted of theft within the liberty was sentenced to be decapitated by a machine called the Halifax gibbet. In Germany the machine was in general use during the Middle Ages under the name of the Diele, the Hobel, or the Dolabea. From the thirteenth century it was used in Italy, under the name of Mannala, for the execution of criminals of noble birth. Dr. Guillotin, who first suggested its use in modern times, was b. at Saintes in 1738. In 1789 he brought forward two propositions regarding capital punishment, one being that it should be by means of a machine and the other that all, gentle and simple, who were sentenced should be executed in the same way, as swiftly and painlessly as possible. The idea was adopted on Oct. 6, 1791. A Ger. named Schmidt furnished a machine for each of the departments in France. Experiments were first made with dead bodies from hospitals. A highwayman was the first

to be thus executed; this was in 1792. Some doubt seems to have at first existed as to whether death was instantaneous, and the case of Charlotte Corday was instanced in support of the theory that it is not. See A. Chereau, *Guillotin et la guillotine*, 1871.

Guimarães, anct. fort. in Portugal, in the prov. of Minho. It is picturesquely situated on the R. Ave and possesses hot sulphurous springs. Knives, leather, paper, etc., are manufactured, and table linen is woven. The tn. is famous for its embroidery. Pop. (1940) 12,968.

Guinea, former gold current coin of Great Britain, first struck in Charles II.'s reign (1664), and so called because originally made from gold obtained from the G. Coast. 'Spade Gs.' were those which had a spade-shaped shield on the reverse with the royal arms. It was the chief Eng. gold coin, till replaced by the sovereign in 1817. Its value varied considerably from 30s. in 1695 to 21s. in 1717—the value now understood by the word, though no current coin of the name still exists. Professional fees, subscriptions, prices of pictures, etc., are often estimated in Gs.

Guinea, large section of the W. coast of Africa, generally considered to extend from the mouth of the Senegal to Capo Negro. The name came into general use in the fifteenth century. It is divided into two parts, Upper G. and Lower G., and comprises many states and political ters., viz. Senegal (a Fr. colony), the Eng. settlements on the Gambia; Birrajos (Portuguese ter.); Sierra Leone (Brit.); the Ivory and Gold Coasts (Fr. and Brit.); the Slave Coast (Fr. and Brit.); the Brit. Protectorate of S. Nigeria, etc. etc. The coast-line is uniform and flat, interspersed with shallow lagoons. Inland the country rises to the central plateau of Africa, and the rivers are usually precipitated in cataracts and rapids. The coast is hard of access from the sea, owing to the dearth of good havens and the roughness of the surface. The climate of G. is very unhealthy, if not deadly. The Portuguese were the first to explore and trade along the coast, tempted by the gold deposits and later by the opportunities of slave-trading.

Guinea, French, see FRENCH GUINEA.

Guinea, Gulf of, gulf of the Atlantic Ocean on the W. coast of Africa, between Capes Palmas and Lopez. On the N. and E. are two open bays—the bights of Benin and of Biafra—separated by the delta of the Quorra or Niger. The gulf contains the Is. of Fernando Po, Prince's (Principe) Is., St. Thomas (São Thomé), and Annobon. It receives the counter-equatorial current crossing the Atlantic near the equator, and sends out the equatorial current which flows in the opposite direction, finally giving rise to the Gulf Stream.

Guinea-fowl (*Numida*), genus of African birds of the pheasant family (Phasianidae). There are about a dozen different species in the Ethiopian region, extending E. to Madagascar and S. to Natal. They are now naturalised and domesticated in most

countries, but prefer a warm climate. Gs. are inclined to be quarrelsome in a poultry yard, but are much valued for their flesh and eggs, which command high prices. The common pintado (*Numida meleagris*), sometimes called 'Come-back' from its frequent harsh cry (probably the *Meleagris* or *Gallina Numidica* of the Romans), has dark-grey plumage with round white spots, a horny 'casque' on the head, and fleshy wattles on the cheeks. Other species are the *Gallus cristatus* of W. Africa and the *Phasidus niger* of equatorial W. Africa (very rare), the males having spurs like pheasants. The birds are mostly gregarious and ground-feeders, but roost in trees. They were probably reintroduced to Europe by the Portuguese explorers of Africa in the sixteenth century. See C. Gesner, *Paralipomena*, 1555, and C. Darwin, *Animals and Plants under Domestication*, 1875.

Guinea-grass, or *Panicum maximum*, species of *Gramineae* in the same genus as the millets. It is a perennial plant growing in a tropical climate, and is used as a fodder plant.

Guinea Pepper, or **Bell Pepper**, name given to the seeds or dried fruit of sev. plants of W. Africa, such as the *Capsicum grossum*, *C. frutescens*, *Piper Clusii*, and *Xylopiya Ethiopica*. Malaguetta (Malaghetta) pepper and Ethiopian pepper are often considered equivalent to it. It was much used as a vegetable and for pickling in the E. (till replaced by E. peppers in the eighteenth century), and the trade in it resulted in the settlements of Grand Bassa and Cape Palmas. See CAPSICUM; CUBEBS.

Guinea-pig, or **Cavy** (*Cavia*), genus of small rodents native to S. America, but now domesticated in most countries. Sometimes considered as a separate species (*Cavia cobaya*), the familiar common cavy is probably a domesticated form of the *C. aperea* of Guinea and Brazil, introduced by the Dutch into Europe in the sixteenth century. The domesticated kinds are mostly white, or marked with yellow and black, or tawny-coloured. They have short limbs, the fore-feet having four toes, the hind feet only three. Their ears are short and rounded and they have no tails. Gs. are very prolific, producing young five or six times a year. They are much used in bacteriological laboratories for the study of germ diseases.

Guinea-worm, found as a parasite in the tropics under the human skin, especially of the legs. The worms are the thickness of horse hairs, and measure from one or two to six feet in length. The eggs enter the stomach in drinking-water. The G. is said to be the 'fiery serpent' of Mosala hist.

Guinegate, vil. of arron. Saint-Omer, dept. Pas-de-Calais, France. The site of two important battles: (1) In 1479, when the Austrians defeated the Fr. and (2) In 1513 (Aug. 16), when the Eng., under Henry VIII., and the Imperialists, under Maximilian I., put the Fr. to flight so precipitately that the battle was called the 'battle of Spurs.'

Guines: 1. City of Havana prov., Cuba,

on R. Mayabecque, 34 m. S.E. of Havana. The tn. is flourishing, with many modern institutions, and stands in a fertile plain. Pop. 22,600. 2. Tn. of arron. Boulogne, dept. Pas-de-Calais, France, 7 m. N. of Calais. Near this tn., in 1520, Francis I. of France and Henry VIII. of England met on the Field of the Cloth of Gold. Pop. 4200.

Guinevere, **Guinever**, or **Gueenever**, corrupt form of Guanhumara (Welsh *Gwenhwyfar*), anct. Brit. queen, daughter of King Leodogranus of Camelyard, and wife of King Arthur. She was the most beautiful of women and cherished a guilty love for Sir Launcelot of the Lake, one of the Knights of the Round Table. According to Geoffrey's *History of Britain*, during King Arthur's absence against Leo, king of Rome, she married his nephew Modred, who had usurped the kingdom left in his charge by Arthur. Arthur returned and defeated Modred at Camlula, a battle fatal to both leaders, while G. fled from York to the nunnery of Julius the Martyr at Newport in S. Wales. According to Malory, Arthur had gone to Brittany to punish Launcelot when Modred usurped the kingdom and attempted to marry G. She, however, shut herself up in the Tower of London, and on hearing of Arthur's death went into a nunnery at Almesbury. Tennyson, in the *Idylls of the King*, makes Modred discover the relationship between G. and Launcelot. The latter flung Modred to the ground and took to horse, while the queen fled to Almesbury where Arthur came to take leave of her.

Guingamp, cap. of arron. in the dept. of Côtes-du-Nord, France, on the R. Trieux, 52 m. W. of St. Malo. From the fourteenth to the seventeenth century it was the cap. of the duchy of Penthièvre. The medieval church of Notre Dame de Bon Secours is a great resort of pilgrims. Pop. 8600.

Guinicelli, **Guido** (c. 1230-76), lt. poet, b. in Bologna, where he studied and practised law. In 1274 he was exiled as one of the Ghibelline Lambertazzi party, and d. in exile. Only seven canzoni and five sonnets by him are extant, the best known being the canzone, *The Gentle Heart* (trans. by G. D. Rossetti), which is praised by Dante. They are printed in a collection pub. at Florence by Nannucci in 1813.

Guinness, **Arthur Edward**, see ARDILAUN, BARON.

Guinness: 1. *Arthur* (d. 1855), brewer; head of the firm of Arthur G. & Sons, of Dublin. He married Anne, daughter of Benjamin Lee. 2. *Sir Benjamin Lee* (1798-1868), third son of the above, b. in Dublin and succeeded his father as head of the firm, which he managed with the greatest success. In 1851 he became first lord mayor of Dublin, and during 1860-65 restored St. Patrick's Cathedral at a cost of £150,000. In 1863 he was made an LL.D. of Dublin Univ.; in 1865 was elected M.P. for the city in the Conservative interest, and in 1867 was created a baronet. 3. *Sir Arthur Edward* (1840-1913), eldest son of the above, succeeded

to the baronetcy, and in 1880 was created Lord Ardilaun. 4. *Edward Cecil* (1847-1927), third son of Benjamin Lee, was created a baronet in 1885, Baron Iveagh in 1891, and Viscount Iveagh in 1905. See also *IVEAGH, EARL OF*.

Guinobatan, tn. and com. in Albay prov., Luzon, Philippine Is. It is situated on the R. Inaya, and hemp is extensively cultivated. Pop. 28,700.

Guipuzcoa, maritime prov. of N. Spain, situated on the bay of Biscay, with an area of 728 sq. m. There are numerous mineral springs—salt, sulphurous, and ferruginous—which are greatly frequented by visitors. Zinc is found in the prov. The industries are carpets, glass, paper, chemicals, soap, cannon, etc. San Sebastian is the cap. Pop. 352,300.

Guiraud, Ernest (1837-92), composer, b. at New Orleans, of Fr. parentage; studied at Paris and Rome. He served in the Franco-Ger. war (1870-71), and in 1876 became prof. of harmony and accompaniment at the Conservatoire. His operas include *Le Roi David* (1852); *Sylvie* (1864); *En Prison* (1869); *Le Kobold* (1870); *Mme Turlupin* (1872); *Gretna Green* (1873); *Piccolino* (1876); *Le Galante Aventure* (1882); *Gli avventurieri*, and *Brunhilde* (ed. and produced posthumously). He also wrote sev. cantatas, overtures, etc.

Guiraut de Bornell (c. 1138-c. 1220), Provençal troubadour, b. at Excideuil (modern *Dordogne*), and accompanied Richard I. of England to the third crusade. About eighty love poems by him, written to a lady of Gascony, are extant, and are distinguished by simplicity and directness. He was known as 'Master of the troubadours,' and is mentioned in Dante's *Divina Commedia*. Some of his poems were ed. by Kolsen in 1894, but no complete ed. exists.

Guilsborough, mrkt. tn. of N. Riding, Yorkshire, England, situated in the valley of Cleveland, 9 m. E.S.E. of Middlesbrough. Iron is largely obtained in the neighbourhood, and there are breweries and tanyards. There is a sulphurous spring in the vicinity. Pop. 8000.

Guiscard, or **Wiscard**, **Robert** (1015-1085), first Norman duke of Apulia and Calabria, b. near Coutances, Normandy; the son of Tancred de Hauteville. He went to Italy as a pilgrim, and raised a band of adventurers to fight the Gks. and Calabrians. He was soon joined by many Normans and was very successful. In 1060 he captured Reggio and Cozenza, and accordingly obtained from Nicholas II. the investiture of Apulia and Calabria. He and his brother Roger were the papal champions in S. Italy and Sicily against the Gks. and Saracens. In 1081 he invaded the Byzantine Empire and defeated the emperor, Alexius Comnenus, at Durazzo. He hurriedly returned to Italy to protect the pope, Gregory VIII., from the Emperor Henry IV., and later went back to the E., dying in Cephalonia.

Guise, or **Guyse**, Dukes of, ducal family of Lorraine, France, named from the tn. of G. (q.v.). **Claude of Lorraine** (1496-1550), the first duke, b. at the Château

de Condé, being the fifth son of René II., duke of Lorraine. He became a Fr. citizen; married Antoinette de Bourbon about 1514; joined the army and fought at Marignano (1515), and was created duke of G. by Francis I. for suppressing the peasant revolt in Lorraine in 1527. **Francis of Lorraine** (1519-63), the second duke, was the son of Claude, and became a great military commander and leader of the Catholics. In 1552-53 he defended Metz against Charles V. of Germany; in 1554 fought at Renti, and in 1556 commanded the expedition against Naples. In 1557 Henry II. made him lieutenant-general of the kingdom, and in 1558 he took Calais from the Eng. and brought about the treaty of Cateau-Cambresis in 1559. He and his brother Charles, cardinal of Lorraine, were active in suppressing the Protestants, and defeated the conspiracy of Amboise, taking its leader, the duke of Condé, captive at Dreux in 1562. He was assassinated by a Huguenot at the siege of Orleans. He left valuable memoirs.

Henry of Lorraine (1550-88) (Balafré), the third duke, was the son of Francis, and succeeded him as an opponent of Protestantism. He fought at Poitiers, Jarnac, Moncontour (1569), and Dormans, was concerned in the massacre of St. Bartholomew (1572) and in the murder of Coligny. In 1576 he became head of the Catholic League. Becoming too ambitious, he was assassinated at Blois by the order of Henry III. **Charles IV. of Lorraine** (1571-1640), fourth duke, was imprisoned at Tours on the assassination of his father, Henry, in 1588. He escaped in 1591 and entered the service of Henry IV., gaining a victory at Marcellus in 1596. He was banished by Richelieu in 1631. **Henry II. of Lorraine** (1614-64), fifth duke and prince of Joinville, b. at Blois, son of Charles IV. In 1629 he became archbishop of Rheims and in 1640 succeeded to the dukedom. In 1641 he joined the conspiracy of the count de Solissons against Richelieu and was condemned to death, but escaped to Flanders. In 1647 he joined the Neapolitan revolt of Masaniello against Spain, but was taken as a prisoner to Madrid. He escaped in 1652, again attempted to win Naples in 1654, and became high chamberlain of France in 1655. The ducal line became extinct at the death of **Francis Joseph of Lorraine** (1670-75), the seventh duke.

Guise, Mary of, see **MARY**.

Guiseley, par. and vil. of W. Riding, Yorkshire, England, 2 m. S.W. of Otley. Tweeds and other woollen goods are manufactured. Numerous ant. stone coffins have been discovered. Pop. 6000.

Guise, tn. of arron. Vervins, in the dept. of Aisne, France, on the R. Oise, 16 m. N.E. of St. Quentin. It has important ironworks and manufs. textiles, and contains a communistic labour colony. It was fortified in the eleventh century and has stood many sieges. It gives its name to the duchy of G., founded 1528. Considerable damage was done to the tn. during the First World War. Pop. 7100.

Guitar (Sp. *guitarra*), stringed musical instrument. It has a flat soundboard made of pine, with a large sound-hole; a

flat back, made of maple, ash, or cherry-wood, and joined to the soundboard by ribs and curving sides. There are six strings, three of gut and three of wire-covered silk, which extend from the bridge, which is of ebony, to the end of the finger-board, from which the head is bent back at an obtuse angle. The strings are tuned to the notes F, A, D, G, B, E, in the treble clef, but they are produced an octave lower than written. The instrument is played by plucking at the strings with the thumb and three fingers of the right hand, while the fingers of the left hand press the strings to regulate the intervals.

Guitry, Lucien-Germain (1860-1925), Fr. actor, b. in Paris. First appearance, 1878. Married in London, 1882. Spent nine years in St. Petersburg. Returned to Paris, 1891. Acted at Odéon, Grand, and Porte-St-Martin. In 1900 appeared as Coupau in *L'Assommoir*. In 1902 and 1909 appeared in London theatres. Played the cock in Rostand's *Chantecler* (1910). Played in *Le Juif polonais* and *L'Aiglon*, and represented Crainquebille in Anatole France's play.

Guitry, Sacha (b. 1885), Fr. playwright and actor; b. at St. Petersburg, where his father, Lucien G. (q.v.), was director of the Théâtre Michel. His first known play, *Nono*, was produced in 1905. He has written about forty-five pieces, including *Debureau* (1918), *L'Amour masqué* (1923), and *Un Miracle* (1927), in all of which, except about half a dozen, he has acted—being indeed almost a necessary item in their interpretation. Two of those in which he does not appear are serious plays, *Jacqueline* (1921) and *Un Sujet de roman* (1923)—in the latter his father appeared.

Guittone of Arezzo (d. 1294), It. poet, b. in Tuscany; fought in the wars between Florence and Pisa, and in 1267 became a brother of the military order known as the Fratelli Gaudenti. He founded the Camaldolese monastery, Degli Angeli, at Florence, but d. before it was completed. As a poet he ranks high as one of the founders of It. literature, being the first to give polish and regularity to the sonnet, while his prose style also had considerable influence for good. He is mentioned by Dante and Petrarch. His poems mostly appear in old collections of It. poetry, such as *Antichi Poeti* (Venice), 1532. His prose writings and letters were pub. by Bottari at Rome in 1745.

Guiuan, city of Samar Is., belonging to the Philippine group. It is situated in the S. of the archipelago. Pop. 12,000.

Guizot, François Pierre Guillaume (1787-1874), Fr. historian and statesman, b. at Nîmes, of Protestant family. His father d. on a scaffold during the revolution and the family fled to Geneva, where G. was educated. In 1805 he went to Paris to study law, but met with literary people who fired his aspirations, and in 1812 he became modern hist. prof. at the univ. of France. The same year saw the pub. of his trans. of Gibbon's *History*. In 1816 he became secretary for the interior and was promoted the

following year to the State Council. During the next few years he led the 'Doctrinaire' party, but on the break-up of the Duc Decazes ministry (1821) he was stripped of office, and a year or two later was forbidden even to lecture. During this period he produced his *History of the English Revolution* (vols. I-II.), 1826-27; *History of Civilisation in Europe* (1828); and the *History of Civilisation in France* (1829-32); all of which have appeared in Eng. trans. In 1830 he again took to public life as deputy for Lisieux (Normandy), and after the July revolution became a cabinet minister, being finally promoted, when the Cabinet was reorganised (1832), to minister of education. In 1840 when his rival Thiers became foreign minister, G. came to London as ambas. and was very cordially received, but returned to Paris after a very brief sojourn. The next task which he attempted was the complete reconstruction of the Fr. ministry and reorganisation of public administration, which occupied him until the 1848 revolution. In 1847 he became Prime Minister, but at once involved himself in a disgraceful intrigue over the 'Sp. marriages' question; he aimed at Palmerston's foreign policy in this, but succeeded only in causing bad feeling between England and France. The revolution was largely due to his iron-handed firmness in carrying out his schemes; after this he took no further part in political life, but retired to his home at Lisieux and concentrated on literary work. The first eight years of his retirement were occupied in the completion of his *History of the English Revolution* (vols. III-VIII.), 1850-56; his *Mémoires* appeared in nine vols. (1858-1868), and his daughter, Mme de Witt, pub. his *Child's History of France* (5 vols.), 1870-75. His only remaining work of importance is the remarkable biography of Washington (1840). G. is considered to be the founder of historical science, as opposed to the old style of chronicle pure and simple. His writings leave much to be desired in point of form and style, but are highly suggestive, well reasoned, and full of striking ideas. See G. Bardoux, *Guizot*, 1894; M. Guizot, *Les années de retraite de M. Guizot*, 1901; H. P. Thiem, *Guide bibliographique de la littérature française de 1800 à 1906*, 1907; and C. H. Pontbas, *Guizot pendant la Restauration*, 1814-30, 1923.

Gujarat, in its widest sense, denotes the whole region in India in which the G. language is spoken; in its narrower and more correct sense it applies to the central plain eastward of Cutch and Kathiawar. The various feudatory states such as Baroda, Cambay, Chota, Udaipur, Rajpipla, and Baria included in the linguistic region are now either integrated with Bombay Prov. or have formed groups among themselves (see INDIA, *Effect of Indian Independence on the Indian States*). The region, which has an area of 29,071 sq. m., contains parts of the W. Ghats and the Vindhya and Satpura Mts., and is watered by the Tapi, Nerbudda, and Mahi Rs. The soil is fertile, but

the climate unhealthy. Pop. 9,500,000, mainly Hindu in religion.

Gujranwala, dist. and tn. of the W. Punjab, Pakistan. The tn. is situated on the Grand Trunk road and N. State railway, 40 m. N. of Lahore. There are manufs. of silk scarves, jewellery, and brass goods. Pop. about 42,000.

Gujrat, tn. and cap. of the dist. of the same name in the W. Punjab, Pakistan, 73 m. N.W. of Lahore. It has industries of brass vessels, footwear, inlaid articles, and textiles. Here, on Feb. 21, 1849, Sir Hugh (later Lord) Gough defeated a Sikh army of 60,000 men, the victory leading to the cap. of G., then a Sikh fortress, and the surrender of the Punjab. Pop. 40,000.

Gulbarga, see KULBARGA

Gulek-Boghaz, or The Cilician Gates, pass in the S.E. of Asiatic Turkey. From earliest times the main road from all parts of the plateau has been through here.

Gulf: 1. Tract of the sea extending into the land similar to, but larger than, a bay. 2. Term applied at Cambridge to that section of an examination list coming between the creditable passes and the complete failures.

Gulfport, port for the Pearl R. customs dist., situated in Mississippi, U.S.A., 13 m. from Biloxi. It has saw-mills and canning factories. Pop. 15,100.

Gulf Stream, ocean current in the N. Atlantic. It issues from the gulf of Mexico, which gives it its name, being formed from the warm waters of the equatorial current, and flows out northward through the gulf of Florida and along the E. coast of N. America, from which it is separated by the 'cold wall,' a narrow strip of cold water. It is early joined by another current coming from outside the W. Indies. When leaving the gulf the G. S. is from 50 to 100 m. wide, and 2000 ft. deep, and moves with an average velocity of 80 m. a day. Its temp. is then about 80° F., but as it flows northwards the temp. drops, and the current becomes broader and less rapid. At a point off Newfoundland it merges into the G. S. Drift, which flows eastward across the Atlantic, and later divides into two branches, which flow N. and S. respectively. According to Mackinder the G. S. ceases fully 1500 m. from the nearest shore of Britain.

Gulfweed, floating seaweed, *Sargassum baccifurum*, found in large quantities in the Sargasso sea. The Gulf Stream carries it northwards from the gulf of Mexico. It has small, bladder-like berries.

Gull, Sir William Withy (1816-90), Eng. physician, b. in Kent; educated at Guy's Hospital, London. From 1847 to 1849 he was Fullerton prof. of physiology at the Royal Institution of Great Britain, and from 1856 to 1865 a physician and lecturer at Guy's Hospital. He was elected a fellow of the Royal College of Physicians in 1848, and in 1871 attended the Prince of Wales during his attack of fever. For his services in this respect he was made a baronet and appointed physician to the queen in 1872. His numerous works, which have been edited by Dr. Acland,

include *Gullstonian Lectures on Paralysis* (1849); *Report on Cholera* (1854); *Hypochondriasis*; and *Abscesses of the Brain* (1854).

Gull (Welsh *gwylan*), name applied to a group of sea-birds, members of the div. Larinae of the family Laridae. Under the most recent classification forty-nine species of Gs. are admitted and these are placed in five genera: *Pagophila* (the Ivory G.) and *Rhodostethia* (which has a small bill and wedge-shaped tail), in each of which there is only one species, *Rissa* (in which the hind toe is wanting) and *Xema* (the members of which have forked tails), each containing two species, and *Larus* (with square tails), in which are a

GREAT BLACK-BACKED GULL

large number of varying species. Among the most common are the black-headed G. (*L. ridibundus*), which frequents marshy coasts; the herring G. (*L. argentatus*), a large and handsome variety; the common G. (*L. canus*); the lesser black-backed G. (*L. fuscus*); the greater black-backed G. (*L. marinus*), which is one of the largest species; and the glaucous G. (*L. glauces*) which is circumpolar in its distribution. The smallest species are the *L. minutus* and the *L. philadelphia*.

Gullet, or Œsophagus, tube lined with mucous membrane which is separated by cellular tissue from its muscular foundation. The muscular fibres are striped in the upper portion and unstriped in the lower. The mucous membrane is thrown into a number of longitudinal pleats to allow of stretching. Compound racemose glands secrete a viscid mucus, and occur throughout the whole length of the G., though they are most numerous at the bottom. In man the tube is 9 to 10 in. in length, and from 1 to 1 in. in diameter, and extends from the lower part of the pharynx, passes along the front of the spine, and terminates with about 1 in. of it in the abdomen at the cardiac end of the stomach. Among certain mammals, e.g. ruminants, a layer of voluntary muscle in the G. allows of antiperistaltic movements being induced by which food can be regurgitated into the mouth.

Gum. Gs. are the solidified exudations of different parts of plants (branches, stems, fruits, etc.), or are contained in the plant juices themselves. They belong to the carbohydrate group, are odourless, tasteless, amorphous substances which on treatment with water form either clear solutions or gelatinous liquids. The following are the prin. kinds met with commercially: *G. arabic*, obtained from various species of *Acacia*, sometimes known as *G. acacia*, is probably a calcium potassium salt of gummic acid (first prepared by dialysis by Graham). The *G.* occurs in rounded lumps which in some cases are almost transparent, while in others opaque owing to the large numbers of minute cracks. When treated with water it swells up and eventually dissolves, giving a solution with marked adhesive properties. On treatment with dilute sulphuric acid it gives galactose, and on oxidation a mixture of mucic and saccharic acids together with oxalic and tartaric acids. It is used in the dressing or finishing of fabrics such as silks and calicoes, and, when mixed with glycerine, for making gummed labels. *G. senegal* is closely allied to *G. arabic*, and is often used to adulterate the latter. It is derived from *Acacia Senegal*. *G. tragacanth*, sometimes known as *G. dragon*, is obtained from different species of *Astragalus* which flourish in Persia, Syria, and Kurdistan. *G. tragacanth* forms curious horny translucent masses which swell slowly when treated with water, yielding a thick mucilage of low adhesive power. It is mainly used in the dressing of fabrics and in calico-printing, but is also employed in the manuf. of metallic-filament lamps for electric lighting. *G. tragacanth* probably belongs to the bassorin group of Gs. The Gs. exuding from cherry, plum, and apricot trees form a group apart. On hydrolysis they yield arabinose, and on oxidation oxalic acid. Under the term *G. resins* are included the juices of certain plants which are mixtures of Gs. and resins. On treatment with water partial solution of the *G.* takes place and the resin is held in suspension. The best known specimens of this class are *G. ammoniacum*, *G. euphorbium*, *G. galbanum*, gamboge, and myrrh. Possibly caoutchouc and gutta-percha might find place in this group.

Gumal Pass, or Gomal, mt. pass of Afghanistan, and the chief on the Indian frontier, between the Khyber and the Bolan. It forms a connection between Dera Ismail Khan and the G. valley.

Gumbinnen, manufacturing tn. of the R.S.F.S.R., formerly of E. Prussia, Germany, on the Pissa, 72 m. E. of Königsberg (Kalliningrad). The first important engagement between the Gers. and Russians in the First World War took place here on Aug. 19-20, 1914. In the Second World War *G.* fell to the Red Army early in 1945. Pop. 17,400.

Gumbum, see KUMBUM.
Gummersbach, tn. of Germany, situated in the Rhineland, 24 m. E. of Cologne. Pop. about 16,000.

Gull's Disease, see under MIXOEDIMA.

Gummie Acid, see ARABIN.

Gumming, contagious disease which commonly attacks the vine and the plum, cherry, pear, peach, and other trees. It is due to the ravages of a fungus, *Coryneum betjerinckii*, which converts the cells of the host into gum. It is best to destroy the diseased tree, but the treatment consists in frequent washings. Excess of manure is often the cause.

Gumti, riv. of the United Provs. and Oudh, India, rising 520 ft. above sea level. Its course is generally S.E. for 385 m., until it enters the Ganges, 25 m. from Benares.

Gumürjina, tn. situated in Adrianople, W. Thrace, on the R. Karaga. Wheat, barley, maize, etc., are grown, copper and antimony are mined, and there is a trade in wine and silk. Pop. about 25,000.

Gun, name applied generally to a weapon from which is discharged by means of an explosive a projectile. The word is, nowadays, applied almost exclusively to cannon and to the weapons used for sport. The military weapons, such as a musket or a rifle, are in technical language called small arms. Originally the *G.* was employed for purely military purposes; it was not until very much later that the weapon began to be generally used for sport. The origin of the name *G.* is not certainly estab. Skent refers it to Welsh *gun*, a bowl. Others derive it from the O.F. word *mangonne*. The name is applied really only to the tubular weapon, together with its stock, as used for hand-firing. The hand *G.* was in fairly general use by the middle of the fifteenth century, but at this time was of very rude construction. It consisted simply of a tube of brass or iron which had a touch-hole at the top and a straight stock which was placed under the armpit when the weapon was to be fired. The soldiers carried long matches made of cotton soaked in a strong solution of saltpetre. Cavalry also carried this type of *G.*, which was suspended by a cord over the shoulder and which when about to be fired was placed on a forked rest. The latter when not in use hung down by the side. During the early Tudor period an improvement in the shape of a matchlock *G.* was invented. This had a cock at the side of the *G.* which held the match, and by means of a trigger the match was brought into contact with the gunpowder. This improved weapon, with a bent stock and broad butt, was generally termed an arquebus and was a lighter weapon than the later musket. A smaller weapon was at the same time used, constructed on much the same principle, but which may be regarded as the forerunner of the later pistol.

The next improvement in *G.*-making was the invention of the wheel lock, a weapon which carried a wheel at the side of the priming pan. This wheel was wound tightly up and could only be released by the trigger. When the trigger was pulled the wheel revolved, and by means of its rapid action on a piece of iron pyrites on which it rested gave forth a number of sparks which ignited the

powder. This weapon, however, did not come into general use, since its mechanism was somewhat involved and therefore expensive. Nevertheless it remained in use until the reign of Charles II. About the middle of the sixteenth century the musket was invented by the Spaniards. This weapon was much heavier than the Gs. previously used, and carried a much heavier shot. It necessitated the use of a forked rest, but proved of such great value that it was generally adopted throughout Europe. It was made on the matchlock principle, and it carried a ball of about 1½ oz. During this period the snap-hance was invented in Germany. During the early part of the seventeenth century the firelock or flintlock was produced. This did away with the necessity for filling the priming pan, either from a flask of powder which was carried for that purpose or by biting off the top of the cartridge as was the later practice. From William III.'s time, for example, the raising of regiments of fusiliers dates. These were regiments which carried a fusil or musket made on the principle of the firelock or flintlock. This weapon was of the type of the famous Brown Bess used during the War of the Sp. Succession by Marlborough's troops. This type of weapon, however, was always liable to misfire, since the priming could not always be kept dry. To obviate this difficulty early in the nineteenth century percussion caps were invented, but were not used in the army until some considerable time later. By the end of William IV.'s reign, however, we find them in fairly general use. In 1842 the last improvement took place in the weapons of the Brown Bess type, but these were within ten years replaced by the use of rifles in the Brit. Army. Rifles did not at first altogether replace the percussion musket, but with the improvement of the rifle the use of muskets was abandoned altogether (1855). The rifle was a form of musket in which, by means of grooves in the bore, the bullet was made to rotate before leaving the barrel. The effect of this rotation is to ensure a more accurate flight of the projectile. The grooves in the bore were usually spiral in form, although some seem to have been made with straight grooves. The principle of rifling was discovered early in the sixteenth century, but does not seem to have been generally used except for purposes of amusement. Some rifle regiments were formed both in France and in England, but the difficulty of loading, and the waste of time which it entailed, prevented the general adoption of this method of warfare. The difficulty, however, was gradually being overcome, and by 1835 a regiment of riflemen had been raised and armed with rifles made on the percussion principle. This, in fact, was the first recognition by the army authorities of Forsyth's invention of the percussion cap. In 1835 Greener produced an expansive bullet which was rejected by the army authorities on the ground that it was a compound bullet. It had, however, shown the advantage of rifle fire over musket fire, and had also shown that the

difficulty of windage and the erratic flight of the bullet could be overcome. In 1851 the Minie bullet was adopted by the Brit. military authorities, and this Minie rifle was used during the Crimean war. In 1856 the Enfield rifle was invented, and was adopted by the authorities, being used in the later stages of the Crimean war and taking the place of the Minie rifle. The Enfield rifle was in general use until the adoption of the breech loader in 1867. During the Amer. civil war breech-loading Gs. were used by the federal cavalry, and in 1867 Snider's method of converting the muzzle-loading Enfield into a breech loader was adopted by the military authorities of Great Britain. The celebrated needle G., invented by Nicolaus von Dreyse (1787-1867), which was of such great importance during the short Austrian war, had been adopted some time previously; in fact, the Prussians were the first to appreciate thoroughly the value of a breech-loading bolt action weapon. In 1871 the breech-loading Martini-Henry rifle was adopted by the Brit. military authorities. The calibre of this rifle was .433 in., and it had a falling block action. Various improvements were continually being made until a great step forward was made by the invention of a magazine G. Russia was again to the fore in the adoption of this new invention, and in 1881 it adapted the Mauser rifle to the magazine rifle. Not unnaturally France followed suit, but adopted a rifle of different pattern. In the meantime, after a series of experiments and exhaustive commissions, the Brit. War Office adopted a new rifle in the shape of the Lee-Metford Mark I. in 1888. In 1891 the Lee-Metford Mark II. was adopted, this being a six-cartridge magazine carbine with bolt action and firing smokeless powder, which had come into general use in 1890. This rifle was subsequently still further improved, and became known as the Lee-Enfield rifle. Cordite was introduced as a smokeless explosive adapted to both the Lee-Metford and Lee-Enfield types of rifle, both of which took cartridges made from cordite. Both these rifles also wore small-bore magazine rifles, the whole length of whose barrel was protected by a wooden handgrip. The length of the barrel was 21 in. In 1900 Great Britain had adopted a rifle of the bolt action type, but had rejected the multiple loader by means of a charger. This adopted weapon was given up in 1903 when the short rifle came into prominence. Up to 1903 the principle adopted by the musketry regulations had been to use the rifle as a single loader whenever possible and to reserve magazine fire for special emergencies. The long Lee-Metford and Lee-Enfield rifles (with bayonets five inches longer than before) were fitted out with a charge-loading apparatus and issued to the infantry of the territorial force.

The massed formations in attack used by the Gers. in the First World War needed an automatic G. to resist them; otherwise they would have overwhelmed their opponents before suffering any

appreciable number of casualties. Consequently the number of machine Gs. of the Allies rapidly increased. Early in the First World War the Lewis light automatic G. was invented and used extensively, and it is still in use, being the prin. weapon of half the infantry in the Brit. Army. It is not regarded as a 'specialist' weapon, and instruction in its use is a normal part of training. The G. is air-cooled, is fed by circular pan-shaped magazines, each holding forty-seven rounds of .303 S.A.A. The weapon is shoulder-controlled, can produce a large volume of highly concentrated fire, has many delicate parts, and therefore requires careful handling. Its rate of fire is between 600 and 700 rounds per min., best delivered in short bursts of four or five rounds at intervals.

As a result of the First World War experience a new Mark VI. S.M.L.E. rifle was approved. This has an aperture sight, and has a much stronger body and barrel than its predecessor. As a result of experience, opinion has grown in favour of a streamline bullet, but this requires deeper loading, thereby reducing the space allocated to the charge, and great care is required in ensuring exact concentricity as this governs the flight. (See also ARMS; BULLET; and, for further information on sporting Gs., see also RIFLE.)

Cannon.—An old name for Gs. as used by the artillery and as contradistinguished from hand Gs. The name is derived from the Lat. *canna*—a hollow reed. It is difficult to establish when cannon were first used in Europe, but they were first used in Great Britain by Edward III. in his campaign against the Scots in 1327. They were then called 'crakys of war.' The Fr. appear to have first used them in 1338. Originally cannon were somewhat in the nature of mortars, constructed by welding together iron bars, strengthened by iron hoops. A good specimen of this type of early cannon is 'Mons Meg,' now in the Tower of London. The earliest patterns were loaded and fired at the muzzle, but breech loading and firing was not long in developing. A form of cannon was the bombard—from the Gk. *Bombarra*—the noise made when it was fired. These were made of hammered iron originally, but later on they were cast from a composition called G. metal. A G. of this pattern was found on the coast of Ireland, and is supposed to have been used by the Sp. Armada. Gradually the term cannon was used to describe all sorts of missile-throwing machines, small as well as large. It was the custom in the Middle Ages to give these weapons personal names, such as the Devil, the Twelve Apostles (for a battery of twelve), a survival of which is seen in Queen Elizabeth's Pocket Pistol at Dover. Many types of cannon were named after serpents. The name culverin remained until a very late date. The mounting of cannon was very crude in the early days; they were simply laid on pieces of timber to which they were fastened. For mobility wheels were fixed to the timber. Elevation was obtained by fixing to the front portion of the timber,

called the carriage, an arrangement similar to that used for high-jumping, i.e. a vertical stand pierced with holes so that the cross-bar could be raised or lowered. Another method was to fix the cannon to gimbals which swivelled round in any direction from a bench. These Gs. were controlled by hand and were loaded at the breech. In the seventeenth century red-hot shot was fired from cannon, the idea having occurred to a Ger. Improvements in the construction of cannon were noticeable in the sixteenth century in Switzerland, where the casting of a whole cannon was experimented with, the bore being 'bored out' from the solid. The Flemings were considered the masters in everything pertaining to cannon in the fourteenth and fifteenth centuries, and many of the chief positions in the artillery of England were held by them. They were also the writers of all the authoritative manuals on the construction and employment of cannon. The numerous wars in Europe during the seventeenth and eighteenth centuries gave ample scope for the employment of cannon and improvements were constantly being made, until a light cannon or G., with fairly good accuracy, was evolved which was eventually displaced by the modern field G. See also ARTILLERY; HOWITZER.

Gunboat. The main principle which underlies the construction of a boat of this type is that she shall to all intents and purposes be simply a floating gun-carriage. The earliest type of G., constructed about the middle of the nineteenth century, was of about 180 tons, 75 ft. long, with a speed of about 6½ knots. Various improvements were made on the type of boat, until at the present time we have specially constructed Gs., which are used to a very great extent for liv. service and which have a displacement tonnage of about 700 tons. The average speed is just over 12 knots an hour, and they carry two 4-in. quick-firing guns, four 12-pounders, and ten machine guns. The boat is steel built and copper sheathed, and about two and a half times as long as the earliest type of G. Boats of this type are used a great deal on the R. Nile. In the Second World War Brit. Gs. were used against the Axis in N. Africa and by the Amers. in Chinese waters.

Gun-carriage, support of a very large piece of ordnance. It is built in order to be able to stand very heavy strains. It has to withstand the shock caused by firing the piece, and it has also to be of great stability in order to be able to stand the strain of being drawn at a rapid pace over broken or rocky ground. The detachable front consisting of two wheels, axle, and shafts, to which horses were harnessed, is called the limber. There is a special dept. in the arsenal at Woolwich which attends to the manuf. of Gs. This dept. is of special importance since the G. must of a necessity be neither too heavy nor too cumbersome to be easily moved.

Gun-cotton, regarded usually as a nitrate of cellulose, is probably a mixture of nitrates. It is produced, briefly, by the action of strong nitric acid and

sulphuric acid on cellulose. Early in the nineteenth century the action of concentrated nitric acid on fibrous or woody bodies was noted, and finally Pérouze made the discovery that cotton when treated with concentrated nitric acid became a highly explosive body. Following on these experiments Schönbein commenced his discovery of G. proper, i.e. cotton which had been treated with nitric acid and which had then become an exceedingly explosive substance. The modern method of manuf. is based essentially upon the method discovered by Schönbein. Cotton waste which has been carefully cleaned and dried is treated with a mixture of concentrated sulphuric and nitric acid. The sulphuric acid is used in quantities in excess of the nitric and its chief use is to absorb the water produced during the process and to keep the nitric acid constantly concentrated. The process takes place at the ordinary temp. and lasts for from three to four hours. After being carefully washed and cleaned so as to remove the impurities which give rise to sulphates, the G. is pulped and either compressed into blocks, or dried in its ordinary state. It still retains the appearance of ordinary cotton waste, and does not explode save under confined conditions. The chemical formula is $C_{12}H_{11}O_2(O\cdot NO_2)_8$. Mixed with nitroglycerin (q.v.), it forms the useful propellant explosive cordite.

Gundagai, tn. of New S. Wales, Australia, situated in Clarendon co., 95 m. N.E. of Albury, in the vicinity of the goldfields. Pop. 2000.

Gung'ü, Josef (1810-89), Hungarian composer and conductor, b. at Zsámbék; was a bandmaster in the Austrian Army (1835-43); in 1843 estab. an orchestra, with which he toured in Europe and America. He became director of music to the king of Prussia in 1849, and to the emperor of Austria in 1858. He composed numerous popular dances, marked by easy and rhythmical melody, of which the *Amorellen waltz* is perhaps the most popular.

Gunib, fort. tn. of Daghestan, Caucasus, R.S.F.S.R., 75 m. N.W. of Derbent. It stands at an altitude of 4020 ft. close to G. Peak (7718 ft.) and was the last refuge of Shamil, the Circassian chief who surrendered to Russia in 1859. Pop. 1000.

Gun-metal, alloy consisting of about nine parts copper, one part tin, together with small quantities of lead and zinc. It is a tough reddish metal, much used for making castings for bearings and other engineering purposes, and formerly used for making ordnance. It requires careful casting as the constituents are somewhat liable to separate in the process.

Gunnery, science which governs the employment of firearms. The science is itself very detailed, since a knowledge of it requires a knowledge of the metals from which the guns are made, the method of their manuf., and an ability to calculate the strain to which its use will subject the weapon. Again the science must calculate the probable effect of the missile upon the object fired at, the velocity of the

projectile when fired, and the effect of the forces which will be brought to bear upon the missile both before and after it leaves the gun. The subject has been frequently treated in books pub. from time to time, the earliest being pub. fairly early in the sixteenth century. But literature on the subject increased enormously during the nineteenth century and is increasing almost every day. The science is to-day far more exact than it has ever been. Calculating tables and instruments have been produced, and have reached such a pitch that it is possible nowadays to calculate, before a shot is fired, the range of a gun, where elevations and calibre are known, and usually such calculations are well within the mark. The intricate calculations and the delicate mechanism, both of the modern gun and of the modern instruments, are such that G. may now be regarded as an exact science. On the various operations involved in spotting and attacking hostile aircraft see ANTI-AIRCRAFT DEFENCE. See also ARTILLERY. See *The Official Text-book of Gunnery; Ordnance and Gunnery*.

Naval Gunnery.—Adm. Sir Percy Scott, a great expert on naval G., laid particular stress on 'director' firing (see his *Fifty Years in the Royal Navy*, 1919). Prior to the First World War the regular pub. of the ann. returns of the gunlayer's test gave Scott a conspicuous position in the public eye, and there has been controversy over the alleged neglect by the authorities to adopt his inventions. The opposed or anti-Fisher school of thought suggests the problem of naval fighting, in the days preceding the First World War, was never contemplated as a whole; but it is to be borne in mind that 'director' firing, to which this school attaches such great importance, would not by itself have achieved for naval G. all that a naval action demanded. There are other and more important elements to be taken into account; for, in default of some device for knowing and keeping the range in the conditions in which a ship should fight, the 'director,' so far from giving increased efficiency, might lead to worse results than individual laying. This fact would seem to have been clearly proved by the Gers., whose naval guns were far more accurate than the Brit. It is true that a study of the actions of the Dogger Bank and of the Itzumi R. reveals that the Ger. broadsides fell persistently short or just over the target for hours without making one hit; but this result is exactly what might be expected of a broadside which was fired, not only as a single gun, but in which each gun, of necessity, behaved exactly like every other gun. With less mechanical uniformity of firing the broadsides would, on the law of averages, have occasionally straddled the target or hit it; and failure was due to the fact that, while the aiming and gun were good, the arrangements for finding and keeping the range were defective. Again the battle of Jutland affords no proof that the 'director' by itself guarantees efficiency; and it is significant that only one Ger. ship (*Blücher*) was sunk by gun-fire.

Lord Jellicoe indeed tells us that his range-finders were not equal to the conditions of light or visibility, and that he dared not manoeuvre his fleet under large helm, for to do so would have meant putting his artillery out of action. Owing to the fact that space on a warship is limited and the platform not stable, the naval gunner's problem of defeating aircraft attack is even more difficult than that of the land-based anti-aircraft gunner. Naval fire control work calls for precision in the highest possible degree—a precision which must keep pace with the ever-increasing speed of aircraft (see also *Itadar*).

Gunnigfeld, com and small tn of Westphalia, Germany, situated in the gov of Arnsberg. Pop about 10,000.

charcoal, sulphur, and saltpetre. This substance has had an enormous influence on the hist. of the world; it revolutionised the art of war, and has not been without its effect on the arts of peace. It is perhaps scarcely possible to speak about the discovery of G, since if it was discovered we have no definite proof of the fact, and what facts we have at our command seem rather to prove that it was but the development which went on for some considerable time. The names, however, of Friar Roger Bacon and the Ger Schwartz have usually been associated with its discovery. Schwartz is supposed by the greater number of authorities to be the inventor of G, but we have proof that G. and cannon existed previous to the date

THE GUNPOWDER CONSPIRATORS—FROM AN OLD PRINT

Gunning, Elizabeth, Duchess of Hamilton and of Argyll (1734-90), celebrated beauty, daughter of John G. of Castle Coote, Co. Roscommon, Ireland. In 1751 she and her sister Maria (q.v.) went to London and attracted great attention as 'the handsomest women alive'. In 1752 Elizabeth married James, sixth duke of Hamilton, who d. in 1758; and in the following year she married John Campbell, marquess of Lorne, who was afterwards fifth duke of Argyll. She and her sister were frequently painted, and numerous engravings of the portraits exist.

Gunning, Maria, Countess of Coventry (1733-60), celebrated Eng. beauty, said to have been more handsome than her sister Elizabeth (q.v.). She was once mobbed by a crowd in Hyde Park, and the king accordingly gave her a guard. In 1752 she married George William, sixth earl of Coventry.

Gunnison, riv. of Colorado, U.S.A. Its source is in the N. of Saginaw co., and its course is W. and N.W., until it enters the Grand R. at Grand Junction, about 25 m. E. of the W. borders of Colorado. There are numerous canyons.

Gunpowder, explosive composed of

when Schwartz is supposed to have invented it. Bacon himself does not appear to have been aware of many of the properties of G, although he may have been the first person in England to make it. He, however, regarded it to a very great extent as an explosive which was to be used for purposes of diversion, although he was aware of its explosive properties, and probably realised that it could be used for blowing people up. Many references to the existence and use of cannon and G. are found between the years 1327 and 1340. Edward III. is supposed to have used cannon against the Scots in the early wars of his reign, whilst we find another reference to the existence of G. in England in 1338. In Richard II.'s reign it was in fairly common use, and Henry V. ordered that G. should not be taken out of the country without licence. Henry V. used it before Harfleur, but it did not become really effective until the end of the fifteenth century. Though superseded for most purposes by more powerful explosives, G. is still employed in fireworks, sporting cartridges, etc.

Gunpowder Plot, conspiracy to blow up the Houses of Parliament and the king

(James I.), who was to be present to open Parliament on Nov. 5, 1605. It was contrived by a number of Rom. Catholics, with Robert Catesby at their head, and seems to have been brought to a head by the revival, in 1604 and 1605, of measures of repression against the Rom. faith in England. It is known that Catesby was conceiving a plan in May 1603, and in Jan. 1601 some details were arranged between himself, Robert Winter, and John Wright. They were later joined by Guy Fawkes, brought by Winter from Spain, Thomas Percy, Thomas Winter, John Grant, Ambrose Rokewood, Robert Keyes, Sir Everard Digby, Francis Tresham, and Thomas Bates, a servant of Catesby's, while two Jesuit priests, Greenway and Garnet, were also involved. In May 1604 the conspirators hired a house adjoining the House of Lords, and in Dec. began to work a mine from the cellar. In March 1605 they obtained possession of a vault under the House of Lords, and stored in it thirty-six barrels of gunpowder. In May they separated to make arrangements for the carrying out of the plot subsequent to the explosion. The plot was discovered through an anonymous letter, for which Tresham was probably responsible, sent to Lord Montague on Oct. 26. On Nov. 4 a thorough search was made, and Guy Fawkes was arrested at his post in the cellar. The efforts of Catesby to bring about the arranged rising were fruitless. The ceremony of searching the vaults of Parliament at its ann. opening is a legacy of the G. P. The plot made a deep impression on the country, and from then Nov. 5 has been commemorated as 'Guy Fawkes' Day' by the lighting of bonfires, in which 'guys' are burned, and by firework displays. See D. Carwell (ed.), *Trial of Guy Fawkes and Others*, 1934, and H. R. Williamson, *Gunpowder Plot* (a novel), 1949.

Güns (Hungarian Kőszeg), tn. of Hungary in the co. of Vas, situated on the Gyongyos. It has an extensive wine and fruit trade, and there are manufs. of earthenware and cloth. There is a noted castle. Pop. about 8500.

Gunst, Pieter van (1667-1724), Dutch portrait engraver, b. at Amsterdam. His work is neat and careful, but sometimes weak in drawing. Among his best engravings are those of A. Houbraken's drawings from Vandryck; of Brandon's 'William III. and Queen Mary'; of Holbein's 'Erasmus'; of van der Werf's 'Duke of Marlborough'; of Kneller's 'Queen Anne'; of Riley's 'Dryden'; and of Greenhill's 'Locke.'

Gunter, Edmund (1581-1626), Eng. mathematician, b. in Hertfordshire; educated at Westminster and Oxford. In 1619 he became prof. of astronomy at Gresham College, London. He was the inventor of sev. useful mathematical devices, including G's chain, used in land surveying, which is 22 yds. long and divided into 100 links; G's line, being a logarithmic line laid down upon scales, etc.; G's quadrant, used for finding times and altitudes; and G's scale, employed in navigation and trigo-

nometry. He pub. sev. mathematical treatises.

Gunter's Chain, see CHAIN.

Günther, Albert Karl Lewis Gotthilf (1830-1914), Ger. zoologist. He pub. 10 vols. of catalogue of the reptiles and fishes in the Brit. Museum (1858-70). *Fische der Südsee* (1873-1910) and *Reptiles and Batrachians of Central America* (1885-1902) are two of his many original contributions to zoology.

Günther, Johann Christian (1695-1723), a Ger. poet, belongs to the Silesian school of poetry, of which indeed he is the last representative of talent. His poem on the peace of Passarowitz and his lyrics, which reveal a deep emotionalism and a fine imaginative range, won Goethe's praise.

Gunther, King of Burgundy, see BRUNHILDA.

Gurdaspur, name of a tn. and dist. of Pakistan, in the Lahore div. of the Punjab. The tn., which was captured after a long siege by the Moguls in 1712, has a pop. of 8906. The dist. (1889 sq. m.) has a pop. of 852,000.

Gurgaon, tn. and dist. in the Ambala dist. of the W. Punjab, Pakistan. The dist. rebelled during the mutiny. The commerce is chiefly in corn, hardware, and minerals. Pop. of tn. is 5000 and of dist. (1984 sq. m.) 682,000.

Gurhwal, see GARNHWAL.

Guriev, or Guriev Gorodok, dist. and tn. on the r. b. of the Ural, 11 m. from the Caspian Sea in the region of Uralsk, R.S.F.S.R. Pop. 10,000.

Gürkhas, see GHURKHA.

Gurnard, or *Trigla*, genus of fish belonging to the family of mottled-cheeks (*Triglidæ*). Gs. are bottom-fish and are best caught therefore with a trawling net; they keep near the coast and are represented by as many as forty species in temperate and tropical seas. Along Brit. shores the most common are the grey and red G. (*Trigla gurnardus* and *T. pinn.*). The head of a G. is angular and bony, but the two most characteristic features are three detached finger-like rays, projecting beneath its mouth, which are at the same time organs of motion and of touch, and the pectorals which, when expanded, make a young fish look like a butterfly.

Gurney, Edmund (1847-88), Eng. psychologist. At Trinity College, Cambridge, he obtained a good classical degree, and later turned his attention to music, medicine, chem., and physics. In his *Power of Sound* he discussed the philosophy of music, but his fame rests on his psychological writings, including *Hallucinations*, an essay, and *Phantasms of the Living* (1886), a mass of data collected by G., Myers, and Podmore during their experiments in hypnotism and thought-transference for the Society of Psychical Research.

Gurney, Sir Goldsworthy (1793-1875), Eng. inventor, b. at Padstow, began life by practising as a surgeon, and disappointed his patients, when, shortly after 1823, he gave up the practice of medicine altogether. Faraday acknowledged his indebtedness to G.'s course of scientific

lectures, which were pub. in 1823. G.'s first invention was the oxy-hydrogen blow-pipe; later he discovered the splendid light obtained by the fusion of magnesia and lime (the 'Drummond light'), and soon afterwards the high-pressure steam jet, which was to revolutionise locomotion and was also invaluable in the purification of sewer gas. The systems of lighting and ventilation in the present Houses of Parliament were devised by G.

Gurney, Joseph John (1788-1847), Eng. philanthropist, b. in Norfolk, became a minister of the Society of Friends, and in social work supported the unselfish efforts of Zachary Macaulay and Wilberforce. The two causes into which he threw his best endeavours were the abolition of slavery and the improvement of prisons. In the latter he worked side by side with his sister, Elizabeth Fry. In *Prison Discipline* (1819) he unfolds his schemes of reform, whilst a Quaker's opinion of his own sect is revealed in his *Religious Peculiarities of the Society of Friends* (1824).

Guryev, region of the Kazakh S.S.R., in Central Asia.

Gustafsson, Greta Louisa, see GARBO.

Gustav Line, see under ITALIAN FRONT IN SECOND WORLD WAR.

Gustavus I. (Vasa) (1496-1560), king of Sweden, b. at Lindholm, the son of Erik Johansson of Bydholm and Cecilia Mansdatter. In 1514 he was sent to the court of his cousin, Sten Sture, and bore the Swedish standard in the battle of Brännkyrka (1518), when Sture defeated Christian II. of Denmark. During the subsequent negotiations he was one of the Swedish hostages, and was treacherously carried off by the Danes and imprisoned at Kalo. He escaped and returned to Sweden in 1520. In the same year, roused with the rest of the nation by the news of the Stockholm massacre, he organised the revolt of the yeomen of Dalecarlia. The Danes were driven out and G. was proclaimed king by the parliament of Stenungsund and crowned in 1523. The task which faced him in establishing the independence of Sweden was full of difficulties, as the country was in great poverty and there was an utter lack of capable statesmen. He made a treaty with the Danes at Malmo in 1524, but never felt safe with regard to them. His projects for the strengthening of the national monarchy were in constant danger from the Swedish peasantry, and between 1525 and 1542 he put down four rebellions. For political reasons he severed Sweden's connection with Rome and introduced the Reformation at the Parliament of Westeras in 1527.

Gustavus II. (Adolphus) (1591-1632), king of Sweden, was b. at Stockholm, the son of Charles IX. and Christina. He was carefully educated in languages, politics, military science, and Protestant principles, and succeeded to the throne in 1611 as a capable and practical ruler. In 1613 he terminated the war with Denmark by the peace of Knärd and in 1617 the peace of Stolbova closed the Russian war and gave Karelia and Ingria to Sweden.

In 1621 he resumed the war with Poland, of which the chief events were the capture of Riga and Mitau in 1621, the capture of Kokenhusen and the invasion of Lithuania in 1625, the battle of Walshof, completing G.'s conquest of Livonia, the occupation of Pillan, the conquest of Ermeland, the surrender of Elbing and Marienburg, and the blockade of Danzig in 1626, the disastrous campaign of 1627, and the defeat of G. by Koulekpoliski at Stuhm in 1629. The war ended with the truce of Altmärk. G. then joined in the Thirty Years war, partly from a sincere desire to help the Ger. Protestants, but still more from a fear that the emperor might acquire the Baltic ports and so menace Sweden. The Swedish fleet set out in 1630 and the army

GUSTAVUS ADOLPHUS

Engraving after a picture by Van Dyck.

disembarked at Pienemunde in June. A successful campaign in Pomerania followed, and later in the year Magdeburg declared in favour of G. This city was invested by the imperialists and early in 1631 G. advanced to relieve it. The suspicions and timidity of the electors of Brandenburg and Saxony frustrated his designs, and Magdeburg fell in May. In Sept. the elector of Saxony definitely threw in his lot with G., and the allies defeated Tilly at Breitenfeld, near Leipzig. G. then marched towards the Rhine, took Marienburg and Frankfurt and wintered in Mainz (1631-32), and then resumed the pursuit of Tilly. In April he forced the passage of the Danube and the Lech, and finally defeated Tilly at Ingolstadt. In July Wallenstein united with Maximilian of Bavaria, and G., attempting to reach Saxony, was confronted with the allied army and defeated at Nuremberg in Sept. Wallenstein then retired southwards, but was overtaken by G. at Lützen. A terrible battle was fought on Nov. 16, during which G. was killed, while Wallenstein was forced to retire upon Leipzig.

G. was a wise and popular ruler, and succeeded in bringing the wealthy nobles and the lower classes into the working of a harmonious scheme. The gov. was reorganised on a departmental basis, and prosperity increased by the building of ins. and the promotion of commerce. G. married Marie Eleonora, sister of the elector of Brandenburg, in 1620, and had one daughter, Christina, who succeeded him. See C. R. L. Fletcher, *Gustavus Adolphus*, 1890, and Sir G. MacMunn, *Gustavus Adolphus: the Northern Hurricane*, 1930.

Gustavus III. (1746-92), king of Sweden, was b. at Stockholm, the son of King Adolphus Frederick and Louisa Ulrica of Prussia. In 1766 he married Sophia Magdalena, daughter of Frederick V. of Denmark. In 1768, during his father's interregnum, he compelled the 'Caps' to summon a Diet which he wished to execute some monarchical reforms, but these were defeated by the 'Hats'. During the early part of 1771 he spent some time in Paris, where he was very popular, on a diplomatic mission. On his accession he attempted to mediate between the opposing 'Hat' and 'Cap' factions, which were leading the country into a position of great danger, but only succeeded in breaking the power of the oligarchical 'Caps' by the *coup d'état* of Aug. 19, 1772. The greater part of his reign was occupied in organising many useful reforms. In 1774 the liberty of the press was provided for; the army and navy enlarged; in 1777 the 'currency realisation, ordinance' righted the national finances; free trade in corn was promoted, and religious liberty was proclaimed. In 1786 the mutinous spirit of his Diet caused him to adopt an attitude of absolutism, which he maintained throughout the war with Denmark and Russia (1788-90). He was assassinated at Ankerström.

Gustavus IV. (1778-1837), king of Sweden, was b. at Stockholm, the son of Gustavus III. and Queen Sophia Magdalena. He ascended the throne in 1792. In 1797 he married Frederica Dorothea, daughter of the grand duke of Baden. His character was marked by an abnormal seriousness and piety, which, added to a hatred and fear of Jacobinism, led him to act in a most mistaken way in sev. directions, notably in the foreign policy of the country. In 1800 he joined the armed neutrality of the N. powers; in 1803 joined the Bourbon cause, and later allied himself with the coalition against Napoleon. In 1807 he refused the terms offered him by Napoleon, and thus lost Rügen and Stralsund, while Napoleon persuaded Russia to invade and annex Finland. By the end of 1808 it was obvious that G. was insane, and in May 1809 he was deposed. He d. in Switzerland in 1837.

Gustavus V. (b. 1858), king of Sweden, was b. at Drottningholm, the son of Oscar II. of Sweden and Norway, and Sophia Wilhelmina; entered the army and travelled considerably. In 1881 he married Victoria, daughter of the duke of Baden. He succeeded to the throne of Sweden in 1907, the union between Nor-

way and Sweden having been dissolved in 1905.

Güstrow, tn. in Mecklenburg-Schwerin, Germany. It stands on the Nebel, about 20 m. from Rostock, and contains sev. interesting old buildings, among them a cathedral, church, castle, and tn. hall. Pop. 20,000.

Gut, technically used in zoology as equivalent to the alimentary canal. Three parts have to be distinguished: (a) the fore-gut or stomodæum lined by the outer layer or ectoderm; (b) the mid-gut or mesenteron lined by the inner layer or endoderm; (c) the hind-gut or proctodæum lined by the ectoderm. These three typical parts, thus distinguished according to their origin, vary greatly in size and function in different classes, but the mid-gut is the most important on account of its digestive function, and because of its outgrowths (liver, etc.) in higher animals. In vertebrate anatomy the pharynx, gullet, and stomach are sometimes called fore-gut; the small intestine, mid-gut; the large intestine, hind-gut. In a human adult the small intestine is from 22 to 25 ft. long, and the large intestine, which is wider but much shorter, is connected to the small intestine at the ileo-cæcal valve.

Gut of Canso, strait of Canada, situated between Nova Scotia and Cape Breton Is. It is 20 m. in length and from 1 to 2 m. wide.

Gutenberg, Johann Gensfleisch, or Henne (c. 1397-1468), Ger. printer, was b. at Mainz. He is said to have been the inventor of the art of employing movable types in printing. About 1424 he settled in Strasburg, where he stimulated the art of block-printing by the invention of a press for the multiplying of impressions. At the end of 1454 he returned to Mainz and was occupied until 1459 trying to perfect his art. In that year he entered into partnership with a rich burgher named Faust or Fust, who lent him the money to set up a printing press. This partnership, however, was dissolved in 1455 when Faust brought an action against G. to recover his money, and in consequence of the verdict Faust secured the press. G. however, continued his work, but was not very successful commercially. The works ascribed to him are *The Bible of 42 Lines* (1452-53) which was sold in 1873 for £3400; *The Bible of 36 Lines*, and the *Catholicicon*.

Gutersloh, tn. of Westphalia, Germany, which is famous for its rye-bread (*Pumpernickel*). Before 1939 it also manufactured silk and cotton goods, and had a large trade in Westphalian hams and sausages. Pop. 22,000.

Guthrie, Sir James (1859-1930), Scottish painter, b. at Greenock. He first studied under John Pettie in London, but afterwards went to Paris. His first pictures, 'The Gipsy Fires are Burning' and 'The Funeral Service in the Highlands,' are rather highly coloured, but his later ones are better. 'Schoolmates' is in the Ghent Gallery. He also painted portraits, some of his best being of Mr. Galloway, Major

Hotchkiss, and Professor Jack. He was president of the Royal Scottish Academy 1902-19.

Guthrie, Thomas (1803-73), Scottish preacher and philanthropist, b. at Brechin, Forfarshire. From 1815 to 1825 he was at the univ. of Edinburgh, but in 1826 went to study in Paris. In 1837 he became one of the ministers of Old Greyfriars Church, Edinburgh, and in 1840 was appointed to St. John's par. there. He supported Dr. Chalmers in 1843, who was against the intrusion of civil authority into church government, and his eloquence did much for the cause. He was also one of the first in Scotland to advocate compulsory education, and his name is associated with the cause of Scottish ragged schools, his *Plea for Ragged Schools* being pub. in 1847. Other works of his are *The Gospel in Ezekiel* (1856); *The City, its Sins and Sorrows* (1857); *The Way to Life* (1862); and *Christ and the Inheritance of the Saints* (1858).

Guthrie, Thomas Anstey, see ANSTAY, F. Guthrie, cap. of Oklahoma, U.S.A., and the co. seat of Logan co. It was founded in 1889, and in 1890 made the cap. of the ter., becoming the "city" in 1907, when Oklahoma was made a state. It has considerable trade with the surrounding country, and manufs. cotton-seed oil, cotton goods, flour, cereals, cigars, lumber, brooms, and furniture. Pop. 10,000.

Guthrum (d. 890), one of the leaders of the Dan. host which encamped near Reading in 871, and fought against Æthelred and Alfred. He was finally defeated by Alfred at Ethandun in 878, and a treaty was made at Wedmore whereby G. pledged himself to withdraw from Alfred's kingdom. He afterwards occupied E. Anglia, and was baptised at Aller, Alfred standing godfather to him.

There was another G. (d. 916), who was king of E. Anglia, having succeeded Eulric (d. 902) and was probably a son of G. (above). In 906 he made peace with Edward the Elder, but subsequently broke it and was slain at the battle of Tomsford. The E. Anglian Danes then submitted to Edward and their kingdom came to an end.

Guthrie, Henry (c. 1600-76), Scottish bishop of Dunkeld, b. at Cupar-Angus. In 1632 he was presented by Charles I. to the par. church of Stirling, but opposed the king in 1636, when he was about to introduce a liturgy. In 1665 he was translated to the bishopric of Dunkeld. He was the author of *Memoirs of Scottish Affairs, Civil and Ecclesiastical, from the Year 1637 to the Death of Charles I.* (pub. 1702), a book which is of value as a contemporary account.

Guts-Muths, Johann Christoph Friedrich (1759-1839), Ger. teacher, b. at Quedlinburg. He was educated at Halle Univ., and in 1785 became a teacher of geography and gymnastics at Schnepfenthal. He introduced a new method of teaching geography, and it was largely owing to him that gymnastics became so popular in the schools of Germany. His handbooks explain his methods—*Gymnastik für die Jugend* (1793) and *Handbuch der Geo-*

graphie (1810)—but he also pub. *Deutsches Land und deutsches Volk* (1820).

Gutta-percha, name applied to the dried milky juice of trees found mainly in the is. of the Malay Archipelago. These trees belong to the order Sapotaceae, and often reach a height of 100 ft. and have trunks varying from 2 to 3 ft. in diameter. The name G. is Malay *getah*, meaning gum, and *percha* being the name of the tree. The substance, which is similar to india-rubber, was formerly obtained by cutting down the tree and then stripping off the bark, but now the less destructive method of tapping the trees is employed. The milky juice soon coagulates on exposure to the air and is then kneaded under a supply of running water and rolled into sheets to expel the air and to enable it to dry quickly. It is afterwards put into

GUTTA PERCHA

a masticator, which is heated, and revolved until it is fit for use. There are various kinds of G., but that from Singapore is considered the best. The substance has long been known to Europeans, having been imported in the form of native shoes, etc., but it was not until 1843 that they realised its value, or knew of its nature and usefulness. Dr. Wm. Montgomerie, of the Indian Medical Service, first noticed that the Malays used it for making handles to their knives, etc., and conceived the idea of employing it for medical instruments. After this it was imported to a great extent, and used for coating marine electric telegraph wires (although it has now been superseded by india-rubber), for making golf-balls, overshoes, beltings for machinery, tubing, etc., as well as for stopping teeth. It is also used by surgeons for splints, but it is chiefly employed now for electrical purposes because of its inability to conduct electricity. When imported G. appears in hard cakes of a reddish-brown colour, and when cut has a peculiar cheese-like smell. It becomes soft when put into hot water, and can be drawn out into threads, but hardens on cooling and is not brittle.

It is not affected by alkaline solutions or by dilute acids, but rapidly deteriorates when exposed to air and light. It differs from india-rubber in being non-elastic.

Gutzkow, Karl Ferdinand (1811-78), Ger. dramatist, b. at Berlin. He studied theology at the univ. of Berlin but the pub. of his *Forum der Journalliteratur*, in 1831, began his literary career. The same year he joined Menzel in Stuttgart, and worked on the *Litteraturblatt*, and in 1832 pub. *Maha-Guru*, a satirical romance. In 1833 his *Wally, die Zweiflerin* appeared, for the pub. of which he was imprisoned, having shown himself in this book to be an advocate of the 'Young Germany' movement. On his release he went to Frankfurt and Hamburg, where he wrote his tragedy *Richard Savage* (1839). Other plays of his are *Zopf und Schwert* (1844); *Das Urbild des Tartuffe* (1847); *Der Königsleutnant* (1849), all three of which are comedies; and *Uriel Acosta*, a blank-verse tragedy. In 1847 he became director of the Court Theatre, Dresden. He was also a writer of novels: *Seraphine* appeared in 1838 and *Blaséow und seine Söhne*, a satire on the education of the day. His *Die Ritter vom Geiste* was pub. in 1851 and *Der Zauberer von Rom*, a picture of Rom. Catholic life in S. Germany, 1858-61. G.'s works contain some very fine character drawing and are of interest for the glimpses they afford of the conflicts and intellectual problems of his time, but they are marred by the fact that he could not subordinate his political opinions to art. See lives by K. Freilberg-Ruter, 1930, and M. Schönfeld, 1933.

Guy, Thomas (1641-1724), founder of Guy's Hospital, b. in Southwark. He was educated at Tamworth, and in 1660 was apprenticed to a bookseller, but in 1668 set up in business for himself. By his trade, chiefly in Bibles, and his investments, especially in the South Sea Company, he amassed a large fortune, and in 1697 became member of Parliament for Tamworth, where he had founded an almshouse in 1678 for six poor women. He also built a tn. hall for Tamworth in 1701, which is still standing. In 1709 he contributed largely for the poor refugees from the Palatinate, and in 1712 subscribed to the fund for Bowyer, the printer, after his great loss by fire. In 1704 he became governor of St. Thomas's Hospital, and in 1707 built three new wards at a cost of £1000 and contributed yearly towards their support. In 1722 he began the erection of Guy's Hospital, on which he spent £18,793, and when he d. left for its endowment £260,000. He endowed Christ's Hospital with £400 a year.

Guyenne, see **GUIENNE**.

Guy of Warwick, hero of a Middle Eng. romance, ver. ions of which existed in Fr. in the thirteenth century. The story is an account of G.'s foreign wars and of his marriage to Félice, daughter and heiress of the earl of Warwick. His pilgrimage to the Holy Land is also related, and his defeat of the giant Colbrand, by whose death Winchester was delivered from the invading N. kings.

Guyon, Mme (née Jeanne-Marie Bouvier de la Motte) (1648-1717), Fr. mystic, b. at Montargis. She was acquainted with the duchesse de Héthune, and was also very friendly with Father Lacombe, who was imprisoned for his false mysticism in 1687. She preached her doctrine of quietism at Turin, Grenoble, Nice, Genoa, Vercelli, and Paris, where she settled in 1686, but was arrested in 1688 for having taught heretical opinions and for having corresponded with Molinos, the leader of quietism in Spain. After her release she became acquainted with Fénelon, who defended her conduct in a controversy with Bossuet. She was again imprisoned in 1695 and not released till 1702. Mme G.'s works, in 40 vols., including the *Autobiography*, were pub. in 1767-91.

Guyton de Morveau, Louis Bernard, Baron (1737-1816), Fr. chemist, b. at Dijon. He studied law in the univ. at Dijon and became a member of the Legislative Assembly in 1791, and was a member of the National Assembly in 1792 and 1795. From 1800 to 1814 he was master of the mint, and was made a baron in 1811. He contributed largely to the scientific periodicals of the day, and also pub. *Méthode d'une nomenclature chimique* and *Traté des moyens de désinfecter l'air*, which describes the disinfecting powers of chlorine and of hydrochloric acid gas.

Guzerat, see **GUJERAT**.

Guzman, Fernán Pérez de, see **PEREZ**.

Guzzeh, see **Gaza**.

Gwalior, the premier Mahratta state in, and one of the largest native states of, W. Central India; lies between the United Prov. and the Central Provs. (i.e. together with twenty-eight of the other states located in W. Central India, were formed into the Malwa Union (or Madhya-Bharat). It consists of hilly country and plains. The climate is extreme. The hilly part contains the small dist. of Amalghera. The cap. is G., or Lashkar; it is strongly fortified, the fortress being on a rock 340 ft. high. From 1845 to 1855 it was in Brit. hands. It is a centre for stone-quarrying and the carving industry. There is a fine irrigation system and good railway. The founder of the present dynasty, Ranoji Sindhya, held military rank under Peshwa Baji Rao (1720) and estab. his headquarters at Ujjain. In 1782 Mahadji Sindhya was recognised by Lord Hastings as an independent ruler. In 1886 G. fort was restored to Maharaja Sindhya by Lord Dufferin. Area 26,400 sq. m. Pop. 3,524,000.

Gwelo, central tn. of S. Rhodesia, S. Africa. It is situated midway between Salisbury and Bulawayo, being 113 m. N.E. of the latter tn. by rail. It is the cap. of the midlands, was founded in 1894, and is a thriving centre of supply of an important mineralised dist. producing gold, chrome ore, silver, and asbestos fibre; and it is also an important rail centre. The chief farming crop is maize and the tn. is an important cattle centre. There are Anglican, Catholic, Dutch, and Presbyterian Churches. The memorial library was opened in 1935, and

the gov. hospital, the most modern in S. Rhodesia, in 1938. G. has a public park, an aerodrome, race-course, and golf links. It has a good water supply and electric light. There are gov. high schools for both sexes. The Selukwe, Que Que, and other goldfields lie at a distance of 12-30 m. from the tn. and the dist. is full of auct. mine workings. In 1934 auct. ruins of the Zlumbabwo type were discovered near Dalsyfield (40 m. from G.). Pop. (white) 2500.

Gwersyllt, par. and tn. of Denbigh, Wales, 2½ m. N.N.W. of Wrexham, situated in a colliery dist., with iron works. Pop. 5600.

Gwyn, Nell, or Eleanor Gwyn (1650-1687), Eng. actress and the mistress of Charles II. Of her early hist. very little is known, but when quite young she sold oranges somewhere near Drury Lane. She afterwards joined the acting profession, and made her first appearance in 1665 as Cydaria in Dryden's *Indian Emperor*, and afterwards in many other witty parts, being a general favourite with the public. Her two sons by Charles were Charles, made duke of St. Albans, and James Beauchamp, who d. young.

Gwynedd, realm of the early princes of Wales. It was the strongest of the sev. petty states into which Wales was formerly divided. It comprised the modern cos. of Carnarvon and Merioneth, together with a part of Denbigh.

Gwyniad, see under CORREGION POLLAN.

Gwyr, see GOWEL.

Gyangtse, fort. tn. of Tibet, situated on the trade route between Lhasa and Darjeeling. In 1904 the Eng. entered this tn. when on an expedition. Pop. about 5000.

Gyaros, Ghiura, or Giura, one of the Cyclades Is., about 10 m. from Syra. This is. was used as a Rom. place of banishment.

Gyetva, see DETVA.

Gyges, king of Lydia, was the founder of the Mermnad dynasty in the seventh century B.C. having put to death Candaules, his predecessor and last of the previous dynasty. During his kingship he captured Smyrna, Colophon, and other cities and was successful against the Cimmerians. After helping the Egyptians against the Assyrians, he was again attacked by the Cimmerians, who took Sardis and put him to death.

Gylippus, son of Cleandridas, an exile from Sparta, was a Spartan general. In 414 B.C. G. was appointed commander of the Syracusans against the Athenians, and in this he was entirely successful—Nicias being defeated. Afterwards, however, he was entrusted by Lysander with treasure from Athens, and, on being found guilty of appropriating some, was exiled as his father had been.

Gyllemborg-Ehrensavård, Thomasine Christine (1773-1858), Dan. writer, b. at Copenhagen. When quite young she (then named Buntzen) married Peter Heiberg and became the mother of Johan Ludvig Heiberg. She was afterwards divorced and then married Baron Ehrensavård. Her first novel, *Familien Polonius*,

appeared in 1827 in the jour. known as the *Flyvende Post*. Among her other works are *En Hverdagshistorie* (1828) and *To Tidsaldre*. See J. L. Heiberg, *Peter Andreas Heiberg og Thomasine Gyllemborg*, 1882.

Gyllensjöerna, Johan (1635-80), Swedish statesman. After travelling in various countries he returned to Sweden and took an active part in politics there. He sided with the country against the aristocrats, to whom he belonged, putting the national interests before all others. About the year 1675 he became the adviser of Charles XI., and obtained an influence over him which lasted throughout his reign. In 1679 he was the chief promoter of peace at the congress of Lund.

Gymnastics, term signifying physical exercises practised for recreation or for promoting health. The gymnasium of the Gks. was originally the school where competitors in the public games received their training, and was so named from the circumstance that the competitors exercised naked (*gymnos*). Athletic contests formed part of the social life of the Gks. from the earliest times, and their prin. religious festivals were marked by games. The victor in any such contest was rewarded with the honour and respect of his fellow citizens, and a victory was looked upon as an honour to the whole state. In these circumstances the training of athletes became a matter of public concern; accordingly special buildings were provided by the state, and their management was entrusted to public officials. Men were paid to look after the youths who were training for public contests, to conduct the games at the great Athenian festivals, to exercise general supervision over the morals of the youths, and to adorn and keep up the gymnasium. This office was one of the public services, and great expense was entailed on the holders. Under them were the *sophronistæ*, whose duty was to watch the conduct of the youths at all times, and especially to be present at all their games. The practical teaching and selection of suitable exercises for each youth were in the hands of the *paidotribæ* and *gymnastæ*, the latter of whom also superintended the effect on the constitution of the pupils, and prescribed for them when they were unwell. The *aleiptæ* oiled and rubbed dust on the bodies of the youths, acted as surgeons, and administered any drugs prescribed. According to Galen there was also a teacher of the various games of ball. The gymnasia, built to suit these various purposes, were large buildings which contained not merely places for each kind of exercise, but also a stadium, baths, covered porticoes for practice in bad weather, and outer porticoes where the philosophers and men of letters read public lectures and held disputations.

The gymnasium of the Gks. did not long remain exclusively devoted to athletic exercises. It soon began to be put to other even more important uses. The gymnasium became connected with education on one side and medicine on the other. Due training of the body and

maintenance of health and strength of children were the chief part of the earlier Gk. education. The education of boys was conducted in the gymnasia, save that part devoted to letters and music. As they grew older philosophers and sophists attended to talk and to lecture in the gymnasia. In Athens there were three great public gymnasia—Academy, Lyceum, and Cynosarges—each of which was consecrated to a special deity, with whose statue it was adorned; Plato's teaching in the Academy has given that gymnasium immortality. Aristotle conferred lustre on the Lyceum, and Cynosarges was the resort of the Cynics. Plato, when treating of education, devotes much time to G. Prodicus is said to have first pointed out the connection between G. and health. The Gk. institution of the gymnasium never became popular with the Romans, who thought such training was conducive to idleness and immorality, and of little use from a military point of view, though at Sparta G. training had been chiefly valued as promoting bodily strength, such as was needed for the use of weapons and the endurance of hardship. The first public gymnasium at Rome was built by Nero, and another was built by Commodus. Rousseau in his *Emile* was the first in modern times to call attention to the serious consequences of neglecting G. And Pestalozzi and Froebel, the Ger. educational reformers, emphasised the need for systematic physical training. It was not till the end of the nineteenth century that G. were regarded in England as more than recreation, and at present the larger public schools and univs. are supplied with elaborate gymnasia, and even the children in the council schools are taught simple gymnastic exercises. In Sweden, Denmark, Switzerland, Italy, and Russia systems are more or less distinct and enjoy a wide popularity. The Swedish system so greatly in vogue to-day was instituted by Pehr Henrik Ling (1776-1839) early in the nineteenth century for the Swedish children in school. By the end of the century it was recognised by adults also, and in a short time it was widely practised throughout athletic Europe, entering even into military training. The rhythmic method of G., founded by Emile Jacques-Dalcroze (q.v.) and known as Eurhythmics, was a development of the twentieth century, and though it enters into the curriculum of many trained gymnasts, it is more correctly looked upon as a mode of dancing. See C. A. Forbes, *Greek Physical Education*, 1929; N. E. Gardiner, *Athletics of the Ancient World*, 1930; A. J. Butler, *Sport in Classic Times*, 1930; also C. A. Westerblad, *Ling, the Founder of Swedish Gymnastics*, 1909, and E. Jacques-Dalcroze, *Eurhythmics*, 1930.

Gymnosophists (Gk. *γυμνός*, naked, *σοφιστής*, sage) was the name given by the Gks. to those Hindu philosophers who practised the most rigorous asceticism, regarding food and clothing as hindrances to purity of thought. They often lived as hermits in forests, and some, like Kalanus,

even burned themselves to death to enter a state of purer being.

Gymnophiona, group of amphibians found in the E., in tropical Africa, and in central and S. America, and also sometimes known as *Coeclia*. The characteristic feature is that the limbs have almost totally disappeared, with the result that the G. resemble worms. Also, the archaic skeletal axis, the notochord, is largely persistent.

Gymnosperms (plants with naked seeds), one of the two divs. of phanerogams or flowering plants. It differs from the other group, the angiosperms, in the fact that there is no closed ovary in the female flower at the time of pollination. When this process takes place the cone scales are separated from one another sufficiently to leave an open passage down to the ovules, and it is upon the micropyle of the ovule itself that the pollen falls. Thus there is no need for a stigma and style. After pollination the scales close up so as to shelter the developing seeds, opening again when the latter are ripe, so as to allow them to escape. The flowers are all unisexual, and are generally without a

perianth. The plants of this class are all perennial trees and shrubs, for the most part evergreen; they are classified into three families, *Cycadaceae*, *Coniferae*, and *Gnetaceae*.

Gympie, tn. of Queensland, Australia, 107 m. N. by W. of Brisbane. In the dist. gold, copper, silver, and antimony are mined. There is also dairy farming, agriculture, cattle and pig raising, and timber production. It is connected to Brisbane by rail and road. Pop. 8600.

Gynæcology (Gk. *γυνή*, woman; *λόγος*, abode, λόγος, a discourse) is the study of diseases of women, and is particularly concerned with diseases of the urinary and genital organs. At the beginning of the nineteenth century it was realised that this study was sufficiently extensive to constitute a special branch of medicine, and the gynaecologist specialises in the investigation and treatment of such diseases. G. is concerned with the structure and functions of the organs of the urogenital system; with the symptoms and possible causes of interference with the normal

working of these organs; and with the prevention and cure of disorders affecting them. The chief disorders are those due to malformation, displacement, and disease. Malformation of the organs of reproduction may be due to arrested development, resulting in the absence of certain organs or in their failure to develop to their normal size, or it may be caused by faulty development or the growth of organs characteristic of both sexes. Most malformations cannot be rectified, but displacements of the uterus or ovaries are much more amenable to treatment. Displacements are due usually to difficult childbirth or to undue strain during pregnancy, and operations are sometimes necessary to rectify them. Minor operations were performed in the sixteenth century, sometimes by men who were experienced in cattle-breeding. The first recorded operation seems to have been that of Jacob Nufer, a sow-gelder, who in 1500 successfully performed a Caesarean section on his wife. This marked the beginning of operative G., and later in the century a comparatively large number of other Caesarean operations were recorded. The first book on operative G., as the term is now understood, was pub. in Holland in the seventeenth century by Hendrik van Roonhuysen, and in the latter half of this century operative G. became estab. as a specialised branch of G. Ephraim McDowell and James Marion Sims have been described as the founders of operative G. Working in the S. states of N. America, in the latter half of the eighteenth century, these two men successfully performed various operations on the genital organs, and marvellous progress has since been made in gynaecological surgery. McDowell performed the first ovariotomy (drainage of a cyst in the ovary) in 1809; Sims is chiefly remembered for his duck-billed speculum used in examinations of the vagina. In Britain two of the greatest names in G. are those of Wm. Hunter (1718-83), who investigated the anatomy of the gravid uterus, and Wm. Smellie (1697-1763), who perfected the obstetrical forceps already invented by Peter Chamberlen (1601-83). There are many different diseases of the urogenital systems and some are highly contagious. Prevention and cure of venereal diseases are particularly important, for they may infect the infant before or during birth. Malignant growths may be formed on the reproductive organs, and seem to be more liable to occur at the climacteric or 'change of life,' when menstruation ceases. Nervous disorders also frequently accompany the bodily changes that take place at this period, and medical advice may then be very helpful. Especial care may also be necessary during puberty in the estab. of regular menstruation and the prevention of anaemia. Psychological factors are frequently responsible for many female ailments, and if there be no apparent physiological reason for the ailment the gynaecologist may recommend psychological treatment. See T. W. Eden and

Gyndes, anct. riv. of Assyria. It has been identified with various modern rivers, among them the Dila and the Mendeli.

Gyoma, vil. situated in the prov. of Békés, on the Koros, Hungary. Pop. about 12,000.

Gyöngyös, tn. in the co. of Heves, Hungary. This tn. possesses a Franciscan monastery, and trades in dairy produce and wine. Pop. over 19,000.

Győr (formerly Raab), cap. of Raab co., Hungary, on the R. Raab, 65 m. W.N.W. of Budapest. It has some well-built public edifices, and manufs. oil, agric. instruments, and machinery. This tn., which was built on the site of the Rom. tn. of Arrabona, was originally a fortress. Pop. 51,000.

Gyp, pseudonym of Sybille Gabrielle Marie Antoinette Riquetti de Mirabeau, Comtesse de Martel de Janville (1849-1932), Fr. novelist, b. at the château of Coëtval in the Morbihan. She began by writing stories for the *Figaro* and the *Vie parisienne*, but afterwards pub. numerous other novels in which she describes the society of Paris. In 1882 *Petit Bob* appeared; in 1883 *Autour du mariage*, which has run through over ninety eds. Other works are *L'Éducation d'un prince* (1890), *Mariage civil* (1892), *Bijou* (1896), *La Bonne Fortune de Toto* (1897), *Le Journal d'un cochin de perruquiste* (1918), *Souvenirs d'une petite fille* (1927-28), and *Du temps des cheveux et des chevaux* (1929).

Gypastus, genus of birds of the subfamily Gypetinae, family Falconidae. They are birds of prey, and are natives of the mt. regions of Africa and Asia, also some parts of Europe. Among them may be mentioned *G. barbatus* (hammerkay).

Gypogeraus, see SECRETARY BIRD.

Gypsies, or Gipsies, wandering race scattered over the world, and found throughout Europe, in W. Asia and Siberia, Krypt, N. Africa, America, and Australia. It is impossible to estimate their numbers exactly. Their total number in Europe is probably over 900,000. They are in greatest numbers in Hungary, Rumania, and Turkey. The figures for Hungary have been given as 280,000 in 1910, falling to 18,660 (or 0.2 per cent of the pop.) in 1941, for Rumania as 278,793 in 1930, for European Turkey 117,000 (in 1903), and for Asiatic Turkey about 80,000. Austria has over 16,000, and France and Germany a negligible number. For the Brit. Isles it is estimated that there are some 12,000 G., but there are no reliable estimates later than 1931. It would be mere guesswork to state how many thousands of these nomads are settled or are wandering in America, Africa, and Australia.

The word gypsy is a corruption of Egyptian, and is found in different forms throughout Europe: *Gyptenac* in the

Netherlands; *Aegyptier* in Germany (sixteenth century); *Gitano* in Spain; and *Gyphios* in modern Greece. The name no doubt arose from the tale which they spread on their first appearance in Europe, that, for refusing to apostatise, they had been driven by the Saracens out of 'Little Egypt,' by some supposed to be a confusion between Little Armenia and Egypt, and by others identified with Epirus. The other name of the G. is *Azigan*, or *Azingan* derived, according to Miklosich, from the *Athinganoi* ('not to be touched'), a heretical sect formerly inhabiting parts of Asia Minor. This name appears in Rumania under the form of *Tsigan*, in Turkey *Tahingian*, in Hungary *Czigany*, in Germany *sigeuner*, in Italy *zingari*, and in Spain *zincali*. G. have also been known as *Karaon* and *Phdrao-Nephka*, again indicating their supposed Egyptian origin, *Heydens* or *Heidens* ('heathens'), Saracens, Bohemians, and Tartars. They have also been called (Gks., Gers., Flemings, etc.), apparently from the country from which they happened to have come last. The G. call themselves *Rom* (feminine *Romni*), which may be derived from *Droma*, Indian, or more likely from *Romanoi*, the name applied to themselves by the Byzantines of the Grecian Empire.

The *Athinganoi* mentioned above were magicians, soothsayers, and serpent charmers who lived in Asia Minor as early as A.D. 810. According to one tradition they were the descendants of Samer, an outcast, since he fashioned the Golden Calf for the Israelites in the desert. The G. cannot definitely be identified with these *Athinganoi*, but it is known that G. passed into Europe from the further side of the Bosphorus in the early fourteenth century, and traces of people with peculiarities not unlike those of the G. may be found in E. Europe and Asia Minor prior to that century. In the rhymed paraphrase of the Genesis, written before 1122 (ed. Dittmar, 1862), there is a passage referring to the 'Ishmaelish folk,' descended from Hagar's son. The writer calls them *Chaltimide* ('iron-workers'), and says of them: 'They have neither house nor country; every place is the same to them. They roam about the land, and abuse the people by their knaveries. It is thus they deceive folk, robbing no one openly.' It is certain that as early as the tenth century there were itinerant smiths or tinkers, who sold their wares in many countries. The *Komodromoi* ('village roamers') mentioned by Theophanes as hailing from Italy in 554 were probably smiths of the same order of the *Chaltimide*. Even if G. may not with certainty be identified with these vagrant pedlars, it is extremely probable that they assimilated them in large numbers. *Atkinson*, 'sorcerers and famous rogues,' lived at Constantinople about 1050, and an unnamed race, who 'wander like a cursed people' and dwell in 'little, oblong, black, low tents, like those of the Arabs,' are mentioned in Friar Simon's *Itinerarium* as living in Crete in 1322. It is certain that G. existed in Corfu before 1326, and

twenty years later they were reduced to a state of serfdom by the Empress Catherine de Valois. There can be no doubt that by the fifteenth century they had been settled for a long time in the Balkan Peninsula and in many of the countries N. of the Danube. They had possibly already made their way further W., but there is no very good authority for their appearance in W. Europe before the beginning of the fifteenth century. In 1414 a troupe of G. is said to have arrived in Hesse. In 1417 a large company of them, bearing letters of protection from the Emperor Sigismund, who declared that they were Christian penitents engaged on a seven years' pilgrimage, were well received by various W. tns. Some had reached Hamburg, Wismar, and Lübeck in 1417; others arrived in Switzerland, Leipzig, and Frankfurt-on-the-Main in 1418; they entered Bologna on their way to Rome in 1422, and reached Paris in 1427. In 1423 a second immigration followed, led by Ladislaus, *Wohode* ('count') of the Cigani, who also was furnished with letters of protection by Sigismund, and who appears to have hailed from Hungary. Between 1438 and 1512 the G. came in hordes, swarming over Germany, Italy, and France. They probably reached England and Scotland about 1500. The exodus of the G. from Rumelia and the E. countries is generally accounted for by incursions of Turks who subdued the kingdoms of Greece, Serbia, and Bulgaria. The *Constitutions of Catalonia* (1512) speaks of the G. as Gks., which shows that they continued for a time to live in Greece under Turkish rule. The most nomadic of the tribes probably first moved to Walachia and Transylvania, and then, as others followed in ever-increasing numbers, moved further and further westwards.

From the earliest description of G., it is evident that they then possessed those peculiarities of physique and mode of life which distinguish them to-day. The G. who settled in Germany in 1417 are described by Krantz in his *Saxonia* and subsequently by Münster in *Cosmographie*. Most of them bivouacked in the fields, while their count and knights sometimes put up for the night in an inn. Some of them rode on horseback, others following on foot, while the women and children travelled in wagons. They had no honest means of livelihood, but practised palmistry and fortune-telling, and before very long became notorious for dishonest dealings and for theft. In appearance they were described as being black and dirty. At first they were well received if not welcomed by the chief tns. of Europe. At Utrecht, in 1420, they were given pots of ale, bread, and a hundred herrings, probably because they had a 'written permission from the pope to visit the Christian land,' and in the following year twenty schellings were paid from the public purse of Middelburg to a count of 'Little Egypt.' In 1505 James IV. of Scotland gave Antonius Gaginius, a count of Little Egypt, letters of recommendation to the king of Denmark. They were

entertained by the earl of Surrey in Tending Hall, Suffolk, in 1519, and were given 'two towers for their residence' by Sir Wm. St. Clair, whom they had delighted by their dancing and acting. But before very long their popularity had waned. Middelburg, which had previously given generous hospitality to the wandering strangers, in 1460 sent Constantino, count of Egypt, a bribe of ten schellings that his troupe might not visit the town. Country folk had been gulled by these wily insinuating visitors, and small farmers and owners of barns looked forward with dread to any repetition of their

John H. Stone

A GYPSEY CAMP IN ENGLAND

visits. In 1560 an ordinance of the states of Orleans enjoined all Bohemians or Egyptians to quit the kingdom under pain of death, and similar edicts had been and continued to be issued in many European countries. At Durham, in 1612, five men were hanged 'for being Egyptians,' and at Edinburgh, in 1611, four met with the same punishment 'for abiding within the kingdom, they being Egyptians.' In Hungary and Germany G. were racked and tortured as late as the eighteenth century. They were also accused of definite malpractices and crimes, often without any foundation. As early as 1424 they were thought to be emissaries of the Turks, probably on account of their dark, foreign faces and strange tongue. Certainly they were used as spies by Frederick the Great. But far more dreadful crimes than treachery and

stealing were attributed, most unjustly, to the G. In 1692 four Estremadura G. were taken captive, and under the torture of the Inquisition confessed that they had devoured a friar, a pilgrim, and a woman of their own race, and were in consequence put to a painful death. The charge of cannibalism was first made in 1547. In Hungary, in 1782, forty-five G. were hanged, drawn, and quartered on a charge of having eaten the victim of a supposed murder. The case was subsequently inquired into and the charge was proved false, for there had been no murder. Since the beginning of the seventeenth century G. have frequently been charged with kidnapping children, and many lurid tales have been told and written on the subject. In 1872 forty-seven G. were imprisoned in Germany for child-stealing, but the charge was afterwards proved false. G. have frequently been deported from one country to another, as from Scotland to the Barbados, and other Amer. colonies in 1665 and 1715, and from the Basque country to N. Africa in 1802. Even in the twentieth century Ger. legislation has been busy with the gypsy problem. In Rumania and E. Europe a certain class of G. called *Robi* were deprived of their liberty, bought, sold, and exchanged, and treated as slaves. They were granted freedom in Hungary and Transylvania between the years 1781 and 1782, and in Moldavia in 1866. The Empress Maria Theresa interested herself on their behalf, and ordered those G. in her states to be instructed in agriculture with a view to their permanent settlement. A great improvement became evident in their character and bearing, and in 1866 they were declared Rumanian citizens with full political rights. The G. of Bulgaria have not enjoyed similar privileges and in 1906 held a congress at Sofia, protesting against their political status and demanding their recognition as citizens.

G. from the beginning of their hist. have shown great versatility in turning their hands to any kind of work. In Rumania and Turkey a large proportion of the settled nationalised G. are bricklayers. In Hungary and Transylvania many of them follow some regular trade and have fixed habitations. They wash gold from the sand of the rivers, and they work iron or copper; some are horse-dealers, others are carpenters and turners, and some even keep wine-shops or public-houses. In England they are generally thought of as hawkers, tinkers, knife-grinders, showmen, and basket-weavers. The nomadic G. still carry on the traditional craft of metal-work, while some make sieves and traps. They also cast bells, the church bell (1726) of Edzell in Forfarshire being their work. In Scotland they were engaged during the eighteenth century on pewter, copper, and lead work, and also executed some engravings and paintings in somewhat primitive fashion. They were also known by the bullets and cannons they fashioned in Hungary, and had an iron-foundry at Little Carron in Scotland. They make

excellent farriers and good horse-dealers. They are far-famed for their musical talent. The gypsy musicians, it is thought, originally belonged to the serf class, and were kept within the precincts of courts and palaces to provide entertainment. The women were regarded as particularly graceful dancers, and danced to the accompaniment of the fiddle. In 1530 we hear that they 'dancit before the king in Holyrudhouse' in Scotland. They won a high reputation in Wales as harpists and in Hungary as fiddlers. In fact, Liszt declared, though his theory has been hotly disputed, that the Hungarian national music originated in them. G. show special talent in singing or reciting old ballads and folk-songs, often to the accompaniment of the guitar. They have too a great aptitude for telling fairy stories. These tales do not appear to belong to their own tribe, but to have been picked up in the various countries which they have visited, and are passed on by word of mouth from one generation to another. In this connection their extraordinary gift of speaking in foreign languages may be mentioned. The gypsy women are famous fortune-tellers. They seldom repeat their charms and incantations in their own tongue, but in Gk. or Rumanian in a Romanised dialect. They tell fortunes not only by palmistry but by playing-cards. They use the Tarock, a special set of cards, each card having a mystical meaning of its own, the secret of which they keep within their own tribes. It is quite possible that playing-cards were first brought into Europe by the G., and were originally only used for telling fortunes and for lotteries, later being employed for games and gambling. G. were formerly despised for their looks, the writers probably being unable to recognise their undoubted beauties behind the dirt. They are dark-skinned, with dark, lustrous eyes, thick dark hair, often coarse and frizzled, and gleaming white teeth. They show off their darkness by wearing bright oriental colours. The women bind their hair with gaudy silk handkerchiefs, and show an inordinate love of jewellery. Though paying great attention to their clothes, they are at the same time shabbily and untidily dressed, and are slovenly in their habits. Their great moral defects are probably due to the vagrant life the race has lived from its beginning. G. as a whole have no sense of responsibility, and have not the same sense of honour as other European races. They are not religious by nature, but frequently adopt the prevailing religion of the country in which they travel. Many of them still retain old superstitions, probably the remnants of a religion they have lost. Some of these superstitions, such as the worship of trees and serpents, may be found in their folk-tales and songs. G. seldom go to church, except to baptise their infants, to marry, and to bury their dead. They are fatalists, and have the philosophy of the open high-road. To their friends they are loving and lovable, and generous to excess.

Language.—*Romani* *tib* ('gypsy lan-

guage') is the same language all over the world, though the dialectal differences from country to country are so great that, for instance, an Eng. gypsy would have great difficulty in understanding a Gk. gypsy, and possibly could not understand him at all.

The researches of Ruediger (1782) and Grellmann (1783) in Germany, and of Marsden (1783) in England, proved that the language of the G. was unmistakably connected with some Indian language. Some of the words in *Romani*, however, have a more archaic form than those of modern Indian dialects. The speech of the Armenian Gypsy shows more resemblance to Sanskrit than does the speech of the European (Gypsy), and the speech of the Asiatic (or Syrian Gypsy) is peculiar in itself, and entirely different from any other dialect. These facts have led scholars to think that the G. originally came from India, and that there must have been various great movements. The route taken can be determined in part from the elements other than Indian present in *Romani* vocabulary, and even more so from the phonetic changes in the development of the *Romani* dialects. The question in which Indian sub-branch *Romani* had its origin, has been much discussed, and is still an open problem. It is, however, generally agreed that it originated in N.W. India. Separated from the other members of the Indian family, original *Romani* has developed upon lines of its own. Some of its most important and characteristic features have been developed outside India, firstly in Persia, where, according to Prof. Sampson (1926), the G., perhaps about the tenth century A.D., have split into two separate bands, one travelling N. by way of Armenia and becoming the ancestors of the Boshia and of the European G.; and the other, from whom descend the Nawar, Karachi, and Helebis, journeying southwards into Syria, whence some of them passed into Egypt and Asia Minor. Sampson seems to be right in pointing out that this main separation took place on Persian soil; indeed, while Persian loan-words are found in the speech of both Boshia and Nawar, Armenian borrowings seem to be wholly lacking in the dialects of the latter. On the other hand, the fact that there is in *Romani* a large percentage of Persian words, but, according to Miklosich (1878), no Arabic element, shows that the G. could not have resided in Persia long after the Moslem conquest to have been so completely unaffected by the language of the conquerors, and that they must have made their way to Europe via Persia and not through Arabia. That is to say, the movements from the E. must have taken place long before the tenth century A.D. Important phonetic changes and additions in vocabulary arose in Byzantine Greece, in all of which the Armenian *Romani* dialects differ from European and Asiatic *Romani*. The gypsy tongue possesses more Gk. than Persian words, so that it has been suggested that their stay in Greece was more prolonged than it had been in Persia.

Some scholars have thought that they lived in Greece from very early times, but this theory cannot be accepted, for the gypsy vocabulary contains no old forms of Gk. and not even many forms of early Slavonic words.

Various developments of minor extent, due to the influence of local surroundings, appear later in individual Romani dialects, dating from the time of separa-

GYRONNY

tion within Europe itself. Mention may be made of Romani borrowings from Rumanian, Slavonic (mainly Bulgarian and Serbian, but also Russian and Czech), Sp., It., Fr., Ger., Eng., and Welsh. At the present day there are at least three distinct groups of dialects, the Armenian, the Asiatic (other than Armenian), and the European; each one, and especially the last, is subdivided in numerous dialects, the existing differences being due to the adoption of words and idioms of the different peoples with which the G. have come into contact. The G. of Wales and of Turkey speak the purest Romani, and retain the oldest forms. In the majority of countries, however, Romani is being broken down by the stress of modern life. The language of Anglo-Romani shows an almost complete loss of grammatical inflections and a great part of its original vocabulary; it has thus sunk to the level of a semi-jargon by its adoption of many Eng. words, forms, and idioms. In Spain, Italy, Norway, and other countries the same process of levelling has been taking place, and in many cases the original inflections have been superseded by those in use among their neighbours. Consequently the language has deteriorated in grammar, although its vocabulary has been enriched by the adoption of foreign words. In a country like England, where attendance at the national schools is compulsory, where gypsy children are brought into daily contact with other children, and are obliged to learn and speak Eng., their assimilation with the land of their adoption must gradually take place. On the other hand we use quite a number of Romani words in our everyday speech without realising that we do. The most common of these words is *dad*, in Romani, 'father'; cf. *Daddio daddo*, *Ossetlo dadda*, Sanskrit. *Ita*, Hindi, *Ita*. There are about 750,000 Romani speakers in Europe (c. 300,000 in Rumania, c. 100,000 in Bulgaria, c. 50,000 in Spain and Yugoslavia). There are also a certain number of G. in the U.S.A.

Gypsum, hydrated calcium sulphate ($\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$), which occurs in large monoclinic crystals sometimes known as selenite. Marggraf in 1750 showed that *gypsum arifactum*, obtained from sulphuric acid and lime, was identical with the naturally occurring mineral. When G. is heated to 120° a hemihydrate, $2\text{CaSO}_4 \cdot \text{H}_2\text{O}$, is obtained, and on further heating the anhydrous calcium sulphate results. In this state the product is almost insoluble in water, and is identical with natural anhydrite. Another modification, soluble anhydrite, is obtained from G. by dehydration *in vacuo* over phosphoric anhydrite. When G. is heated moderately there results a product known as plaster of Paris (G. was formerly worked in Montmartre, to the N. of Paris), which, according to Le Chatelier, consists mainly of the hemihydrate above mentioned. On addition of water this dissolves in part, forming a saturated solution which is, however, supersaturated with respect to the dihydrate, $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$. Consequently some of the dissolved salt separates as G., and the solution can then dissolve more of the soluble form. By repetition of this process all the hemihydrate is converted

into G., which separates in interlacing crystals, forming a solid mass. In the original burning of the G. care must be taken that too great heat is not applied, otherwise the product refuses to take up water at all, or at least very slowly. In this state it is said to be 'dead-burnt.'

Gyration, Centre of, see CENTRE.

Gyron, in heraldry an ordinary, consisting of two straight lines, drawn from any given part of the field, and meeting in an acute angle in the fesse point. (See p. 661.)

Gyronny, in heraldry is a term applied to a field divided into gyrons or triangular parts of alternate tinctures. The shield is divided quarterly and per bend and bend sinister. (See Illustration, p. 661.)

Gyroscope and Gyrostat, mechanical instruments used to illustrate the curious principles of rotating bodies. The ordinary form of G. (Fig. 1) consists of a heavy wheel A mounted on an axis BC, which is fixed in a ring BDCE. This ring in turn is capable of rotation about the axis DE, which is fixed in another ring also capable of rotation about the axis FG. The instrument is supported by a heavy stand. The whole is arranged so that the three axes of rotation in any position pass through a fixed point, which is the centre of gravity of the wheel. The wheel is thus

FIG. 1

GYROSCOPE. ESSENTIAL MECHANISM

capable of rotation about three mutually perpendicular axes and its axis may thus take up any direction. If the wheel is rotated rapidly it is found that a very considerable push is required to change the direction of the axis of rotation. In the absence of any external forces, the rotating axis will preserve a fixed direction in space. This was used originally by

Fourcault to prove the rotation of the earth. Thus if the axis is initially pointed to some star and the wheel kept rotating rapidly, the axis will remain pointing at the star irrespective of the earth's rotation. Thus it will appear to an observer to turn about an axis parallel to the axis of the earth, and follow the star as it rises and sets. It is on this principle that the G.

FIG. 2

TRACK AROUND A VERTICAL AXIS

compass is made. So long as the rotation of the wheel can be kept up, the axis, if originally pointed to the pole star, will remain in that direction. By means of sev. rapidly rotating wheels a telescope stand has been constructed which will remain fixed irrespective of the motion of a ship. Perhaps the most important practical application of the theory is seen in the torpedo. It is of immense importance that the original direction should be kept after the torpedo has been fired, and so the steering gear is connected with a G. by means of a slide valve. The wheel is set rotating very rapidly at the moment of fire, and the axis of rotation remains fixed in direction. Thus if the torpedo shows any deviation in course, the connection between the rudder and the G. at once produces a steady effect. So long as the rotation remains very rapid, it is found that the general line of fire is accurately kept. The G. has also been applied to the mono-rail by Louis Brennan, an Eng. inventor, the stability of the train being secured by two gyroscopic wheels revolving *in vacuo* at a high speed. A more simple form of the G. is sold as a toy. It consists of a wheel set on an axis in a ring, like the wheel A and the ring BDCE in Fig. 1. This ring is fixed on an axis in the same straight line as BC, the end of which fits into a small cup on the top of a stand provided. In Fig. 2 let O represent the cup, and let CBO be the position of the axis as it is placed in the cup after the wheel has been rapidly rotated. It is found that the whole instrument revolves about the vertical axis OY, the end C gradually dropping lower and lower as the rotation of the wheel gradually dies away. This turning about the axis OY is known as *precession*. Another motion of an oscillatory character, known as *nutation*, also exists, but this is so small as often to be hardly perceptible. The reason for pre-

cession may be seen from the following: Let ABCD be a wheel rotating about an axis through O perpendicular to the plane of the paper, and also turning about the axis BD. Let any particle of mass m move in the circle from P to Q in a short time τ . Then if ω_1 is the angular velocity of the wheel, $PQ = \omega_1 \tau$. If ω_2 is the angular velocity about BD, P is also moving up out of the plane of the paper with velocity $\omega_2 PM$ when PM is the per-

FIG. 3
CAUSE OF PRECESSION

pendicular on BD). At Q the velocity out of the plane of the paper has increased to $\omega_2 QN$, i.e. it has increased by $\omega_2 QL$. PQ may be considered a straight line since the time τ is very small, and its length is $OP \cdot \omega_1 \tau$. Hence this increase of velocity $= \omega_2 PQ \cdot \cos \theta = \omega_2 OP \cdot \omega_1 \tau \cos \theta = \omega_1 \omega_2 \tau \cdot OM$. Hence the momentum of the particle upwards out of the paper increases at the rate $m\omega_1\omega_2 OM$, i.e. proportional to its distance from AC. It must therefore be acted upon by a force $m\omega_1\omega_2 OM$ upwards out of the plane of the paper. Similarly particles on the arc AB are acted upon by an upward force, whilst those on AD and DC are acted upon by a similar downward force. Thus the rotation about BD is due to a couple which would turn the wheel, when not rotating, about the axis AC. Generally the effect of a couple on a rapidly spinning wheel is to produce displacement of the axis of rotation perpen-

dicular to the plane of the couple. Hence in Fig. 2 the effect of the force of gravity and the support at O results in a turning about a vertical axis. Though the terms G. and gyrostat are often used for one another, the distinction usually made is that the gyroscopic flywheel rotates about an axis of which one point is fixed, whilst the gyrostat is free to move on a plane. The common model of a gyrostat consists of a flywheel enclosed in a case, slits being left for the string to set the wheel in motion. When the wheel is rotated the instrument may be placed on a table on its point (in the same straight line as the axis of the wheel) or on any point of the bearing edge (in the plane of the wheel itself, and usually consisting of a regular sixteen-sided figure). In the former case the motion is exactly that of a spinning top, which is the most simple practical form of gyrostat. Other common forms are a hoop and the two wheels of a bicycle. The general properties of a rotating wheel hold equally well for these cases. Thus the precession of a spinning top, the circular path of a hoop moving with its plane inclined to the vertical, and the turning of the handle-bars of a bicycle to preserve equilibrium, are to be explained by methods similar to that employed in Fig. 3. In the construction of an aeroplane, where the engine parts and the propeller are rotating rapidly, the gyroscopic effect has to be considered. The barrels of guns and rifles are fitted with spiral grooves to give the projectile a rapid rotation on its axis, thus tending to keep the direction of the axis unchanged. The rotation of the earth about its axis makes its action very much like that of a top suspended by a string, and corrections for precession and nutation have to be made in astronomical calculations. Many other cases may be quoted. See M. Davidson (ed.), *The Gyroscope and its Applications*, 1918.

Gythium, one of the old seaports of Greece, situated on the gulf of Laconia. The Spartan fleet was stationed here, and consequently during the time of the wars against Athens it suffered many vicissitudes. At the present day the larger part of it is sunk in the sea. It is now a modern seaport with a good harbour. Pop. about 5000.

Gyula, chief tn. of the co. of Békés, Hungary. It carries on a considerable trade in cattle, and manufs. spirits, wine, and oil. Pop. 22,000.

H

H, eighth letter of the Eng. alphabet, as it was of the Semitic, Gk., Etruscan, and Lat. from which it is derived. It was formerly written *h*, and was called *heth* or *kheth*. The Semites used it as a strong aspirate, which is also the modern use. The Gks., of course, borrowed it with the rest of the symbols, and early made use of it either (1) to represent a long *e* sound, *hēra*, to distinguish it from the short; or (2) for smooth and rough breathings, the latter being the aspirate, so that the aspirate *h* passed into the Rom. alphabet. Yet by 240 B.C. it was quite neglected by the common people just as it is to-day, so that Catullus pokes fun at Arrius, who tried to be correct, but always succeeded in getting his aspirates in the wrong place, so that he said *hinsidias* for *insidias*, etc. In modern It. the *h* as an aspirate has quite disappeared (although it is still written in some words, like *ho, hanno*, and in combinations *ch, gh*), and it is fast becoming obsolete in Fr. Sometimes it represents other sounds; for example, the Sp. *h* is often a substitute for the Lat. *f* (*hijo*, from *filius*), but it is not pronounced. In Eng. it is not infrequently put for *c* and *s*. Thus the prefix *hyper-* corresponds to *super-*; the first syllable of *her-agon* corresponds with *sir*, whilst *hundred* and *century* are real doublets. In Eng. the *h* may be anything from a strong aspirate to a cipher. Thus it is very pronounced in *history*, less so in *when*, and not at all in *hour*.

Haag, Den, see HAGUE, THE.

Haakon, or **Haco** (Old Norse *Hákon*), name of as many as seven kings of Norway.

Haakon I. (d. 961), called the Good, was the son of Harold Fairhair and was brought up as a Christian by Athelstan, king of England, but failed in his efforts to convert his own people from their pagan rites. His foster-father gave him ships in 933, and he sailed home and was soon proclaimed king. The sons of Erik, H.'s half-brother, were constantly rebelling, but H. came off victor.

Haakon IV. (1204-63), called the Old, put to death Earl Skule in 1239, as the latter had become the centre of intrigue. He is said to have added Iceland and Greenland to his kingdom. But his defeat at Largs in 1263 by Alexander III. lost him the Hebrides. Compelled to put to sea again he wintered in the Orkneys, where he d.

Haakon V., or **Haakon Longlegs** (reigned 1299-1319), was the son of Magnus Lagabæt (law reformer), and became king after Erik, his brother (and father of the 'Maid of Norway'). He was the last male descendant of his line. His daughter, Ingeborg, was married to Duke Erik (1312), who was starved to death by his father, King Birger of Sweden.

Haakon VII. (b. 1872), present king of Norway, was a Dan. prince, Charles, second son of Frederick VIII. of Denmark. He married Maud, the youngest daughter of Edward VII. of England; and his only son, Prince Olaf, was b. in 1903. In 1905 Norway separated from Sweden, and in the following year Prince Charles took the anct. name of Haakon and was crowned king. When Germany invaded Norway in April 1940 H. led the heroic resistance of the Norwegian Army, supported by the Brit. and Fr. allies. He rejected Hitler's demands for surrender, and showed great courage under Ger. air attacks. Came to Britain in June 1940, after the allied forces abandoned N. Norway, and returned to Norway on the cessation of hostilities.

Haarlem, chief tn. of the prov. of N. Holland in the Netherlands, is 11 m. distant from Amsterdam. It has a thorough communication to Zandvoort, Leyden, Amsterdam, and Alkmaar by means of electric and steam trams and railways. It presents the appearance of a typical Dutch city, with its long, narrow canals and gable-roofed houses. The prin. buildings are situated in the market-place, which is a large space in the centre of the city; here are to be found the Fleishers' Hall (built in 1603 and containing the archives), the tn. hall, the Stadsdoelen, and the Grote Kerk, or Great Church, dedicated to St. Bavo, dating from the close of the fifteenth century. This church has a famous organ consisting of four keyboards, sixty-four registers, and 5000 pipes, and constructed by Christian Muller. The statue of L. Koster, the founder of the movable printing type, stands in the market-place. Cotton manuf., dyeing, printing, and typefounding form the chief industries of H. The city carries on an extensive horticultural trade, rearing the celebrated Dutch bulb., especially the hyacinth and tulip. H. has played no inconsiderable part in the hist. of Holland; it took part in the revolt of the Netherlands against the Sp. tyranny in 1572, and was forced to submit to Alva's son, Frederick II. in 1573; it owed its final deliverance to William of Orange, who rescued it in 1577. H. is the bp. of the celebrated Dutch painters Ostade, Berchem, Ruysdael, and Van der Helst. In Ger. occupation from 1940 to 1944, when it was liberated by the Canadian Army. Pop. 155,700.

Haarlem Lake, or **Haarlemmer Meer**, in the prov. of N. Holland in the Netherlands, a triangular-shaped expanse of now fertile land reclaimed by dint of unremitting industry in 1840-53 from a sheet of water formed by the great inundation of the sixteenth century. It lies between Amsterdam, Haarlem, and Leyden, and has an area of about 72 sq. m. It

communicates through the R. Y with the *Zaidur Zee*.

Hababli, see **HILLH**.

Habakkuk, one of the twelve minor prophets of the O.T. Nothing is known of him historically, although legend, as embodied in such works as *The Lives of the Prophets*, has much to say of him. The book bearing his name can be separated into two distinct parts at the end of the second chapter. The third chapter is a psalm ascribed to the prophet H., but which internal evidence shows to be certainly post-exilic. Its text is somewhat corrupt, but not so much so as is that of the first two chapters. In each div. valuable emendations have been made by Wellhausen. The problem of the earlier chapters is more difficult. The book opens with a lament to Jehovah (or Yahweh) asking why the iniquity of the wicked is suffered to continue (vv. 2-4), and the prophet receives an answer that Yahweh is about to raise up the Chaldeans as an instrument of vengeance. Then follows another complaint (vv. 12-17) and in chap. II. 2 comes Yahweh's answer. Then follows the song of triumph of the nations over their oppressor. Many critics hold that the world-power over which the nations should exult is Assyria, and that the difficulties which arise in this interpretation are due to the editors of the fifth or fourth century B.C. Others have held that the prophecy was primarily directed against the Chaldeans themselves. The date of the original composition was towards the end of the seventh century B.C. (c. 615). See commentaries by Deltsch, Davidson, Nowack, and Driver (*Old Testament Literature*, 1897).

Habberton, John (1842-1921), Amer. author, b. at Brooklyn. He was successively printer, soldier, merchant, and journalist. From 1865 to 1872 he was connected with Harper Brothers; he was on the editorial staff of the *New York Herald* in 1877. His most popular work was *Helen's Babies* (1876). He also wrote *The Jericho Road* (1877); *Deacon Crankell* (a play, 1880); *All He Knew* (1890); *The Tiger and the Insect* (1902); *Other People's Children* (new ed., 1903); *Life of George Washington* (1881); and *Some Boys' Doings* (1901).

Habeas Corpus, in law, a writ directed to a person having custody of a prisoner commanding him to produce the body (*habeas corpus*) of the prisoner before the court, with a statement of the day and cause of his detention. The personal liberty of the subject has ever in England been the subject of jealous regard, and as early as Magna Charta the principle underlying the writ of H. C. was solemnly enacted. Up to 1679 the constantly recurring acts of repression in the name of the king, notably in the time of the Star Chamber, demonstrated the need for a far more stringent system of procedure. The Petition of Right explicitly demanded that in future the orders of the sovereign should not be sufficient ground for incarcerating his subjects. But after the historic arrest of Jenks in 1679, when the judges decided that a change of prison quarters fully

exonerated the prison governor from all liability for failure to produce the prisoner, the famous Habeas Corpus Act of 1679 was passed to meet the new difficulty. Briefly, the Act provides: (1) That a writ of H. C. may be claimed by any prisoner except one committed for treason or felony, the writ to be returnable immediately before the judge granting it with a statement of the cause of the commitment; (2) prisoners committed for treason or felony are to be brought up for trial at the next ensuing assizes, unless the Crown witnesses cannot be produced so soon; (3) heavy penalties for shifting the custody of the prisoner from one prison to another without sufficient reason or authority, or for neglecting to give the prisoner a true copy of the warrant of commitment; (4) penalties of £500 for sending persons to prison beyond the seas or re-committing them after delivery by H. C. The flaws in this Act were that there were no safeguards against (a) excessive bail, (b) a false return, or (c) illegal civil detention. The Bill of Rights remedied (a), and an Act passed in 1816 extended the Act of 1679 to cases of civil detention, and remedied (b) by empowering the judges themselves to examine the truth of the return. The Habeas Corpus Act of 1679 has occasionally been suspended in times of rebellion and civil commotion, e.g. during the Jacobite rebellions of 1711 and 1745 and the agitations excited out of sympathy for the Fr. revolutionaries at the end of the eighteenth century. The writ has been used before now to restrain the rights of a parent over a child, and of a guardian over his ward; and again, the mother of an illegitimate child can claim the custody of such a child as against the reputed father by suing out a writ of H. C. On the person detained being produced before a judge the latter has three courses open to him. He may either make no order at all, discharge the prisoner, or release him on bail.

In the U.S.A. the Federal and state legislatures have founded their procedure on the Act of 1679. The U.S. constitution provides that 'the privilege of the writ of habeas corpus shall not be suspended unless when, in cases of rebellion or invasion, the public safety may require it.' This question has caused discussion as to whether the right of suspension is vested in the President or in Congress; and some difficulties are caused by the conflict of state and federal courts with regard to the right to issue a H. C.

Haber-Bosch Process, see under **HABER, FRITZ**.

Haber, Fritz (1868-1934), Ger. chemist, b. of Jewish parents, at Breslau. Studied at Berlin and Heidelberg, and became prof. of chem. at the Kaiser-Wilhelm Institute for Physical Chem. (1911). He pub. works on electro-chemistry and the thermodynamics of gas reactions, and in 1908 produced ammonia synthetically. He is chiefly remembered for his researches, with Karl Bosch (1874-1940), industrial chemist, which resulted in a process, called the Haber-Bosch process, of synthesising ammonia from hydrogen and the nitrogen

of the air. These researches kept Germany supplied with nitrates for explosives and agric. purposes during the First World War when Chilean supplies were cut off. He was awarded the Nobel prize for chem. for 1918 (1919). As a protest against anti-Semite legislation by the Nazi Gov. he resigned the directorship of the Kaiser-Wilhelm Institute and his chair at Berlin Univ. Later he lived at Cambridge, where he was given laboratory facilities by Prof. Wm. Pope.

Habibullah Khan (1871-1919), amir of Afghanistan, son of Abdur Rahman; assassinated in 1919. He succeeded his father in 1901. Renewed the arrangement with Great Britain by which the control of foreign relations was delegated to the Brit. Gov. in consideration of protection being given by the latter to the amir in the event of unprovoked aggression. He continued a loyal friend of Great Britain in spite of blandishments in the shape of Ger. gold and seductive promises, and held out against Ger. emissaries during the First World War. That his assassination was followed by a rising in Afghanistan and intrigues between the new amir and the Moscow Soviet (1919) is some evidence of the recognition that his loyalty would end only with his death. He was a polyglot of some attainments, and was so far an occidental in taste that he played golf and followed horse-racing, insisted on his courtiers wearing European dress, and limited his wives to three.

Habington, Edward and Thomas, see ABINGTON.

Habington, William (1605-54), Eng. poet, b. at Henslip, in Worcestershire. He belonged to a Catholic family, and his father and uncle were both implicated in Babington's plot. Having resisted the pressure brought to bear upon him to become a Jesuit, he went to Paris and married Lucy Herbert, daughter of the first Lord Powys, whom he immortalised in *Castara* (1634), a vol. of lyric poems, some of which are of great sweetness and marked by unusual purity. He also wrote *Historie of Edward the Fourth* (1610); *The Queene of Arragon* (1640, a tragic-comedy); and *Observations upon Historie* (1641).

Habit, in physiology. It is well known that every time a certain stimulus gives rise to a specific reflex, the response to the stimulus comes more easily, so that if the cycle is repeated often enough it becomes automatic, and even unconscious, and thus a H. is formed. When any nerve ending is stimulated an impulse passes along its specific nerve fibre until the spinal cord is reached. In the cord there is a choice of sev. paths up to the brain, or directly to the nerve fibres passing out of the cord (see diagram). It is not known what makes the impulse take one of these courses more than another for the first time. The direction must depend upon conditions of tension and of block existing at the moment in the nervous system. But once a stimulus has travelled along a certain path, it becomes the easiest path, and will always be used unless there is a block in the path from some other cause. The process is often, and very fairly,

compared to the making of ruts in a road. Modern psychologists are agreed that it is primarily due to the physical properties of the matter of which the nervous system is composed. A H. is thus a conditioned

DIAGRAM TO ILLUSTRATE SOME OF THE PATHS THAT A STIMULUS TO AN AFFERENT NERVE MAY TAKE

S, Surface at which sensory impulse is received; G, cell of posterior root ganglion; P, cell of posterior horn; C, cell of Clarke's column; A, cell of anterior horn, MF, muscle fibre.

1, Fibre of posterior columns; 2, fibre of comma tract; 3, fibre of tract of Flechsig; 4, fibre of pyramidal tract; 5, fibre of tract of Loewenthal.

reflex action, or a series of such actions. Most Hs., e.g. walking, swimming, cycling, etc., are complex, and involve the co-ordination of various groups of muscles. In fact the growth of a H., in the physiological sense, can be very well seen in the baby feeling its feet and learning to walk, or in a boy learning to swim. Actions which at first occupy the whole attention, which are laborious, irregular, and varied, become more and more uniform, and less and less conscious, until they can be continued for long stretches of time without any effort of the will. Persons with a neurotic temperament contract Hs. far more readily than lethargic individuals. It is this fact that explains H. spasms, the well-known tic. The movement of the tic is at the first the reflex to an irritation, such as ill-fitting, uncomfortable clothes, some irritation of the eyes, etc., but owing

to the peculiarly irritable state of the nervous system at the time the action rapidly gets beyond the control of the will. Alcoholism and drug fits can be explained in the same way. The law of H. applies equally to mental and bodily functions, and is of vital importance to educationists, for education may be described as the development of Hs. The greater the number of mental processes reduced to the realm of H., the more is the brain set free for further thought, so that the aim of the educationist is to create good Hs. and many.

Habit and Repute, in Scots law, a phrase indicating the inference of a legal relationship or fact of which the law takes cognisance from the *general belief* that such relationship exists or that such event has happened. It is especially applicable to the presumption of marriage from evidence of general reputation as husband and wife coupled with cohabitation. Erskine states that the repute in such a case must be that of substantially all who have an interest to inquire. The term also has a special significance in regard to the condition of a person accused of theft.

Habitual Drunkards, see DRUNKENNESS.

Habsburg, see HAPSBURG.

Hacha, Emil (1872-1945), Czech politician, president, and lawyer, b. at Trhové Sviny, Bohemia. After practising as an advocate he became president of the Czechoslovak supreme administration court (1925) and, in 1938, when Benes resigned following the Munich agreement (*q.v.* and see also CZECHOSLOVAKIA), he was elected to succeed him. Tried in vain to maintain the independence of the State after the loss of the Sudetenland and consequential Ger. demands, and on March 11, 1939, when the Ger. forces were marching into the country, he was summoned by Hitler to Berlin where, under duress, he signed a declaration placing his country under Ger. 'protection.' H. was left nominally in office, but really as a 'puppet' 'State president' of the 'Protectorate of Bohemia and Moravia,' and appears very soon to have urged his fellow countrymen to throw in their lot with their new masters. In spite of his denunciations of Dr. Benes (*q.v.*) the people, throughout the occupation, continued to look upon the latter as their leader, and remained as bitterly hostile to the Gers. at the end as in the beginning. It was decided by law by the exiled Czech Gov. that special national courts should be constituted to try guilty Czechs and Slovaks, particularly members of the H. Gov. in the Czech lands (and of the Tiso Gov. in Slovakia). But H. did not long survive the liberation of Czechoslovakia, dying in imprisonment June 27, 1945.

Hachette, Jean Nicolas Pierre (1769-1834), Fr. mathematician, b. at Mazières, and educated at the college of Rheims. Through the influence of Gaspard Monge he obtained the post of assistant prof. in the newly-estab. Ecole Polytechnique (1794), becoming prof. of descriptive geometry in 1797. In 1816 he lost his chair on the accession of Louis XVIII., and

failed to obtain election to the Académie des Sciences owing to royal opposition until after the revolution in 1831. His chief works are *Deux Suppléments à la géométrie descriptive de Monge* (1811); *Traité élémentaire des machines* (1811); *Éléments de géométrie à trois dimensions* (1817); *Traité de géométrie descriptive* (1822).

Hachette et Compagnie, Fr. house of publishers and booksellers, estab. in Paris in 1826 by Louis Christophe François H. (1800-64). At first the firm pub. only a series of books designed to improve the system of school instruction, especially the classics, but in 1850 they extended their pub. to include books of almost every type, as well as magazines, a directory-gulde to Paris, *Paris Hachette*, and a popular annual.

Hachinohe, tn. of Japan, situated about 40 m. S.E. by E. of Awamori. Pop. 10,600.

Hachioji, tn. of Hondo, Japan, 30 m. W. of Tokyo, with an extensive silk industry. Pop. 55,000.

Hackbut, see FIREARMS.

Häkel, Ernst, see HAECKEL.

Hackensack, tn. of New Jersey, U.S.A., and the cap. of Bergen co. It is situated on the R. H., 12 m. N. by rail of Jersey City, and 14 m. N.W. of New York, and is served by four lines of railway. It is chiefly a residential tn., but in the vicinity are many factories and silk mills. Pop. 25,000.

Hackenschmidt, Georges (b. 1878), Russian wrestler, b. at Dorpat; became an engineer in St. Petersburg (Leningrad), and in Germany. Won many victories on the Continent; came to England in 1901, and became famous as a wrestler on the music-hall stage. In 1908, at Chicago, he failed to conclude a match with Gotch, thus forfeiting world's championship.

Hackert, Philipp (1737-1807), Ger. landscape painter, b. at Prenzlau in Prussia. About 1768 he visited Rome, and passed the rest of his life in Italy. He was commissioned by the Empress Catherine of Russia to paint six pictures of Count Orlov's naval victory over the Turks in 1770. In 1786 he was appointed painter to the king of Naples, but left Naples for Florence in 1799. His paintings, the chief merit of which consists of their close imitation of nature, include 'View of Rome,' 'Views in the Vicinity of the Villa Horace,' and many seaports of Italy. See Goethe's memoir, *Philipp Hackert: Biographische Skizze*, 1811.

Hackländer, Friedrich Wilhelm von (1816-77), Ger. novelist and dramatist, b. at Burscheid, near Aachen. He served an apprenticeship to business, and served for some time in the Prussian artillery, but began his literary career with *Bilder aus dem Soldatenleben im Frieden* (1841). In 1843 he became secretary to the crown prince of Würtemberg. *Hackstubenabenteuer* (1845) was followed by *Bilder aus dem Soldatenleben im Kriege* (1849), the fruits of a campaign in Piedmont. A tour in Spain in 1854 resulted in *Ein Winter in Spanien* (1855), and in 1857 he founded, with Zoller, the illustrated weekly *Über Land und Meer*.

Among his novels the best are *Namenlose Geschichten* (1851); *Eugen Schillfried* (1852); *Krieg und Frieden* (1850); and his best comedies are *Der Geheime Agent* (1850) and *Magnetische Kuren* (1851). See H. Morning, *Erinnerung an F. W. Hackländer*, 1878.

Hackney, N.E. metropolitan bor. of London, 3 m. N.N.E. of St. Paul's. The bor. is in two divs. (H. and Stoke Newington, and H. S.), and includes Clapton, Homerton, Dalston, and part of Kingsland. The R. Lea flows to the E., and Victoria Park lies partly within the bor. limits. The anct. Gothic church of St. Augustine is the only important historic building. H. was once a fashionable place of residence, but is now a poor dist. John Howard (d. 1790) and Daniel Defoe (d. 1731) both resided here. Pop. 180,500.

Hackney Breed, see *under* HOUND.

Hackney Carriages are carriages used for the conveyance of passengers and include motor omnibuses, charabancs, trainway cars, hansoms, four-wheeled cabs, and taxi-cabs. The forerunner of the cab (*cabriolet de place*) was the hackney coach (q.v.); the hansom cab was invented by J. A. Hanson in 1834. The first stand for H. C. appeared in 1334 near the old Maypole in the Strand. H. C. in London are regulated by a variety of statutes. Every cab must have an ann. licence from the home secretary, which is issued by the chief commissioner of police. It must have the number of persons it is licensed to carry painted on the back, and must bear a light from one hour after sunset to one hour before sunrise. See also CABS.

Hackney Coach (Fr. *haquenée*), an ambuling horse or mare, maintained especially for the use of ladies). From the hiring-out of hackneys the word came to be associated with letting out coaches, etc., for hire. The H. C. was a conveyance with four wheels and two horses let out for hire generally after being discarded by some owner among the nobility.

Haco, see *HAAGON*.

Haddington, royal, municipal, and police bor. and the co. tn. of E. Lothian, Scotland. It lies on the Tyne, 18 m. E. of Edinburgh. The chief building is the ruined St. Mary's Church, a cruciform decorated building in red sandstone, the nave of which is sufficiently repaired to serve as par. church. Other buildings are the co. buildings (1833), the corn exchange (1854), the tn. hall (1748-1831), and the Knox Memorial Institute (1880). Famous natives of the tn. were John Knox, John and Samuel Brown, Samuel Smiles (1816-1904). The tn. has suffered from fires in 1216 and in 1244, floods in 1775, and the great siege of the Eng. by the Scots in 1549. The chief industries are the manufs. of agric. implements, woollen goods, and sacking, and brewing and tanning. Pop. 5700.

Haddingtonshire, see *EAST LOTHIAN*.

Haddock, or *Gadus aeglefinus*, species of Gadidae, a family of marine carnivorous fishes; it is found on all coasts in the N. Atlantic Ocean, and is abundant everywhere round Great Britain. There is a strong resemblance between the H. and G.

morrhua, the cod, both having three dorsal and two anal fins of an elongated form; the H. is distinguished by a black lateral line and a black spot behind each of the pectorals. The H. is also smaller, as it never exceeds a length of 3 ft., some of the largest specimens being found in Dublin Bay. Its colouring is brown, and silvery underneath, the black markings on the pectorals sometimes extending to the middle of the back; tradition ascribes the origin of these spots to the finger and thumb of St. Peter, and alleges that the H. was the fish from whose mouth he took tribute money. The H. lives largely on molluscs, and the bait used in catching it consists generally of mussels; trawls are also employed in H. fishery. These fish are gregarious and inhabit deep waters, travelling to the coast to spawn during March and April. They are sometimes cured by salting, but the usual method is to dry and smoke them; the familiar Finnan H. is so named after the fishing vil. of Fintona, Kincardineshire.

Haddon Hall, one of the most famous old Eng. baronial mansions, stands on the E. Wye, 2 m. S.E. of Bakewell in Derbyshire, and 23 m. N.N.W. of Derby. The styles of the architecture range from the Norman to the sixteenth and seventeenth centuries. Before the Conquest it was the property of the Crown, but William I. granted it to Wm. Peveril. It has been successively in the families of Avenell, Vernon, and Rutland. It is referred to by Scott in *Peril of the Peak*. See S. Rayner, *History and Antiquities of Haddon Hall*, 1836; G. Le Blanc Smith, *Haddon, the Manor, its Hall, its Lords, and Traditions*, 1906.

Hadersleben, or **Haderslev**, seaport and tn. of Denmark, in Slesvig, situated on the H. Fjord, an inlet communicating with the Little Belt. A considerable export trade is carried on in grain, seeds, hides, etc., and among the industries are iron foundries and engineering works. Pop. 16,000.

Hades, in Gk. mythology, was the name applied to the kingdom of the underworld, the place of the departed spirits or shades. It is the Gk. trans. of the Heb. *sheol*, which is frequently referred to in the N.T. H. was also the personal name of the king of the underworld, Dis or Pluto (q.v.), who is sometimes represented as seated on a throne of sulphur from which issued the streams of Lethe, Cocytus, Phlegethon, and Acheron, which traversed the kingdom of the dead. For the legend of Dis's rape of Persephone, see *PROSERPINE*.

Hadfield, par. and vil. of Derbyshire, England, on the Cheshire border, 2 m. N.W. of Glossop. The cotton industry is carried on. In the Catholic church are some noted pictures, including a 'Transfiguration' by Raphael. Pop. 6000.

Hadhramaut, dist. on the S. coast of Arabia, bounded W. by Yemen, E. by Oman, and N. by the Dehna desert; modern Arab geographers restrict the name to the dist. between 48° and 51° E. It is part of the E. Aden protectorate, and consists of the Qaaiti state of Shihr and Mukalla and the Kathiri state of Selyun. It consists of a plateau, cut into deep

ravines, between a strip of coastland and the range of hills which bound the interior desert. The climate is dry but healthy, the inhab. mainly of S. Arabian stock, and the chief pursuits agriculture, cattle-breeding, date, indigo, and tobacco cultivation. The chief tns. are Shibam, Saiyun, Tariba, and Tarim. It is under Brit. protection and control. In the account of H. by Eratosthenes the people are called Chatromotifs and in the earliest (3d. c.) accounts are included in the Sabæans (see SABÆI). The first European who penetrated into this land of fanatics, as were the Hadramis, was Leo Hirsch, and the next was Theodore Bent and his wife, with a number of followers. Bent's discoveries put the geography of the H. in a new light, and it was no longer regarded as merely a S. dist. of Arabia between the coast and the central desert, but as a wide central artery extending for more than 100 m. parallel to the coast through which the valleys of the high Arabian plateau discharged their meagre supplies of water to the sea near Salhut. Ilmyaritic inscriptions found in the valley establish that sev. centuries B.C. the name Hadramaut (or Hadramut or H.) is applied to this valley only, the meaning of which was Valley of Death, and that there from time immemorial was pld the historic trade in frankincense and myrrh which centred in Shibam. Once the country was held to be a dependency of the Yemen. In 1934-35 W. H. Ingrams, a political officer of the Aden protectorate, with his wife, toured the country, collecting much extremely interesting information, which was subsequently embodied in a report issued through the Colonial Office. In 1938 Miss Freya Stark also made a journey among the Hadramis, and described her adventures in books and articles. Pop. (estimated) 150,000. See L. Van der Berg, *Le Hadramut et les colonies arabes*, 1885; J. T. Bent, *Southern Arabia*, 1897; Freya Stark, 'Two Months in the Hadramaut,' *Geographical Journal*, Feb. 1938; *The Southern Gates of Arabia*, 1936; *Seen in the Hadramaut*, 1938; 'An Exploration in the Hadramaut and Journey to the Coast,' *Geographical Journal*, Jan. 1939; W. H. Ingrams, *A Report on the Social, Economic, and Political Condition of the Hadramaut* (H.M.S.O.), 1936. 'The Hadramaut, Present and Future,' *Geographical Journal*, Oct. 1938; 'Hadramaut: a Journey to the Se'ar Country and through the Wadi Masella,' *Geographical Journal*, Dec. 1936; 'Unexplored Regions of the Hadramaut,' *Journal of the Royal Central Asian Society*, vol. xxiii., July 1936.

Hading, Jane, stage name of Jeanne Alfrédine Tréfouret (1859-1944), b. at Marseilles, daughter of an actor. Sang in operetta in Marseilles. She made her appearance in Paris at the Palais Royal in *La Chaste Suzanne*, and in 1883 made a great hit at the Gymnase in *Le Maître de forges*. She married the manager of the theatre, Victor Koning, in the following year, but divorced him in 1887. In 1888 she toured America with Coquelin, and on her return played at the Vaudeville in London with great success.

Hadj or Hajj, the Arabic word, meaning literally a setting out, is used for the greater pilgrimage of Moslems to Mecca which takes place from the eighth to the tenth of the twelfth month of the Muslim year, and which every Moslem whose wealth and health will permit of it must perform once at least in his lifetime. The term is used more loosely to include the 'umrah or lesser pilgrimage to Mecca, a Moslem's pilgrimage to any shrine or sacred place, and also the pilgrimages of E. Christians to Jerusalem. The title of hadji is given to all Moslems who have performed the greater pilgrimage. See MECCA and MOHAMMEDANISM.

Hadleigh, tn. in the co. of Suffolk, England, situated 9½ m. W.S.W. of Ipswich. It is a very old-fashioned and old-world tn., and contains many quaint houses. It is chiefly noted for the possession of a very fine church. Pop. 3000.

Hadley, John (1682-1714), Eng. mathematician and mechanician. He greatly improved the reflecting telescope, and in 1731 he invented a reflecting quadrant or sextant. His claim to the invention was disputed, a glazier in Philadelphia named Thomas Godfrey (1704-49) having invented a similar instrument, but it was satisfactorily proved that each had worked independently.

Hadley, par. and vil. of Shropshire, England, situated in the Wellington div., 10 m. E. of Shrewsbury. Coal and iron are found, and the works of the Shropshire Iron Company are here. Pop. 3000.

Hadow, Sir (William) Henry (1859-1937), Eng. musician and scholar; b. at Ebrington, Gloucestershire; eldest son of Rev. Wm. Elliot II. Educated Malvern; Worcester College, Oxford. Formerly fellow, Worcester College; examiner in languages at different periods between 1900 and 1909. Occupied educational posts with troops during First World War. His *Report on the Education of the Adolescent* contains many important ideas. One of these is that 'all children who do not go forward to "secondary education" in the narrow sense of the word, should go forward none the less to a form of secondary education, in the inner and broader sense of the word, and after spending the first years of their school life in a primary school should spend the last three or four years in a well-equipped and well-staffed modern school, under the stimulus of practical work and realistic studies, and yet, at the same time, in the free and broad air of a general and humane education.' Hon. D.Mus., Oxford, Durham, Wales. He lectured for some time for Stainer (q.r.), prof. of music, Oxford. He was president of the Federation of Musical Competition Festivals and of the conferences on musical education, held in Louvain, 1929 and 1931. His *Studies in Modern Music* (1894-95) and *Sonata Form* set a new standard in Eng. musical literature. He also ed. the *Oxford History of Music* (sev. vols., from 1901) and pub. *English Music* (1931). His compositions include chamber music and songs.

Hadrian, see ADRIANUS.

Hadrianopolis, see ADRIANOPLE.

Hadrian's Villa, near Tivoli (Tibur), Italy, about 17 m. E.N.E. of Rome, a country residence of the Emperor Hadrian, a magnificent building with gardens, temples, a palace, theatres, and a stadium, all miniatures of the most celebrated places in the provs., and filled with art treasures.

Hadrian's Wall, name generally given to the remains of the Rom. fortification stretching from Wallsend on the Tyne to Bowness on the Solway, probably built by command of the Emperor Hadrian in A.D. 122 as a turf wall. It was repaired

and exquisitely arranged museum at Chesters (anct. Eboracum); his great-grand-nephew, John Maurice Clayton, presented the collection to the nation under a body of trustees. The museum contains over 300 inscribed or sculptured stones; a collection of jewellery, household and toilet implements, votive offerings, sculptures, inscribed altars, objects in bronze and pottery, a reproduction of the 'Chesters Diploma'—a bronze tablet of the year A.D. 145 officially giving a soldier his discharge and full rights of Rom. citizenship; the original was presented by John Clay-

(O.I. Crown copyright)

HADRIAN'S WALL

and partly rebuilt in stone by Septimius Severus in A.D. 197-208. The fortification consists of (1) a stone wall to the N. with a ditch on its N. side to act as an obstacle to Pictish cattle raids; (2) a series of forts, blockhouses, and towers along the rampart in which were quartered the 11,000 auxiliary troops who maintained continuous patrols along the frontier; (3) an earthwork to the S., fenced with stakes, and called the *vallum*, whose function was merely to mark the exact limit or boundary of Rom. ter. The total length of the wall, from one coast to the other, is 73½ m.; its greatest width is 9½ ft. on a foundation 10½ ft. wide, but in some places, in order to economise material, the builders had reduced the width to 7½ ft. Since 1921 a great many excavations have been made, bringing to light many new treasures and inscriptions of archaeological interest. In 1924 it was taken under the authority of the Office of Works, which now accords it a much-needed protection against vandalism and sees to the preservation of the ruins. John Clayton (1792-1890) made a magnificent collection of antiquities found in the Rom. wall, and in 1895 his nephew stored them in a small

ton to the Brit. Museum. Housesteads Camp, with ½ m. of the wall and a mile-castle, was presented to the National Trust in 1930, and in 1912 the trust acquired Hotbank Farm, adjoining Housesteads, with a further 2½ m. of the wall. Hotbank Farm (900 ac.) is bounded on the S. by H. W., and the views at Crag Lough, or Peel or Hotbank Crag, cover a wide area of wild and romantic beauty. In 1946 negotiations were completed for the transfer to the minister of works of part of the wall, a fort, a mile-castle, three turrets, and the remains of a bridge. It has long been the hope of antiquaries that the wall and all that the name covers—*vallum*, N. ditch, military road, forts, turrets, and mile-castles—should belong to the nation, for only in that way can it be really available as a laboratory for archaeological research, since the present (1919) piecemeal ownership prevents its opening up for the benefit of students and tourists. See J. C. Bruce, *The Roman Wall*, 1851; F. G. Collingwood, *Guide to the Roman Wall*, 1926, and *Archæology of Roman Britain*, 1930; J. Mothersole, *Illustrated Hadrian's Wall*, 4th ed., 1929; and S. E. Vinholt, *Britain under the Romans*, 1945.

Hadrianus, Publius Ælius (A.D. 76–138), generally called **Hadrian**, emperor of Rome, A.D. 117–38. In A.D. 85 or 86 he was placed under the guardianship of Ulpian Trajanus (afterwards the Emperor Trajan) at Rome. He held various public offices in Rome; distinguished himself in the Dacian campaigns; was *legatus prætorius* of Lower Pannonia in 108, *legatus* in the Parthian campaign (113–17). When the emperor fell ill in the E., he formally adopted Hadrian as his successor, and left him as commander in Syria. Hadrian was proclaimed emperor on Aug. 11, 117, and promptly proceeded to simplify the difficulties which besieged him at home and abroad by adopting a peaceful policy. He made peace with the Parthians, abandoning Mesopotamia and Assyria to them; appeased the Roxolani, who had invaded Moesia, and sent Marcus Turbo to pacify Mauritania. In 118 he hastened back to Rome to remove the unfavourable impression produced by the execution of some conspirators who had plotted his assassination. In 119 he began his celebrated travels through the empire, visiting Gaul, Germany, Britain, Spain, Mauritania, and Egypt. From 125 to 126 he was in Athens; in 130 on the Nile, where he lost his beloved Antinous; in 134 he returned to Rome and passed the remainder of his life between the cap. and his beautiful villa at Tibur. Hadrian was a capable and just ruler, and, except during his last illness, when he was subject to fits of violent cruelty and severity, succeeded in endearing himself to his subjects, and at the same time maintaining a strict disciplinarian. He introduced various constitutional reforms at Rome, and was a patron of poets and scholars, while his magnificent buildings, especially in Athens and Rome, have been the admiration of succeeding centuries. See F. Gregorovius, *The Emperor Hadrian* (Eng. trans.), 1898.

Haeckel, Ernst Heinrich (1834–1910), Ger. biologist, b. at Potsdam. He studied medicine and science at Würzburg, Berlin, and Vienna under Müller, Virchow, and Kolliker. He began to lecture at the Univ. of Jena in 1861, and was prof. of zoology there from 1862 to 1899, with short intervals spent in travelling in search of zoological specimens. He was equally famous for his detailed zoological researches and for his generalisations on biological themes. In the former he confined himself mainly to the Invertebrata, and pub. *Die Radiolarten* (1862); *Die Kalkschwämme* (1872), on calcareous sponges; *Das System der Medusen* (1879–81), on jelly fishes, and numerous smaller works, as well as his contributions to the *Challenger* reports—on *Deep-sea Medusæ* (1882), on *Siphonophora Keratosa* (1888), and *Itiololaria* (1889), all beautifully illustrated with superb plates which show the author's supreme skill in draughtsmanship. In the work of generalisation in biology his greatest achievement was *Generelle Morphologie* (2 vols., 1866), a treatise on animal morphology in the two sections of tectology (structure) and promorphology, much of which he subsequently rewrote

in his *Natürliche Schöpfungsgeschichte* ('Natural History of Creation') (1867). H. was one of the first to attempt to draw up a genealogical tree (*Stammbaum*) exhibiting the relationship between the various orders of animals with regard both to one another and their common origin, and his theory that the life hist. of the individual is more or less a recapitulation of its historic evolution, embodied in his *Studies on the Gastræa Theory* (1873–84), has been generally accepted, though with some reservation in recent years. H.'s more popular works are very brilliantly written, but he is not always so careful in statement as Darwin, while his monist theories result in a materialistic tendency in his writings. His most notable treatise is *Natürliche Schöpfungsgeschichte* ('Natural History of Creation'), in which he divides the whole animal creation into two categories—the Protozoa, unicellular, and Metazoa, multicellular animals—the former remaining throughout their existence single-celled, while the latter were built up of cells innumerable. Of these studies the most striking outcome was the stem of the human race, in which he traced the descent of man through six-and-twenty stages from Monera, that is simple structureless masses of protoplasm, up to the chimpanzee, and *Pithecanthropus erectus*, remains discovered in Java, which he held to be the missing links between primitive man and the manlike apes. (See ANTHROPOLOGY.) When Darwin pub. his *Descent of Man* in 1871 he observed that H. in his *Natural History of Creation* had fully discussed man's genealogy, and said that had this work appeared before his own essay he should probably never have completed it. Almost all the conclusions at which he (Darwin) had arrived, he found confirmed by this naturalist, whose knowledge on many points was much fuller than his. On the controversial subject of the inheritance (see HEREDITY; WEISMANN) of acquired characters, H.'s conclusions agreed with those of Lamarck and Darwin, that the hereditary transmission of acquired characters was one of the most important phenomena in biology, that it was proved by thousands of morphological and physiological experiences, and was an indispensable foundation of the theory of evolution. In support of this view H. refers to the inheritance of rudimentary organs, which once were serviceable in our simian ancestors, but are now utterly useless or even injurious—as, for example, the appendix, the frequent disease of which is the cause of appendicitis. But this illustration misses the point at issue. The inheritance of useless rudimentary organs is admitted; it is the inheritance of acquired characters which is denied by many modern biologists—whether these qualities be useful or ornamental. Sir Francis Darwin adhered to his father's views, as did Herbert Spencer to the end; that view being that if parents acquired any useful characteristic their offspring would generally inherit it; but many Brit. biologists have been in agreement with Weismann, whose famous germplasm theory is

to the effect that only those characters can be transmitted that were contained in rudimentary form in the embryo. H.'s reputation as a monistic philosopher is much less secure than his reputation as a biologist. In importing his evolutionary theories into the realms of philosophy, morals, and religion, he advanced propositions in physics which no physicist would admit and which only betray his limited acquaintance with the subject. His *Die Weltätsel* (trans. into Eng. as *The Riddle of the Universe*), which enjoyed wide popularity among Eng. readers, contains theses on the 'monistic view of substance' which have been summarily dismissed by the spiritualist Sir Oliver Lodge (*Life and Matter*) as mere nonsense; yet H.'s book is padded with quaint theses on the fundamental forms of substance in which H. believed that he had proved that there was no immortal soul, or free will, or personal God. Even in questions of natural hist., when he attempts to philosophise, he writes with a like crudeness. Yet H. really thought his Monism a very essential part of his work. This theory of Monism was, however, by no means novel. Plotinus, Spinoza, Berkeley, Hegel, and Schopenhauer were all, each in his way, Monists. Where men have denied mind and have denied matter, H. conjectured substance as the foundation of both—which is only materialism 'dignified with a higher title.' (Consult on this Herbert Spencer's *Synthetic Philosophy*.) But while H. the monist will be forgotten, H. the naturalist will live. His *Anthropogenie* (1874, trans. into Eng. as *The Evolution of Man*, 1879) and his *Lectures on Development and Evolution* (1873-79) were very widely read. Extending his theory of evolution from zoological subjects, H. applied it to problems of philosophy and religion, embodied in *Die Weltätsel* (1899, Eng. trans., *The Riddle of the Universe*, 1901) and *Die Lebenswunder* (1904, Eng. trans., 1904). His other works include *Ursprung des Menschen* (1898, Eng. trans., *The Last Link*, 1899); *Aus Insulinde* (1901); *Wanderbilder* (1903); *Das Menschenproblem und die Herrrentiere* (1907); *Das Weltbild von Darwin und Lamarck* (1909). See lives by W. Boische, 1900; W. McCabe, 1906; H. Schmidt, 1926; V. Franz, 1934; and G. Wichler, 1934.

Hæmatemesis, blood vomiting, from changes originating in the stomach wall, as in cases of ulcer, the result of long-continued dyspepsia. The hæmorrhage may be sudden and unexpected in cases in which the dyspepsia has lasted so long that individuals regard it as their normal condition, to which they have become accustomed. H., however, may also occur suddenly and unexpectedly on account of liver trouble. It may also be the result of swallowing blood coming from the mouth and nose.

Treatment.—Until the bleeding has ceased, and its cause has been certainly decided upon, it is inadvisable to take anything, solid or liquid, but to remain absolutely at rest, sucking pieces of ice and spitting out the water. In this way the thirst is relieved, but care should be taken

to prevent anything whatever entering the stomach. A thorough investigation of the cause is indicated.

Hæmatin, see **HEMATIN**.

Hæmatite, or **Hematite**, *diferrie tri-oxide* (Fe_2O_3), obtains its common name from its characteristic blood colour. It crystallises in the rhombohedral system, and is isomorphous with corundum. *Elba iron ore* or *H.* from *Ilo Marina* often possesses a brilliant metallic lustre which may be iridescent; this particular form receives the name of *specular iron ore*, and has a hardness of 6, and sp. gr. of 5.2. H. may also exist in fibrous or granular conditions, and an impure earthy form, *red ochre*, is an economic product. The hard fibrous form from Spain is used by bookbinders, goldsmiths, and others as a burnisher. In the N. of England fibrous H. often occurs in concretionary masses, it then receives the name of *kidney ore*, in recognition of its appearance on fracture. H. is widely distributed, and has been known since very remote days, having been occasionally cut and polished as an ornamental stone by the Assyrians, etc. The modern use of the mineral is as an ore of iron, and being remarkably free from phosphorus it is particularly suitable for the manufacture of steel. Analyses of certain specimens have closely approached the theoretical 70 per cent of iron for this oxide. Important mines occur in Elba, Spain (Bilbao), and Scandinavia on the Continent. Large deposits also occur near Lake Superior. In Britain the chief supplies are in W. Cumberland and N. Lancashire. Apart from the uses mentioned above, ground H. is used largely in paint manufacture.

Hæmatoxylin, colouring extracted from logwood (*Hæmatorylon campechianum*). Its chemical formula is $\text{C}_{12}\text{H}_{14}\text{O}_4$, and is in itself a crystalline substance and nearly colourless, but when combined with oxygen becomes a reddish colour, forming a substance known as hæmatin. H. is used for dyeing, principally to produce blue and black colourings. In biology it is employed as a stain for the nucleus and chromosomes.

Hæmatozoa (literally blood animals), worms of the genus *Filaria* that inhabit the blood. In humans these animals only breed in the tropics. They cause the legs to swell until they attain a considerable size and have the straight up-and-down appearance of an elephant's legs. Hence the condition is known as elephantiasis. Various other symptoms are produced, but these are less characteristic than the appearance under the microscope of the worms in the blood.

Hæmaturia, blood in the urine. This may come from the urethra or bladder, from injury, ulceration, or tumours. It may occur as simply trickling or preceding the voidance of urine, as clots, or oozing at the end of the act. It may be derived from the kidneys, when it causes a smoky colour, or it may be in such minute quantities that it can only be detected by the microscope or by chemical tests. Blood from the kidneys is found as a complication in various diseases originating in the

kidneys, and also in fevers and general diseases. Other causes of H. are cancer of the bladder, stones in the bladder or kidneys, rupture of vessels in these parts or, at and after middle life, of the prostate. It occurs in tubercle, in which, however, it is usually a late symptom, and also appears in inflammation of the bladder. When, on account of clots, or from other cause, there is pain, the application of heat, by fomentations or hip baths, is indicated.

Hæmoglobin, protein occurring in the red blood-corpuscles which possesses the property of combining with oxygen and again yielding up the same when the concentration of oxygen sinks below a certain amount (see BROWN). H. gives a definite absorption spectrum which is quite different from that of oxyhæmoglobin (the oxygenated product). In colour it is purplish-red, whilst oxyhæmoglobin is bright red. This difference in colour may be noticed by comparing venous and arterial blood. H. also has the power of combining with carbon monoxide, giving a compound carboxy-hæmoglobin, which has a much brighter red colour than oxyhæmoglobin. The poisonous character of carbon monoxide is due to this property of forming with H. a more stable compound than oxyhæmoglobin; H. is easily decomposed into a pigment hæmatin which contains iron, and a protein globin which seems to belong to the group of histones. Hæmatin has the formula $(C_{11}H_{12}N_4O_4FeO)_n$, and is chemically related to chlorophyll, the green colouring matter of plants. H. occurs in some invertebrates, e.g. the earthworm, the 'blood worm,' and the 'water flea' (*Daphnia*). In molluscs and crustaceans it is replaced by hæmocyanin, containing copper instead of iron.

Hæmophilia, literally, a tendency to blood. This is also known as the hæmorrhagic diathesis. Patients suffering from this are known as 'bleeders.' H. is a condition in which the blood clots very slowly, and consequently, from the slightest injury, hæmorrhage persists for some considerable time, and even the smallest wound may be fatal. The condition is of great interest, as it is distinctly hereditary, being transmitted by women, but exhibiting its symptoms in men only. Tooth extraction and other operations are much dreaded by dentists and surgeons, as, except for the tendency to bleed, there is no other sign or indication of disease. The bleeding may be internal, under the skin, when the slightest injury causes extensive discoloured bruises. In joints slight injuries result in bleeding into them, so that they swell to considerable size and become useless. A fall on the head may result in bleeding in the brain, which may be fatal. A popular fallacy is that a bleeder has a skin too small for him originated in the official statement that this was what a distinguished personage, with this disease, was suffering from. As regards treatment, various methods to promote clotting have been tried, varying from administration of calcium salts through the mouth to injections of egg albumen and other substances, but none are completely effective. See also HEREDITARY, *Types of Inheritance*.

Hæmoptysis, spitting of blood, that is, hæmorrhage from the lungs or air passages; a common, if not the most frequent, symptom of tuberculosis. It has consequently come to be unduly feared, because looked upon as identical with consumption, whereas it may be beneficial as an indication of a condition which, when treated early, results in complete recovery and the restoration of good health. On the other hand, in the course of consumption, unexpected bleeding may occur and cause death by choking. The main lines of the treatment of H. are to keep the patient absolutely flat on the back, with perfect rest of mind and body. Warm drinks should be avoided and all food taken cold, or even nothing taken at all, except sucking small pieces of ice.

Hæmorrhage, bleeding. This may occur from an artery, when the blood spurts out in jets synchronous with the pulse beat

HÆMORRHAGE

- A Compression of the subclavian artery
- B Compression of right carotid artery.
- C Compression of the brachial artery from behind

and contraction of the heart; the blood is scarlet in colour. From a vein the blood is purple and flows in a continuous steady stream. Oozing, or capillary bleeding, is intermediate in tint between the two former ones. It is more readily controlled than the others, though in a place where the bleeding spot cannot be reached, as in the nose, it may continue for a considerable time. The main art of the surgeon is to perform an operation with as little bleeding as possible and to control the H. in cases of injury. Thus, to discuss bleeding fully would be to write a treatise on surgery. The main points, however, are to apply pressure on the bleeding spot; this is usually sufficient in a case of oozing, such as occurs in small cuts, when no large vessels are severed. In venous bleeding, the parts should be raised and pressure applied on the distal side of the wound

(i.e. on the side away from the heart); H. from varicose veins, however, requires pressure on *both* sides of the wound. In cases of arterial bleeding pressure should be applied in the course of the artery between the wound and the heart, or a bandage tied round the part sufficiently tightly to check the H. Styptics are used to stop H.; they include very hot or very cold water, adrenalin, pituitary extract, and fibrin foam. The cautery can also be employed.

HÆMORRHAGE

+ points where arteries can be compressed in the head

Hæmorrhoids, see PILES.

Hæmus, see HALKAN MOUNTAINS.

Hæst, see under HASTINGS.

Hafenbreidl, Joseph Alexander, see H. BNF.

Haffkine, Waldemar Mordecai Wolff (1860-1930), bacteriologist; b. at Odessa, of Jewish race; became a pupil of Pasteur; held for some time the post of prof. of physiology at the Geneva medical school. From there he went to India, where he was made director-in-chief of the gov. laboratory at Bombay. He was the first to produce a vaccine for the treatment of cholera, his first inoculation being made at Agni in 1893. Four years later he introduced a fluid for inoculation against plague. He was later appointed bacteriologist to the Indian Gov.

Haffs (Dan. *hav*, sea), term applied to lagoons in the Baltic Sea. These lagoons are separated from the sea by *nehrungs*—strips of sand. The chief ones are Pommersches or Stettiner Haff, Frisches Haff (50 m. long and over 10 ft. deep), and Kurisches Haff (80 m. long).

Hafiz, nom-de-plume of Khwāja Shams-ud-din Mohammad, the greatest Persian lyric poet, 'the most Persian of the Persians' (FitzGerald). The date of his birth is doubtful; his death is variously given as 1388, 1391, and 1394. Little is known of his life except that it was mainly spent in Shiraz under the successive patronage of

the governor Shah Ishāk, Shah Shujā, and the vizier Kawām-ud-din, at whose college he lectured on the Koran; of this his knowledge was unrivalled, and he is credited with having written a great commentary. His verses, which reveal an extraordinarily brilliant technical accomplishment, are expressed in terms of typical oriental hedonism—wine, roses, and lovely maidens; he has been called the Anacreon of Persia. But his writings had a deeper mystic significance, and expressed symbolically the religious idealism of the Sufis (q.v.). H. was apparently a Sufi by training, and a realist by temperament. The famous *Diwān*, a series of ghazals collected by one of his pupils, is his best-known work, but no satisfactory complete trans. has yet appeared. The most important European study of H. was written late in the seventeenth century by a Bosnian, Sudl. Eng. trans. are Sir W. Ouseley (1797-98); S. Robinson (1875); and H. Loto (1877); E. Cowell's trans. of the Odes (1854); and Abul Majid and Cranmer Byng's *Rubaiyat* (1910). See H. H. Schaefer, *Goethes Erlebnis des Ostens*, 1938.

Hafnium, metallic element of symbol Hf, atomic number 72, and atomic weight 178.6. It was discovered by the Dan. chemists Coster and Hevesy, and is closely related to the element zirconium; zirconium ores almost always contain small amounts of H. compounds. The metal is obtained by passing the vapour of a specially prepared iodide over a heated tungsten filament; also by heating the hydrofluoride, Hf_2F_6 , with sodium.

Hagar (Gen. xvi.), Egyptian slave of Sarai, the wife of Abraham. She was evidently the companion as well as the servant of Sarai, and at the latter's wish became the concubine of Abraham, to whom she bore a son, Ishmael. Motives of jealousy then led Sarai to drive her out into the wilderness, where she received the oracle as to the future fate of the Ishmaelites.

Hagberry, see BIRD CHERRY.

Hagedorn, Friedrich von (1708-51), Ger. poet b. at Hamburg, contributed satirical works to the *Hamburg Patriot*. He imitated classical, Fr., and Eng. forms, and his work became popular, both in poetry and philosophy. See life by K. Epting, 1919.

Hagelberg, vil. in Brandenburg, Germany, situated 22 m. S.W. of Potsdam. Noted for the victory obtained by the allies, under Hirschfeld, over the Fr., Aug. 1813.

Hagen, Walter (b. 1891), Amer. golf champion, b. at Rochester, U.S.A. Began playing golf as a boy, early showing great aptitude for the game. Won U.S.A. open golf championship in 1914 and again in 1919. Won the Brit. open golf championship in 1922, 1924, and 1928, and the Belgian open championship in 1924, in which year he also won the professional championship, U.S.A. He won the Canadian open championship, 1931.

Hagen, (n. 1.) Westphalia, Germany, 15 m. N.E. of Elberfeld. Before the Second World War it was one of the most flourishing industrial centres of the Ruhr, and possessed some fine public buildings, including a technical school with a special

engineering branch. There are large iron and steel works, and woollen, cotton, leather, paper, etc., are manufactured; there are also breweries and distilleries. In the neighbourhood there is an alabaster quarry, and limestone may be worked. In the allied operations for the envelopment of the Ruhr (April 1945), after the main industrial tns. in the N. part had been cleared, the enemy pocket of the Ruhr was split in two at H. on April 14. The E. half collapsed on April 16, when 80,000 prisoners were taken, and, on April 18, the whole pocket of resistance was finally liquidated, the total of prisoners reaching 320,000. Pop. 148,300.

Hagerstown, city and the co. seat of Washington co., Maryland, U.S.A., about 86 m. by rail N.W. of Baltimore. It is situated in a valley overlooked by the N. and S. Mts., and contains the Kee Mar College (1852) for women. Produces flour and agric. implements. Pop. 32,400.

Hag-fish, or **Borer**, name applied to all members of the Myxiniidae, marine fishes belonging to the Cyclostomata; they occur off all the coasts of W. Europe and off the E. Amer. coast as far as Cape Cod. Their bodies are eel-shaped, with no lateral fins, and a slight median fin at the extremity; the head is equipped with four pairs of sharp tentacles, with which the fl. attack cod, haddock, etc., devouring all the flesh and leaving only the skeleton of their prey. Shoals of fish are often destroyed by the various species of *Myrine* which, when not seeking food, lives in mud-beds at the bottom of the sea; *M. glutinosa* and other species secrete a thick glutinous slime. *Bellostoma* contains two species which occur in the S. Pacific.

Haggai (either 'born on a feast-day' or 'feast of Yahweh'), prophet contemporary with Zechariah, whose prophecies are contained in the book of the O.T. which bears his name. Little is known about the prophet himself, but from chap. ii. 3 of his work we may gather that he was already an old man when he began to prophesy, being one of those who had seen the temple 'in its former glory.' His book contains four short prophecies all delivered in the latter part of the second year of Darius the king (520 B.C.), the first three dealing with the restoration of the temple, the last being a special promise to Zerubbabel.

Haggard, Sir Henry Rider (1856-1925), Eng. novelist and writer on agriculture; b. at Bradenham Hall, Norfolk, England. At nineteen years of age he went to S. Africa as secretary to Sir Henry Bulwer, governor of Natal. In 1877 he was a member of the staff of Sir Theophilus Shepstone, special commissioner for the Transvaal; and in 1878 he became master of the high court of the Transvaal. He married Miss Margitson, of Norfolk, in 1879. He took a deep interest in rural and agric. questions, being an exceedingly practical farmer and gardener on his own estate. In 1902 he pub. *Rural England*, a valuable study of rural conditions and of agriculture. In 1905 the Colonial Office commissioned him to inquire into the Salvation Army settlements in the U.S.A.—his report being pub. in 1905 as *The Poor*

and the Land, with a scheme for national land settlements. *Cetewayo and his White Neighbours* (1882) was his first book. In 1884 he pub. *Dawn*, the first of his novels. This was followed by others, most of which were very successful. The most popular are *King Solomon's Mines* (1886), one of the best-written and most thrilling of his romances; *She* (1887); *Jess* (1887); *Alan Quatermain* (1888); and *The World's Desire* (1901), written with Andrew Lang. He received the honour of knighthood in 1912—in recognition of his services to agriculture, on which he wrote sev. books, for his novels were purely sensational. D. in a London nursing home, May 14.

Haggis, anct. Scottish dish, called by Burns 'great chieftain o' the puddin' race.' The stomach bag of a sheep, having been well washed, turned inside out and salted, is filled about half full (room being left for expansion) with the heart, liver, and lungs of the animal, all minced, together with a large onion, half a pound of oatmeal, a pound of suet, salt, pepper, and half a teaspoonful of mixed spice; the addition of the juice of a lemon and some good stock is often found to be an improvement. The bag is then securely sewn up and left to boil for about three hours. It was common in England until the eighteenth century.

Hagi, tn. on the W. coast of Hondo, Japan, 145 m. N.E. of Nagasaki, which took a prominent part in the national movement for the abolition of feudalism. Pop. 21,000.

Hagiographa, The ('sacred writings'), name sometimes given to the miscellaneous books of the O.T. which are not grouped either with the Law or with the Prophets. Among these are the various poetical books, such as the Psalms, Lamentations, and Canticles, and the other three books, Ruth, Ecclesiastes, and Esther, which, with the two last, form the Megilloth or Hittim.

Hagiology, name of the body of literature dealing with the lives of Christian saints and martyrs. The oldest collection is *The Assembly of the Ancient Martyrs* by Eusebius. In the Gk. Church these collections of lives of the saints are called menologies (Gk. *μην*, month), and they can be traced from the ninth century. Among those of the W. Church, perhaps the most famous is the *Legenda Aurea* (Golden Legend, q.v.) of Jacobus de Voragine. The founder of hagiologic criticism was a Flemish Jesuit, Heribert Roscoe (d. 1829), who pub., among other works, the *Vitae Patrum* (Antwerp), 1615. He also arranged a great systematic collection of the lives of the saints, resulting in the *Acta Sanctorum*, and the foundation of the Belgian Society of Bollandists, who occupied themselves in the critical pub. of the *Acta Sanctorum* (q.v.).

Hagonoy, tn. of the prov. of Bulacan, Luzon, Philippine Is., on Manila Bay. It produces rice, Indian corn, sugar, and coffee. The chief industries are alcohol distilling and the weaving of native fabrics. Pop. 25,000.

Hague, Cap de la, cape in France at the N.W. extremity of the Cotentin peninsula,

in the dept. Manche, between Cherbourg and the is. of Alderney, on the Eng. Channel. It must be distinguished from La Hogue, which is a roadstead lying on the E. side of the peninsula, where the Fr. fleet, which was sent to the support of James II., was defeated by the Eng. and Dutch fleets in 1692. The Channel Is. are visible from 'Cap de la II.

Hague Conference, peace conference initiated by the Tsar Nicholas II. in 1899, with the object of 'a possible reduction of the excessive armaments which weigh upon all nations,' to be effected by 'putting a limit to the progressive development of the present armaments.' But it was not found practicable either in 1899 or in 1907 (the second conference) to achieve anything in this direction. The conference of 1899 estab. a permanent judiciary system ready to be called into action whenever two or more states desire a matter in difference to be settled. The convention provided for the conduct of good offices and mediation, inquiry by commissions into disputed matters of fact, the constitution of a permanent court, with an international office at The Hague. The provision for commissions of inquiry did good service in 1904, during the Russo-Jap. war, when a Russian fleet opened fire upon the Hull fishing fleet off the Dogger Bank. The second conference, 1907, passed an amended convention for the settlement of international disputes. Other matters discussed were the laws and customs of war, e.g., guerrilla warfare, etc., and the application to naval warfare of the principles of the Geneva Conference. Rules, too, were made at the first conference against the throwing of missiles from balloons, the use of missiles intended to diffuse suffocating gases, and the use of expanding bullets.

Hague, The (in Dutch, 's Gravenhage or **Den Haag**), official cap. of the Netherlands, situated about 2 m. from the North Sea. It is the usual residence of the court, and the seat of the States-general, though Amsterdam is still the commercial cap. of the Netherlands. Many of its streets are intersected by canals, bordered with rows of trees, and in the centre of the city is the artificial lake known as Vijver. The fashionable quarter of the city lies in the N., and here the prin. buildings are to be found; the royal palace, purchased by the states in 1595; a large monument by Jacques commemorating the jubilee of the restoration of Dutch independence in 1813; the museum, Meermanno-Westreenianum, which contains specimens of early typography, and the royal library, which contains over 500,000 books, as well as coins and medals, antique gems, and some interesting MSS. Besides these, there are the gov. buildings situated in the Binnenhof, which was once surrounded by a moat, and was founded in 1249 by William II., count of Holland, whose son made it his residence; the prison, where the brothers De Witt were killed by the mob in 1672; the law courts, the building containing the state archives, and the Mauritshuis, which was built in 1633-44, and contains the famous picture gallery of The

H. The city, too, contains numerous churches, the Groote Kerk of St. James, which dates back to the fifteenth century and is Gothic in style; the Nieuwe Kerk, containing the tombs of the brothers De Witt and of the philosopher Spinoza, and many others. There are also a picturesque tn. hall, built in 1565, a fine modern railway station erected in 1892, and the famous royal villa 'Huys ten Bosch,' built in 1645, where the International Peace Conference was held in 1899. The H. was the bp. of the astronomer Huygens, the physician Boerhaave, and the place where Spinoza, to whom a monument has been erected, d., 1677. Here too, the Triple Alliance between England, Sweden, and the Netherlands, 1688, was signed; The H. Convention was assembled, 1899 and 1907, and the Palace of Peace designed by Cordouner was completed in 1913. In 1912 the International Opium Convention was signed at The H. After the First World War, in 1920, a committee of the council of the League of Nations met here to promote a permanent court of international justice. This was concluded later in the year at Geneva and has (1939) its seat at The H. The H. Academy of International Law was opened in the Palace of Peace in July 1923. The International Law Library was given by Carnegie and cost over £1,500,000. The chief industries are printing, cannon founding, copper and lead smelting, iron casting, gold and silver decorations, and the manuf. of furniture and carriages. In the Second World War the Germ. bombed the city during the invasion of May 1940. Sev. embassies, a maternity hospital, and a prison were hit. The city sustained further damage by bombing during the course of the war. Pop. 523,700.

Haguenau, tn. of France in the dept. of Bas-Rhin. It is about 16 m. N. of Strasbourg, in the middle of the Haguenau Forest. It possesses two fine old churches dating from the twelfth and thirteenth centuries, besides other public buildings. The main industries are wool and cotton spinning and carpet weaving; machinery, boots, soap, wine, and oil are manufactured; and there are also breweries and potteries. It is a garrison tn. and dates from the twelfth century, when the dukes of Swabia had a hunting-lodge there. In 1154 the Emperor Frederick I. gave it tn. rights and built walls round it, and an imperial palace. In 1257 Richard of Cornwall, king of the Romans, made it an imperial city. Later it fell into the hands of the Fr., passing into the possession of Germany, 1871. By the treaty of Versailles, 1919, it passed back once more into the possession of France. Following the occupation of Strasbourg by the Fr. 2nd Armoured Div. on Dec. 23, 1944, the 79th Amer. Div., which had been mopping up in the rear of the Fr. 2nd Armoured Div., resumed a northward advance and, with the 44th Amer. Infantry Div., made rapid progress towards H., which they took on Dec. 12. In the major offensive S. of the Moselle, begun by Gen. Eisenhower (March 15, 1945) to destroy the Ger. armies V. of the Rhine, two corps of the Seventh

(Amer.) Army attacked N. between H. and Saarbrücken. This S. thrust took the Ger. First Army by surprise, and resistance in the W. portion of the front became disorganised. Pop. 19,500.

Hahn, Helen Petrovna, see BLAVATSKY.

Hahn, Otto (b. 1879), Ger. chemist; began studies in radioactivity under Sir Wm. Ramsay, and then for a time worked with Rutherford in Montreal. In London he discovered radiothorium, an intermediate between thorium and thorium X, and in Montreal radioactinium. Returning to Berlin in 1906 he isolated mesothorium 1 in 1906, and mesothorium 2 in 1908, and from that time he continued to contribute regularly to lead, advances in specialised chemical technique for pioneering work with the heavy radioactive elements. Collaborated for thirty years with Lise Meitner (1908-38), the physicist, a collaboration terminated only by the rigour of the racial laws of discrimination in Nazi Germany. During the war II. worked on the chemical side of the problem of uranium fission. While he missed the significance of nuclear isomerism he discovered the first recorded instance of this phenomenon (1921). In 1944 he was awarded the Nobel prize for chem. in recognition of his discovery (with F. Strassmann) of the neutron-induced fission of uranium and thorium.

Hahnemann, Samuel Christian Friedrich (1755-1843), Ger. physician and founder of homoeopathy, b. at Meissen, in Saxony. He studied medicine at Leipzig and Vienna, and took his degree in 1779 at Erlangen. He practised first at Dresden, then, in 1789, settled at Leipzig. He was not satisfied with the state of the science of medicine, and in 1796 advanced a new principle, 'the law of similars,' i.e. that diseases should be treated by those drugs which produce symptoms similar to them in the healthy. Four years later he pub. his doctrine on a system of smaller doses of drugs. In 1810 his chief work was printed, *Organon der rationellen Heilkunde*, explaining this system, which he named homoeopathy. The hostility of the apothecaries forced him to leave Leipzig and find protection with the grand duke of Anhalt-Köthen. Fourteen years afterwards he went to Paris and practised homoeopathy with great success. See also MEDICINE, *Homoeopathy*. See T. L. Bradford, *Hahnemann's Life and Letters* (Philadelphia), 1895, and J. H. Clarke, *Hahnemann and Paracelsus*, 1923.

Hai Cheng, tn. in the prov. of Liaotung, Manchuria, 20 m. S.E. of Newchwang. It was the scene of a Jap. victory over the Chinese in 1891, and over the Russians in 1904.

Haiderabad, see HYDERABAD.

Haider Ali, see HYDER ALI.

Haikuang, or **Haizung**, cap. of a prov. of the same name in Tongking, Fr. Indo-China, 32 m. E.S.E. of Hanoi, and largely in ruins. Pop. (prov.) 1,100,000, (tn.) 10,000.

Haifa, or **Khalife**, seaport of Palestine, on the S. of the bay of Acre, 9 m. S.W. of Acre, and at the foot of Mt. Carmel. Corresponds to the classical Syceaminum, but there is nothing of archaeological

interest in the present tn. Since 1890 it has rapidly developed, and is now the terminal point of three railways—one linking it with Damascus (an old line), a second built soon after the First World War and linking it with Egypt and the Suez Canal, and a third, built during the Second World War, linking it with Beirut and Turkey. It developed considerably in importance under the Brit. mandatory gov. The construction of a new harbour, at a cost of £1,250,000, was completed in 1933. There is a pier 125 yds. long. The pipe line from the Mosul oil wells terminates here (as well as at Aleppo). Egyptian cotton is cultivated. There are a secondary school, a dist. court under a Brit. president and two Palestinian judges, and a bench of honorary magistrates. A pleasing feature of the tn. is the 'Persian Garden' on the lower slopes of Mt. Carmel. Soap boiling is an industry of export importance. There are also cement and tobacco factories. Grain and oil are exported. In the Jewish terrorist outrages of 1946-47 damage to the amount of £250,000 was done by fire from explosions to the Shell oil installation at H. Bay on the night of March 30, 1947. The gov. imposed on the Jewish community collective measures for reimbursement of the cost. The pop. consists of Muslims, Christians, and Jews, and numbers about 145,400.

Haig, Douglas, first Earl (1861-1928), Viscount Dawick, and twentieth Laird of Beimersyde; Brit. field-marshal; b. in Edinburgh, and educated at Clifton School and Brasenose College, Oxford, of which he was made an honorary fellow in 1915. From Oxford he entered the Royal Military College, and joined the 7th Hussars in 1885. He took his profession as a soldier seriously from the outset, and within a few years was a student at the Staff College, where, after gaining his 'p.s.c.' (passed Staff College), he joined the Egyptian Army. Served in the Sudan in 1898, being at Atbara and Khartoum. During the S. African war, 1899-1902, he held important posts, was promoted lieutenant-colonel, and awarded the C.B. He commanded the 17th Lancers for a short time, but his next important post was inspector-general of cavalry in India (1903-6). He was director of military training at army headquarters in 1906-7, and director of staff duties in 1907-9. Later he returned to India as chief of staff (1909-11), and in 1912 became general officer commanding-in-chief, Aldershot Command. When the Brit. expeditionary force went to France on the outbreak of the First World War he was in command of the 1st Army Corps, and in Dec. 1915 succeeded Sir John French as commander-in-chief. Haig's motto was 'Service—not Self,' and in accordance with this he gave himself up entirely to the service of ex-service men immediately after the conclusion of hostilities. Many organisations working on behalf of ex-service men came into existence as soon as demobilisation commenced, but H. saw that one strong body was what was needed, and by his personal efforts sev. were welded together to form

the Brit. Legion (*q.v.*), which remains a world-wide monument to his interests in the welfare of those who fought under him.

When H. was director of staff duties at the War Office before the First World War, he brought out the first ed. of the *Field Service Regulations*. This, as well as his *Cavalry Studies*, shows the thorough grasp he had of his profession. For his eminent services during the First World War he received the thanks of Parliament,

LORD HAIG

a grant of £100,000, and was raised to the peerage, taking the title of Earl Haig of Bernersye in the co. of Berwick. H. was probably the most popular figure in Great Britain that emerged from the First World War. Comparisons with generals of former times are unprofitable, yet military writers have essayed the task of estimating H.'s capabilities as a general. No doubt his name lacks the *éclat* or almost legendary glamour of that of the duke of Wellington. As a strategist and tactician, too, H. was by no means the equal of the Iron Duke; but standards of comparison are difficult to make because, whereas Wellington commanded in wars of movement, it fell to H.'s lot to command for years in trench warfare and, at the most vital periods, under the supreme command of Foch. His qualities as a soldier were attacked in Lloyd George's memoirs (1931), largely on account of the grim fiasco of the battle of Passchendaele. In 1905 he married the Hon. Dorothy Vivian, daughter of the third Lord Vivian. He d. suddenly on Jan. 29, 1928. *See also* FRANCE AND FLANDERS, FIRST WORLD WAR CAMPAIGN IN. For dispatches, consult *Sir Douglas Haig's Despatches*, ed. by Lt.-Col. J. H. Boraston, 1919; and, for an account of his leadership, see G. A. B. Dewar and J. H. Boraston, *Douglas Haig's Command*, 1922; and G. Duff Cooper, *Haig*, 1933.

Halk, *see* ARMENIA.

Hai-k'ou, *see* HOI-HAU.

Hail, Central Arabia, *see* under JEBEL SHAMMAR.

Hail and Hailstorms. In old text-books hail used to be described as frozen rain, but its production is now ascribed to more complex atmospherical conditions than were then supposed. Volta suggested that when two clouds, charged respectively with positive and negative electricity, lie one above the other, hail is produced by electric discharges passing up and down through the moisture-laden atmosphere. More modern theories depend on the fact that condensation in the atmosphere takes place, even at temps. below freezing, mainly into 'supercooled' water droplets. If the motion in the cloud is very turbulent (this is the case in thunderstorms) an ice particle, when formed, may be carried up and down many times in different currents; it will then collect, either by coagulation with supercooled water drops or by condensation, sev. coats of ice. Near the bottom of a downward and upward journey the ice particle may pass through regions with temp. above freezing when a layer of water forms on the particle. When again reaching freezing regions this freezes and forms clear ice; an opaque skin is formed by collision with supercooled drops and at the same time trapping a little air. Hail-stones are therefore commonly spherical, but other shapes that have been observed on rare occasions are rough prisms, four-sided pyramids, lens-shaped disks, and rather jagged-shaped masses with projections in sev. directions. E. G. Bilham and E. F. Relf calculated the velocity of fall of spherical hail ranging up to 60 m.p.h. for a stone 1.5 in. in diameter and to nearly 120 m.p.h. for a stone 5 in. in diameter and weight about 1.5 lb., which they also considered to be the theoretical maximum size. A. Wegener gives the largest known hailstone to have weighed 1 kg. (2½ lb.), but this is not considered so authentic as a stone which fell at Potter, Cheyenne co., W. Nebraska, on July 8, 1928, which had a diameter of 5.4 in. and weighed 1½ lb. Damage during hailstorms has sometimes been very severe; Sir George Simpson quotes a storm at Kathiawar in India where, over a very large area, all the cattle (buffaloes) were wiped out by hailstorms; one of the worst storms in England occurred on June 21, 1897, in Essex, when hailstones fell in various shapes, commonly as large as hens' eggs. In July 1788 a hailstorm passed over France in two parallel bolts, each only about 9 m. wide, one 500 m. and the other 600 m. in length. In the interval between them, 15 m. wide, rain fell in torrents.

Hail, Mary, *see* AVE MARIA.

Hailé Selassié (or *Silassie*) I. (b. 1891), emperor of Abyssinia, known, prior to his coronation in 1930, as Ras Tafari Makonnen; son of Ras Makonnen, and great-nephew of Menelik; officially styled 'King of Kings, Conquering Lion of Judah, Elect of God, Emperor of Abyssinia.' A romantic if small figure of a man, possessing

the traditional beauty of David's line, no darker than many Spaniards, clear-cut features, mobile face, short silky beard. The deposition, through his exertions, of Lij Yasu, in 1916, removed a menace to European interests in Africa, for that emperor, besides being dissipated, was in touch with the Mad Mullah in Brit. Somaliland, and it is said that he aimed at extending his ters. to the coast so as to embrace Eritrea and the whole of Somaliland with the object of securing a kind of European suzerainty; a design which

HAILE SELASSIE I.

E. A. A.

could only have created international jealousies and difficulties—probably intended. But Lij Yasu was defeated in a barbarous campaign and, after dethronement, placed in captivity near Ficho. In the spring of 1930 H. S. fought yet another campaign against Ras Gugsa, the divorced husband of the late Empress Zaoditu, and brother-in-law of Emperor Menelik II., H. S. (then Ras Tafari) assuming the role of rightful heir fighting a rebel. The coronation of H. S. at Addis Ababa in Nov. 1930 was an event in the evolution of Ethiopian civilisation of first-rate importance, because it was the culminating point of the domination of the Christian Church party in conjunction with the leading families of Amhara over the Muslims and pagans of S. Ethiopia. The duke of Gloucester paid a visit to the cap. during the coronation of H. S., when Ras Kassa acted as his host. It is said that the latter had a better title to the succession than had H. S., and might with more resolution have reached the throne.

Succession, however, is regulated by royal proclamation and for the most part is rarely disputed in Ethiopia. H. S. is essentially a social reformer, and, though nearly all Abyssinians treat their slaves well, it was said to be the emperor's purpose gradually to abolish slavery. In this policy he showed courage, for Abyssinia was a turbulent state, the forces of reaction were strong, and all men were armed to the teeth. Energetic to a degree, H. S. also directed sev. commercial concerns in order to increase the national revenue. With his private printing press he printed part of the Scriptures and other religious literature in the vulgar tongue, so that the common people might read for themselves. In 1935 Italy overran Abyssinia and annexed the country, and H. S. fled to Palestine, afterwards residing in Great Britain. Early in 1941 he re-entered Abyssinia to lead his rebel troops against the It. and to recover his throne. In this aim he received much help in men and munitions from the Brit. Gov. and the Brit. authorities in the Sudan. H. S. has founded sev. educational, medical, and other institutions in Addis Ababa and other tns. of Abyssinia, and he is consistently engaged in trying to advance the Abyssinians to the standards of W. civilisation. *See also* ABYSSINIA. *See* Christine Sandford, *Ethiopia under Haile Selassie*, 1946.

Hailes, Lord, *see* DALRYMPLE, SIR DAVIN.

Haileybury College, in Hertfordshire, England. One of the big public schools, it was founded by the E. India Company, in 1806, as a training college for civil service cadets. Originally it occupied Hertford Castle, but in 1809 the college was removed to its present site, 2 m. S.E. of Hertford. In 1862 the present school was estab. and incorporated by royal charter in 1864. *See* Higgins, *Old and New Haileybury*, 1887.

Hailsham, Sir Douglas McGarel Hogg, first Baron (b. 1872), Eng. lawyer and politician, son of Quintin Hogg, founder of the London Polytechnic, Regent Street, of which he has been vice-president and vice-chairman since 1902. Educated at Eton. First destined to a mercantile career, he studied sugar-growing in the W. Indies, but turned to the Bar and politics, gaining a large practice at the common law. Elected as Conservative member for Marylebone in 1922, and appointed attorney-general in the Conservative Gov. 1922-24, 1924-25. On the resignation of Lord Cave (q.v.) became lord chancellor 1928-29, and again from 1935 to 1938. Succeeded Lord Halifax as Lord President of the Council, 1938; resigned Nov. 1938. Editor of a new ed. of Halsbury's *Laws of England*.

Hailsham, mkt. tn. in the Eastbourne parl. div. of Sussex, England. It possesses a fine example of Perpendicular architecture in the church of St. Mary, and close by is the Augustinian priory of Michelham, with an old gatehouse and crypt. Hops and mutton are manufactured, and there is a good agric. trade. Pop. 5000.

Hainan, is. off Kwangtung prov., China, separated from the mainland by H. Strait, and lying between the China Sea and the gulf of Tongking. Area about 16,000 sq. m. The central and S. portions are traversed by granitic mts. reaching an altitude of nearly 7000 ft., while the N. portion is an undulating plain, broken by isolated hills. The is. is well watered and produces timber, rice, sugar, cotton, etc. Chief tn., Klungchow (harbour, Hoihow), on the N. coast, which is a treaty port. It was seized by the Jap. forces in Feb. 1939 ostensibly to prevent the influx, from Indo-China, of arms and munitions for the Chinese nationalist forces. Pop. estimated at about 3,000,000.

Hainan, or **Haynau**, tn. in the prov. of Silesia, Prussia, about 10 m. W.N.W. of Liegnitz. Before the Second World War it was chiefly engaged in tanning and the manuf. of gloves and agric. implements. There were also iron foundries in the tn. Pop. about 11,400.

Hainaut (Flemish *Henegouwen*), prov. of Belgium, bounded on its S. side by France. Its fertile soil, its quarries, but most of all its extensive coal-fields, made it a highly industrialised centre. Iron and steel are produced in large quantities. The manuf. of glass and textile goods is also carried on. The cap. is Mons. The old co. of H. was united sev. times with Flanders. In 1433 it came under the rule of Burgundy; in 1477 under Austria; in 1555 under Spain. In the seventeenth century parts of it were acquired by France. It came again under Austria in 1714; was incorporated in the United Netherlands in 1815, and eventually became a Belgian prov. in 1830. Area 1437 sq. m. Pop. 1,270,000.

Hainburg, tn. in Lower Austria, on the R. Danube, 27 m. E.S.E. of Vienna. It is a fine old tn., surrounded by walls with a gate guarded by two auct. towers. There are numerous Rom. remains, and water is brought to the tn. by a Rom. aqueduct. In 1177 it was besieged by the Hungarians, and five years later was captured by Matthias Corvinus, king of Hungary, and in 1683 it was sacked by the Turks. There is an historic old castle known in Ger. tradition as *Heinburg*, which the Emperor Henry III. took from the Hungarians in 1042. Before the Second World War it had one of the largest tobacco factories in Austria, and also a needle factory. Pop. 7500.

Hainichen, tn. of Saxony on the Little Strieke, 28 m. W.S.W. of Dresden, and 40 m. S.E. of Leipzig. There are collieries in the neighbourhood and it is noted for manufs. of cotton and linen goods; it is also a centre of the flannel manuf. Pop. 8000.

Haiphong, or **Haifong**, tn. and port of Tongking, Fr. Indo-China, situated on the Chuam, one of the branches of the Song-Koi delta, about 20 m. from the gulf of Tongking. It is the second port of Fr. Indo-China, and a naval station, having communication by canal, riv., and railway. There is a sandy bar which prevents ships drawing more than 13 ft. from entering the harbour. Shipbuilding, cement works,

and cotton spinning are the chief industries. A centre of disturbance during the dispute between the Fr. authorities and the Viet-Nam republic after the Jap. occupying forces were driven out of Fr. Indo-China. The Viet Minh (League for the Independence of Annam) complained that the Fr. claim to maintain a customs house at H. was a contravention of rights conferred on Viet-Nam by a treaty concluded in March 1946. Fr. forces moved up in Dec. from H. to Hanoi, and occupied gov. buildings in the latter place. Pop. 70,000. See further under **INDO-CHINA**, **FRENCH**.

Hair, filamentous outgrowth from the skin, forming the coat of mammals, and corresponding to the feathers in birds. The word applies also to analogous outgrowths from insects and plants and other organisms. This article, however, is mainly concerned with human H. The human body, with the exception of the palms of the hands and the soles of the feet, is covered with short, fine Hs. or down, but on the scalp and, in the case of men, on the cheeks, etc., H. tends to grow both thick and long.

Physiology of Human Hair.—A H., like a nail, is built up from the corneous cells of the epidermis. It is shut up in a bag, called a H. sac, or follicle, at the bottom of which is a papilla. The superficial epidermic cells surrounding the papilla become horny and coalesce into a shaft, which is finally thrust out above the surface skin by new growths from below. When it has reached its natural height it dies, but not before a fresh papilla and sac have been formed so as to send up another H. to replace the old one. Each H. shaft has an elaborate structure. In the centre is medullary matter, which may contain air. This is wrapped round with a cortical substance, composed of elongated horn cells. Enveloping the latter is an outer cuticle made of flat corneous plates fitting transversely round the shaft. The cuticle in its turn is enclosed in the epidermis of the H. sac which corresponds to the integument, just as the dermis of the H. sac, which is the last coating, corresponds to the dermis of the integument. In these superficial layers of the follicle are the root-sheaths, which, as their name suggests, contain the root of the H. A fatty liquid, which lubricates the H., is secreted from the sebaceous glands, whose ducts open into the H. follicle. The phenomenon called goose-skin, when H. stands erect, usually through alarm or horror, is produced by the involuntary contraction of tiny H. muscles.

Growth of Hair.—A crop of head H. lasts from two to four years, but normally its loss is imperceptible, as a new one has meanwhile arisen to take its place. Baldness results when the powers of renewal are unequal to the loss. It is a natural process for H. to turn grey with age, but there are many curious cases on record where, under the influence of violent emotion, like inconsolable grief or panic, H. has turned grey in a night or even in a few hours. This misfortune is supposed to have happened to Marie Antoinette. In

some families white patches, or premature blanching of the H., are hereditary. Length of H. varies very considerably. There are records of crops 6 ft. long, but 2½ ft. is an average length for a good growth of women's H.

Hair and Anthropology.—H. is an important anthropological criterion. There are four kinds, whether superficial or structural distinctions be taken into account. Most negroes have jet-black H., which is short and curly, and popularly

A HAIR IN ITS FOLLICLE.

A papilla; B, newest part of the hair growing on the papilla; C, mouth of a sebaceous gland

described as woolly. The yellow races have straight, coarse, lank, and generally speaking, the longest H. The H. of Europeans is either wavy, or glossy and smooth, the colour varying from black to very fair brown or yellow, whilst 'frizzy' H. is characteristic of the Australian aborigines, etc.

Hair Diseases are intimately related to many skin diseases, such as eczema, and in general the condition of the H. may be said to be symptomatic of the general health. Children especially are liable to vermin in their H., and an inflamed, itching scalp and a verminous head often lead to eczema, in which case a sulphur or an ammoniated mercury ointment should be smeared over the diseased parts. If a child suffers from ringworm, which is a highly contagious and troublesome skin disease, his H. will break off or fall out and bald circular patches be left. This disorder is due to a fungus which grows between the true skin and the scarf, and the safest remedy is to shave off the hair and then to apply some chemical agent, such as oil of cade or pitch mixed with glycerine to kill the parasite. Constitutional weak-

ness and many forms of debility may cause the forking, or splitting, or excessive shedding of the hair. Such evils may be checked by regular cutting, which undoubtedly strengthens the hair, but the best way to deal with them is to try to remove the much more serious bodily weakness which lies at their root. There are endless prescriptions for saving the H. and preserving it in good condition, but many of them emanate from quacks, and on the whole it is unwise to adopt any, unless recommended to do so by a properly qualified practitioner. Some aver that a drachm of balsam of Peru, well mixed with an ounce of simple cerate (melted), makes an excellent local application. Baldness is probably the most common of all H. diseases, and one which still continues obstinately to resist most treatments. Adults of the male sex are in particular prone to baldness, and are often faced quite early in life with the problem how to deal with it. General diseases such as fever, or a chronic constitutional malady like tuberculosis, may give rise to it, whilst other causes are excessive perspiration, which invariably weakens the epidermis, and a decrease in the supply of blood to the scalp, which often accompanies old age. Applications containing Sp. blistering flies or cantharides are often effective in stimulating the skin and thus encouraging the growth of another crop; perspiration on the head may be diminished by ventilation when under cover, and also by covering the head as little as possible; shaving two or three times in succession may promote another growth when the H. has fallen out after some serious illness, but should the misfortune be due to an eruptive disease, the patient should apply to his doctor, who will probably try some soothing and medicinal treatment. There is no cure for grey Hs. or the baldness of old age. This section may be closed with the mention of a disease which seems endemic only in Poland. A peculiar glutinous sweat exudes and renders the H. disagreeably matted and almost succulent. One symptom is great irritation of the scalp.

Trade in Hair is very considerable in Great Britain, but it is difficult to get statistics up to date as hair is usually included with hides, etc., in all tables of imports and exports. Peasant girls of France, Belgium, and Italy sell their H. to agents especially appointed for collecting it. Auburn and golden hues fetch a much higher price than browns, because of their comparative rarity. Great Britain obtains fair H. from Scandinavia and Germany, whilst coarser kinds are imported from India and China. Wigs, artificial fronts, etc., are produced both from long tresses and combs of human H. Long tail H. of horses is imported into this country from Russia and S. America to be woven into H.-cloth. Short horse-H. is curled and freely used for stuffing chairs and sofas. The H. of cows is utilised in the manu. of roofing and boiler felts, and also of coarse rugs and blankets; plasterers employ it to bind the mortar applied to walls of houses; and the tail H. of oxen is

suitable for stuffing cushions and making barblers' wigs. Russian pigs' bristles are in great demand for toilet and decorators' brushes, whilst artists' brushes are made from camels' H. Even the tail H. of elephants has been turned to account, and is worked up into bracelets in Nyasaland.

Hairdressing has continued, since the beginning of times down to the twentieth century, to exercise and to tax to the utmost human ingenuities. Babies and young children are usually allowed to wear their H. as it grows, and Negroes for the most part leave their luxuriant and tousled masses as nature made them. But, speaking generally, a comparison of different tribes and nations brings out an extraordinary diversity in hairdressing, a diversity, moreover, which is hardly less remarkable when note is taken of the multiplicity of fashions which at one time or another have held an individual people in their grip. Perhaps savages have been most fertile in the invention of H. contraptions. Such tribes of Amer. Indians as the Dakotas and Troquois wear a picturesque head-dress of gaily coloured feathers. All kinds of plumes and feathers are variously worn by different tribes all over the world, whilst Papuans wear houses; Maoris, sharks' teeth; Polynesian, flowers and coco-nut leaves; Danakils, porcupine quills; and Niam-niams, cowries for ornament. Some met in the New Hebrides proudly twist their H. into as many as 600 whip-cords, a process which takes years to complete, and certain natives of S. tropical Africa are at great pains to stiffen some strands into a screw-like tuft by means of fat, and then to decorate the same with an ostrich feather. Shaving, frizzing, greasing, and plaiting are devices every where practised for forcing the H. into fashionable shapes. A Chinaman shaves his scalp in front and wears his fine black pigtail behind. Jap. ladies coil their glossy H. into an elaborate chignon, secured by a great pin and made smooth with the aid of bandoline. Moslems have been known to clip away all their H. save a small clump, which in time will serve as a handle to raise them up to heaven. In England early Britons were remarkable for their long, bushy H., whilst Danes and Saxons also wore it long. In Edward I.'s reign men wore their H. in large curls, which stood out at the sides, whilst ladies confined theirs in a caul of gold network, or, as later, in a ponderous turban. In the days of Henry V. men cropped their H. hideously close, whilst in Tudor times they parted it in the centre, combed it down on either side, and turned it under all round. Cavaliers, during the Stuart period, wore their H. in curls over the shoulders until the Restoration, when the huge powdered perukes were borrowed from France, together with other eccentric modes. In modern times short cutting for men has become universal. The acme of extravagant and vicious taste in ladies' coiffures was reached in the eighteenth century, when, indeed, the trade of barber was elevated to a high art. The H. was gathered over a mighty erection of tow,

which was profusely adorned with pearls, glass beads, and all manner of jewels, mostly false, and with endless varieties of curls, plumes, ribbons, and bobs. If a court lady were economical, she would make one dressing suffice for three weeks, and often she would be obliged to go to the barber some days before a ball if she wished to ensure a new and extensive H.-dress. At all times false H., powders, pomatum, H. washes, and frames of every size and description have been in vogue. To-day the modes of hairdressing for women are still legion, but they are one and all free from the incredible monstrosities of the Georgian era. At the end of the First World War, because of its greater convenience, women began to 'bob' their H., cutting it to fall evenly all round the head. From this severe style the 'shingle' developed, when the H. was allowed to wave gently at the sides, but was cropped at the back to show the contour of the head. The 'Eton crop,' a very severe and masculine type affected mainly by the outdoor or sporting woman, is a practical schoolboy cut. From the frequency with which bobbed and shingled heads must be trimmed and waved, hairdressing has recently been looked upon as one of the most lucrative of trades. In Great Britain hairdressing is an organised calling. It has its trade organisations and papers, including the *Hairdressers' Weekly Journal and Hairdresser and Beauty Trade*. There is a Hairdressers' Registration Council, and a Hairdressers' Exchange and Employment Agency. Since 1930 hairdressers have been compelled by law to close their shops on Sunday.

Hair Dye has been used from earliest times by savage tribes, and among civilised nations is still fashionable with certain classes at the present day. The Chinese colour H. with the juice of the *Indigofera tinctoria*, but chemical compounds are now in greatest demand. Women may obtain golden tresses by bleaching their H. with hydrogen peroxide, which is also recommended for matching white Hs. with requisite shades of grey. The most permanent and deepest black is procurable as follows: The H. is saturated with a solution of potassium sulphide and, after drying, dipped in a solution of silver nitrate, the strength of which depends on the colour desired. In the E. henna has long been used as a dye which will produce an auburn colour in the H., but in addition to this use in England it is also followed by a preparation of indigo to dye the H. black. As a brightener of fair H. camomile is effectively used; while para-diamino-benzene, or para-phenylenediamine, is used for the darkening of the H., but should be undertaken only by cautious and skilful hands. See H. S. Redgrove and G. A. Foan, *Blonde or Brunette? A Complete Account of the Theory and Practice of Hair-dyeing*, 1929, and *Hair Dyes and Hair Dyeing. Chemistry and Technique*, 1934; G. S. Miller, *Human Hair and Primate Patterning*, 1931; and Agnes Saville, *The Hair and Scalp*, 1914.

Hair Balls, see GREGORY.

Hair-eel, or **Hair-worm**, name applied

to various species of Nematelminthes, and particularly to those of the genus *Gordius* (q.r.) because of their thread-like shape.

Hairs in Plants are natural excrescences from epidermal cells. They are many in kind: root hairs are one-celled tubes; stinging hairs, with a drop of poison on the top, are attached to the nettle genus (*Urtica*), and glandular hairs, the glands being either at tip or base, characterise the sun-dews (genus *Drosera*). Ferns have scaly hairs: bristles are merely hairs made rigid with silica, etc., and the prickles of rose-trees and brambles are hairs grown firm and woody. Externally they grow on any part of the plant, whilst in a few species they cover inner surfaces. The function of hair underground is to absorb food, i.e. water and minerals, and above ground to afford protection from frost, cold, or excessive radiation.

Haiti (Hayti), **Santo (San) Domingo**, or **Hispaniola**, is, in the W. Indies, lying in the centre of the chain, and second in size to Cuba. Since the discovery of the is. by Columbus in 1492 there has been no generally accepted designation for it. Columbus called it *Española* (Hispaniola), 'Little Spain,' whereas the native name for it was Hayti (Haiti), 'Highlands,' and after the first settlement the is. received the name of San Domingo. In 1677, when Spain ceded the W. section to France, the name H. was reserved for the W. part of the is., Santo Domingo for the E., and the whole land was known as Hispaniola. The is. has a length of 400 m., with an extreme breadth of 162 m., and a total area of 28,000 sq. m. It is essentially a mountainous region, and the steep escarpments run right down to the shores. The highest point is Mt. Loma, 10,300 ft., which is situated N.W. of the city of Santo Domingo. It has a coast-line of 1250 m., which has some good harbours, the Samana inlet containing one 30 m. in length. There are four large rivers, the Yagui, the Neyba, the Yuma, and the Artibonite, as well as smaller ones, but the mouths of all are obstructed by shallows, so that they are only navigable for light riv. craft. H. has a wider range of climate than any other part of the Antilles, owing to the great diversity of its relief. The yearly rainfall is abundant, but is badly distributed; the uplands are constantly bathed in dense mists or heavy rains, while other dists. have hardly any rain. The mts. are densely wooded, and such valuable species as rosewood, mahogany, satinwood, pines, cedars, oaks, and ironwood are found. All tropical fruits, too, arrive at perfection, the coffee shrub yielding heavy crops, and no other region is better suited for tobacco and sugar culture. Sev. ores exist in abundance, gold, silver, copper, tin, etc., but the mines are no longer worked. H. is predominantly agric.; except for services such as electric light, automobile depots and garages, and a single large-scale sugar factory there is no industry or outlet for industrial training. The chief agric. products are coffee, cotton, sisal, sugar, tobacco, pineapples, and bananas. Apart from retail trade commerce is confined to the seaports, and

is largely in the hands of foreigners. The retail textile trade in particular is in the hands of Syrians, Palestinians, and other Levantines who are detested by the native ruling classes.

The republic of H. owns the W. part of the is., and has an area of 10,204 sq. m. The old constitution of H. provided for freedom of worship, trial by jury, freedom of the press, etc. H. is now governed under a constitution ratified in 1918, which provides for the creation of a Senate and a Chamber of Deputies. H. is governed under a centralised system provided by the constitution of 1935, to which, however, many amendments were added in 1939, considerably enhancing the powers of the National Assembly. The president is elected by a two-thirds vote of the Assembly, and serves for five years. The Assembly, which has exclusive power to amend the constitution, consists of thirty-seven deputies and twenty-one senators, and, as life members, all ex-presidents who have completed their term of office since 1930. Deputies are elected for four years by popular vote; senators for six years, eleven of them by being elected by the deputies and ten appointed by the president. The pop., which, in 1936, was estimated at 3,000,000, is almost entirely composed of Negroes (with some 3000 white foreign residents) who speak a *patois* of Fr. origin known as 'creole,' but Fr. is the official language. The chief towns are Port-au-Prince (cap.), with a pop. of 125,000; Cap-Haitien (20,000); Aux Cayes (15,000); Gonaïves (12,000); Jacmel (10,000); St. Marc (10,000); Port de Paix (8000); and Plaisance, (Gros Morno, and La Croix des Bouquets in the interior. There is regular passenger steamship communication with New York, Jamaica, Cuba, and the Canal Zone. There is regular passenger and mail air communication with U.S.A. via Cuba, and with S. America via Santo Domingo, Puerto Rico, and Trinidad. There are freight services between H. and the chief European ports, New York, gulf ports, other is. of the Antilles, the Canal Zone, and Colombia. There are about 135 m. of railway. Wireless telephony was estab. in 1937 between H. and Puerto Rico, Santo Domingo, New York, and Europe. A wireless broadcast station has been erected at Leogane, some 20 m. W. of the cap.

History.—After the discovery of H. by Columbus, who called it *Española* (Little Spain), adventurers from Europe, drawn by the usual stories of gold, flocked to the is. and in three decades crushed the aborigines out of existence. Negro slaves were first brought into the is. at the opening of the sixteenth century, and in 1517 the importation of 4000 slaves annually was authorised. In 1630 a pilked colony of Fr. and Eng., who had been driven out of St. Kitts (q.v.) and estab. buccannering hide-outs on Tortuga, settled in H. At the end of the century that part of H. which they occupied was ceded to France by the treaty of Ryswick, and named Saint Dominique by the Fr. The colony prospered until the Fr. Revolution, when the free coloured people demanded that

the Fr. revolutionary principles should apply to them. This was opposed by the Fr., and conflict ensued. In 1791 the mulattoes, disappointed at not being made Fr. citizens, sided with the Negroes against the Fr. in a war which originated in a slave rising. In 1793 the abolition of slavery was proclaimed, and the Eng. having invaded the is., Toussaint L'Ouverture, leader of the Negroes, threw in his lot with the Fr., who made him commander of their forces. The Eng. were expelled in 1798, and the Fr. thus became masters of the whole is., which had been ceded to them by the treaty of Basle in 1795. Toussaint in 1801 set up a constitutional form of gov. with himself as president for life, but Bonaparte, with the intention of reintroducing slavery, dispatched a large force to the is. under his brother-in-law, Gen. Leclerc. The Negroes took to the mts. and a desultory war followed until Leclerc, havingajoined Toussaint into suspending hostilities and invited him to a parley, treacherously sent him to France, where he d. in prison in 1803. The infuriated Negroes renewed the struggle under Gen. Dessalines, a former black slave who had fought under Toussaint, in the same year, but on the approach of an Eng. squadron they agreed to evacuate the is., and in the next year its independence was declared, and the old name H. restored, Dessalines being made governor for life. Later that year he proclaimed himself emperor, but was assassinated in 1806, and two rival chiefs, Christophe and Pétion, set themselves up in the N. and S. respectively, while the Spaniards seized the E. part of the is., naming it Santo Domingo. Pétion d. in 1818, and Christophe took his own life two years later. Gen. Boyer was master of the is. until 1843, but was expelled by a revolution, and in 1844 the people in the E. part estab. the Dominican republic; and from that date the two political divs. have been maintained. In 1915 a treaty was concluded with the U.S.A. for the control of various public services by Amer. officials. In 1931 the U.S. officials in charge of public health, public works, and other services were withdrawn, while the last U.S. marines evacuated H. after an occupation of nineteen years. Until 1947 the financial service was under Amer. control, there being a fiscal representative and his deputy, who were appointed by the president of H. on the nomination of the Amer. president. The Amer. control of the Haitian reserves ended officially on Oct. 1, 1947, when the Haitian Gov. redeemed the outstanding balance of the Amer. loan (1922), amounting to \$5,400,000. See H. P. Davis, *Black Democracy, the Story of Haiti*, 1938; Z. N. Hurston, *Voodoo Gods*, 1939; and J. G. Leyburn, *The Haitian People*, 1941.

Hai yun tau, or Hai Yan Tao, Battle of, was a battle of the Sino-Jap. war of 1894-95. It was fought on Sept. 17, 1894; the Chinese fleet was commanded by Adm. Ting, and the Jap. by Vice-Adm. Ito. The battle resulted in a Jap. victory, by which they obtained the command of the sea in that quarter.

Hajdu-Böszörmény, see BÖSZÖRMÉNY. **Hajdu-Dorog**, com. and mkt. tn. of Hungary, in the prov. of Hajduken, situated 20 m. N.W. of Debreczen. Pop. 10,000.

Hajdunahas, tn. and magistracy of Hungary, in the prov. of Hajduken, situated 20 m. S. of Tokay. Pop. 20,000.

Hajipur, tn. of Bengal, India, on the Little Gandra at its junction with the Ganges, in the Muzaffarpur dist. It has considerable water traffic. The old fort here was taken by the imperial troops in 1572 and 1574. Pop. 26,000.

Haji, see HADJ. **Hakata**, seaport tn. of Japan on the N.W. coast of Kinshin Is., 70 m. N.N.E. of Nagasaki, with manufs. of silk. It is also noted for its talence ware. Pop. 25,000.

Hake, Thomas Gordon (1809-95), Eng. poet, was b. at Leeds and came of an old Devonshire family. His mother's maiden name was Gordon. He entered the medical profession, studying at St. George's Hospital, London, and at Edinburgh, but he abandoned medicine for literature. He met with a friend in Dante Gabriel Rossetti, who keenly interested himself in his literary efforts. When he was thirty years of age he pub. a prose epic called *Vales*, which was reprinted as 'Valdarno' in *Anisworth's Magazine*. His poems were reviewed by Rossetti in the *Academy* and *Fortnightly Review*. His chief productions are *Madeine* (1871); *Parables and Tales* (1872); *The Serpent Play* (1883); *New Day Sonnets* (1890); and *Memoirs of Eighty Years* (1892). A civil list literary pension was bestowed upon him in 1893, which he lived to enjoy for only two years.

Hake (Merluccius), fish of the cod family, which has an elongated body, two dorsal fins, one short and one long, and a very long anal fin. The head is flattened, and the mouth has no barbels. It varies in length from 3 to 4 ft., and has a dark grey back, but is much lighter at the sides and underneath. It is found in the Brit. seas and off the coasts of Europe and E. N. America, and large quantities are consumed as food, the flesh being white and flaky. The spawning season is from March to June, and during these months the fish keep near the bottom and has to be caught by trawl-nets; at other times it is taken by lines.

Hakim-ibn-Allah, see AL-HAKIM-IBN-OTTO.

Hakkas ('guests' or 'strangers'), people of China found chiefly in Kwangtung, Fukien, and Formosa. They differ from the Chinese in disposition, appearance, and customs, and speak a distinct dialect. They are very industrious and have great intelligence, and serve as intermediaries between the Chinese and European traders and natives. They were persecuted by the native pop. for over 2000 years, yet at the invasion of Kublai Khan they distinguished themselves by their bravery on the Chinese side.

Hakluyt, Richard (1551 or 1552-1616), Eng. geographer; belonged to a family long settled in Herefordshire, and traceable c. 1280 under the name of Haklutel or Hakitel. Educated at Westminster

School and Christ Church, Oxford, where he held a studentship for sev. years after taking his degree. To distinguish him from his cousin and namesake, R. H. the lawyer, he is sometimes referred to as R. H. the preacher. II. the lawyer, a not-worthy but minor character in the Elizabethan story, was head of the family and possessor of the Herefordshire property. H. took holy orders, the only course open to a man of no private fortune, who wished to devote his life to scholarship, and particularly to cosmography. Became prebendary of Bristol, 1586, and seven years later archdeacon of Westminster. His books had a strong practical purpose, being indeed called for by the spirit and necessities of the times. That H. was consciously a publicist and a historian as well as a geographer is evident from his own words: thus in his dedication of a pub. to Raleigh in 1587 he remarks that 'geography is the eye of history' in a context which leaves no doubt that hist. is the primary motive and geography accessory. The Elizabethan period called for work of a publicist and a counsellor for present and future enterprise across the ocean, and the public interest with which II. was concerned was first the revival, and then the advancement of national greatness by means of trade. II. was a forceful advocate of the colonial school of thought and of sea power, though by the latter he meant rather seamen and merchant shipping than warships and guns. In 1582 he pub. *Divers Voyages touching the Discovery of America*. This work was new of its kind, and an admirable piece of work for the end in view, namely to interest intelligent men in the enterprise then about to be undertaken by Sir Humphrey Gilbert: to colonise N. America; for though H. did not give prominence to Gilbert's name or intentions, he familiarised the reading public with the idea of Eng. dominion in N. America. In 1584 H. visited London, where Raleigh engaged him to aid his project for colonisation in America, and the outcome was the *Discourse of the Western Planting*, his longest piece of continuous writing, and different in literary character from the editorial work which occupied most of his career. It was first printed in 1877, or 300 years after it was written. In fact the book was directed at the queen, and is worth perusal to-day as a 'fascinating essay in planning, wisely rejected,' but it failed to move Elizabeth. H. went to Paris, where he encountered gibes from Fr. and Portuguese at England's failure to rise to her opportunities. This aroused his feelings as a patriot, and set him to work on a new project of wide scope—a complete collection of all the Eng. travels and explorations by sea and land since the beginning of Eng. hist. The full title, so characteristic of II.'s rolling style, is *The principall Navigations, Voyages and Discoveries of the English nation made by Sea or over Land, in the most remote and farthest distant Quarters of the earth at any time within the compass of these 1500 yeeres*. It was an epoch-making work, dedicated to Sir Francis

Walsingham, and pub. in 1589; it was superseded by the author ten years later by a much longer work, under an almost identical title. This latter work was in three vols., the first dedicated to Lord Howard, the second and third to Sir Robert Cecil. It was the crown of II.'s career, and has always been highly esteemed. Froudo called it 'the prose epic of the English nation.' In the final *Voyages*, indeed, H. created a living book, which is bought and read to this day. It may be said, too, that he is known to-day by this one book, for all his other work was for his own generation, and much of it was forgotten until the rediscovery by modern research. His *magnum opus* was reprinted in 12 vols. (the Glasgow ed.) in 1903-5. It is also in Everyman's Library. His last work was a trans. from the Portuguese, known as *Virginia Richely Valued* (1609). II. is buried in Westminster Abbey. See centenary vol. of H. Society, *Richard Hakluyt and his Successors*, H. Society works, second series, No. XCIII., 1946.

Hakluyt Society was founded in 1816 for printing 'rare and valuable Voyages, Travels, Naval Expeditions, and other geographical records.' The H. S., therefore, described its work as geographical. But its 225 vols. (down to 1946) were to build up, nevertheless, a collection of material whose interest became increasingly historical as the scope of hist. expanded to embrace it. Some 225 vols. have now been issued by the society, which include *Divers Voyages* (1850); *Principall Navigations* (1903-5); Adm. Bethune's ed. of II.'s *Galeão* was pub. in 1862; Bealey's ed. of *Carpini, Kubruquis*, and other medieval texts from II. in 1903. The society also issued Purchas's *Pilgrimages* (1903-5). See centenary vol., *Richard Hakluyt and his Successors*, H. S. works, second series, No. XCIII., 1946.

Hakodate, or Hakodadi, seaport tn. of Japan on the is. of Yezo; it was formerly the cap. of the is. until supplanted by Sapporo. It is frequently compared with Gibraltar on account of its position. Before the Second World War there was daily steamboat traffic with Aomori, and also passages to Yokohama, etc. II. is connected by rail with Tokio. The exports are edible seaweed, dried fish, fish manure, fur, sulphur, beans, pulse, etc., but foreign trade was of small account even before the war. Pop. about 207,000.

Hakon, see HAAKON.

Halas, or Kiskunhalas, tn. of Hungary, situated on Lake Halastó, 75 m. S.S.E. of Budapest. There is a trade in wine. Pop. 19,000.

Halberd, or Halbert, weapon, which consists of a combined spear and axe, i.e. a wooden staff about 5 ft. long, surmounted by an axe-blade, the end opposite the staff furnishing a spear. This weapon was much used during the fifteenth and sixteenth centuries, and while similar in make, its varied a little in shape; some blades were extremely narrow, while others were flat, broad, and double-edged. The H. originated in Germany and Scandinavia, and later was used by the Swiss,

Fr., and Eng. Now the H. is carried by yeomen of the guard on ceremonial occasions, being a mere symbol of authority.

Halberstadt, tu. of Saxony, Germany, situated at the base of the Harz Mts., on the R. Holtemme, a trib. of the Bode, 30 m. S.W. of Magdeburg. It is extremely quaint; many houses date from the fifteenth century and are decorated with fine carving. The cathedral (thirteenth to fifteenth century) is Gothic and, viewed from the interior, is particularly lofty and majestic. Before the Second World War the tn. had manufs. of gloves, sugar, etc., and there are railway works, paper mills, and breweries. It was heavily raided by allied bombers in daylight on Feb. 22, 1944. Pop. 50,000

J. B. S. HALDANE

Halcyon Days, see **ALCYON**.

Halcyone, see **ALCYONE**.

Halcyonides, see **KINGFISHERS**.

Haldane, James Alexander (1768-1851), Scottish preacher, b. at Dundee. When a man he settled in Edinburgh (1794), and estab. the Society for Propagating the Gospel at Home (1797). In this work he was aided by his brother, Robert, and friends. He seceded from the Church of Scotland, and founded in Edinburgh in 1799 the first Congregational church in Scotland, and became its pastor. He wrote numerous controversial treatises, but more important are his itinerant evangelistic tours throughout Scotland. His brother built for him a great 'tabernacle' in Leith Walk, Edinburgh. See A. H., *Lives of Robert and James A. Haldane*, 1852.

Haldane, John Burdon Sanderson, Brit. man of science; b. Nov. 5, 1852; son of Prof. John Scott H. Educated Oxford Preparatory School; Eton; and New College, Oxford (where he obtained a first in greats, or classics). Served with the Black Watch in First World War (France and Iraq); twice wounded; captain, 1915. Fellow of New College, 1919-22. Dunn reader in biochemistry, Cambridge Univ., from 1922 to 1933, when he left Cambridge to become prof. of genetics at London Univ., a post which he held until 1937, when he was elected the first prof. of biochemistry at Univ. College. Head of genetical dept., John Innes Horticultural Institution, since 1927. In 1930 he became Fullerian prof. of physiology at the Royal Institution. He has attained celebrity by uniting scientific attainments with a wonderfully facile literary style. Most of his technical writings—on physiology, natural selection, etc.—are in the *Journal of Physiology*, the *Journal of Genetics*, and the *Proceedings of the Cambridge Philosophical Society*. The general public has read with interest *Dædalus, or Science and the Future* (1924); and *Callinicus: a Defence of Chemical Warfare* (1925). In the *To-day and To-morrow Series*; a book of short papers entitled *Possible Worlds* (1927); and *Science and Ethics* (1928). He has written, in collaboration with Julian Huxley, *Animal Biology*, a students' book (1927). Later publs. include *Enzymes* (1930); *The Causes of Evolution* (1933); *The Marxist Philosophy and the Sciences* (1935); *New Paths in Genetics* (1941); and *Science Advances* (1948). He is also well known for his broadcast talks.

Haldane, John Scott (1860-1936), Brit. scientist, b. in Edinburgh, brother of Viscount H. (q.v.). Studied physiology at various univs., and became reader in that subject at Oxford. His most valuable achievements in research were in the principles of respiration. Expert on problems of atmosphere in mines. He devised the H. gas-analysis apparatus.

Haldane, Robert (1764-1842), Scottish propagandist, brother of James H., b. in London. He was educated at Edinburgh Univ., and spent some years in the navy, being present at the relief of Gibraltar, but in 1783 retired to Airthrey, near Stirling. Here he devoted himself to the advancement of Christianity, and in 1797 founded, with his brother and others, the Society for the Propagation of the Gospel at Home. In Montauban in 1817 he procured the printing of two eds. of the Bible in Fr., and circulated a Fr. trans. of his *Evidences and Authority of Divine Revelation* (one of his most important works). He returned to Scotland in 1819. He also wrote *The Authenticity and Inspiration of the Scriptures* (1828); and *Exposition of the Epistle to the Romans* (1835).

Haldane of Cloan, Richard Burdon Haldane, Viscount (1856-1928), Brit. Liberal statesman and critical philosopher, b. in Edinburgh. He was educated at Edinburgh Academy, and there, leading a life of the most Spartan simplicity, laid the foundations of that profound scholarship

which made his subsequent career so distinguished. He graduated at Edinburgh Univ., where he gained every possible distinction in philosophy and acquired a good knowledge of science and mathematics, and then at Göttingen, where, as the pupil of Lotze, philosophy became his governing passion. He was called to the Bar in 1879, becoming queen's counsel in 1890. He entered Parliament in 1885 as member for Haddingtonshire, and retained his seat until 1911. His entry into Parliament was almost contemporaneous with that of Asquith and Lord Grey of Faldoon with both of whom he was soon on terms of close friendship. Gladstone was then Prime Minister but H., whose legal activities precluded continuous attendance at the House did not at that time attract the Premier to the same degree as did his two friends, but three years later when the Conservatives were in office, his sound judgment on educational administration coupled with his support, though a Liberal of Balfour's unsuccessful attempt to solve the Roman Catholic university question (*q.v.*), proved his worth as adviser unbiassed by faction or prejudice.

He was eminent alike in law, politics, and philosophy and exercised a more enduring influence on contemporary institutions than any man of his time. At various periods of his career he aroused strong antagonism, as might be expected of a thinker and statesman whose opinions went beyond mere party bounds and who like Hegel realised that democracy with out true leadership could degenerate into the rule of the mob. Unlike many successful statesmen who have used the Bar as a stepping stone to politics H. also left his mark as a lawyer his judgments in the House of Lords and in the Privy Council affording many notable precedents. In this sphere he rendered much assistance in the thorny problem between the govts of Canada and Newfoundland concerning the Labrador boundaries, while as a law reformer he had a large share in rationalising the law of real property. During the S. African war 1899-1902, he was conspicuous as a Liberal imperialist, being vice president of the Liberal League in 1901. In that war as in the crises of Home Rule and Tariff Reform Liberal cohesion was sorely tried but H. always pursued an independent line, and it is probable that his views better reflected the opinion of the nation than those of his colleagues. He refused to join in Campbell Bannerman's condemnation of the gov't action in the S. African war, and strongly opposed Milner's reactionary proposal, later on to suspend the constitution of the colony. With the Education Bill of 1902 however Liberal unity was restored and intensified by their opposition to Chamberlain's tariff reform proposals of 1903 in which opposition H. played an important part. But the great landmark in his political career was his appointment in 1905 as secretary of state for war. His great work in that capacity was the supplementing of the reforms of Cardwell (*q.v.*) by the creation of an expeditionary

force, the substitution of the territorial force (now army) for the old volunteers and militia, and the formation of a general staff on the lines recommended by the Kisher Committee—reforms which not only terminated a period of drift and indecision, but so reorganised and modernised the military forces of the nation as to enhance beyond all recognition its chances of meeting the subsequent crisis of the First World War. Some experts have alleged that H. was wrong in cutting down the artillery to effect these reforms, but the success of the expeditionary force in

Optical Press

LORD HALDANE

1914 in face of colossal difficulties does not justify this contention. Less sincere if more flattering is the attempt made in the *Life of Henry Wilson* (chief of the general staff in the later years of the war and afterwards) to credit Wilson with the greater part of H.'s reforms but evidently without any striking success, and the reputation of H. as the greatest war minister since Cardwell seems securely established. A detailed account of his part in advising the Cabinet on the military measures necessary to meet a possible world crisis is to be found in *British Documents on the Origins of the War* (ed. by Gooch and Temperley) where it will be seen that the Moroccan imbroglio had by 1905 already opened the eyes of the Brit. Govt. to the possibility of a world crisis with Germany. H.'s military reforms were probably the utmost that could have been accomplished on the basis of the voluntary system, for he was opposed to the champions of compulsory service, in which attitude he was supported both by the general staff and by the general body of opinion in the country. Possessing an exceptional knowledge of Germany H. in the period before the First World War, was the chief ministerial adviser to the foreign secretary in questions appertaining to that country, and his cautious sympathy with Ger. ideals and institutions tempered the pronounced

anti-Teutonic attitude of the departmental advisers. This sympathy for Germany became crystallised in the famous phrase in which he described the country as his 'spiritual home,' a phrase which brought down on him unmeasured and ill-judged condemnation during the war, an outcry which in no way weakened his goodwill towards Germany, as may be seen in his *Before the War*, pub. in 1920. H. at all times worked hard for the preservation of concord between Great Britain and Germany, and his visits to Berlin in 1900 and 1912 did temporarily allay mutual suspicions. When the First World War broke out H. gave the gov. his unqualified support; but, on the formation of the first Coalition Gov. in 1915 the Conservatives demanded his exclusion from office, and Asquith yielded to the demand, a surrender which permanently cooled the friendship between the two statesmen. The immediate result of the severance was, however, to accentuate H.'s natural tendency to independence of judgment, and, after the war, he transferred his services to the Labour party, becoming their first lord chancellor, in 1923, this being the second time he had occupied the post. In the former occasion being when he succeeded Lord Loreburn in 1912. His position was, however, anomalous, and after the defeat of his party in 1924 it is doubtful whether he would have again resumed office, though he remained leader of the Opposition in the Lords. He was rector of Edinburgh Univ. and chancellor of the univ. of Bristol before the war. After the war, when the Goethe Society was revived, he succeeded Sir Adolphus Ward in the presidency.

As a philosopher, H. initiated no new school of thought, and was hardly a constructive philosopher in any sense of the term. A confirmed adherent of the Hegelian metaphysics, his philosophical reputation rests partly on his interpretation of Hegelian thought, and partly on his own doctrine of the fundamental character of knowledge and of degrees of knowledge and reality. From 1902 to 1904 he was Gifford lecturer in St. Andrews Univ., and in 1903 pub. *The Pathway to Reality*, his most important work, the thesis of which is his belief that reality is knowledge—a conviction which he attempted, later, to connect with Einstein's theory of relativity. His other chief works on philosophy are *Essays in Philosophical Criticism* (in collaboration with Prof. Seth, 1883); *The Philosophy of Humanism* (1922); *Human Experience* (1926), a summary of his opinions, which was widely read; and *Affirmations* (1928), a series of pamphlets on his doctrine of knowledge. Other works, *Life of Adam Smith* (1887); a trans. of Schopenhauer's *World as Will and Idea* (in collaboration with J. Kemp, 1883); and *Education and Empire* (1902). He was made Viscount H. of Cloan in 1911, being the first to hold that title. See his autobiography, 1920, and F. Manlio, *The Life of Viscount Haldane of Cloan*, 1939.

Halde, Jean Baptiste du (1674-1743), Fr. Jesuit, b. in Paris. For many years he

was occupied in adapting the letters and reports of the missionaries for pub., and from this source derived his material for his great work, *Description géographique, historique, etc., de la Chine*, pub. in 1735. This book has been trans. into many languages, including Eng., and was long regarded as the standard work of reference on the subject of which it treats.

Halden, see FREDERICKSHALD.

Hale, Edward Everett (1822-1909), Amer. Unitarian minister and author, b. at Boston, U.S.A., and graduated at Harvard (1839). In 1856 he became pastor of the S. Congregational Society in Boston, a Unitarian church, only resigning in 1899. Though he regarded his Christian ministry as his true work in life, he yet found time to contribute voluminously to the periodical press, to edit magazines and newspapers, and to be the author of over sixty vols. of fiction, juvenile stories, hist., biography, and sermons. His fame as a writer rests chiefly on his celebrated short story *The Man without a Country*, which, contributed to the *Atlantic Monthly* during the darkest moments of the Civil war, is said to have done much to help the cause of the Union in the N. The detailed realism of style he employed in this and in other of his non-romantic stories, such as *Ten Times One is Ten* (1870), induced in many readers the belief that the narrative was a record of sober fact. The last-named story, centring on its hero Harry Wadsworth and his motto 'Look up and not down,' led to the formation in some parts of the country of Look-up Legions and Harry Wadsworth clubs—all indicative of the strong influence his personality always exercised, especially on New England life. His other writings include *Franklin in France* (1887-88), written in collaboration with his son, and *James Russell Lowell and his Friends* (1899), both these works being the fruit of much painstaking research. A collected ed. of his works appeared in 1898-1901. See H. Hale, *The Life and Letters of Edward Everett Hale*, 1917.

Hale, George Ellery (1868-1938), Amer. astronomer, b. at Chicago, Illinois, U.S.A. He organised the Kenwood observatory and, while there, invented an instrument for photographing the sun in certain aspects of its light. In 1892 he was made assistant prof. of astronomy at the univ. of Chicago, and organised and became director of the great Yerkes observatory. In 1904 he left Chicago, and organised the even bigger observatory at Mt. Wilson, California, and was connected with it as director from that date until 1923. He became noted among his peers as a specialist in solar physics, particularly solar vortices and solar magnetic fields. Awarded the Copley medal of the Royal Society, and numerous other foreign distinctions. Among his best-known books are *The Story of Solar Evolution* (1908); *The Depth of the Universe* (1924); *Beyond the Milky Way* (1925); *Signals from the Stars* (1930); and numerous books and papers on spectroscopy and solar and stellar physics.

Hale, Horatio Emmons (1817-96), Amer. lawyer and philologist, b. in New Hampshire. Graduated at Harvard in 1837. His great work, *Ethnology and Philology* (1846), the 6th vol. of the reports on Charles Wilkes's exploring expedition of 1838-42 (see WILKES, CHARLES), contains a large amount of philological data and is said to have laid the foundations of the ethnography of Polynesia. He also ed. *The Iroquois Book of Rites* (1883).

Hale, Sir Matthew (1609-76), Eng. lawyer and judge, was b. at Alderley in Gloucestershire. He was called to the Bar in 1637, and in 1653 became judge in the court of common pleas. In 1655 he sat in Cromwell's Parliament, but on the Restoration (1660) he was made chief baron of the exchequer, and received the order of knighthood. In 1671 he was made lord chief justice, but resigned in 1676 owing to ill-health. It is significant that while H. was neither a good speaker nor a bold pleader he rose to the head of his profession, but he owed his success to the fact that he steered a middle course, realising that a judge and lawyer can best serve his country who holds himself aloof from partisanship. He wrote *History of the Common Law of England* (1713); and *History of the Pleas of the Crown* (1736). He was also the author of *Contemplations, Moral and Divine* (1676), containing edifying discourses, together with seventeen effusions in the heroic couplet, and numerous MSS. on legal and religious subjects, which were pub. after his death.

Hale, par., tn., and vil. of Cheshire, England, about 2 m. S.S.E. of Altrincham and 7 m. W.S.W. of Stockport. The par. has an acreage of 372½, and contains the Altrincham Girls' Home, estab. in 1883, which has accommodation for sixty girls. Pop. 13,200.

Haleb, see ALEPPO.

Halebid, vil. of Mysore, India, and the site of the ant. Dorasamudra. There are the ruins of two temples which were never completed, but which are regarded as masterpieces of Hindu architecture.

Halepa, see CANEA.

Hales (Doctor Irrefragabilis), see ALEXANDER OF HALIS.

Hales, Alexander, see ALESIOUS.

Hales, John (1581-1636), Eng. scholar and theologian, often called 'the Ever-memorable', was b. at Bath. He was educated at Corpus Christi College, Oxford, and in 1612 became public lecturer on Gk. to the univ. He was present at the Synod of Dort in 1618, and his reports are included in his *Golden Remains* (1659). In 1636 he wrote a tract, *Schism and Schismatics*; this fell into the hands of Laud, who made H. one of his chaplains, and obtained for him a canonry at Windsor. In 1642 he was deprived of his office, and retired to Eton. See H. J. Elson, *John Hales of Eton*, 1918.

Hales, Stephen (1677-1761), Eng. philosopher, physiologist, and inventor, b. a Beckesbourn; educated at Cambridge and Oxford; was curate of Teddington from 1709. He invented artificial ventilators and other contrivances. His valuable researches in vegetable physiology were

pub. in *Vegetable Staticks* (1727), and in animal physiology in *Statical Essays* (1733). He also wrote *Philosophical Experiments* (1739). He was a F.R.S. in 1718. Copley medalist in 1739, and vice-president of the Society of Arts in 1755.

Halesowen, par. and mrkt. tn. of Worcestershire, England, situated in the Oldbury parl. div. The par. has an acreage of 12,439, and the tn. lies in a fertile valley, watered by the Stour and its feeders. There are extensive iron and steel works and manufs. of anchors, gun barrels, perambulators, agric. implements, etc. Wm. Shenstone, the poet, is buried here. The ruins of a Premonstratensian abbey, founded in 1215, are to be seen S.W. of the tn. Pop. (dist.) (1931) 36,100; (par.) 5000.

Halesworth, par. and mrkt. tn. of Suffolk, England, situated on the Blyth, 27 m. N.E. of Ipswich. There were a few breweries. Pop. 2,100.

Halévy, Elie (1870-1937), Fr. historian, b. at Etrolat, Seine-Inferieure, France, son of Ludovic H. Educated in Paris, at the Ecole Normale Supérieure and the Lycee Condorcet. In 1898 he became prof. at the Ecole Libre des Sciences Politiques. In 1896 appeared his *La Theorie platonicienne des sciences; La Formation du radicalisme philosophique* (3 vols.) in 1901-4. He is, however, best known as a student of Eng. hist. and institutions and as the author of *Histoire du peuple anglais au XIX^e siècle* (1913, 1923; trans. 1937, 1949).

Halévy, Fromental (Jacques François Fromental) (1799 1862), Fr. operatic composer of Jewish descent; entered Paris Conservatoire at the age of eleven, and became the pupil and friend of Cherubini, by whose musical purism he was greatly influenced. After a few still-born early works he first gained recognition with the excellent opera, *La Juive* (1835), adding later to his reputation by *La Reine de Chypre* (1841); *Prometheus Bound* (1849); and *The Tempest*, written the following year for a London production. In 1851 he was appointed secretary to the Académie des Beaux-Arts. His music, which consists almost entirely of lyrical dramas, is brilliant and charming, rather than great or profound; he has been called the Fr. Verdi. Sainte-Beuve relates that H. was a man of genial disposition and wide culture, an elegant poet, and an accomplished linguist. See lives by L. Halévy, 1862, and A. Pougin, 1865.

Halévy, Joseph (1827-1908), Fr. Semitic scholar, was b. at Adrianople. He wrote numerous books on Semitic, Berber, Indian, and Babylonian subjects, and for some time was prof. of Ethiopian at the Ecole des Hautes Etudes in Paris. In 1868 he made a journey to N. Abyssinia to study the religion of the Jewish Falashas, and in 1869 went to Yemen in quest of Sabæan inscriptions, collecting as many as 860. His chief works are *Mission archéologique dans le Yémen* (1872); *Etudes berbères* (1875); *Nouvel Essai sur les inscriptions proto-arabes* (1903); *Préliminaires assyrien en sumerien* (1905); and

Précis d'allographie assyro-babylonienne, 1912.

Halévy, Léon (1802-83), Fr. man of letters, brother of Fromental H., the composer. He wrote *Résumé de l'histoire des Juifs* (1827-28); *Poésies européennes* (1837); *Recueils de fables* (1844); *La Grèce tragique* (1845-61); besides a life of his brother, and sev. dramatic pieces.

Halévy, Ludovic (1834-1908), Fr. dramatist, was b. in Paris. From his early years he was connected with the stage, his uncle Fromental H. being associated with the opera, and his father Léon H. being a dramatist. He became famous by the production of his *Orphée aux enfers* (1858), a musical parody (a trans. of which was produced at His Majesty's Theatre, London, in 1911, by Tree). About 1860 he met Honoré Méilhac, and the two collaborated, producing operettas, farces, and comedies. Their works met with extraordinary success, both being endowed with wit, humour, and observation of character, but they owed a great part of their success to the music of Offenbach, as indeed did his *Orphée aux enfers*. The most celebrated were *La Belle Hélène* (1864); *Barbe-bleue* (1866); *La Grande Duchesse de Saxe* (1867); and *La Périochole* (1868). Their attempts at more serious drama were not so successful, but *Froufrou* (1869), made a great hit. H. also made a name as a novelist, and was elected to the Fr. Academy in 1884, his *L'abbé Constantin* (1882) being a great favourite. Other works of his are *Criquette* (1883); *Marcelle* (1883); *Kari-kari* (1892); *La Famille Cardinal* (1907); and *Deux Mariages* (1883).

Hale-White, Sir William (1857-1949), Eng. physician and historian of medicine, b. in London, son of Wm. Hale White (q.v.), better known as 'Mark Rutherford,' the novelist. Entered Guy's Hospital as a student in 1875; ten years later he was appointed assistant physician there; he was physician from 1890 to 1919, when he retired, and was made consulting physician. From 1886 to 1893 he was one of the joint editors of *Guy's Hospital Reports*, and contributed many papers to that journal over a period of fifty years. As president of the Fellowship of Medicine (1927-32) and as founder of the *Post-Graduate Medical Journal* he did much for medical education. He was president of the Association of Physicians of Great Britain and Ireland (1930-31), and one of the original editors of its journal. He wrote numerous books on medicine, but the work by which he is so well known to generations of students and practitioners is his handbook of *Materia Medica, Pharmacology, and Therapeutics*, the first ed. of which appeared in 1892, and the 26th ed. in 1944. His other works include *A Text-book of General Therapeutics* (1880); *A Text-book of Pharmacology and Therapeutics* (1901); and *Common Affections of the Liver* (1908). In 1923 he pub. a trans. of selected passages from Iacopo's *Treatise on Mediate Auscultation*, with a biography, in the series of *Medical Classics*, ed. by Dr. Charles Singer. During his retirement he devoted his leisure to the

study of medical hist. and pub. *Great Doctors of the Nineteenth Century* (1935); and a book on *Keats as Doctor and Patient* (1938).

Halfa, see EMPARTO GRASS.

Halfa, see under WADI HALFA.

Half-blood, related through one parent only. When two persons are b. of the same father, but not of the same mother, they are said to have a consanguinean relation one to the other, but if they have the same mother and not the same father their relationship is said to be uterine. In the succession to real or landed property a kinsman of the H. inherits next after a kinsman of the whole blood in the same degree, and after the issue of such kinsman when the common ancestor is a male, but next after the common ancestor when such ancestor is a female. So that brothers consanguinean inherited next after the sisters of the whole blood and their issue; and brothers uterine inherited next after the mother. But in the succession to personal property relatives of the whole and the half blood were on an equal footing. Under the new law, by which the rules of succession to both real and personal property are assimilated, relatives of the whole blood obtained priority over those of the half blood; thus, for example, if a person dies intestate, leaving surviving him brothers and sisters of the whole blood and a brother of the half blood the latter is excluded altogether and the estate is distributed equally among the others (Administration of Estates Act, 1925). It may be noted that in Canada kinsmen of the half blood inherit equally with those of full blood.

Half Dome, or South Dome, granite mt. of California, situated near the E. end of the Yosemite valley. It is separated from N. Dome by the canyon of the Tenaya Fork, and rises 8800 ft. above the sea level.

Half-pay, allowance given in the Brit. Army (corresponding to the Fr. *demi-solde*) to commissioned officers who are not actively employed, and is most commonly granted to those who have been promoted to higher rank when there is no vacancy for them. Officers, as a rule, can be put on H. at their own request or if suffering from illness, but can only continue on the list for five years, after which period they must resign, permanent H. having been abolished in 1884. They are then placed on 'retired pay,' and are liable to be called upon to serve in case of great emergency, or when the country is in peril.

Half-tone Process, see under PROCESS WORK.

Haliartus, anct. tn. of Greece in Bœotia, situated on a hill overlooking Lake Copais. It was burnt down by Xerxes (480 B.C.) and rebuilt. In 393 B.C. the Thebans defeated Lysander in front of H. It was finally destroyed in 371 B.C. by the Romans.

Haliburton, Thomas Chandler (1796-1865), author was b. in Nova Scotia, Canada. Called to the Bar there, he eventually rose to be chief justice, to which high office he was appointed in 1828. He retired in 1856, when he came to England, where he resided until his

death. He was the author of many books, including histories of his native prov.; but it is for his writings under the pseudonym of 'Sam Slick' that he became best known. The three series of *The Clockmaker, or Sayings and Doings of Sam Slick of Slickville* (1837-40), were reprinted in England and attracted much attention. His wit was racy, and the rigour of his outspokenness was only glided by the humorous coating under which he disguised it. There is a memoir by F. Blake Crofton (1889).

Halibut, or **Holibut**, so called because it was commonly eaten on holy days, is the name given to *Hippoglossus vulgaris*, a species of Pleuronectidae, or flat-fish (q.v.). It has both eyes on the right side, which is brown with deeper coloured markings, the under side being white; the mouth is symmetrically placed and very capacious; the body is smooth and covered with small oval scales. The H. attains considerable size, specimens 7 or 8 ft. in length being common on the coasts of N. America, but the flesh of smaller fishes is more highly esteemed; these are abundant on all the Atlantic coasts, though infrequent in the Eng. Channel.

Halicarnassus, anct. Gk. city of Asia Minor, on the site of the modern Budrum, situated on the S.W. coast of Caria on the Ceramic Gulf. Originally it was built partly on the is. of Zephyria, but the latter became united to the mainland during the course of time, and the city consequently was extended. It was founded by the Dorians, who settled there from Troezen, and was in 334 B.C. almost destroyed by the Macedonians. In 352 B.C. the Mausoleum—the tomb of Mausolus—was erected which was regarded as one of the seven wonders of the world. It consisted of a basement 142 ft. by 92 ft., a pedestal, ionic columns, a pyramid, and a chariot group. Herodotus and Dionysius were b. in the city.

Haliscora, see DUGONO.

Halicz, see GALICIA.

Halicz, or Galicz, tn. of E. Galicia, situated on the Dniester, 48 m. W.S.W. of Tarnopol and 70 m. S.S.E. of Lvov. Salt and soap are manufactured and a trade in lumber is also carried on. The tn. and fort of H. were bitterly contested in the First World War, falling to Gen. Brusilov (q.v.) on Aug. 27, 1914, in the Galician campaign. After being retaken by Austro-Ger. forces H. again fell to the Russians in July 1917, only to be taken again later that month by the Austro-Ger. armies in the course of the general debacle of the Russian armies during the initial stages of the Russian Revolution. In the Second World War the tn. fell to the Russians in their great drive of 1943-44 on Lvov and other strongholds. Pop. 5000.

Halidon Hill, hill situated 2 m. N.W. of Berwick-on-Tweed, England. It is noted for a battle fought, in 1333, between the Eng. and Scots, when the latter were defeated.

Halifax, Charles Montagu, Earl of (1861-1915), Eng. statesman and poet, b. at Horton in Northamptonshire. He was educated at Westminster School and Trinity College, Cambridge, and assisted

Newton in forming the Philosophical Society of Cambridge. In 1887 he wrote (with Matthew Prior) *The Country Mouse and the City Mouse* (a parody on Dryden's *Hind and Panther*), which secured him a great reputation. In 1889 he entered Parliament as member for Maldon; in 1892 was made lord of the treasury and commenced the national debt by raising a loan of £1,000,000. In 1894 he introduced a Bill for the incorporation of the Bank of England, following out Paterson's idea, and was for this made chancellor of the Exchequer. In 1895 he took measures to remedy the currency, and in 1897 was made first lord of the Treasury. In 1898 and 1899 he acted as one of the council of regency during the king's absence from England, and in 1899 accepted the auditorship of the Exchequer. He was impeached for malpractices in 1701 and 1703, and continued out of office during the reign of Queen Anne, but became first lord of the Treasury on the accession of George I. He is especially famous as a minister of finance.

Halifax, Edward Frederick Lindley Wood, third Viscount, of Kirkby-Underdale, E. Riding, Yorkshire (b. 1881). Brit. statesman, son of second viscount H. Educated at Eton and Christ Church, Oxford. Conservative M.P. for the Ripon div. of Yorkshire in 1910. Between 1921 and 1926, the year in which he was appointed viceroy of India and made Lord Irwin, he held successively the offices of parl. under-secretary for the colonies, president of the Board of Education, and minister of agriculture. Privy councillor, 1922. As viceroy of India he favoured the gradual development of Indian constitutional progress to dominion status, and endeavoured to reconcile Hindu and Moslem differences by promoting a conference in 1927. In 1929 he declared publicly in India that dominion status for India was the goal of Brit. policy in India, having, in England, previously submitted to the party leaders a statement that this was implicit in the declarations already made in India. Two years later he concluded a pact with Gandhi (q.v.). After his return from India he was appointed in 1932—having in that year succeeded to the title of Viscount H.—president of the Board of Education and, from 1935, was leader of the House of Lords. Held successively the offices of war secretary, Lord Privy Seal, and Lord President of the Council. In Nov. 1937 he visited Hitler at Berchtesgaden to discuss Anglo-Ger. relations, but nothing came of the visit, Hitler being in a moody unresponsive frame of mind. On the resignation of Mr. Anthony Eden (q.v.) H. was appointed foreign secretary (Feb. 25, 1938) in the gov. of Mr. Neville Chamberlain, and he held that post in the gov. of Mr. Winston Churchill until Dec. 1940, when he succeeded Lord Lothian as ambas. in Washington. As foreign secretary it fell to him to declare Britain's foreign policy. Although in Oct. 1938 he declared that the Brit. Gov. must lose no opportunity of helping forward the results of the personal contacts estab. between Germany, Italy,

France, and Great Britain at Munich, he made it clear, five months later, after Germany had invaded Czechoslovakia, and annexed Memel that force would be met by force and recalled that 'history recorded many attempts to dominate Europe, all ending in disaster to those who made them.' His speeches as foreign secretary before the outbreak of war and subsequently, admirably express the Brit. moral conscience, upholding the sanctity of treaties and the pledged word. See A. C. Johnson, *Viscount Halifax*, 1941, and S. Hodgson, *Lord Halifax*, 1941.

Halifax, George Montagu, second Earl of (1716-71), assumed the surname Dunk on his marriage, in 1741, to Anne Richards, the heiress of Sir Thomas Dunk. In 1748 he was made president of the Board of Trade, and helped to found Halifax, Nova Scotia. In 1757 he entered the Cabinet, and in 1761 was appointed lord-lieutenant of Ireland, and first Lord of the Admiralty. In 1762 he became secretary of state for the N. dept. under the earl of Bute.

Halifax, George Savile, first Marquess of (1633-95), Eng. statesman, b. at Thornhill, Yorkshire. In 1660 he was elected member for Pontefract, and in 1668 was created Baron Savile of Eland and Viscount H. He took an active part in passing through Parliament the Test Act of 1673; in 1680 was instrumental in getting the Exclusion Bill rejected, and in 1688 took the popular side on the occasion of the trial of the bishops. On the accession of William III. he was made Lord Privy Seal, and had considerable influence. H. was a great statesman and consistent in his principles, although he was not appreciated in his own day, earning for himself the title of 'Trimmer', which he defended in *Character of a Trimmer* (circulated in MS., 1685, and first pub. in 1688).

Halifax, municipal co. and bor. of W. Riding, Yorkshire, England, situated on the Calder, 7 m. S.W. of Bradford, 16 m. S.W. of Leeds, and 194 m. N.N.W. of London. It is served by the L.N.E. and L.M.S. sections of Brit. Railways. It ranks with Bradford, Leeds, and Huddersfield in the woollen and worsted manuf.; and in the vicinity are important coal-mines and iron and steel works; stone is also quarried. The tn. is chiefly modern, and contains some noteworthy buildings. The present par. church is the third that has stood upon the same site—once the centre of the tn., but now solitary and apart through successive waves of the pop. flowing away in the course of development of trade. Of the first church, built by the Cluniac monks of Lewes, c. 1120, some Norman fragments survive. A second and larger church was built c. 1290, and three of the windows of that building remain. The foundations of the present church were probably laid c. 1150, and took over forty years to build, but the last of the chapels was not completed until a century later. The Rekoby chapel, built in the reign of Henry VIII., is worthy of the old church. The Jacobean pews and the elaborately carved font cover are among the treasures of the church and the

clear windows in the choir, dating from the Commonwealth, are unique. Most of the other Anglican churches of H. were erected in the nineteenth century. Holy Trinity church belongs to the Classic style of the eighteenth century, but it has been restored later. One of these modern churches, All Souls, is among the masterpieces of Sir G. Gilbert Scott. Rom. Catholicism and the prin. Nonconformist denominations are represented by many churches. The tn. hall was designed by Sir Charles Barry, the architect of the Houses of Parliament. It is in the H. style, and the upper portion of the tower is richly decorated by groups of figures representing Britannia supported by figures of Science and Art. It was opened in 1863 by the Prince of Wales (King Edward VII.). Belle Vue, the residence of the late Sir Francis Crossley, was acquired by the corporation of H. in 1889 and adapted for a public library. The Akroyd branch library is at Bankfield, former residence of Edward Akroyd, also a noted benefactor of the tn. The Belle Vue museum was founded in 1897. Its reorganisation on modern lines, begun in 1937, was interrupted by the war. The Bankfield museum and art gallery in Akroyd Park, was opened in 1887; its main interests are textiles, art, and ethnography. Shibden Hall, in Shibden Park, now scheduled as an anct. monument, is a very fine 'period' museum, and the hall is a notable example of the old timbered houses of England, containing seventeenth-century furniture and a valuable collection of MSS. relating to the dist., early printed books and court rolls. The bor. market was erected by the corporation at a cost of £100,000. The Prince's Arcade, at the junction of Woolshops and Market Street, was opened in 1931. The Royal Infirmary of H. dates back to 1807, when it was founded as a dispensary. It now possesses outpatient, X-ray, rehabilitation, and pathological depts., and two operating theatres. One of the most prominent buildings is Wainhouse's Tower (270 ft.), built in 1871 of stone from nearby quarries and intended for use as a chimney, but kept as a tower and landmark. The war memorial in front of the central library resembles the Whitehall cenotaph. It may be mentioned here that H. suffered comparatively little air-raid damage in the Second World War. The many parks and open spaces include Shropps Park, overlooking Wheatley Valley; Savile Park (formerly Skircoat Moor), with Albert Promenade overlooking Conley Valley, the People's Park, presented by Sir Francis Crossley, W. View Park, Shibden Hall and Park, Akroyd Park, Belle Vue Park, Manor Heath, and numerous recreation grounds, and the Jerusalem Farm camping site, at Luddenden Dene, a local beauty spot.

Industries.—Textiles and allied trades are the chief occupations of the inhabs., a feature of the tn., viewed from the surrounding hills, being the large number of mill chimneys. The woollen trade was in existence in H. in the latter part of the thirteenth century, local records for that period referring to 'websters' (weavers),

'walkers' (fullers), and 'litsters' (dyers) as carrying on the trade. Later H. became the centre of the W. Riding for piece goods, which were taken by the weavers to the Piece Hall for disposal. When the railways were made H., unfortunately, was not placed on the main line, and Bradford consequently became the centre of the textile trade so far as markets were concerned. The carpet manufacturing firm of John Crossley & Sons is the largest industrial concern in H. Blouse, underclothing, and skirt manufacturing is also a well-developed industry. H. is an important centre of the machine-tool making industry, amongst the specialities being radial drilling, slotting, planing, boring, and shaping machines. As the general trades of the tn. are greatly varied, so are the branches of the engineering section. Wire manufacturers make specialities of telegraph wire, patent steel, and plough rope wire, and steel card and heald wire. The tn. also has a reputation for its fireclay products. The H. Chamber of Commerce was founded in 1862.

History.—In the Norman era H. was a very small hamlet in the manor of Wakefield, ruled by the Warrens, whose prin. castle was at Lewes in Sussex. Earl Warren had bestowed the par. church of H. to the priory of St. Pancras at Lewes. The par. of H. was one of the largest in the country, embracing the Upper Calder Dale from Brighouse to Todmorden, with its trib. valleys and surrounding moorlands. The townships of H. and Heptonstall were included in the gift to the priory. There is evidence that the cloth trade was indigenous, and estab. here long before the Flemish weavers came to England. But the weavers' guilds of York and other medieval cities endeavoured to monopolise the cloth trade and controlled the export of textiles. Hence the wares of H. men had to be sold in the fairs of the country, and in the fifteenth century the par. of H. produced more cloth than any other place in the W. Riding; and the large Perpendicular church of H. is a monument to the piety and wealth of H. people of those days. A section of the main street in H. is called 'Woolshops,' once the site of the wool-staplers' warehouses. Elland, Sowerby, and other hamlets were as populous and rich as the township of H., but H. was the eccl. cap. of the dist., and its fairs and markets the most important. A member of Parliament was allotted to the par. in the seventeenth century. About the middle of the eighteenth century the local weavers began making worsteds, and within a short time the W. Riding became the centre of the Eng. cloth trade. In 1779 the Piece Hall (now used as a market) was opened, an immense cloth hall, marking the zenith of the trade. In the nineteenth century the leading H. manufacturers and public men were the Crossleys and Akroyds. In 1801 the pop. was 12,000; in 1831, 22,000; and in 1851, 34,000. This rapid growth led to overcrowding, and appalling sanitary conditions, and an inquiry was initiated by John Crossley the mayor, and Edward Akroyd, both of whom laid out

model housing estates, gave public parks, almshouses, and churches. By charter of March 22, 1848, H. became a municipal corporation, and under the Local Government Act, 1888, the bor. became a co. bor. H. was granted a separate court of quarter sessions in 1923. For the purposes of municipal elections the tn. is divided into fifteen wards, and the council consists of fifteen aldermen and forty-five councillors, governed by a mayor. There are six secondary schools, forty-three primary schools, and two special (day) schools, besides a municipal technical college, which provides courses of study for those engaged in the trades, industries, and professions in H., and the surrounding dists. Pop. (1945 estimate) 89,000.

See J. Watson, *History and Antiquities of the Parish of Halifax*, 1775; J. Crabtree, *Concise History of the Parish and Vicarage of Halifax*, 1836; T. W. Hanson, *Story of Old Halifax*, 1920; J. S. Fletcher, *Halifax*, 1923; and J. J. Mulroy (editor), *The Story of the Town that bred us* (centenary souvenir of Halifax), 1918.

Halifax, city and cap. of Nova Scotia, Canada, situated on the E. coast on a fortified eminence on Chebucto Bay. The harbour, which has splendid anchorage, is 6 m. long and 1 m. wide, and ice-free all the year round, being open to the Atlantic Ocean with its warm Gulf Stream. It has two entrances, which are formed by McNab's Is., situated at the mouth, and in the N. it is connected by a narrow channel with Bedford Basin, which is deep enough for the largest vessels. Until 1905 this was the sole point in Canada with a garrison of Brit. regular troops. It is the chief naval station of Brit. N. America, and is very strongly fortified. It is the Atlantic terminus of the Dominion Atlantic, Canadian National, and other railways. It was in response to the demands of the Act of Confederation of 1867 that the Intercontinental railway was built from H., reaching Rivière du Loup in 1876, and Quebec three years later. Most of its houses are built of wood and roofed with shingles. Notable are Admiralty House, the martello tower in Point Pleasant Park, and the Prov. House, home of the Nova Scotian legislature, which was built in the reign of George III. It is the seat of Dalhousie Univ. There are fascinating seascapes in the archives building of the univ. H. has a considerable share of the dried and canned export fish trade, and also handles the fruit from the Minas and Annapolis regions, apples and other temperate fruits, and dairy produce. There are also large lumber exports. There are foundries and machine shops, and a steel shipbuilding plant. On Dec. 6, 1917, occurred the H. explosion. Through careless navigation on both sides, a Fr. ship laden with nitro-glycerine and gasoline collided with a Norwegian ship carrying a relief cargo to Belgium; the result was that some 1800 persons were killed, 4000 persons injured, while more than 2 sq. m. of the city suffered total destruction. A great blizzard on the following day added to the tragedy. As the point of departure for hundreds of convoyed ships in

the war, H. had become the most important port on the Atlantic coast, and its people, conscious of the essential part they were playing, struggled to their feet with indomitable courage. Pop. 75,000. See T. H. Raddall, *Halifax: Warden of the North*, 1948.

Hall, Basil (1788-1844), Brit. naval officer, b. at Edinburgh. He entered the navy in 1802, and was present at the battle of Corunna in 1809, on board the *Endymion*. In 1816 he went to China with Lord Amherst's embassy, and described the incidents of the commission

(Canadian Government)

AN AERIAL VIEW OF HALIFAX, NOVA SCOTIA

Halifax Law, properly known as the **Gibbet Law**, was a curious custom enacted at an early period of the woollen manuf. to protect the trade. By this law the inhab. were empowered to execute any one taken within their liberty who had stolen property of the value of 13^d or above. The accused were tried by the fifth-burgheers, and if found guilty were executed on a H. gibbet (an instrument similar to a guillotine) outside the tn on a market-day. The last execution took place in 1650.

Halitherium, see **DUGONG**.

Halkirk, vil. of Caithness, Scotland, on the Thurso. Flagstones are quarried and exported, and there is a distillery. Pop. 2000.

Hall, Anna Maria (née **Fielding**) (1800-1881), Irish novelist, b. in Dublin, but left Ireland at an early age. Ireland, however, gave her the motive of sev. of her successful books, such as *Sketches of Irish Character* (1829); *Marian* (1840), and *The White Boy* (1845). Other works are *The Buccaneer* (1832) and *Midsummer Eve* (1848), a fairy tale; and many sketches in the *Art Journal*, of which her husband, Samuel Carter H., was editor. With him she collaborated in a work entitled *Ireland, its Scenery, Character, etc.* (1841). She was a very voluminous writer, and her descriptive talents and power of depicting character were considerable. She was prominent in charitable work, and assisted in the foundation of Brompton Consumption Hospital.

and the explorations in the E. seas, etc., in his *Account of a Voyage of Discovery to the West Coast of Corea and the Great Loo-Choo Islands* (1818). He also pub. *Extracts from a Journal written on the Coasts of Chili, Peru, and Mexico* (1823) and *Fragments of Voyages and Travels* (1832-34), which contains, besides the subject-matter of the title, some interesting accounts of the navy in the early part of the nineteenth century. In 1842 H.'s mind gave way, and he ended his days in Haslar Hospital.

Hall, Catharine, see **HAYES**.

Hall, Charles Francois (1821-71), Amer. arctic explorer, b. at Rochester, New Hampshire. He was for some time a journalist, but offered his services to the Amer. Geographic Society in 1859 to go in search of Franklin. He sailed in 1860 on board a whaler, but was ice-bound and lived among the Eskimos for two years. He described his experiences in *Arctic Researches and Life among the Esquimaux* (1864). He made another expedition in 1864, and was more successful, finding out some information respecting Franklin's crew. In 1871 he went on a N. Polar expedition in the *Polaris* and reached 82° 11' N. lat., until 1876 the highest point attained.

Hall, Charles Martin (1863-1914), Amer. inventor, b. at Thompson, Ohio, U.S.A. He graduated from Oberlin College in 1885. While there he became interested in the chemical problem of how to procure aluminium so that it would be cheap

and of wide use. Shortly after he graduated, and while still working in the Oberlin laboratory, he invented an electrolytic process which completely revolutionised commercial production of aluminium. He interested a great Pittsburgh concern in his discovery, and was made vice-president of the company. Aluminium soon became a metal universally in use, and H. made a big fortune. He bequeathed the greater portion of his millions to Amer. schools and colleges, Oberlin being the chief beneficiary.

Hall, Chester Moor (1703-71), Eng. optical inventor. b. in Essex; was a benchman of the Inner Temple in 1763. In 1733 he anticipated Dollond in the invention of the achromatic telescope.

Hall, Christopher Newman (1816-1902), Eng. Congregational minister. From 1842 to 1854 he was minister of Albion Chapel, Hull, and in 1854 minister of Surrey Chapel, Blackfriars Road, London, founded by Rowland Hill. He was a very popular preacher, and in 1876 a new church was opened for him in Westminster Bridge Road, where he remained till 1892.

Hall, Edward (c. 1499-1547), Eng. historian, b. in London; educated at Eton and Cambridge. In 1532 he was appointed common serjeant; from 1533 to 1540 he was reader at Gray's Inn and, in the latter year, judge of the sheriff's court. He became M.P. for Bridgnorth in 1542, and a commissioner to inquire into transgressions of the Six Articles (1541-44). But he is chiefly remembered for his *Union of the Noble and Illustre Families of Lancastre and York* (1542), a glorification of the House of Tudor, and, especially, a justification of the actions of Henry VIII. Commonly called *Hall's Chronicle*, it was continued after the author's death by Richard Grafton, and was prohibited by Queen Mary. The first ed. is so rare that it may be doubted whether a complete copy has been extant for many years. The early part of the work is not of great independent value, but Shakespeare followed it closely in some of his earlier historical plays. For the reign of Henry VII. it is more important. H.'s basis is the hist. of Polydore Vergil entitled *Anglice Historie Libri xiii*, written in polished Lat., and valuable for Henry VII.'s reign though prejudiced towards Wolsey; while for the early years of Henry VIII. H. is an authority of considerable value on account of the information he gives on the social life and public opinion of the times. His descriptions of court festivities are striking and detailed and, in particular, he is instructive on the discontent awakened by Wolsey.

Hall, Sir Edward Marshall, *see* MARSHALL-HALL.

Hall, Joseph. (1571-1656), Eng. bishop and satirist, b. at Ashby-de-la-Zouch, Leicestershire. H. was educated at Emmanuel College, Cambridge, and while there wrote his *Virgudemarum* (1597), in which he claims to be the first Eng. satirist. For this he was attacked by Marston in 1598, and the works of both were burnt in 1599. In 1603 he

became chaplain to Prince Henry, in 1616 dean of Worcester, and in 1627 bishop of Exeter. His religious views corresponded with those of Charles I., but he was frequently blamed by Laud for his leniency to the Puritans. He defended the Eng. Church in *Episcopacy by Divine Right* (1640) and *An Humble Remonstrance to the High Court of Parliament* (1640), which latter produced a reply from the Puritan divines who wrote under the name of 'Smectymnus.' Thus began a long controversy in which Milton took part, attacking H. for his early satires. In 1641 he was trans. to Norwich, but at the end of the year was expelled from office and suffered imprisonment under the Long Parliament. When released he retired to Ilgham.

Hall, Marshall (1790-1857), Eng. physiologist, b. near Nottingham; graduated M.D. at Edinburgh in 1812, and visited foreign medical schools, 1814-15. He practised at Nottingham (1817-25), and in London (1826-53). His speciality was nervous diseases, and his main contributions to medical science are his discovery of reflex action, his rational treatment of epilepsy, and his introduction of methods of resuscitation in asphyxia and drowning. He pub. numerous medical and scientific works.

Hall, Oliver (b. 1869), Brit. artist. Studied art at S. Kensington and Lambeth art schools, and abroad. Became known first with his etchings, but later was chiefly a landscape painter. His 'Shap Moors,' bought by the Chantry, trustees is in the Tate Gallery, and his 'Angerton Moor' in the Budapest Gallery.

Hall, Owen (c. 1818-1907), pen-name of James Davis, dramatic author. He practised as a solicitor from 1874 to 1886. Became famous as a writer of musical comedy, his chief plays being *An Artist's Model* (1895); *A Gaiety Girl* (1896), *The Geisha* (1896); *Florodora* (1899). *A Greek Slave* (1901); *The Silver Ship* (1901); *The Girl from Kay's* (1903); and *The Medal and the Maul*.

Hall, Robert (1761-1831), Eng. Baptist minister, b. at Arnesby, Leicestershire; educated at Bristol and Aberdeen. In 1791 he succeeded Robert Robinson at the Baptist church in Cambridge. In 1807 he took charge of Harvey Lane church, Leicester, remaining there till 1826, when he returned to Bristol. His pub. sermons and other works rank high.

Hall, in architecture, term used in rev. senses: (1) A large room in a private or public building. Thus the *tepidarium* of the Rom. baths, and the interior of Egyptian temples are spoken of as Hs. In the Middle Ages the H. was the most important room in the residence of an Eng. nobleman. It may be said, in fact, that it was the only important room. Here all the inhabs. of the house, the lord, the ladies, the family, and the retainers, met for their meals, and here many of the latter slept. The prominence of the college Hs. at the univs. is a survival of this system, and their presence shows how the medieval H. retained its importance even after the multiplication of private rooms.

The medieval Hs. were simple in plan, consisting generally of a low, oblong apartment lighted from side windows. The public H. is a large room built for lectures, meetings, concerts, entertainments, or some such purposes. The name is often extended to the entire building, as especially in the tn. H. and the music H. (2) In Britain the term H. is applied to a large and important mansion, more especially in country dists. (3) In recent times it has also been given to the vestibule of a building when it is large enough to merit it. Generally the title is given if the room or passage into which the outer doors open is large enough to contain some furniture, but the term is often used very loosely.

Hallam, Arthur Henry (1811-33), Eng. poet, son of Henry H., historian, b. in London. He was educated at Eton and Trinity College, Cambridge. In 1829 he visited Italy with his parents, and on his return wrote some excellent lt. sonnets. He entered the Inner Temple, 1832, but his health broke down, and whilst traveling on the Continent with his father, he d. in Vienna. He was an intimate friend of Tennyson, who commemorated his death in *In Memoriam*. His *Remains* were pub. in 1831.

Hallam, Henry (1777-1859), historian, b. at Windsor, son of a dean of Wells; educated at Eton and Oxford Univ. Was one of the first Eng. historians of importance to go to original documents for his material. The result of this careful research work is that his books, in spite of the investigations of his successors, still hold a place as standard authorities. He was not a brilliant writer, but he was impartial, and he was usually accurate. His first great work, pub. in 1818, was *A View of the State of Europe in the Middle Ages*, and this at once gave him a recognised position. It was followed nine years later by *The Constitutional History of England from the Accession of Henry VII. to the Death of George II.*, and his third important book appeared in 1837-39, the *Introduction to the Literature of Europe during the Fifteenth, Sixteenth, and Seventeenth Centuries*. All these have been trans. into the prin. languages of Europe, and have gone through numerous eds. In politics he was a Whig—like many of our historians of the eighteenth and nineteenth centuries—but he took no active part in party warfare.

Hallamshire, dist. of W. Riding, Yorkshire, England, which comprises the pars. of Sheffield and Ecclesfield. Its character is that of forest and moorland.

Halland, maritime dist. (län) of Gotland, Sweden. Said to have been acquired by the Dan. hero 'Dan' in the sixth century; ceded to Sweden at peace of Bromsebro, 1645. Area 1900 sq. in. Pop. 156,900.

Hallé, Sir Charles (1819-95), Anglo-Ger. pianist and conductor, b. at Hagen in Westphalia. In 1836 he went to Paris, where he became friendly with Cherubini, Chopin, Liszt, de Musset, and George Sand, but was compelled to leave France in 1848 and came to London. Here he started pianoforte recitals, and it was

mainly due to him that Beethoven's sonatas became so well known in England. He frequently performed at concerts, and in 1853 was director of the Gentlemen's Concerts in Manchester. In 1857 he started the famous H. concerts. In 1888 he married Madame Norman-Neruda, the violinist, and toured with her in 1890 and 1891. H.'s orchestra (dating from 1857) was one of the best in England, and since H. has had as resident conductors Dr. Hans Richter, Sir Thomas Beecham, Sir Hamilton Harty, and Sir John Barbirolli.

Hallé, Lady (Madam Wilma Maria Francisca Norman-Neruda) (1839-1911), violinist, b. in Moravia. She rapidly became famous, appearing in the London Philharmonic concerts, as well as in France and Russia, and in 1901 was appointed violinist to Queen Alexandra. In 1908 she played at the concert in London in memory of Joachim, with whom she had been very friendly. She was remarkable for technique, and was the first of the women violinists to compare with men in fullness of tone.

Halle, or Halle-an-der-Saale, tn. on the Saale, 18 m. E. by S. of Eisleben, connected by railway with Leipzig, Berlin, Frankfurt, Hanover, and Magdeburg, in Saxony, Germany. Its univ. was founded in 1694, and considerably augmented in 1817. Among the many buildings of interest may be mentioned the Gothic Marienkirche and the cathedral, now in the hands of the Calvinists (sixteenth century), the medieval tn. hall in the market square, where stands a bronze statue of Handel, who was b. in H., and the twelfth-century St. Moritzkirche. The chief industries are porcelain and sugar refining, and the manuf. of machinery. The commercial prosperity depended largely on lignite beds in the vicinity. Close by are important salt works. In A.D. 806 H. was fortified by Charlemagne's son; in 965 it came under the control of the archbishop of Magdeburg; later became an influential Hanse tn. It is the bp. of Handel. In the allied operations of April 1944 the tier. salient which had extended westward from the line of the Mulde to the Leipzig-H. area was eliminated by April 20, and allied troops advanced eastward from the riv. Pop. 220,000.

Halle (Fr. Hal), Belgian city in the prov. of Brabant, situated on the R. Senne, 10 m. S.W. of Brussels. The chief mams. are paper, sugar, and chicory. It has a beautiful church dating from the fourteenth century. Pop. 17,400.

Halleck, Fitz-Greene (1790-1867), Amer. poet, b. at Guilford, Connecticut; became a clerk in New York, and in 1832 secretary to John Jacob Astor, who left him an annuity, upon which he retired in 1849. His first poems which attracted attention appeared in 1818-19 in the New York *Evening Post*, over the signature of 'Croaker & Co.' designating himself and J. R. Drake. His work includes *Fanny* (1820), a satire upon contemporary literature, fashions, and politics, and *Marco Bozzaris* (1825). His complete works appeared in 1868-69, ed. by J. G. Wilson.

Halleck, Henry Wager (1815-73), Amer.

general, b. at Westerville, New York. From 1841 to 1866 he was employed on the defence works at New York, and in 1845 visited the prin. military estab. in Europe. On his return he gave lectures on the science of war, publishing them under the title of *Elements of Military Art and Science*. He served in Mexico in 1846, and in 1849 helped to frame the state constitution of California. In 1862 he was made commander-in-chief of the Federal forces. He wrote *The Mining Laws of Spain and Mexico* (1859); and *International Law* (1861), etc.

Hallein, tn. of Salzburg, Austria, on R. Salzach, 8 m. S.E. of Salzburg. Has famous salt mines and brine baths. Pop. about 7000.

Hallelujah (Heb. 'Praise ye Jehovah'), term which is used as a doxology by both Jews and Christians, the custom dating from very early times. It is not used in the penitential seasons, being essentially a song of gladness, and in the time of St. Augustine was sung only from the feast of Easter to that of Pentecost. Later, however, it was omitted only in Advent and Lent, and on the vigils of the prin. festivals. The word was inserted in the Prayer Book after the first Gloria Patri in 1549; in 1552 trans. to 'Praise ye the Lord.'

Haller, Albrecht von (1708-77), Swiss poet, anatomist, and physiologist, b. at Bern. His poem *Die Alpen*, written in 1729, was the result of a journey through the Alps, and his other poems, lyrical and didactic, show him to be among the regenerators of Ger. poetry. He at first practised as a physician at Bern, gaining a name for his anatomical investigations, and in 1736 he was appointed prof. of medicine, etc., at the univ. of Göttingen, but resigned in 1753. His chief works (besides *Die Alpen*) are *De partibus corporis humani sensibilibus et irritabilibus* (1752); *Elementa physiologiae corporis humani* (1757-66); and *Bibliotheca anatomica, chirurgica, medicinae practica et botanica* (1771-72); also collected *Gedichte* (1732) and three philosophical romances, *Usona* (1771), *Alfred* (1773), and *Fabius und Cato* (1774). See studies by S. Lisauer, 1873, and S. d'Irsay, 1930.

Hallett, Holt S. (1845-1911), Eng. engineer and author, was employed (1860-1868) in building railways through Lancashire and Cheshire, and for the twelve years following (1868-80) was in the service of the public works dept. in India. The Indian and Burmese railway systems were constructed largely at his suggestion and in accordance with his practical recommendations. In 1883-84 he discovered the source of the Menam and made a preliminary survey for a branch line to Bangkok. He wrote a great deal on social and economic questions of India.

Halley, Edmund (1656-1742), Eng. astronomer, was b. at Haggerston, London, and educated at St. Paul's School. In 1676 he went to St. Helena to observe the stars, earning for himself the title of the 'Southern Tycho.' In 1682 he began his study of the moon, and the important problem of gravity which resulted in the pub. of Newton's *Principia* (1688-1700).

He studied the variation of the compass in the Atlantic, and pub. his results in a *General Chart of the Variation of the Compass* in 1701. In 1703 he was made Savilian prof. of geometry at Oxford, and in 1720 succeeded Flamsteed as astronomer-royal, and carried out a complete observation of the moon through a period of eighteen years. He is famous for having detected the 'long equality' of Jupiter and Saturn, for his method of determining the solar parallax by means of the transits of Venus, for his prediction of the return of

THE PATH OF HALLEY'S COMET

the comet of 1682, which occurred in 1759, and his discovery of the proper motions of the fixed stars, etc. A man of remarkable versatility, H. was also a poet, and is known to have written three poems, all in Lat.: the first in praise of Isaac Newton, prefixed to the *Principia*, which H. pub. at his own expense. His two other poems appeared in 1700, on his famous magnetic chart, one being in praise of Queen Anne, but now of little interest; the other lauding the unknown inventor of the compass. Another study of H. was that of geomagnetism, which in our time has been studied by Crichton Mitchell, and, prior to him, by Hellmann and Sylvanus Thompson; but the attraction of iron by the impact of loadstone was known to antiquity and is mentioned by Plato, and many later writers. One remarkable gap in his geomagnetic work was his apparent total neglect of the magnetic dip, particularly in view of the importance given by Wm. Gilbert to the dip in his demonstration that the earth was a great magnet. For two centuries H. had no comparable successor in this field and the magnetic survey of the globe was not renewed with his zeal until in 1905, the Amer. Louis Bauer, with the support of Andrew Carnegie, resumed the task. See *Nature*, Aug. 30, 1943. His prin. astronomical and mathematical works are *Catalogus Stellarum Australium* (1679), the substance of which was incorporated in vol. III. of Flamsteed's *Historia Coelestis* (1725); *Synopsis Astronomiae Cometicae* (1705); *Astronomical Tables* (1752); and numerous miscellaneous papers in the *Philosophical Transactions*. Also may be added an ed. of the *Cometes* of

Apollonia, with the treatise by Serenus, *De sectione cylindri et cono* (1710), and an ed. of the *Spherica* of Menelaus, pub. posthumously (1758).

Halley's Comet, name of the most celebrated of the periodic comets, taking its name from Edmund Halley (q.v.), who, in 1705, predicted that the comet of 1682 would return in 1758. This prediction proved true, and the comet has since returned in 1835 and 1910, its period being about seventy-five years, but this varies considerably owing to planetary perturbations. Halley thought that the comets of 1531 and 1607 were identical with his own, and it may be taken as practically certain that the comet of 1066, depicted on the Bayeux Tapestry, is H. C. It is also quite possible that it is the same as the comets mentioned in the Chinese records as having been seen in 87 B.C. and 240 B.C. At aphelion H. C. is thirty-five times more distant from the sun than the earth is at its mean distance.

Hallgrímsson, Jónas (1807-45), Icelandic poet and critic. After 1832 he lived mainly in Denmark, but was one of the chief agents in the reformation of Icelandic poetry. His chief poem, *Runmárháttur*, has been trans. into Eng. by D. Leith (1897).

Halliburton, William Dobinson (1860-1931), Eng. physiologist, b. in London and well known to all medical students for his able editing of Kirke's *Physiology*, the stock text-book on the subject. He was educated at Univ. College School and at Univ. College Hospital, serving as house physician at the latter place. He was assistant prof. of pathology at Univ. College (1883-89) and, later, prof. of physiology at King's College. H. resigned the latter post in 1928, when he was made emeritus prof. there.

He was one of the students of physiology who contributed to raising the subject, in England, from a theoretical into an experimental science, deriving much inspiration from Wm. Sharpey. His own side of the work was chiefly directed to the chemical aspect of nervous activity, the biochemistry of muscles and nerves, and the relation between chemical physiology and pathology. President of the physiological section of the Brit. Association in 1902 and of the Brit. Medical Association in 1900 and 1906.

Halling, par. and vil. in Kent, England, situated on the Medway, 3½ m. S.S.W. of Rochester. The chief industry is connected with Portland cement. Pop. 2500.

Halliwel - Phillips, James Orchard (1820-89), Eng. biographer, was all his life a collector of books and MSS. It is as a Shakespearean student, however, that he became eminent. His biography of Shakespeare appeared in 1848. As the result of further investigation he pub. his *New Note about Shakespeare and Stratford-on-Avon* (1850). In 1863 he supplemented his previous works with his *Illustrations of the Life of Shakespeare*. He also pub. a *Dictionary of Archaic and Provincial Words* (1846) (known as Halliwel's).

See G. R. Wright, *A Brief Memoir of the Late J. O. Halliwel-Phillips*, 1889, and an obituary in the *Athenaeum*, 1889.

Hall-marks, or Plate-marks, set of marks impressed upon gold and silver wares at the Goldsmith's Hall, London, or one of the five other authorised assay offices, to attest the genuineness of the metal and the date of its testing. Hall-marking was first introduced in 1300 when, under a statute of Edward I., it was necessary to impress upon each piece of plate assayed the effigy of a leopard's head (*the king's mark*).

The series now consists usually of the following marks: (1) *the standard mark*, indicating the standard of the metal; (2) *the lion's mark*, indicating the town where the assaying has been done; (3) *the date mark*; letter changed annually and showing the year in which the article has been marked at the assay office, the type of letter and the shape of the shield being changed at the end of each cycle of twenty, twenty-five, or twenty-six years; (4) *the maker's mark*, impressed by the maker and consisting of the initial letters of his Christian names and surname.

The authorised standards of fineness are: for gold, 22, 18, 14, and 9 carats of fine gold in every 24 carats of metal, of which standards the decimal equivalents are: 9166, .750, .585, and .375 respectively; for silver, 11 oz. 10 dwt. and 11 oz. 2 dwt. of fine silver in every 12 oz. troy, of which standards the decimal equivalents are .9584 and .925 respectively.

In general the law requires that any gold or silver ware made in the United Kingdom or imported or offered for sale there shall be hall-marked before being sold or offered for sale. The list of gold wares exempted from compulsory hall-marking is contained in the Plate (Offences) Act, 1738. The Silver Plate Act, 1790, declares that certain silver wares are exempted. Rings were exempted by the Act of 1738, but now gold wedding rings must be assayed and marked as gold plate. All jeweller's work in which jewels or stones are set is exempt (Act of 1738). Gold or silver plate manuf. abroad over 100 years before being imported or being sold in the United Kingdom is exempted from assay and marking (Hall-marking or Foreign Plate Act, 1839). Articles of foreign plate which may be described as hand-chased, inlaid, bronzed, or filigree work of oriental pattern are exempt from assay and marking in the United Kingdom (Revenue Act, 1864).

To forge a hall-mark or to transpose a hall-mark from one ware to another is a felony punishable by imprisonment. A person who without lawful excuse possesses or offers for sale a ware bearing a forged or transposed hall-mark is liable to a penalty varying from £10 to £50. See J. P. de Caserio, *Hall-marking Gold and Silver Wares: Law and Practice*, 1935.

Hall of Fame, building in the grounds of New York Univ., opened in 1900 to commemorate great achievements of Americans.

It has a colonnade containing 150 panels for bronze tablets bearing name of person, dates of birth and death, and particulars of works. The names were submitted to the univ. senate, who submitted them to 100 selected persons, it being the intention at first to select fifty names and five every five years so that all the panels would be filled by the year 2000.

Halloween, Halloweven, or All Hallow-e'en, name given to Oct. 31, the eve of All Saints or Hallowmas. It was generally believed that it was the time when supernatural influences prevailed, indeed this day is still called the Vigil of Saman (Saman being the lord of death) in some parts of Ireland. In Scotland and England, H. was long observed by fireside revelries which were chiefly concerned with divination of the future.

Hallstatt, see under IRON AGE.

Hall-Stevenson, John (1718-85), Eng. author; was a friend of Laurence Sterne, and the Eugenius in the latter's *Tristram*. He wrote an imitation of *Tristram Shandy* and a continuation of *A Sentimental Journey*. His prin. book is *Crazy Tales* (1762), a collection of clever verses, disguised, as all his writings are, by coarseness of expression and thought. He entertained at his seat, Skelton Castle, a club called The Demoniacs, of which Sterne was a member. There is an account of him in L. Melville's *Life and Letters of Sterne*, 1911.

Hallström, Per (b. 1866), Swedish writer, a native of Stockholm. For some years he worked as a civil servant in the post office, but he definitely resigned his position in 1897. In spite of his humorous vein, which reveals to him the comic side of life, H. ranks in literature with the idealists. It is the purity and charm of his prose which his countrymen especially single out for praise. Among his works are *Vilena Fäklar* (1894); *Purpur* (1895); *Vägen* (1898); *Thanatos* (1900), *Duda Fallet* (1902); *Gustaf Sparfverts roman* (1903); trans. of Shakespeare (1922-31).

Hallucination (from Lat. *alucinari*, to wander in mind; Gk. *ἀλν*, wandering), perception of an object which does not exist, while illusion consists in wrong interpretation of the sensory object. H. may or may not involve delusion, i.e. belief in the reality of the object falsely perceived. Sane people can recognise almost at once that their brains are playing them tricks, whereas the insane or those under the influence of hypnotism are not able to do so. Hs. of all the senses occur, but those connected with sight and hearing are the most common. It generally depends upon the condition of the brain whether a person suffers from H. or not; if he is in a semi-conscious state, or insane, or under the influence of drugs, or hypnotism, his brain cannot work properly, and the result is he thinks he actually sees something of which he is thinking, i.e. he suffers from H.

Halluin, tn. of France, in the dept. of Nord, and the arron. of Lille, on the Lys, 11 m. N.N.E. of Lille. It is an important industrial tn. with manufs. of cottons and linens, oil, bricks, chairs, and rubber goods. Pop. 12,900.

Halmahera, see JILOLO.

Halmstad, seaport at the mouth of the Nissa, on the E. shore of the Categat, 70 m. N.W. of Christianstad, in the dist. (lan) of Halland, Sweden. The chief exports are granite, timber, butter, and hats, whilst in the tn. are manufactories of beer, wood-pulp, jute, and paper. Both the salmon fisheries and potato crops are profitable. Pop. 31,300.

Halmiros, or Kirtsinion, tn., 18 m. S.W. by V. of Volos, in the prov. of Larissa, Greece. Pop. 7000.

Halo, word applied to any luminous ring, such as that sometimes seen around the sun and moon; probably derived from *άλος*, a threshing floor, on account of the circular path traced out by the oxen threshing the corn. In physical science, Hs. are coloured circles which appear around the sun and less frequently about the moon. They are formed by refraction of light by ice crystals floating in the atmosphere. It is necessary to distinguish between Hs. and coronæ. Hs. are at definite distances (22° and 46°) from the sun, and are coloured red on the inside, being due to refraction; coronæ surround the sun at variable distances, and are coloured red on the outside, being due to diffraction. Hs. are very common in N. regions and are not rare in our climate. The H. which is most commonly seen has an angular radius of 22°. Mariotte explained the phenomenon by the existence of ice crystals in the atmosphere. Crystals of ice occur in numerous forms, but one crystalline form occurs more frequently than all others; this is the form of a hexagonal prism which may be elongated like a needle or very flat like a thin flake. Three different refracting angles are possible in a hexagonal prism. Two adjacent faces are inclined at 120°, alternate faces at 60°, and the base of the prism forms an angle of 90° with the sides. To explain the H. of 22°, suppose the air contains ice crystals distributed in all directions in space; there must occur prisms whose edges will be perpendicular to the plane drawn through the luminary and the observer's eye. The minimum deviation for a ray of light passing through a prism of ice of refracting angle 60° is exactly 22°. Therefore, since the changes of deviation are slowest near a minimum or maximum, a maximum of light will be seen in all directions making an angle of 22° with the line adjoining the eye and the luminary. Also, since red rays are deviated less than blue rays, the H. will be coloured red on the inside and violet on the outside. Cavendish attributed the H. of 46° to the refraction of light across faces inclined to each other at 90°. Calculation shows that for such a refraction through an ice prism the minimum deviation is 46°. Thus the formation of the H. and the order of the colours are explained just as before. The impurity of the colours in Hs. is due to two causes: first, the superposition of the spectra produced by light coming from different points on the luminary; secondly, oblique refraction. As a rule, only the red is at all pure, a mere trace of blue or green is

seen, the external portion of each H. being nearly white.

Halo, or **Nimbus**, disk or glory encircling the head of saints and holy personages in sacred art, used in the W. as a symbol of sanctity from about the fifth century. It had a pagan origin, being known to Hindu, oriental, and classical art. In the E. it was regarded as the 'attribute of power,' figuring in Byzantine art in representations of Satan and other great powers of evil. Many of the Rom. emperors are represented with radiating diadems or Hs. The usual form of the nimbus is circular; sometimes it is formed by concentric circles, or indicated by a straight line or by rays diverging from the head. A triangular or cruciform H.— P or P , the

Constantinian monogram or labarum—marked one of the three persons of the Trinity. A square nimbus denoted that the person represented was still living. The nimbus was usually of gold, but sometimes of other colours. After the Renaissance it became lighter, almost melting away into the picture. An illumination surrounding the whole figure was called an aureole.

Halogens, or salt-producers (Gk *hals*, salt), group of four non-metallic elements, viz. fluorine, chlorine, bromine, and iodine (q.v.), which have properties similar to one another but graduating in the order given above. The halides or haloids are the metallic salts of the halogen acids, and may be formed in most cases by the direct combination of the metal and the halogen.

Halophytes, see **SALINE PLANTS**.

Hals, Dirk (c. 1589–1656), Dutch genre painter, brother of Frans II, the Elder, pupil of A. Bloemaert. Examples of his work are at Amsterdam and Copenhagen. His pictures can be traced from 1624 to 1653, usually representing cavaliers, women, and young people drinking, dancing, listening to music, or talking, as in 'A Party of Ladies and Gentlemen,' 'Three Musicians,' and 'Two Persons Dancing.' His pictures have recently been highly appreciated.

Hals, Frans, the Elder (c. 1580–1666), Flemish portrait and genre painter, b. at Antwerp. In 1616 he settled at Haarlem, where his brother Dirk was b. and d. He was perhaps a fellow pupil of Rubens under van Noort before 1600, and on his removal to Haarlem entered the atelier of van Mander; studied under van Mander the elder. Reputed second only to Van Dyck as a portrait painter, H. was the pioneer in the Dutch school of free, broad brushwork, noted for his masterly juxtaposition of flesh-tints and portrayal of laughter and merriment (see his 'Laughing Cavalier' in the Wallace Collection, London). He worked largely in Haarlem and Deift; the Haarlem Museum, which was once an almshouse of which the painter and his wife were inmates, contains the great groups by H. and is mainly a F. H. memorial (though there are excellent pictures by other painters whom the town fostered). Fine works are 'St. George's Guild Banquet' ('St. Joris' Doelen,' 1610 and 1639), at Haarlem; 'F. Hals and

Lysbeth Reyniers' (1624); 'Uille Hobbe' in the Berlin collection (1650); 'Regents of the Old Men's Almshouse' (1664). The Louvre has his 'Bohémienne'; Antwerp Museum of Fine Arts his 'Dutch Nobleman'; Munich, 'Fish Girl' and 'William Croes'; the Ryks (Amsterdam), 'The

'THE LAUGHING CAVALIER'

From Frans Hals's picture

Painter and his Wife, in a Garden'; Brussels (Museum des Beaux-Arts), 'Willem van Heijthuyzen'; and there are some portraits in the National Gallery, London. Sev. of his sons were minor artists. See W. von Bode, *Frans Hals und seine Schule*, 1871; D. Knackluis, *Frans Hals*, 1896; and W. von Bode and M. Binder, *Frans Hals, sein Leben und seine Schule*, 1914.

Halsbury, Hardinge Stanley Giffard, first Earl of (1823–1921), Eng. lawyer and statesman; b. Sept. 3, in London; son of Dr. Stanley Lees Giffard, a native of Dublin, but of Devon descent, who for a quarter of a century ed. the *London Standard*. H. was educated at Oxford, graduating 1845. He became a barrister of the Inner Temple, 1850; Q.C., 1865; solicitor-general under Disraeli, 1875–80; M.P. (Conservative) for Launceston, 1877–85. H. was lord high chancellor of Great Britain four times between 1885 and 1905, first appointed under Lord Salisbury's administration, 1885–86; again in his second gov., 1886–92; again in 1895–1900; and also in Balfour's first administration, 1902–5. He was engaged in the famous Overend and Gurney and Tichborne cases. He was created Baron H. in 1885; earl of H. and Viscount Tiverton, 1898. H. was high steward of Oxford Univ. from 1896. He was president of the Royal Society of Literature, and senior grand warden of Eng. Freemasons. He was foremost among the 'Diehards' who opposed the passing of the (1911) Parliament Bill through the House of Lords.

He ed. *The Laws of England*, a compendious statement in alphabetical order of subjects, 31 vols., 1907-17. As late as 1916 he sat as a judge in the House of Lords. D. in London, Dec. 11. See J. B. Atlay, *Victorian Chancellors*, II, 1908.

Halsingborg, see HELSINGBORG.

Halstead, or **Halsted**, mkt. tn. of Essex on the R. Colne, 14 m. N.W. of Colchester. The much restored par. church stands in the upper part of the tn. and contains some fine monuments of the Bouchier family in the S. aisle. The Courtauld Homes of Rest were built in 1924. On the N.W. side of the High Street is Chantry House, incorporating some remains of a college said to have been founded in 1411 by Lord Bouchier. Messrs. Courtaulds Ltd. have a large textile factory here. In the neighbourhood is the anct. tn. of Castle Hedingham, with one of the finest Norman keeps in England and a large twelfth-century church. Pop. 6800.

Haltswhistle, mkt. tn. and par. of Northumberland, England, 14 m. from Hexham, on the N.E. region railway. It lies in the valley of S. Tyne, with Hadrian's Rom. wall 1½ m. S., and Featherstonchaugh Castle near by. It contains two border towers and other antiquities. Coal and clay industries are carried on, and coarse balze is manufactured. Pop. 9600.

Halver, tn. of Westphalia, Germanv. 15 m. from Barmen; has iron manufs. Pop. 7900.

Halyburton, Thomas (1674-1712), Scottish divine, b. at Dupplin, near Perth. His father, one of the ejected ministers, leaving d. in 1682, his mother in 1685 took him to Rotterdam, where he attended the school instituted by Erasmus. On his return to Scotland in 1687 he completed his education at Perth and Edinburgh, and in 1692 entered St. Andrews Univ., graduating in 1696. He became minister of Ceres, Fifeshire (c. 1700), for eleven years, and prof. of divinity at St. Andrews (1710). His works, once very popular in Scotland, include *Natural Religion Insufficient, and Revealed Necessary, to Man's Happiness* (1714); *The Great Concern of Salvation* (1721); and *Ten Sermons*... (1722), which were mostly written against the deists. See his *Memoirs*, written by himself and frequently reprinted. 1714; *Works* (pub. by Dr. Burns), 1835; J. Leland, *View of Dissertal Writers*, 1761; and A. Chalmers, *Biographical Dictionary*, 1812.

Ham, according to Gen. x., one of the three sons of Noah, and ancestor of the Ethiopians, Egyptians, Babylonians, etc. The narrative in Gen. shows traces of much alteration, and it is clear that in v. 22 (chap. ix.) the present verse originally had Canaan instead of H., Noah's three sons thus being Shem, Japheth, and Canaan. At this period the div. between the three was considered as referring to Palestinian groups, but it was later extended to the surrounding nations. The name H. is usually derived either from an anct. name for Egypt signifying 'black,' or from the name of an early Babylonian king.

Ham, com. of Somme dept., France, on the Oise-Somme canal, Péronne arron., 12 m. from St. Quentin. Its famous and now ruined old fortress has often served as a State prison. Among its most celebrated prisoners were Charles X.'s ministers (1830), and Prince Louis Napoleon (1840-1846). During the First World War II. suffered considerably, especially in the spring of 1917. Pop. 2700.

Ham (connected with lat. *camur*, crooked), properly the hind part or angle of the knee, usually applied to the cured thigh of hogs or sometimes of sheep or oxen. II. curing and bacon curing are important industries, performed in various ways according to the country and dist. Salting and smoking are essential operations. The meat is rubbed with salt, and later with a mixture of salt, saltpetre, and sugar. Smoking is carried on in smoking-houses, the meat being hung high, and the fire kept smouldering with wood for five or six weeks. Wet salting requires three weeks, dry salting about four weeks. Beef and mutton Hs. are cured largely in N. England, and Dumfriesshire, Scotland; pork-curing thrives at Chicago.

Ham, East, see EAST HAM.

Ham, West, see WEST HAM.

Hamadan, tn. of Persia in Irak Ajemi, 165 m. S.W. of Teheran, at the base of Mt. Elvend. The anct. tn. was Ecbatana (q.v.). It has an elevation of about 6000 ft. It is a trading place of considerable importance, being one of the routes from Bagdad to Teheran and Isfahan. It has extensive bazaars and caravanserais. The chief objects of interest are the tomb of Avicenna, near the great mosque, resorted to by pilgrims, and the reputed tomb of Esther and Mordecai, a structure of black wood. The prin. industries are carpet-weaving and tanning. During the First World War the tn. and dist. were occupied by the Turks. Roads were greatly improved during that period. Pop. 103,000.

Hamadryad, **King Cobra**, or **Giant Cobra**, one of the oriental cobras of a large and poisonous variety, found from S. India to China and the Philippines, sometimes reaching a length of 13 ft., and one of the longest and most venomous of snakes. It is of a yellow colour, with black cross-bands; of a fierce disposition, and feeds wholly on other snakes.

Hamadryas, eight daughters of Hamadryas, in Gk. mythology. They were nymphs attached to particular trees, from which they received their names, and with which they were supposed to come into existence and die. They did not possess immortality, thus differing from other nymphs. They were also known as dryads and oreads and lived in forests from which they never emerged.

Hamah, see HAMATH.

Hamamatsu, coast tn. of Hondo, Japan, 120 m. W.S.W. of Yokohama. Pop. 133,000.

Haman ('Full of Grace'), see ESTHER.

Hamann, Johann Georg (1730-83), Ger. author, sometimes called the Magician of the N. from the originality of his thought, b. at Königsberg in E. Prussia. He lived

a somewhat chequered life, trying various callings, but finally devoted himself to the study of anc. languages and oriental literature. He knew many eminent authors and largely influenced Goethe and Herder, though his own writings were little esteemed by his contemporaries. H. wrote *Sokratische Denkwürdigkeiten* (1760) and *Kreuzzüge des Philologen* (1782). His complete works were pub. by F. Roth, and C. Gildemeister wrote his biography. See J. Claassen, *Hamanns Leben und Werke* (1885).

Hamar, or **Storehammar**, tn. in Norway, 59 m. from Oslo, on Lake Mjosen. It is the seat of a bishopric, and has breweries and metal and iron foundries. It is an important railway junction. Pop. 6000.

Hamasah, or **Hamaseh** (Arabic *hamasah*, bravery, from *hamasa*, to be firm), famous collection of Arabic poetry compiled by Abu Tammam, and divided into ten books (c. 807-846). The first (dealing with the heroes of pre-Islamic times) is the longest book, and the remaining nine deal with various subjects. The collection is of great historical value, and is taken from extempore works chiefly. There are three eds. of the Arabic, viz. Freytag's, Bulak's, and the Calcutt' ed., 1756. See Sir C. J. Lyall, *Ancient Arabic Poetry*, 1885.

Hamath ('fortress,' or 'enclosed place'), or **Hamah**, city situated on the banks of the Orontes, chief city of the Hittites, and cap. of the surrounding terr. In sev. places of the O.T. (e.g. Num. xxiv. 8, Judges iii. 3) it is spoken of as the N. boundary of the kingdom of Israel. It later came under the suzerainty of Solomon, on whose death it became independent. It then finally came under the dominion of Assyria, and was entirely destroyed by Sargon. It was known to the Gks. and Romans as *Epiphania*.

Hambach, com. of the Rhine Palatinate in Germany, formerly of Bavaria, 2 m. S. of Neustadt. The 'Hambacher Fest,' a great Ger. Liberal meeting, was held here in 1832, proclaiming the 'sovereignty of the people,' as the foundation of organized government. Pop. 3000.

Hambato, or **Ambato** (**Hambald**), tn. of Ecuador, cap. of Tungurahua prov., about 78 m. S. of Quito, between Chimborazo and Cotopaxi. Destroyed in 1698 by an eruption of Cotopaxi, and by an earthquake in 1796, it became very flourishing later on. It trades in grain, cochineal, and sugar, and has shoe manufacturing. It is also a vine and fruit growing dist., the climate being temperate. It is connected with Guayaquil and Quito by rail. Pop. 20,000.

Hamborn, rural com. of the Rhineland, Germany, in the dist. of Düsseldorf. Noted for coal and iron industries. Pop. 103,000.

Hamburg, city of Germany, chief tn. of H. state, situated on the N. bank of the Elbe. It is the largest seaport on the Continent, and the third largest in the world. The greater part of the harbour, before the Second World War, was a free port, and, with the two new docks completed in 1904, the total water area amounted to 1250 ac. It was one of the chief continental ports for the embarkation

of emigrants from Europe. Prior to the war the city consisted of two radically different parts, the central part, reconstructed since the fire of 1842; and the anc. ramparts, separating the old city from the adjacent suburbs. The beauty of the city is much enhanced by the large sheets of water formed by the Alster. The canals in the city are spanned by over sixty bridges, and there are numbers of steam ferries. There were many fine public buildings; notably the exchange, with a commercial library of over 110,000 vols.; the Rathaus, completed in 1897; the Deutsches Schauspielhaus, completed in 1900; the marine office (Seewarte), and numerous museums of arts, crafts, botany, natural hist., etc. H. was noted also for fine churches, e.g. St. Michael, St. Peter, St. Nicholas, and St. Catherine, dating from the fifteenth century. But the churches of St. Catherine and St. Jacob were destroyed in the Second World War; that of St. Michael suffered a direct hit on the E. end. The Rathaus, survived, and the museums were but little damaged, except those of hist. and geology. The univ., although damaged, admits of repair. Two-thirds of the books in the tn. library were lost.

The streets of H. are well paved and kept very clean, the prin. thoroughfare being the Jungfernstieg. The fever hospital of H., opened in 1894, was considered one of the best in the world. There were many large and excellent private schools, as well as over 200 public schools, in addition to gymnasiums, a school of art, and a conservatoire. The univ. of H., formed in 1919, consists of the faculties of law, medicine, natural science, and philosophy, and had 5000 students in 1948. In 1888 H. became a member of the Ger. Customs Union, which did much to stimulate its trade. Among its chief industries are cigar making, spirit and sugar refining, machine and shipbuilding, brewing, flour-milling, and the manuf. of furniture, musical instruments, mechanical and optical instruments, leather, ivory, etc. It was, prior to the Second World War, also one of the largest coffee marts in the world. Prior to the Nazi reg. no city-state had a democratic constitution, and was administered by an executive Senate elected by the House of Representatives; the legislative power was confined to the House of Burgesses. H. seems to have been founded early in the ninth century by Charlemagne, who built (811) a citadel and church as a defence against the Slavs. In 831 an episcopal see was estab. by Louis the Pious (son of Charlemagne) and in 834 the bishopric was raised to the rank of an archbishopric. Later, however, Ansgarius, first occupant of the see, who founded a monastery and school, saw his labour nullified by Norman pirates, who reduced the settlement to ashes. A large part of the original terr. of the archbishopric fell away from its allegiance and in 817 it was decided at a synod at Mainz that H. should be attached to the bishopric of Bremen, and the seat of the archbishopric be in the latter city. All through

the tenth century H suffered from the incursions of the Danes and Slavs; but despite this, Archbishop Alebrand built a cathedral in 1037 and Archbishop Adalbert a castle soon afterwards. During the twelfth century it became an important commercial centre for N Europe, and in 1189 was granted important privileges by Frederick Barbarossa, and by treaties with Lubeck and Bremen in 1241 and 1249 re-

its tourist and emigrant traffic, declined considerably after the First World War. In accordance with the treaty of Versailles the commercial fleet of H. was left with only small vessels of 82,000 aggregate tonnage. Subsequently, however, trade gradually resumed its previous level, only to be reduced to vanishing point in the Second World War.

The great port (especially the harbour

Staatliche Tank- und Schiffahrtsamt Hamburg

HAMBURG THE JUNGFERNSTIEG AND THE ALSER

spectively, formed the Hansatic League. It was formally acknowledged as an imperial city in 1618. Owing to the immunity of its position, its prosperity increased during the Thirty Years war and in the eighteenth century commercial relations with N America were developed owing to the Amer. and Fr. revolutions and the wars between England and France. In 1815 it became an independent state of the Ger. Federation, and its trade and importance thereafter greatly increased. It united with the Ger. Empire as a free city state in 1871. H. occupies a distinguished place in the hist. of Ger. literature and the drama. It was the home of Heine, Lessing, Klopstock, Schrodor. Until recent years H. was practically the biggest commercial city of Europe, and next to London had the largest money exchange transaction on that continent, the bank of H. having been founded in 1619. As a commercial centre, its only rivals were London, Liverpool, Antwerp, and New York. But its general trade, as well as

quarters, was much damaged in the Second World War prior to its surrender and occupation by the 7th Armoured Div. on May 3 1945. The docks and industrial buildings were repeatedly bombed by the R.A.F. In 1940-41 many of the dock cranes being put out of action. But these raids were innocuous as compared with the tremendous attacks of July Aug 1943. Thus there were seven attacks between July 21 and 29, on which latter date 2300 tons of bombs were dropped, and great fires raged in the port all that week. One of the heaviest raids was that of July 21, as also was that of the following day, which was unopposed, as all the sirens had been destroyed. Evacuation of H. was ordered, and the inhab. streamed eastwards, causing congestion on the roads as the people of Holland, Belgium, and France fled in the Ger. invasion of 1940. In subsequent raids, in Aug. 1943, the anti-aircraft guns were soon silenced, and the city hampered at will in attacks by successive fleets of 1000 and 1200 planes.

In all about 9 sq. m. of H. were devastated, and more than 75 per cent of the city's 15 sq. m. of fully built-up areas were wiped out (for the loss of eighty-seven bombers). This damage was wrought by some 9000 tons of bombs. Much ruin was caused by 'block-busters' (q.v.), though a great deal of damage was also due to fires from incendiary bombs. An official summary of the damage showed that eight shipbuilding yards were completely destroyed or very seriously damaged, together with three oil works, six non-ferrous metal works, twenty armament and steel works, eleven chemical works, eight textile factories, twenty-one food-stuff plants, and thirty-one miscellaneous factories. Some sixteen public utility works were either destroyed or irreparably damaged, as also were fourteen administrative buildings, sixteen transportation units, and more than 400 warehouses. The damage extended throughout the dock area and widely to the E. and W. Support for the argument that air bombing, if conducted on a sufficiently large scale, could win the war was provided by this detailed survey of the damage done in the battle of H. The capacity of the port in 1946 (in terms of cargo) was not more than 25 per cent of its peacetime standard; but any increase over that proportion depended on the Allies' decision on the amount of production to be allowed Germany. There lay sunk in the riv. after the war fifty-five ships, 2000 barges, and sixteen floating docks. Pop. (1916) 1,474,100. See W. Melhop, *Historische Topographie von Hamburg*, 1923, and H. Reinecke, *Hamburgs Geschichte*, 1933.

Hamburg-American Line, originally called Hamburg-Amerikanische Packetfahrt-Aktiengesellschaft, or H.A.P.A.G., was founded on May 27, 1847. The *Borussia* (1856) was the first steamship to carry U.S.A. mails; and the *Kursk Dismark* was the first to accomplish its journey from Southampton in less than six and a half days. Under Albert Ballin the H.-A. L. made such progress that before the First World War Hapag ships were the fastest transatlantic liners. Ballin then built some of the world's largest vessels, the mammoth liners *Imperator* (1912), later known as the *Berengaria* (q.v.), of the Cunnard line; the *Vaterland* (1914), later the *Leviathan* of the U.S. Shipping Board, and the *Bismarck* (1921), later the *Majestic* (q.v.) of the White Star Line. In 1911 the Hapag fleet consisted of 439 ships aggregating 1,360,000 gross registered tons; and no fewer than seventy-five regular lines were operated to overseas destinations, serving 400 ports in all parts of the world. Ballin d. on Nov. 9, 1918, and thus never knew that by the Versailles treaty the Hapag surrendered entirely to the Entente except for a few small units. In 1920 the company re-established its New York service, in agreement with the Harriman concern (United Amer. lines), with the *Cleveland* (1908), *Resolute* and *Reliance* (both 1920) of the United Amer. lines, and the *Albert Ballin* and *Deutschland* (both 1923), Ham-

burg (1926), and *New York* (1927) of the Hapag. Later the Hapag amalgamated with the Ger.-Australian and Kosmos lines, and in 1930 concluded an agreement for a community of interests and operations with the N. Ger. Lloyd. Before the outbreak of the Second World War the Hapag had some 200 vessels with a gross tonnage exceeding that of 1914. It had passenger and cargo services to N. and S. America, the Dutch Indies, Far E., Australia, Africa, and E. Mediterranean, as well as health and pleasure cruises.

'Hamburger Nachrichten, Die', estab. in 1792; a moderate Liberal, and at one time a very influential, paper. Prince Bismarck attacked through its columns the gov. of William I.

Hamburg-South American Line, The, was estab. in 1871, and at the outbreak of the First World War possessed fifty-six steamers, with a total tonnage of 251,000. After the war its services were suspended by losses of some vessels, and by delivery of the remainder to the Reparations Commission. Reconstruction began in 1921, and by 1927 the company had the fastest steamers plying between Europe and S. America—the *Cap Arcana* (1927), 20 knots, of 27,560 tons gross register, and the *Cap Polonia* (1911), 18 knots (one of the largest steamers of war fitted for liquid fuel) of 20,500 tons gross register. The company also built a series of motor-ships of 14,000 tons gross register, with a service speed of 14 knots, for carrying third-class passenger floating cruises.

Hamden, tn., Newhaven co. Connecticut, U.S.A., 6 m. N.N.E. of Newhaven. It manufs. augers and garden implements. Pop. about 23,300.

Hame, dept. of Finland, the surface of which is largely occupied by lakes. Area 7100 sq. m. Pop. (1930) 390,000. Cap. Tavastehus. Tammerfors (Tampere) is the largest tn. (71,700).

Hameln, tn. of Hanover, Germany, on the Weser, 33 m. S.W. of Hanover. There are many aet. houses here, but the only public buildings of any interest are the minster church, restored in 1872, and a tn. house. It is famed as being the scene of the legend of the Pied Piper. In the Second World War the 19th (Amer.) Corps of the First Army estab. a bridgehead over the Weser at H. on April 6, 1945. Pop. 27,900.

Hamerling, Robert (1830–89), Austrian poet, b. in humble circumstances. Educated at the univ. of Vienna. In 1860 he pub. his first vol. of lyrics, *Sinnen und Minnen*, which was followed by *Amor und Psyche* (1882); and *Blätter im Winde* (1887). *Ahusser in Rom* (1866) and *Der König von Sion* (1869), two powerful satiric epics, are his masterpieces. See his life by M. M. Rabenlehner (1896 and 1901), and A. Polzer (1890).

Hamerton, Philip Gilbert (1834–94), Eng. art critic, b. at Laneside in Lancashire. He worked at landscape painting in Scotland, but in 1858 settled in France, and devoted his life to art criticism. His pubs. include *A Painter's Camp in the Highlands* (1863); *Etching and Etchers* (1866); *Contemporary French*

Painters (1868); *Painting in France after the Decline of Classicism* (1869); *The Graphic Arts* (1882); and *Landscape* (1885). Of his more general literary works the chief are *The Intellectual Life* (1873), and *Human Intercourse* (1884). His autobiography and a memoir by his wife were pub. in 1896.

Hamesucken, in Scots law, means the felonious seeking and invasion of a person in his dwelling-house. It consists essentially in the co-existence of entry with intent to commit an assault and actual personal violence. The entry may be either by terrifying those within or by artifice, or by secretly entering and lying in wait for an opportunity of assault. Formerly it was punishable with death, but since the Criminal Procedure Act, 1887, penal servitude or other imprisonment has been substituted.

Hamhung, walled tn. of Korea, situated near the E. coast of the peninsula in lat. 39° 56' N. Pop. 78,000.

Ham House, near Petersham, Surrey, the former seventeenth-century home of the duke of Lauderdale, notable for its historic contents, and now attached to the Victoria and Albert Museum. The house was built in 1610 by Sir Thomas Vavasour, a successful lawyer, and the H-shaped Jacobean plan survives in all essentials. Under Charles I. H. was bought by Wm. Murray, later earl of Dysart. His daughter, Elizabeth, countess of Dysart in her own right and wife of Sir Lionel Tollemache, made considerable alterations, notably the substitution of a more elaborate staircase enriched with carved panels, and baroque doorways of the type associated with John Webb. Still greater changes were made by the second earl and first duke of Lauderdale, the virtual autocrat of Scotland from 1661 to 1679. These included suites of reception rooms on two floors, thereby making the S. front a continuous façade. The most important of the new rooms was that known as the Queen's Bedchamber, or Cabal Room—from the tradition that meetings of the notorious ministers (of whom Lauderdale was one) used to meet there. Another notable feature is the Long Gallery, running the length of the W. wing, lined with panelling and hung with lively portraits. There is a wealth of walnut, lacquered, gilded, and silver furniture, with which Elizabeth filled her rooms, and the superb quality of which indicates that H. H. is the richest surviving example of the sumptuous period *décor* of the seventeenth century. One of the most complete of the smaller rooms or closets is the Queen's Closet, adjoining the Cabal Room with its rich gilt enrichments on a white marbled ground, its scagliola fire-place, and silvered chimney furniture. This unique assemblage of seventeenth-century furnishings and pictures has been added to the national collections, having been bought by the gov. for £100,000.

Hami, Kamel, or Khamil, tn. of Sinkiang, China, situated in an oasis about lat. 42° 50' N., and long. 83° 28' E. It is an important trading centre. Rice and

fruit are grown in the neighbourhood. Pop. 6000.

Hamilcar, name of sev. Carthaginian generals, the chief of whom was *Hamilcar Barca* (d. 229 B.C.). During the first Punic war he was in command of the Carthaginian forces in Sicily (247), where he maintained his position on Mt. Ierectè, near Panormus. After the Rom. victory at the Ægatian Is., which brought the war to an end, he returned to Carthage, where he suppressed a revolt of mercenaries (240–238). In the latter year he went with his young son Hannibal to Spain, and began the conquest of that country, much of which he accomplished during the following years. He fell in battle against the Vettones.

Hamilton, famous Scottish family, who trace their descent back to Walter Fitz-Gilbert (fl. 1295), son of Gilbert de Hameldone, who is mentioned in a charter of 1272. Walter owned lands in Lanarkshire, and for a time swore fealty to Edward I. of England. After the battle of Bannockburn, however, he joined King Robert Bruce, and was subsequently knighted and granted the barony of Cadzow in Lanarkshire, receiving lands forfeited by adherents to the Eng. crown. His elder son, David, was the first to assume the surname H. His younger son, John, was the father of Alexander H., whose descendants acquired the lands of Priestfield, one Thomas becoming Lord Priestfield in the reign of Queen Mary. Sir David H. of Cadzow, already mentioned, was taken prisoner at the battle of Neville's Cross in 1346, but was ransomed, and sat among the barons in the Scottish Parliaments of 1368, 1371, and 1373. Sir David d. in 1392. Little is known of his son, Sir John H., except that he was twice taken prisoner in England. His grandson, Sir James H. of Cadzow, was likewise taken captive into England, and from him are descended the Hs. of Silvertonhill and of Dalzell. His eldest son, also called James, was created Lord H. in 1445. He was the first layman to found a college in Scotland; as well as endowing a college at Glasgow (1460), he also founded the collegiate church of H. He was connected, by his marriage, with the widow of the fifth earl, with the powerful family of Douglas, whom he assisted in their struggle against James II. About 1455 he changed sides, and on the death of his wife, being now in royal favour, married Princess Mary, sister of James III. and widow of the earl of Arran. His only son, James, by Mary, negotiated the marriage between Margaret Tudor and James IV. of Scotland. In 1503 this James, second Lord H., was created earl of Arran, and succeeded to lands on his mother's side. He d. in 1529, and his heir, James, second earl of Arran (by Janet Beaton, niece to the cardinal), on the death of James V. (1542) was appointed regent of Scotland and governor to the young Queen Mary. In 1549 he was granted the duchy of Châtelleraut by Henry II. of France, and resigned from his governorship in favour of Mary of Guise, the queen-mother. In 1554. His eldest son, James, who succeeded to the title in

1575, was proposed at different times as husband for Queen Mary and for Queen Elizabeth, but he lost his reason in 1502 and *d.* in 1609. His brother, Lord John II., created marquess of H. in 1599, administered his estates until his own death in 1604, when his son James became second marquess. James was created earl of Cambridge (1619), and *d.* in 1625. The third marquess, James, was created by Charles I. duke of H. (1643) for the signal services he had rendered in the struggle with the Scottish Covenanters. He headed a Scottish army against the Parliamentarians, but was defeated by Cromwell at Preston in Lancashire, and was beheaded at Westminster in 1649. His brother Wm., created earl of Lanark (1639), succeeded to the dukedom. He negotiated with Charles I. at Newcastle (1646), and signed the 'Engagement' at Carisbrooke Castle (1647), fleeing with other Royalists to Holland in 1648. He returned with Prince Charles in 1650, and *d.* in the following year from wounds received at the battle of Worcester. The second duke of H. was succeeded by his niece, Lady Anne, whose husband, Wm. Douglas, earl of Selkirk (1635-94), was created duke of H. for life only (1660). The Duchess Anne resigned her titles in 1698 in favour of her eldest son, James Douglas, earl of Arran, who was formally created duke of H. In 1711 he was granted an Eng. peerage, being created duke of Brandon. In the following year he fought the famous duel in Hyde Park with Charles, Lord Mohun (*see* Thackeray's *Rosmond*), the principals being killed. His son, James (1703-43), became fifth duke, and he was succeeded by his son James (1724-58), who married the famous beauty, Elizabeth Gunning. The seventh duke, James George (1755-89), succeeded to the title at the age of three. In 1761, by the death of the duke of Douglas, the titles of his family devolved on the Hs. The seventh duke was succeeded by his brother Douglas (1756-99), who sat in the House of Lords. He *d.* childless, the title passing to his uncle Archibald (1740-1819), whose son Alexander, tenth duke (1767-1852), was ambas. at St. Petersburg in 1806-7. The eleventh duke was Wm. Alexander (1811-63), who married Princess Marie Amélie, a cousin of Napoleon III. His son Wm. Alexander (1845-95) received the anct. title of duke of Châtellerault, granted to his ancestor in 1549. The thirteenth duke, Alfred Douglas (1862-1940), was descended from Claud II., the third son of the fourth duke. From this Claud are descended the dukes of Abercorn, whose eldest sons are styled by courtesy marquess of H. The fourteenth and present duke, Douglas Douglas-Hamilton (b. 1903), is the eldest son of the thirteenth duke. He served in the R.A.F. 1939-45. He was chief pilot of the Mt. Everest flight expedition, 1933. With (r.-Capt. D. P. McIntyre he pub. *The Pilot's Book of Everest* (1936).

See G. Burnett, *Memoirs of the Lives and Actions of James and William, Dukes of Hamilton and Châtellerault*, 1671; J. Anderson, *The House of Hamilton*, 1825; S. R.

Gardiner, *The Hamilton Papers relative to 1638-60* (for the Camdon Society), 1880; and Appendix vi. of the *Eleventh Report of the Historical MSS. Commissioners*, 1887. There is a *Brief Account of the Family of Hamilton* by Dr. James Baillo (early seventeenth century) in MS. in the Advocates' Library, Edinburgh. *See also Scots Peerage* (vol. iv.), 1907.

Hamilton, Alexander (1757-1804), Amer. statesman and economist; one of the men who had most to do with shaping the constitution, policies, and politics of the U.S.A., was b. a Brit. subject in the is. of Nevis, W. Indies. His father was a Scottish merchant. Misfortunes dogged H.'s parents. His father *d.* a bankrupt, and the boy's mother *d.* shortly after. At the age of twelve he had to leave school and enter the counting-house of a merchant. But through the aid of friends he was enabled in 1772 to go to a school in Elizabethtown, New Jersey, and in 1774 he entered King's College, New York city, which afterwards became Columbia Univ. H. proved himself a brilliant pupil, but he left his text-books when the Amer. colonists rebelled against England and identified himself with them. In the campaign of 1776 he acquitted himself so well that he came to the notice of George Washington, commander-in-chief of the Amer. Army. From that time on dated a close companionship, confidence, and friendship with the 'Father of his country' which never abated. Washington appointed him to his staff, and made him his private secretary and aide, with the rank of Lieutenant-colonel. He was given a command and led the Amer. column which carried the first Brit. works at Yorktown. In 1780 the handsome and brilliant young officer had made a great matrimonial match, marrying Elizabeth, daughter of Gen. Philip Schuyler, member of one of the oldest of New York families. H. was a member of the Continental Congress of 1782-83, and then took up the practice of law in New York city. He was one of the delegates from New York state at the Annapolis convention of 1786, and drafted the call for the Federal convention of 1787 at Philadelphia, which was to draw up a constitution for the new-born Amer. nation. He was chosen as one of the New York delegates to this. He was one of the conservative elements in the historic gathering at Philadelphia. He favoured an upper house of Congress chosen for life on a property basis, and a lower house chosen by manhood suffrage. Finding this impossible in the mood of the colonists, he made himself the leader of those who sought to interpolate, and did interpolate, into the constitution as many checks and safeguards as possible. With James Madison and John Jay he wrote the famous series of articles expounding the art of government which were afterwards collected in the classic vol. *The Federalist*. When Washington was chosen as president, H. became his secretary of the Treasury, and outlined a system for the encouragement of home industries which was the precursor of the country's later protective tariff system. In all

things he and Thomas Jefferson, who was secretary of state in the same Cabinet, were at loggerheads. H. was for centralisation of power. Jefferson was opposed to it. H. looked to the leadership of money and property. Jefferson was a thoroughgoing democrat. In a sense H. was thus the father of the Republican party of to-day, and Jefferson of the present Democratic party. Many of the principles they then asserted against each other are to-day the guiding principles of the two great Amer. political parties. H. resigned from office in 1795. His last years were not happy. He indulged in intrigues against John Adams, second president of the U.S.A., and had bitter political quarrels with Aaron Burr for power in New York state. The result of this was a duel with Burr in which H. was mortally wounded, July 11, 1804, dying the next day. His works were pub. by his son in 7 vols., 1851, and by H. Lodge in 12 vols., 1904. See his lives by J. Morse, 1876, and H. Lodge, 1882; and studies by G. Shea, 1877 and 1879, and F. Oliver, 1906. See also Gertrude F. Atherton, *The Conqueror*, 1902.

Hamilton, Count Anthony (c. 1646-1720), Irish-Fr. author; his father was George H., second earl of Abercorn and head of the family of H. in the peerage of Scotland, his mother being Mary Butler, sister of the duke of Ormonde. The place of his birth in Ireland is variously given as either Roscrea or Drogheda. He was carried to France when a child and a Frenchman he remained, in all but blood, till the end (Charles Whibley). His family removed after the execution of Charles I, but the fact that like his father H. was a Rom. Catholic precluded the political advancement he might have expected after the Restoration. On the accession of James II. he obtained the command of an infantry regiment in Ireland and was made governor of Limerick; but after the battle of the Boyne he was again in France as an exile. Though an exile he was much at home, especially as his sister had married the Comte de Grammont, and the rest of his life was spent mostly at the châteaux of his friends. It was at one of these, at Seaux, that he wrote the *Mémoires* of his brother-in-law, the Comte de Grammont, that made him famous. They give an admirable picture of the court of Charles II. and were pub. anonymously in 1713. With this work H. ranks with the most classical writers of France, and he is the only Eng.-speaking writer who, writing in the Fr. language, has become a classic, with the exception of his collateral descendant, Wm. Beckford, the author of *Vathek* (1815). He also wrote *Le Bélin*, *Fleur d'Épine*, and other tales in imitation of, and as satires on, the romances which Galland's trans. of the *Arabian Nights* had popularised in France.

Hamilton, Anthony Walter Patrick (b. 1804), Brit. playwright, b. in Sussex. Educated at Westminster School. Has written many plays, some of which have been adapted for the radio and for the films. They include *Monday Morning* (1923); *Craven House* (1926); *The Mul-*

night Bell (1929); *Rope* (1929), which was a successful 'thriller' on the radio; *The Plains of Cement* (1931); *Twenty Thousand Streets under the Sky* (1935); *Gaslight* (1939), also most successful as a radio and film play; the radio plays *Money with Menaces* and *To the Public Danger* (both 1939); *Hungover Square* (1911); *The Duke in Darkness* (1942); and *The Governess* (1915).

Hamilton, David (1768-1843), Scottish architect, b. in Glasgow. He was awarded one of the four £500 premiums for his designs of the new Houses of Parliament. He designed and executed many of the modern buildings in Scotland, including the Western Clubhouse and the Exchange at Glasgow, the duke of Hamilton's place in Lanarkshire, Toward Castle, and Lennox Castle.

Hamilton, Sir Edward (1772-1851), Brit. admiral. While in command of the *Surprise* he succeeded in capturing eighty privateers (1797-98), and cut out the *Hermione* from the batteries of Puerto Cabello. He was taken prisoner by the Fr. (1800), but was soon exchanged, and in the following year blockaded the N. coast of France. He was promoted to the rank of admiral in 1846.

Hamilton, Elizabeth (1758-1816), Scottish authoress, b. at Belfast. On the death of her father she was adopted by his sister, Mrs. Marshall, and brought up in Stirling. She subsequently lived in Bath, Harrogate, and London, and d. in Edinburgh. Her works include *Letters of a Hindoo Rajah* (1796); *Memoirs of Modern Philosophers* (a satire on the enthusiasts of the Fr. Revolution, 1801); *Life of Agrippina* (1801); and *The Cottagers of Glenburnie* (1805), which shows her at her best in depicting domestic life in rural Scotland. See Elizabeth O. Benger, *Memoirs of Mrs. Elizabeth Hamilton*, 1818.

Hamilton, Emma, Lady (née Emma Lyon) (c. 1761-1815), was of humble origin, and in early days was a nursemaid. Her extraordinary good looks brought her many admirers, and she lived under the protection, first, of Sir Harry Fife, 1st of Fife, and then of the Hon. Charles Greville. She made the acquaintance of Romney, who painted the well-known pictures of her. From 1786 she lived with Sir Wm. H. the ambassador, and married him five years later. While still living with her husband she became the mistress of Nelson about 1794, and in 1801 gave birth to a child, Horatia, of which the sailor was the father. H. and Nelson remained on good terms until the former's death in 1805. In later days Lady H. fell upon evil times, was imprisoned for debt, but contrived to escape to Calais, where she d. in obscurity. There are biographies by J. C. Jeffries on 1897, and W. Sichel, 1905. See also E. M. Keate, *Nelson's Wife*, 1919.

Hamilton, Gavin (1730-97), Scottish painter and antiquary, b. at Lanark. He studied painting under Mussacchi at Rome, where he principally lived. While in London he joined the committee whose object it was to found a royal academy (1755). His excavations at Hadrian's villa at Tivoli, at Civita Vecchia, and elsewhere,

rendered great service to art. His marbles are in the Louvre; his collection of busts and bas-reliefs in the Museo Pio-Clementino in the Vatican. In 1773 he pub. *Schola Italica picturae*.

Hamilton, Lord George Francis (1845-1927), Brit. statesman, a younger son of the first duke of Abercorn. He was educated at Harrow. In 1868 he was returned to Parliament by the co. of Middlesex, and subsequently represented the Ealing div. (1885-1906). He received an appointment in the India Office as under-secretary of state (1874-78) from Disraeli, which he exchanged for that of vice-president of the Council of Education (1878-80). He was twice First Lord of the Admiralty, in 1885-86 and 1886-92. In

LORD GEORGE HAMILTON

Balfour's ministry he was secretary of state for India, but resigned office in 1903 on the fiscal question. Chairman of the Poor Law Commission (1905-9). Chairman of Mesopotamia Commission (1916-1917), whose findings severely criticised the organisation of the Brit. expedition up to that date.

Hamilton, Sir Ian Standish Monteith (1853-1947), Brit. soldier; b. at Corfu; eldest son of Col. Christian Monteith H., commanding the 92nd Highlanders; his mother was a daughter of the third Viscount Gort. He was educated at Cheam, at Wellington College, Sandhurst, and in Germany - entering the army in 1873. He served in the Afghan war (1878-80) and the Boer war (1881) - had one arm permanently disabled at Majuba Hill - and took part in the Nile expedition (1884-85), when he was awarded the Khedive's star. He also saw service in the Burmese expedition (1886-87), and with the Chitral relief force under Sir R. Low (1895). In 1897-98 he commanded the 3rd Brigade during the Tirah campaign. In 1898 he went to Egypt

as commandant of the school of musketry. On the outbreak of the S. African war he went out to Natal, and was appointed head of the staff of the Natal field force under the generalship of Sir George White, being present at the battle of Elands-laagte, where he commanded a brigade with the local rank of major-general. He fought with conspicuous gallantry during the defence of Ladysmith, and was promoted to the rank of major-general.

In 1901-2 he was appointed chief of the staff of South Africa to Lord Kitchener, and was put in command of the mobile columns in the W. dist. of the Transvaal. He returned at the end of 1902, having been created a K.C.B., to the War Office with the appointment of military secretary. He had left S. Africa a lieutenant-general, having added to his reputation when so many had lost theirs. He fought with the Jap. troops in Manchuria (1904-5) as a representative of the Indian Army. In 1905 he was given the S. Command; he was promoted full general in 1907, and in 1910 became commander-in-chief of Malta and G.C.B. At beginning of First World War for a while in command of home defence army. In March 1915 he took command of the Mediterranean expeditionary force - i.e. that employed to force the Dardanelles. He landed on Gallipoli peninsula in April. In Aug., a grand effort was only partially successful. The gov. at home, finding H. opposed to withdrawal, had him superseded in Oct. by Sir Charles C. Monro. H. was lieutenant of the Tower of London, 1918-20. Lord rector of Edinburgh Univ., 1932-35. The fact that H. failed in the one campaign in which he exercised high command made no difference to the strong appeal he made to the general public. For the circumstances of the Gallipoli campaign were understood and H.'s tremendous difficulties fully appreciated, while it was generally thought that had he not been starved of resources he might have achieved an outstanding victory. Moreover, his personal charm, intellectual gifts, and versatility made a remarkable impression on his fellow countrymen. While such qualities suggest the brilliant amateur, it was always deeply realised that substantial soldierly qualities were by no means lacking in him; nor did he shrink from bold decisions. In the Gallipoli campaign he contrived that the army should work in harmony with the fleet, and the Fr. expeditionary force which was placed under his orders he handled tactfully and well, and few soldiers of the war emerged better from the ordeal of an international command. Yet with all his gifts and industry H. just failed to be a great soldier. He may have lacked the solid foundations which sustained others, or again he may have been one of those whom Napoleon reproaches with seeing too many sides of a problem at once. However that may be. In the Gallipoli campaign, after the Suvla landing, he did not reveal proof of the gift of power to gather into his hands all the loose threads, or to impress his determination on supine subordinates, or turn the fortunes of the day by his own

influence and initiative; while throughout the campaign he was overshadowed by the figure of F.-M. Lord Kitchener—though here it must be added that to many laymen it appeared that the criticisms to which he was sometimes subjected by the army sprang from the army's own shortsightedness and narrow-mindedness (*The Times*, Oct. 13, 1917). His chief pub. are *A Jamb in a Junk* (1884); *A Ballad of Hadith*, and other Poems (1888); *A Staff-Officer's Scrap-book during the Russo-Japanese War* (1906); *Compulsory Service* (1910); *Gallipoli Diary* (1920); *The Soul and Body of an Army* (1921); (with Victor Sampson) *Anti-Commando* (1931); *When I was a Boy* (1939); and *Jean—a Memoir* (1942).

Hamilton, James, *see* ARRAN, EARL OF.

Hamilton, John McLure (1853–1936), Amer. painter, b. in Philadelphia, son of George Hamilton, M.D. He studied in Philadelphia, Paris, and Antwerp, and finally settled in London in 1878. He was chiefly a portrait painter, but in his early work he painted subjects such as 'The Syren' and 'The Helress.' His prin. portraits are two of Gladstone (in the Pennsylvania Academy of Fine Arts, and the Luxembourg, Paris). Prof. Tyndall (National Portrait Gallery). Cardinal Manning, Herbert Spencer. Pub. *Men I have Painted* (1921).

Hamilton, Patrick (c. 1504–28), 'the protomartyr of the Scottish Reformation.' He graduated M.A. at Paris in 1520, and three years later became a member of Aberdeen Univ. But he came under suspicion on account of his Lutheran sympathies, and fled to Germany. On his return to Scotland (1527) he began to preach at Kincavel and attended a conference at Aberdeen. In 1528 he was brought to trial on a charge of heresy, and was burned at the stake on Feb. 29. His *Loci communes*, or 'Patrick's Places,' setting forth the doctrine of justification by faith, is included in Foxe's *Acts and Monuments*. See life by P. Lorrimer, 1857.

Hamilton, William (c. 1665–1751), of Gilbertfield, Scottish poet, b. at Ladyland, Ayrshire. His fame rests on his abridged and modernised ed. of Blind Harry's *Wallace* (1722). He contributed to Watson's *Choice Collection*, 1706, and his 'Willie was a Wanton Wag' was included in the *Ten-Table Miscellany* of Allan Ramsay. He had a verse correspondence with Allan Ramsay which is to be found in the latter's *Works* as 'Seven Familiar Epistles which passed between Lieutenant Hamilton and the Author,' 1719.

Hamilton, William (1704–54), Scottish poet, b. at Bangour, in Linlithgowshire. He espoused the cause of Prince Charlie, and was consequently obliged to seek refuge in France, but returned to Scotland in 1749, succeeding to the family estates at Bangour in 1750. He contributed to Allan Ramsay's *Ten-Table Miscellany*, 1724–27. His finest poem is *The Braes of Yarrow*. The first ed. of his poetry appeared in 1748, and a second in 1760. He d. at Lyons, and was buried in the abbey church of Holyrood House, Edinburgh.

See J. Paterson, *The Poems and Songs of William Hamilton*, 1850.

Hamilton, William (1751–1801), Scottish artist, b. in London. He studied at a very early age under Zucchi, the painter of ornaments, at Rome. R.A. 1789; exhibited from 1774 historical pictures, arabesques, and ornaments, scriptural and Shakespearian pictures, and portraits, including full-lengths of Mrs. Siddons and John Wesley.

Hamilton, Sir William (1788–1856). Scottish philosopher, b. at Glasgow. His father and grandfather had held the chairs of anatomy and botany in Glasgow Univ. In 1807 he entered Balliol College, Oxford, as a Snell exhibitioner, and graduated with first-class honours (1811), taking M.A. degree in 1814. He was called to the Scottish Bar (1813), but devoted his whole time to reading and research. In 1816 he made good his claim to the title of the Hs. of Preston, which had not been used since 1688. He was appointed prof. of hist. (1821) and of logic and metaphysics (1836) at Edinburgh, and in 1829 began his literary career with a criticism of Cousin's *Cours de philosophie*, entitled 'Philosophy of the Unconditioned,' in the *Edinburgh Review*. To this paper he continued to contribute, publishing his essays in 1832–53 under the title *Discussions in Philosophy, Literature, and Education*. His influence was great, not only upon his own countrymen, but in Germany and France. His lectures were pub. posthumously by Profs. Mansel and Veitch (1859–61). Sir Wm. H. pub. an ed. of Reid with seven dissertations (1846), and an ed. of Dugald Stewart (9 vols.), 1854–55, but in all his work he was hampered by ill health, his right side having been struck with paralysis (1814). He invented the doctrine of the quantification of the predicate (to quantify the predicate is simply to state whether the whole or the part only of the predicate agrees with or differs from the subject), urged that the philosophy of common sense is the highest human speculation, and distinguished reasoning in the quantity of extension from reasoning in the quantity of comprehension. See a memoir by J. Veitch (1869), and a study by W. Monck (1891).

Hamilton, Sir William Rowan (1805–65), celebrated mathematician. He came of a Scottish family that had settled in Ireland, and was b. in Dublin. He was a precocious boy, reading Hebrew at seven, and having good knowledge of thirteen languages at the age of thirteen. In later life he read Sanskrit and Persian for recreation. In his early teens he showed extraordinary mathematical ability, and when twenty-three years of age, Dr. Brinkley, the astronomer, said of him: 'This young man, I do not say will be, but is, the first mathematician of his age.' H.'s *Theory of Systems of Rays* was pub. by the Royal Irish Academy in 1828, and made a great sensation among European mathematicians, and he gained in reputation by his subsequent works, which include *A General Method in Dynamics*, in *Philosophical Transactions* (1834–35) and *The Elements of Quaternions* (1866).

His *Mathematical Papers* were ed. by A. Conway and L. Synge, 1931. See life by R. Graves, 1882 (new ed. 1903); and T. T. Sægerstedt, *The Problem of Knowledge in Scottish Philosophy* (Lund), 1935.

Hamilton, tn. and parli. bor. of Lanarkshire, Scotland, on l. b. of Clyde, 10 m. S.E. of Glasgow. It stands in the centre of a rich coal- and iron-field, and has large foundries and cotton mills, as well as fine public buildings, extensive barracks, and a good race-course. Here also is the ducal palace of the house of H., with its park, part of old Cadzow forest, where wild white cattle are still preserved, and the ruins of the anct. Cadzow Castle. Pop. 39,300.

Hamilton, city and port of entry of Ontario, Canada, cap. of Wentworth co., situated at the foot of the Niagara escarpment on the S. side of H. harbour (Burlington Bay), 40 m. S.W. of Toronto and 56 m. W.N.W. of Niagara Falls. It is at the W. extremity of Lake Ontario, and its development was much accelerated after the cutting of the channel between the lake and H. Bay (otherwise known as Lake Geneva and Burlington Bay) between 1823 and 1832. It is an important railway centre on the Canadian National, Canadian Pacific, and Toronto, H., and Buffalo railways, besides being linked with the New York Central and other Amer. lines. It is in the midst of a populous and highly cultivated fruit dist., yet is sometimes styled the 'Birmingham of Canada' on account of its 400 or more factories. It contains many fine residences, particularly those on the summit of the escarpment, and public buildings and wide streets. The most noteworthy buildings are the courthouse, city hall, post office, and public libraries. It is the seat of an Anglican and of a Rom. Catholic bishop. It is also the seat of McMaster Univ., the corporate name of what formerly (1887) were the Toronto Baptist College and the Woodstock College. There are many churches, public and technical schools and collegiate institutes, and three large hospitals. H. has more than forty parks, covering an area of 2 sq. m. Dundurn Castle in the park of that name contains the museum of the Wentworth Historical Society. H. has an important lake commerce, and a good service of steamers, as well as every rail facility for export by land; while a civic airport was constructed before the Second World War. Excellent communications and transportation facilities, combined with cheap power, have made H. a thriving economic centre. Many large industries are located in the city, and some of the largest of these are situated on or near the waterfront. H. is the heart of the Canadian steel industry. Its other manufs. include cotton, woollen, and silk textiles, textile and agric. machinery, motor cars and motor tyres, furniture and glass-ware, wire cables, boots, and tobacco. H. was laid out and settled in 1813 on a plateau at the foot of the 'mountain,' where lies the business quarter of to-day. It was named in honour of the Hon. Robert H. of Niagara, who bought land here in 1813,

and surveyed it as a township. La Salle had already explored the dist. in the mid-seventeenth century. The first dwelling is said to have been a log cabin built in 1778 by Robert Land, a United Empire Loyalist, on what is to-day the very heart of the city. In the year of settlement was fought the battle of Stoney Creek, in the war of 1812, between an Eng. force under Col. (later Sir) John Harvey, and an Amer. force under Gens. Chandler and Winder, in which the Amers. were routed and the two generals captured. The site of this battle has been kept as a public park with a memorial. Pop. 166,300.

Hamilton, cap. of Butler co., Ohio, U.S.A., on Great Miami R., and Miami and Erie Canal, 25 m. N. of Cincinnati. It has paper and flour mills, foundries, breweries, manufactories of farming implements, machinery, woollen goods, and trades in grain, hay, vegetables, tobacco, and live-stock. A branch of the Ford motor works is here. Pop. 50,600.

Hamilton, chief tn. of the cos. Dundas and Normanby, Victoria, Australia. It is situated on the Grange Burne Creek, 50 m. from Portland, and 198 m. W. of Melbourne. Sheep-farming is carried on in the dist., and there are meat-preserving works; frozen mutton is exported. Pop. 5000. Also a vil. in Northumberland Co., New S. Wales, Australia; it is a suburb of Newcastle. Pop. 5000.

Hamilton, cap. of Bermuda, situated on Great Bermuda or Main Is., the largest is. of the group; so named after Henry H., governor of Bermuda when it was incorporated in 1790. It superseded St. George's as the seat of government of the colony in 1815. It is laid out on a rectangular plan on gently rising ground. Almost all the houses are built of rock coral, and have white roofs. The little trains of the Bermuda railway run along Front Street parallel to the water-front. Old-fashioned horse-drawn victorias still ply for hire. Notable buildings in Front Street are the cable office, bank of Bermuda, and Butterfield's bank. On the N. side of the square stand the public buildings erected in 1839, containing the council chambers and gov. offices. On the S. side is the cenotaph, unveiled in 1925 to the memory of Bermudians who fell in the First World War. Near the public buildings is the Sessions House dating from 1817. Its upper part is the House of Assembly and the lower the Courts of Justice. The clock tower of the Sessions House was erected in 1893 to commemorate Victoria's jubilee in 1887. The cathedral of the Holy Trinity replaces the building burned down in 1884; it is a fine structure of indigenous limestone faced with Caen stone for doors and windows; the tower, of Nova Scotian freestone, is 144 ft. high. The foundation stone of the sumptuous H. hotel was laid by Capt. Charles Elliott, R.N., then governor of Bermuda, in 1852. Mount Langton, the governor's residence (1 m. from the wharf) was completed in 1899; it takes its name from an estate in Berwickshire, owned by Sir James Cockburn, governor, 1814-1819. Admiralty House, residence of the

commander-in-chief, W. Indies station, is 1½ m. W. of Mount Langton. Pop. 3000.

Hamilton Bay, see under **HAMILTON** (ONTARIO).

Hamilton Group, middle div. of the upper Devonian strata of New York; its deposits are of limestones, sandstones, and shales.

Hamilton Mount, California, U.S.A., 41 m. S.E. by E. of San Francisco, with the Lick Observatory, containing the largest refracting telescope ever made. Altitude 4209 ft.

Hamilton Port, group of little is. off S. coast of Korra, occupied by the Brit., 1885-87.

Hamilton, or **Grand River**, Canada, issues from Lake Petchikapou, flows through a chain of lakes below which are the Grand Falls, about 2000 ft. high, and enters the Atlantic through Labrador at H. Inlet.

Hamites (from Ham, son of Noah), anct. African race with some affinities to the Bantus and Hottentots. The term 'Hamitic' is especially applied to a group of African languages, comprising the anct. Egyptian, the Berber, Galla, and cognate surviving tongues. The H. are commonly included among the white races, as also are their neighbours the Semites; but some consider that Hamitism is nothing more than a specialised form of Semitism, and altogether unconnected with the Turanian family. Both Semitic and Hamitic mythologies are derived from the primeval cherubic worship of Eden. The earliest records show the existence of three well-differentiated types, all evidently of mixed Nigritic blood: the dark-skinned, which includes the Galla, Fulahs, and Semai; the reddish-skinned, found among the Egyptians and Bedja; and the blond type, a Berber race. The most advanced culturally of these are the reddish type, found early in the Lower Nile valley, who assimilated some features of Egyptian civilisation. The blond type would appear to have some kinship with the Kabyles mentioned by James Bruce of Kinnaird. The Hamitic tongues comprise the Berber or Libyan, the Egyptian, including the old Egyptian language and Coptic, and the Ethiopian, also known as Cushitic or Punic, which includes the Bedja, Somali, Galla, and other races of Abyssinia and the neighbouring country. Both the Hausa and Hottentot languages have traces of Hamitic structure, a fact which seems to corroborate the older belief of some bygone Egyptian migration southward.

Hamitic (Hamites), see also **GALLA**.

Hamlet, hero of one of Shakespeare's greatest tragedies which is founded upon a legend in the *Historia Danica* of Saxo Grammaticus (thirteenth century). Shakespeare, however, owed little but the outline of his plot to Saxo, whose hero, Amleth, only feigned his madness and plotted a deliberate vengeance a year before carrying it out. For a discussion of Shakespeare's play and its sources see **SHAKESPEARE**; also R. Latham, *Dissertations on Hamlet*, 1872; C. J. Simrock, *Quellen des Shakespeare*, 1870; and A. Hansen, *Legend of Hamlet*, 1887.

Hamley, Sir Edward Bruce (1824-93), Brit. general and author, b. at Bodmin, Cornwall. He entered the Royal Artillery in 1843, served in Gibraltar, and through the Crimean campaign, where he won special distinction at Inkerman. His articles in *Blackwood's Magazine* brought him literary recognition and led to his appointment as prof. of military hist. at Sandhurst in 1859. His lectures were afterwards pub. as *The Operations of War* (1867). H. was commandant at the staff college (1870-77), and commander of a div. in Egypt (1882), where he took part in the battle of Tel-el-Kebir. He publicly expressed his dissatisfaction at what he considered lack of recognition of his services. From 1885 to 1892 he was M.P. for Birkenhead. See I. Shand, *Life of Hamley*, 1895.

Hamlin, Hannibal (1809-91), Amer. statesman, b. at Paris, Maine. He was admitted to the Bar in 1833, and soon entered the political arena as an anti-slavery Democrat. He was a representative in Congress from 1843 to 1847, and a member of the U.S. Senate, 1848-56, 1857-61, 1869-81. In 1856 he broke with the Democrats on the question of slavery and joined the Republican party, who elected him governor of Maine in the same year. From 1861 to 1865, during the Civil war, he was vice-president of the U.S.A. under President Lincoln. He was minister to Spain, 1881-83. See C. E. Hamlin, *Life and Times of Hannibal Hamlin*, 1899.

Hamm, tn. of Westphalia, Germany, at the confluence of the Lippe and Aise, 22 m. S.E. of Arnberg. Before the Second World War it had an important iron industry. Near it are thermal brine springs. By the outbreak of the war its industries had much increased, but its chief importance in the war for the Ger. war machine lay in its rail communications, great marshalling yards, and supply depots for the Ruhr industries. Situated, as it is, close to such great industrial centres of the Ruhr as Dortmund, Bochum, and Gelsenkirchen, and Münster to the N., it was one of the tns. which most suffered in the battle of the Ruhr (q.v.). It was heavily raided by the R.A.F. on July 8 and Aug. 7, 1941 and repeatedly thereafter, being chosen by the Amers. for testing their heavy bombers on March 4, 1943. In the operations of 1945 for the envelopment of the Ruhr, the trapped enemy, under the command of F.-M. Model, attempted to strike out from H. in the N. and Slegen in the S., but these attempts, like the co-operating counter-attacks by the Ger. armies outside the 'pocket,' were abortive. Pop. (1939) 60,000.

Hammamet, seaport of Tunis, N. Africa, on the gulf of H., a bay of the Great Syrta, 42 m. S.E. of Tunis. The harbour is insecure. In the Tunisian campaign of 1943 there was a fierce tank battle at Hammam Lif, where the Brit. were checked on May 8; but they broke through the centre two days later, and by dawn on May 11 they had driven across to H. to seal off the peninsula and bar the road of retreat to the Ger. and It. armies. Pop. 5000. See

further under AFRICA, NORTH, SECOND WORLD WAR, CAMPAIGNS IN.

Hammam-Rirha, watering-place in Algeria in a beautiful mt. dist., having saline and ferruginous springs, near the ruins of Aquæ Calidæ. Pop. 18,000.

Hamme, tn. in E. Flanders, Belgium, on branch of R. Scheldt, 19 m. N.N.E. of Ghent. Pop. 16,400, engaged in agriculture and manuf. of lace, ribbon, oil, soap, textiles, etc.

Hammer, Sir Thomas Bartholomew (1877-1746), Eng. statesman and scholar; received his education at Westminster and Christ Church, Oxford. He entered into political life in 1701, being elected M.P. for Suffolk, and twelve years later he was chosen Speaker of the House of Commons. In 1727 he retired from public life, and gave up his time to the study of literature. He pub. an ed. of Shakespeare in 1744.

Hammer, implement consisting of a heavy head, usually of metal, but sometimes of wood or stone, set crosswise on a handle and used for striking blows; the name is also applied to heavy masses of machinery in which a block of metal is used for the same purpose (see STRAM and POWER HAMMERS). Hs. of stone have been found among antiquities and are still in use among barbaric peoples. The H., more often under its Fr. name of *marle-de-fer*, was a common weapon in war throughout medieval times. The word is applied to many objects which resemble the common H. in appearance or use, as, for instance, the 'striker' in a clock or in a bell, a part of the sounding mechanism of a pianoforte, the part of a gun which, by its impact on the cap, explodes the charge. It has also been used as a nickname for noted fighters, e.g. 'Hammer of the Scots' for Edward I.

Hammer-head, or **Hammer-headed Shark**, shark of the family Sphyrnidae or Zygænidæ, of which the common species *Ptygæna malleus* occurs in almost every lat. It is generally from 11 to 15 ft. in length, and is so called from the peculiar shape of its head, which resembles a double-headed hammer laid flat, on the flattened ends of which the eyes are placed. Specimens over 13 ft. in length have been captured round the Brit. coasts, and they abound in all the warmer seas.

Hammer, Throwing the. This ancient sport goes back to the Talfin games of Ireland in 1829 B.C. Not, however, until A.D. 1866 was it included in the Oxford and Cambridge sports, and in 1900 in the Olympic games. The H. is a round weight attached by a steel wire to a triangular handle, minimum total weight being 16 lb. In 1875 the length was fixed at 3 ft. 6 in., and the throwing space was limited to a 7-ft. circle. The H. is swung three times round the head, and the thrower makes two, three, or four turns within the circle. If the action is performed smoothly the thrower, after releasing the H., remains stationary in the circle and faces the direction in which the H. is travelling. Great technique is required, combined with physical strength, and a weight of about 15 stone or more. The official world records are those of E.

Blask (Germany), 193 ft. 7 in. (1938), and P. O'Callaghan (Ireland), 195 ft. 8½ in. (1937). Brit. national record is 172 ft. 3 in. (C. J. Lindh, Sweden, 1922) and the Olympic record is 179 ft. 7½ in. (M. J. McGrath, U.S.A., 1912).

Hammerich, Peter Frederik Adolf (1809-77), Dan. theologian and author, b. at Copenhagen. In 1845 he became pastor of a church in Copenhagen, and in 1859 was appointed prof. of theology at the univ. of that tn. His prin. historical works are *Danmark i Valdemarernes Tid* (1847); *Danmark under de tre Nordiske Riges Forening* (1849-54); and *Danmark under Adelsvælden* (1854-59). He also pub. some popular national songs in *Skandinaviske Reisesminder* (1840).

Hammerken, Thomas, see KEMPIS, THOMAS A.

Hammersmith, W. metropolitan bor. (formed 1809), Middlesex, England, on the R. Thames, 5 in. W. of St. Paul's. H., with Fulham, was the winter camp of the Dan. invaders in 879, and formed part of the par. of Fulham until 1834. Old H. bridge (1824) was the first suspension bridge near London, but was insecure and replaced in 1887. St. Paul's School, originally founded by Dean Colet in 1509 under the cathedral church, was moved to its present site in H. Road in 1883. Other buildings are Worinwood Scrubs prison; Olympia, with its huge arena under a glass roof; the 'White City' buildings and grounds, originally occupied by the Franco-Brit. exhibition of 1908; and the W. London hospital. Kensal Green Rom. Catholic cemetery, in which Cardinal Manning is buried, is also within the bor. Thomson wrote his *Seasons* in H. and Wm. Morris also lived there. Chief industries are iron and dye works, lead and oil mills, boat-building yards, motor works, and distilleries. Pop. 94,100.

Hammerstein, Oscar (1847-1919), theatre manager, b. at Berlin in Germany. He migrated to the U.S.A. as a youth and earned living in cigar factory, where he invented a machine for spreading tobacco leaves, which much improved his resources. Founder and editor of *United States Tobacco Journal*. Leased Stadt Theatre, New York, 1870. Built numerous theatres in New York, including Harlem Opera House (1880), Victoria Music Hall (1893), Columbus Theatre (1895), Olympia Music Hall (1895), Republic Theatre (1900), Manhattan Opera House (1906), and Lexington Theatre (1912). In competition with the Metropolitan Opera (1906-10), to whom he sold out (1910). Opened theatres in Philadelphia and London (London Opera House in Kingsway). His nephew Oscar Hammerstein (b. 1895), playwright and librettist, wrote musical plays: *Wildflower* (1923); *Rose Marie* (1924); *Sunny* (1925); *The Desert Song* (1926); *Show Boat* (1927); *Rainbow* (1928); *Music in the Air* (1932); *Carmen Jones* (1943); *Oklahoma* (1943); and *Carousel* (1945), some of these being written in collaboration. Author of lyrics of many songs: *Ol' Man River*, *All the Things You Are*, *Lover Come Back to Me*, and *Oh, What a Beautiful Mornin'*.

President of the Author's League of America, and vice-president and director of the Amer. Society of Composers, Authors, and Publishers.

Hammerton, Sir John Alexander (1871-1949), Scottish author and editor, b. at Alexandra, Scotland. Went to school in Glasgow, where he began work in a tombstone cutter's yard. Began his editorial career as editor of a temperance weekly, the *Scottish Reformer*. From 1893 to 1900 he was editor successively of a number of Eng. prov. newspapers. In 1900 he came to Fleet Street, doing freelance work in the nature of literary causerie for newspapers and periodicals. Towards the end of 1905 he began a close business association with Lord Northcliffe and the Amalgamated Press, which proved the background of his life's work as an editor of popular works of reference. Among his productions in the ensuing five years were *Punch Library of Humour* and the *Harnsworth Encyclopedia*. He collaborated with Arthur Mee in producing the *Children's Encyclopedia*, the *Harnsworth History of the World* (1907-9), and *The World's Great Books* (1909-10). To H. belongs the chief credit for the practice of issuing encyclopedias and similar works of reference in fortnightly or weekly parts, thereby enabling persons of modest means to purchase them. In 1911 he was appointed managing editor of the *Diccionario Hispano-Americano*, working on this ambitious undertaking in S. America for sev. years. On his return to England he ed. the 2d. weekly *The War Illustrated* (1914) and (with H. W. Wilson) the 6d. weekly entitled *The Great War*—issues of which two works reached 75,000,000 and 11,000,000 copies respectively. His next enterprise was a *Universal History of the World*, but notwithstanding his labours in this field he found time to write books on Barrie, Stevenson, Meredith, and others. Under the auspices of Allied Newspapers Ltd., in association with the Educational Book Company, he then brought out in 10 double vols. a work entitled *The Masterpiece Library of Short Stories: the Thousand Best Complete Tales of all Times and all Countries*, selected by a board of critics, including Wm. Robertson Nicoll, Sir Arthur Quiller-Couch, George Saintsbury, Sir Edmund Gosse, and other eminent writers. In 1939 he again produced a war record work, *The War Illustrated*, which by 1947 reached 255 numbers. His biographies include *With Northcliffe in Fleet Street* (1932)—a frank but fair-minded study—and a life of his associate, Arthur Mee. His last work was *The New Universal Encyclopedia* in 10 vols., 1949. H. was an editor of rare skill, with an exceptional capacity for work, combined with a talent for finding capable and sympathetic expert contributors for his numerous productions.

Hammond, Henry (1605-60), Eng. divine, b. at Chertsey in Surrey, and educated at Eton and Magdalen College, Oxford. In 1633 the earl of Leicester presented him with the living of Penshurst in Kent, and in 1643 he was made archdeacon of Chichester. At the outbreak of

the Civil war he joined the king at Oxford and attended him as chaplain during his captivity. He was deprived of his subdeanery of Christ Church by the Parliament, and d. in retirement at Westwood, Worcestershire. At Oxford he pub. his *Practical Catechism* in 1644, but as an author he is best remembered by his *Paraphrase and Annotations on the New Testament* (1653). See life by Bishop Fell, prefixed to H.'s *Miscellaneous Theological Works* (Anglo-Catholic Library, 1847-50).

Hammond, James (1710-42), poet and politician, second son of Anthony H. (1668-1738). When about eighteen he was introduced to Lord Chesterfield, and subsequently became one of the clique who surrounded Frederick, Prince of Wales. In 1741, by the influence of the prince, H. was elected M.P. for Truro, but, according to Walpole, was a failure as an orator. Popular tradition said that he d. of a love for Kitty Dashwood, one of Queen Charlotte's maids of honour, whom he addressed as Nemra or Della in *Lore Elegies by Mr. H.—nd* (written 1732, pub. with preface by the earl of C.—d being Lord Chesterfield) in 1743), written in imitation of Tibullus.

Hammond, John Lawrence Le Breton (1872-1949), Brit. journalist, historian, and biographer, educated at Bradford Grammar School and St. John's College, Oxford. Had a distinguished career on Liberal newspapers, including the *Daily News* and the *Manchester Guardian*—for which he wrote leading articles; and from 1907 to 1913 he held the position of secretary of the Civil Service Commission. But he was chiefly known for his historical writings, particularly his trilogy *The New Civilisation, 1760-1832*, written in collaboration with his wife, Barbara H. This work describes the effects of the industrial revolution on the social and economic life of the labouring classes. The first vol. of the trilogy, *The Village Labourer, 1760-1832*, was completed in 1911; the second, *The Town Labourer* (based largely on Home Office papers), was pub. in 1917; and the third, *The Skilled Labourer*, in 1918. The work is distinguished for its research and literary sensibility and carried widespread conviction. His first independent book was a study of the Wilds hero, Charles James Fox (1903); but his most impressive piece of independent historical work was a study of *Gladstone and the Irish Nation* (1938), in substance a biography worthy to rank with Morley's standard life. Other works were *Lord Shaftesbury* (1923, in collaboration with his wife); *The Rise of Modern Industry* (1925); *The Age of the Chartists: a Study of Discontent* (1930), an analysis of the specific conditions which resulted in chartism and revised and republished as *The Bleak Age* in 1931; and a biography of the Victorian social reformer, James Stansfeld. After the death of C. P. Scott (*q.v.*) H. was entrusted by the family with the task of writing a biography of Scott. This work, pub. in 1931, was less an intimate portrait than a study of an influential editor against a broad political background. Both H. and his wife received the honorary

degree of D.Litt. at Oxford in 1933. II. was also an honorary fellow of St. John's, Oxford, a fellow of the Brit. Academy, and honorary D.Litt. of Manchester Univ.

Hammond, Robert (1621-54), soldier, first in the service of the royalists and later in the army of the Parliament. In the struggle between the army and the Parliament in 1647, II. sided with the former, but retired from active service in the same year, and was appointed governor of the Isle of Wight, where the king was in his custody from Nov. 1647 to Nov. 1648.

Hammond, Walter Reginald (b. 1903), Eng. cricketer; b. in Kent. He learned cricket at grammar school, Cirencester. A distinguished member of Gloucestershire Cricket Club. A brilliant bat and fieldsmen and a useful length bowler. In May 1927 beat W. G. Grace's month's record, scoring 1028. He scored double 'centuries' in successive innings in test match in Australia, Jan. 1929. In 1932 in New Zealand test match he scored 336 not out. Captain of Eng. test team against Australia in England (1938), having reverted to amateur status. As cricketer H. is unique in his generation. Since the early thirties he has estab. a long, solitary supremacy to which that of W. G. Grace affords the only parallel. No other man in cricket hist. has headed the Eng. batting averages in six consecutive seasons. Only two others, Hendren and Sutcliffe, have made a hundred centuries in a single decade. H.'s test-match record is superior to all but that of Bradman. Nor, in the field, has there been a better slip-fielder. H. has played for England eighty-four times, making more test appearances than any other cricketer in hist., and in these games he has scored over 7000 runs and taken eighty-three wickets. He was captain in nineteen test matches. See his autobiography, *Crickets My Destiny* (1946).

Hammond, city in Lake co., Indiana, U.S.A., 20 m. S.E. of Chicago. Its chief industries are meat-packing, flour-milling, steel spring, and chemical manufs., and the building of railroad cars. It is served by eight railways, and has a splendid road connection. About 2 m. S. is H. Ford airport. Pop. 65,000.

Hammoncton, (n. in Atlantic co., New Jersey, U.S.A., 28 m. S.E. of Philadelphia. It is a popular summer health resort on account of its mineral springs. There are manufs. of cut-glass, shoes, and aluminum. Pop. 7600.

Hammurabi (also written Khammurabi and Ammurapi, and Amraphel in Gen. xiv. 1), son of Sin-muballidh, a ruler of Babylonia. He became ruler in 2370 B.C., and within thirty years succeeded in throwing off the supremacy of the Elamites, and driving them out of Babylon. He then added Larsa and Tamutbal to his kingdom and formed Babylonia into a single monarchy. A great revival of literature seems to have followed and to have been encouraged by the ruler, and he drew up a noted code of laws. See **BABYLONIA**.

Hamoaze, see PLYMOUTH SOUND.

Hamond, Sir Andrew Snape (1738-1828),

Eng. naval captain, b. at Blackheath, Kent. He entered the navy in 1753; took part in the battle of Quiberon Bay in 1759, and distinguished himself during the Amer. war of independence, especially in the defence of Sandy Hook (1778), for which he was knighted. In 1780 he was appointed governor of Nova Scotia and commander-in-chief at Halifax. In 1793 he was appointed a commissioner of the navy, becoming comptroller of the navy in 1794, which post he retained. At the special request of Pitt, until his retirement in 1806. From 1796 to 1806 he was M.P. for Ipswich.

Hamond, Sir Graham Eden (1779-1862), Eng. admiral, b. in London, only son of Sir Andrew Snape II., Bart. He was entered on the books of the navy in 1785; served in Lord Howe's flagship at the battle of the First of June 1794; took part in the Baltic campaign; and was present at the battle of Copenhagen, 1801. He was made rear-admiral in 1825, and was commander-in-chief of the S. Amer. station, 1834-38. He became an admiral in 1847, and admiral of the fleet in 1862.

JOHN HAMPDEN

Engraving after a print by J. Houbraken, 1740

Hampden, John (1591-1643), Eng. statesman, entered Parliament at the age of twenty-seven, but first came into prominence in 1626, when he was imprisoned for declining to pay the forced loan raised in that year. He was a leader of the opposition to the arbitrary conduct of the king, and a firm and stalwart objector to ship-money and other methods of raising money, which he regarded as illegal. As a matter of principle he refused to pay the small sum at which he was assessed in respect of his property, but in the courts the judgment went against him. In 1642 he was impeached, but contrived to escape arrest when the king in person came to the House of Commons on Jan. 4 in that year. He took an active part in organising the

parl. army, but early in the Civil war was mortally wounded at Chalgrove Field. His untimely death was a great blow to his party. There are biographies by Lord Nugent (1831), which occasioned Macaulay's famous article, and by John Forster (1837). See H. Ross Williamson, *John Hampden: a Life*, 1913, and *Charles and Cromwell*, 1948; J. Drinkwater, *John Hampden's England* (gives the fuller account of H.'s part in the Civil war), 1933; and C. V. Wedgwood, *17th Century Studies*, 1948.

Hampden, Renn Dickson (1793-1868), Eng. divine, b. in Barbados. He was appointed principal of St. Mary's Hall, Oxford, in 1833; prof. of moral philosophy in 1834; and, in spite of violent opposition, regius prof. of divinity in 1836. His Hampton lectures, delivered in 1832, on 'The Scholastic Philosophy considered in its relation to Christian Theology,' in which he upheld the theory that the authority of scriptures is of greater weight than that of the Church, resulted in a charge against him of unorthodoxy, and a violent controversy ensued. His appointment as bishop of Hereford in 1847 was the signal for another outbreak. His chief works are *Work of Christ and the Spirit* (1847); *Lectures on Moral Philosophy* (1856); and *Fathers of Greek Philosophy* (1862). See *Memorials* by his daughter, Henrietta Hampden, 1871.

Hampole, Richard Rolle (known as the Hermit of Hampole), see **ROLLE, RICHARD**.

Hampshire, Hants, or County of Southampton, S. maritime co. of England, bounded by Dorset, Wiltshire, Berkshire, Surrey, Sussex, and the Eng. Channel. The coast is broken by the great inlets of Langston and Portsmouth harbours (divided by Hayling and Portsea Is.), Southampton Water, Christchurch and Poole bays. The Isle of Wight is separated from the mainland by the Solent and Spithead. The surface of the co. is diversified by the Downs, rising to 940 ft. in Sidown Hill, and 1011 ft. in Inkpen Beacon, the highest chalk down in England. The S.W. portion of the co., cut off by Southampton Water, is occupied by the New Forest (q.v.), while in the E. are remains of the forests of Bere, Woolmer, and Waltham Chase. The chief rivs. are the Avon, the Test, and the Itchen. The chief industries are agriculture and market-gardening, while Hampshire pigs are famous. The manufs. are unimportant except those connected with the gov. establs. at Portsmouth. The co. is very rich in Rom. remains, and there are many notable monastic buildings and old castles, including Porchester castle, Carisbrooke castle in the Isle of Wight, Netley and Beaulieu abbeys. A series of commons and manorial wastes on the edge of the New Forest (932 ac. in area), including Bramshaw and Cadnam, were acquired in 1928 by the National Trust. H. (exclusive of the Isle of Wight) returns five members to Parliament, and Portsmouth, Southampton, Winchester, and Christchurch are parl. bors. Other important tns. are Aldershot, Andover, Basingstoke, Bournemouth, and Romsey. Area (including

the Isle of Wight) 1,055,811 ac. Pop. 1,036,000. See the Victoria Co. Hist., *Hampshire*; L. Ball and T. Varley, *Hampshire*, 1909; R. L. P. Jowitt, *Hampshire* (revised), 1949; and B. Vesey-Fitzgerald, *Hampshire and the Isle of Wight*, 1949.

'**Hampshire**,' Brit. armoured cruiser of the *Deronsire* type (naval estimate 1901-1902), with two torpedo tubes, 21,000 h.p.; 22.5 knots max. speed. It was sunk soon after the battle of Jutland, off the coast of Scotland (June 6, 1916), with the loss of Lord Kitchener and his staff, who were on a secret mission to Russia.

Hampshire Breed, see **SHEEP**.

Hampshire Regiment. Formerly 37th and 67th Foot, linked in 1881 to form the present regiment. The 37th was raised in 1702, and saw service in Holland under Marlborough and under George II. at the battle of Dettingen. It was at Minden (1759) and in the Amer. war of 1776-77. It gained further laurels at the battle of Waterloo. The 67th was raised in 1756, the famous Gen. Wolfe being its first colonel. After a period of service in the W. Indies it went to Spain in 1810, and served under Wellington during the Peninsular war. During the First World War it raised thirty-six battalions, which served in France, Flanders, Italy, Macedonia, Gallipoli, Egypt, Palestine, Mesopotamia, and Siberia. In the Second World War the H. R. fought in N.W. Europe, and in Italy. A memorial to the men of the four battalions who lost their lives at the Salerno landing and in the subsequent fighting, in Sept. 1913, was dedicated in the chapel of St. Martin and St. George at Pontecagnano, 6 m. E. of Salerno. Other units took part in the bitter fighting, in 1945, in the vicinity of Goch, on the Siegfried line.

Hampstead, parl. and metropolitan bor. and residential suburb of N.W. London. In the early part of the eighteenth century it was famous for its medicinal springs. On the top of a hill (430 ft.) is H. Heath (480 ac.), a favourite resort of Londoners, which affords a splendid view and most bracing air. An old house on the heath, now a private residence, was the meeting place of the Kit-Cat club, frequented by Steele, Addison, Richardson, and Walpole. Other famous names connected with H. are Pitt, Du Maurier, and Leigh Hunt. Here lived also Hazlitt and Romney. Keats lived in Well Walk. The graveyard of the church of St. John contains a number of monuments of eminent persons, including those of Joanna Baillo, Sir James Mackintosh, and Constable. The chief institutions are the orphan working school, the general and fever hospitals, New and Hackney colleges. The bor. includes the greater part of Primrose Hill to the N. of Regent's Park. H. returns one member to Parliament. Area 2265 ac. Pop. 67,000. See C. A. White, *Sweet Hampstead*, 1901.

Hampton, Wade (1818-1902), Amer. soldier and statesman, b. at Columbia, S. Carolina; educated at S. Carolina Univ. In early life he served in the legislature of S. Carolina, but his views as a Union Democrat were unpopular. He enlisted at

the beginning of the Civil war, and formed and equipped the command of infantry, cavalry, and artillery known as 'Hampton's Legion,' which served with distinction at Bull Run and Seven Pines. It was prominent at Gettysburg, in the Shenandoah Valley, and in command of J. M. Johnston's cavalry. He was governor from 1876 to 1878, and a senator from 1878 to 1891.

Hampton, cap. of Elizabeth co., Virginia, U.S.A., at mouth of James R., 70 m. S.E. of Richmond. It is served by the Chesapeake & Ohio railway. It has a normal and agric. institute for Negroes, an artillery school, and Army Air Corps headquarters. A strongly fortified naval station and a shipping point for fish and oysters. Pop. 5800.

Hampton, par. in the Spelthorpe div. of Middlesex, England, on the N. bank of the R. Thames, 15 m. S.W. of London, now incorporated, for municipal purposes, with Twickenham. Mentioned in Domesday Book, little of note is recorded of it until early in the sixteenth century. At the time of the Domesday survey (1086) the manor of *Hamptone* was held by Walter de St. Valerie, whose family retained it for a century, when it passed to Henry de St. Albans. In 1211 Lady Joan Grey, probably heiress of de St. Albans, bequeathed the manor to the Knights of the Hospital of St. John of Jerusalem. For three centuries or more the Knights Hospitallers held the manor, their last prior, Sir Thomas Dacyn, leaving it to 'the most Reverend Father in God, Thomas Wolsey, archbishop of York,' for ninety-nine years. It contains many fine private residences, and near it is the old royal palace and park of H. Court (see HAMPTON COURT PALACE). The bridge over the Thames at H. Court opened in 1933 is a beautiful structure with three spans, the centre one being 105 ft. long, and the side spans each 90 ft. The par. church of St. Mary (1830) on the bank of the riv. is built of white brick in the Perpendicular style, with tall rounded windows, which give the sides of the building the appearance of having more glass than brickwork. The organ was the gift of William IV. who, with Queen Adelaide, was then resident at Bushy House on the N.E. confines of the par. Near the porch is the canopied tomb of Mrs. Sibell Penn (d. 1552), nurse to Edward VI. Another memorial is to Richard Tickell, a political writer, who committed suicide in H. Court Palace in 1793. The churchyard contains the tombs of Huntington Shaw (1710), the iron-wright, who constructed the entrance gates to H. Court Palace; George Fitzclarence, first earl of Munster (1842), and sev. Pagets. Here also is interred Mary Clermont of H. Wick, whom Byron castigated in his poem, *A Sketch* (1816), for making mischief between the poet and his wife. At H. Hill, a modern adjunct of H., is the church of St. James, a red-brick building in the Early Eng. style, erected in 1863. A feature of this church is its beautiful spire, built to commemorate the jubilee of Victoria (1887). Mention should also be made of the 'Red Lion' at the corner of Thames Street and Red Lion

Square: the modern hotel stands where forgathered in the sixteenth century many a hunting party, of which Henry VIII. himself was the central figure. Later it was a resort of literary celebrities, including Pope, Swift, Addison, Bulstrode, and Colley Cibber. H. is also noted for its associations with David Garrick. His villa had within its grounds, which fringe the river bank, a domed Grecian temple, which still exists; both temple and lawn have been purchased by the local authority for a public garden. The grammar school, founded 1556 by a local resident, Robert Hamonde, is now, under the Education Act, 1944, a secondary (grammar) school; it was gradually enlarged until 1939, when an entirely new school was erected. Pop. 15,000.

Hampton Court Conference. Conference between the bishops and the Puritans which took place at H. C. Palace in 1604. James I., on his way to London, after his accession, was presented with the Millenary petition by the Puritan clergy, demanding the reformation of certain abuses in the Church and the relaxation of certain penalties directed against themselves. James, whose dislike of the Scottish Presbyterians was extended to the Eng. Puritans, had no intention of complying with their demands, which would have involved changes in the Prayer Book unacceptable to the mass of the clergy and a large proportion of the people, and called a conference in which the High Church element so preponderated over the Puritan that the rejection of the latter's demands, with a few trifling exceptions, was a foregone conclusion.

Hampton Court Palace, on the Thames, 15 m. S.W. of London, was built by Cardinal Wolsey in 1515, and was presented by him to Henry VIII. in 1526. Henry VIII. enlarged it and formed a fine deer park around it; and Jane Seymour d. here at the birth of her son, Edward VI. Mary, Elizabeth, Cromwell, and the Stuarts used it as a residence; the H. C. Conference (q.v.) was held here in 1604, and Charles I. was imprisoned in the palace. William III. partly rebuilt it from the designs of Sir Christopher Wren, and laid out the park and gardens in the Dutch style. It was used as a royal residence till the reign of George II., since when it has been lent in suites to well-born pensioners of the Crown. The state apartments are open to the public, and the picture gallery contains some valuable works of art and other masterpieces. The palace is one of the finest extant examples of Tudor architecture, and the park and grounds are of great beauty. N. of the palace is the royal demesne of Bushy Park (1000 ac.).

There are three prin. courts. On the E. or garden, side, is the Fountain Court, built by Wren. In the centre is the Clock Court, so called from its astronomical clock, made in 1540, but restored by Thwaites in 1879, and still going, with Wolsey's name and motto, 'DOMINVS MEVS ADIVTOR' (The Lord is my Helper) immediately above the archway of Clock Court, but beneath the clock. Westward is the Green or Base Court, the largest of

all. From this the Great Gate leads out over the Tudor bridge crossing the moat, rediscovered in 1909. The picture gallery, one of the finest collections in the kingdom, is housed mainly in Wren's buildings round the Fountain Court. The most celebrated pictures are Mantegna's 'Triumph of Julius Caesar' (series of nine), now in the series of contemporary paintings of the Field of the Cloth of Gold; 'Windsor Beauties,' by Lely; 'Canon Van der Paele,' by Van Kyck; and specimens of the work of many old masters. The carvings of Grinling Gibbons and the ceilings and fireplaces in many of the rooms are noteworthy. Among the more famous apartments are the Haunted Gallery,

John H. Stone

HAMPTON COURT PALACE:

(opened to the public in March 1918). At the end of this gallery is the Great Watching Chamber, with its splendid Flemish tapestries 'Seven Deadly Synnes' and 'The Three Fatal Ladies of Destiny.' Beyond is the great hall with its magnificent hammer-beam roof; on its stage plays were performed in James I.'s reign. 'My Lord Cardinal's Lodgings' lie on the S. side of the Clock Court. The Tudor doorways and fireplaces, oak wall-paneling, and inlaid devices and inscriptions, all merit attention. The gardens cover 44 ac. The Great Vine, probably planted by 'Cupability Brown' in 1768, is in the vine-house. The Great Fountain Garden lies along the E. front, and is named after the fountain which feeds the elliptical gold-fish pond in its centre. The maze (northwards near the Lion Gates) is a well-known attraction. Attached to H. C. P. are two great parks. The nearer is the Home Park (or H. C. Park), almost

the size of Hyde Park and Kensington Gardens together. It was here that William III. was riding when his horse 'Sorrel' threw him so badly that he d. not long afterwards. The second, Bushy Park, is even larger, and its 1100 ac. are cut by the magnificent chestnut avenue, a triple avenue of limes and horse-chestnuts, extending for over a mile along the road to Teddington.

See E. Law, *Hampton Court in Tudor, Stuart, Orange, and Guelph Times*, 1885-1891, and *Masterpieces of the Royal Gallery of Hampton Court*, 1904; Julia Cartwright, *Hampton Court*, 1909; and S. Christina Jerome, *Turn Back the Clock at Hampton Court*, 1949.

Hampton Roads, channel between Chesapeake Bay and the estuary of the James R., Virginia. Two notable naval engagements took place in H. R. during the Civil war. In 1862 the Confederate ironclad, *Virginia* ('Merrimac'), destroyed the Federal frigates *Cumberland* and *Congress*, the other Federal vessels (*Minnesota*, *St. Lawrence*, and *Roanoke*) escaping. Returning the next day to destroy these also the *Virginia* found the Federal ironclad *Monitor* awaiting her. This was the first engagement between ironclads, and the *Virginia* was forced to retire. See 'MONITOR.'

The Hampton Roads Conference was an informal conference held in the cabin of the *River Queen*, near Fort Monroe, in 1865. It was brought about by Blair to try to arrange peace between N. and S. President Lincoln and Seward, secretary of state, represented the Federals, while vice-president Stephens, Senator Hunter, and Campbell, assistant secretary of war, represented the Confederates. Lincoln would only consider peace propositions which ensured complete restoration of the union, and accepted the emancipation proclamation. He disapproved of a joint attack upon the Fr. in Mexico, and the conference broke up without reaching any definite conclusion. See J. Davis, *Rise and Fall of the Confederate Government*, II, 1881; J. G. Nicolay and J. Hay, *Lincoln*, x., 1890; *Cambridge Modern History*, VII, 1903.

Hampton Wick, tn. of England, in the co. of Middlesex, 15 m. S.W. of London Pop. 3000.

Hamster (*Cricetus*), genus of rodent animals of the Muridae family. There are in all nine species, of which the most important is the common H., occurring in certain dists. of Germany, and in parts of Europe and Asia. The H. has a stoutish body with thick glossy coat, short legs and tail, and is about one foot in length. It breeds twice during the year. During the winter it hibernates, living upon its store of food, consisting of roots, grains, and fruits. The H. is a great pest to the farmers of the countries where it abounds, being very destructive to their crops. The male H. is very pugnacious, and will defend itself to the last gasp.

Hamsun, Knut, Norwegian author, b. 1859. Brought up in the Lofoten Isles. After running away to sea he became successively a schoolmaster, a stone-breaker,

a tram-conductor in America, and a journalist. The pub. of his novel *Sull* (1888, Eng. trans. *Hunger*, 1899), won him recognition. Other works are *Lars Ofedal* (1889); *Mysterier* (1893); *Pau* (1894); *Siesta* (1897); *Redaktör Lyngre* (1898); *Kraskow* (1904); *Markens Gröde* (1917) (Eng. trans., *Growth of the Soil*); *Konerne ved Vaiposten* (1920) (Eng. trans. *The Women at the Pump*); and *drumms. Norn*, written in 1894, contains beautiful descriptions of scenery and forest life. Awarded Nobel prize for literature, 1920. A staunch personal friend of Quisling (*q.v.*) he delivered a long tirade against England during the war, which nation, he declared, he had always hated as the eternal enemy of Europe. See life by O. Skavhals, 1929.

Hamun, huge shallow trough in Seistan, on the borders of Persia and Afghanistan, is about 100 m. long. It is generally dry, excepting after heavy rains. Two large lakes receive the Helmund, Farrah-Rud, and Hamud, at the S. end. The water is for the most part salt.

Han, riv. of China, trib. of the Yangtze, which it joins at Hankow. It runs through the provs. of Shensi and Hupeh. Length 1300 m.

Han, Chinese dynasty, which was founded by Lin Pang, 202 B.C., and endured till A.D. 220. It reigned in a period when China extended her empire at the expense of the Huns and other W. tribes, and was fruitful in works of literature, notably historical. The introduction into China of Buddhism dates from this era.

Hanaper, office in the court of chancery, now abolished, under an officer called the clerk of the 'hanaper' (Med. Lat. *hanaperum*), a wicker basket or hamper, in which writs and other documents were kept. The office long survived in Ireland, and from the II. were issued writs for the return of members of Parliament. The comptrollers of the II. were abolished in 1842.

Hanau, tn. in Hesse, 13 m. N.E. of Frankfurt, at the confluence of the Kinzig and the Main. There is an old tn. and a new tn. Protestant refugees founded the latter in 1597, when they came from Holland and Belgium, and introduced woollen and silk manufs. Other pre-war manufs. were carpets, leather, gloves, porcelain, paper, and machinery. Diamond cutting was also carried on, and there was a gov. powder works near. Napoleon defeated the Austrians and Bavarians here in 1813 on his retreat from Leipzig. It is the bp. of the brothers Grimm. Wilhelmshad, a watering-place noted for its mineral springs, is in the neighbourhood. In March 1945 II. was used by the Amer. forces of the central group of armies, together with other tns., as a lodgement area from which an advance in strength could be made on Kassel. Pop. 40,600.

Hanbourdin, tn. in France, dept. of Nord, 4 m. S.W. of Lille. Pop. about 6200.

Hancock, John (1737-93), Amer. statesman, b. at Quincy, Massachusetts. President of Prov. Congress, 1774-75. President of Congress, 1775-77. First signer

of the Declaration of Independence. Governor of Massachusetts, 1780-85 and 1787-93.

Hancock, William Keith (b. 1898), Brit. historian and economist, b. in Melbourne. Educated at Melbourne Univ. and, as a Rhodes Scholar, at Balliol College, Oxford. Elected in 1923 a fellow of All Souls College, Oxford. Spent next years in visits to Italy and in research on modern It. hist., publishing his *Ricasoli* in 1926. From 1924 to 1933 he was prof. of hist. at Adelaide Univ., and in 1930 produced his *Australia* (Modern World Series), a survey of the tendencies and forces, political, economic, and intellectual, which are moulding the life of Australia, the survey being avowedly built on the detailed investigations of other writers. Prof. of modern hist. in Birmingham Univ. since 1933. He made his name with his brilliant and monumental *Survey of British Commonwealth Affairs*, written for the Royal Institute of International Affairs. This great work in 3 vols. (vol. 1, *Problems of Nationality*, 1918-36, 1937; vol. 2, *Problems of Economic Policy*, 1918-39 (two parts, 1916, 1942), analyses the constitutional, racial, and economic problems of the Brit. Commonwealth in the two decades between the two world wars. The analysis is based not only on documents, but on the personal investigations which H. undertook between 1934 and 1940 in Ireland, Palestine, Malta, many African colonies, and all the dominions. It is probably the most important book on the Brit. Empire pub. in recent years. His *Argument of Empire* (1913) is a discussion of the problems which may be regarded as those of capital importance to the Brit. Empire.

Hancock, Winfield Scott (1824-86), famous Amer. soldier, b. in Montgomery co., Pennsylvania. In 1844 he graduated from the U.S. military academy and served for two years with the Sixth Infantry in the Indian country. In the Mexican war he fought with credit, and in 1847 was made first lieutenant 'for gallant and meritorious conduct' at Contreras and Churubusco. He served successively as regimental adjutant and quartermaster from 1848 to 1855, and in that year was appointed captain and assigned duty in Florida. At the outbreak of the Civil war II. was appointed brigadier-general of volunteers, and fought with distinction at Williamsburg, Fredericksburg, Chancellorsville, and Gettysburg. In 1866 he received his commission as major-general in the regular army. In 1880 he was democratic nominee for U.S. president, but was defeated. See F. A. Walker, *General Hancock*, 1894.

Hancock, a tn. in Houghton co., Michigan, U.S.A., on the N. of Portage Lake, 1 m. N. of Houghton. A ship canal connects it with Lake Superior. In the neighbourhood are rich copper mines, in connection with which there are smelting furnaces and machine shops. It is a growing summer resort and centre for tourists of the 'Hiawatha' dist. Pop. 5500.

Hand may be defined as a special forelimb termination distinguished by the

faculty which it possesses of opposing the pollex or thumb to the other fingers, so that small articles may be grasped. The possession of two Hs. was sufficient to classify man as a distinct order, *Himana*. It may be thought that four-handed animals (monkeys, etc.) are better equipped than man, but in reality the former lack the intricacy and delicacy of manipulation possessed by the latter, and in the case of the lower animals the forehands are needed for locomotion and support.

Bones.—The H. possesses twenty-seven bones, viz. eight carpals in the wrist, roughly arranged in two rows of four each;

DIAGRAM OF A HAND

1, carpal bones; 2, metacarpal bones;
3, phalanges.

five metacarpals, forming the bony support of the palm; fourteen phalanges of the fingers, the thumb containing two bones and the others three each.

Movements.—The muscular and nervous connections of the H. are of great intricacy. The sev. bones are strongly bound together, each bone being joined to some three or four others. The turning movements are characteristic of the fore-limb and of the human species. The turning of the palm downwards is termed pronation (*see ARM*), while supination, which is most highly developed in man, is the turning of the palm upwards as for receiving objects. The movements are brought about by the pronator and supinator muscles assisted by the biceps muscle. The greater power possessed in supination has established the thread direction in such objects as screws, gimlets, etc. The flexing of the wrist and H. upon the forearm is brought about by the combined action of three muscles, while the flexing of each finger is caused by two muscles lying along the inner side of the digit, the deeper flexor which is attached to the first phalanx

passing through a perforation in the superficial flexor, which is attached to the second phalanx—a most ingenious contrivance.

Deformities (congenital) are fairly common in some families, and are marked by excess or lack of digits. The joints are frequently the seat of gout, rheumatism, or rheumatic arthritis, while brittleness of the nails often follows serious illnesses. Right- and left-handedness are usually inherited, but may be the result of practice. An ambidextrous condition is more rare, but may be acquired. The term H. has a variety of uses in current speech, and is used technically as equalling 4 in. in horse measurement.

Hand, in heraldry, is termed either 'dexter,' right, or 'sinister,' left, and when seen in the escutcheon, signifies equity, fidelity, and friendship.

Handball: 1. Game is probably Celtic in origin, and is suspected to have been one of the anct. Taitin games of Ireland. The modern version of it, as played chiefly in the U.S.A., has much in common with the Basque game of pelota. It is also something similar to the Eng. game of fives. The court should be about 60 ft. long and 25 ft. wide, and has a front wall of about 30 ft. in height and a back wall of 12 ft. About half-way across the court a line is drawn, called the 'ace line.' Nearer the front wall is another line, called the 'over line' (or 'short' and 'front' respectively). The ball is served against the wall and, to be in play, must land between the two lines. The server scores an 'ace' if his opponent fails to return the ball. Should he return it, however, it is called a 'hand-out,' while if the server misses in his turn, the service then goes to the other player. The winner is he who first scores a number of aces, generally fixed at twenty-one. The National Amateur Athletic Union in America holds ann. singles and doubles championships. 2. Game between two teams of eleven players each, whose object is, by catching and passing, to score by shooting the ball into the opponents' net. Next to football, H. is the most widely played game in Germany, Austria, Switzerland, and other European countries, and is played on a football field in summer and in indoor halls in the winter. The rules are basically the same as for association football but the ball may only be caught, thrown, or punched by hands or arms, and may be carried only three paces by the player. The goalkeeper, however, may play the ball with any part of his body. Penalties for fouls are free throws or corner throws. The ball is 2½ in. in circumference and weighs 15½ to 17½ oz.

Handcuffs, instruments for securing prisoners under arrest, known in the fifteenth and sixteenth centuries as swivols, or manacles. They generally consist of two divided metal rings, connected by a short chain, adjustable to wrists of different sizes, and of recent years sev. improvements have been made in their construction. A long chain is used to remove gangs of prisoners from one prison to another, connecting the separate H. by

which each prisoner is secured, and made fast at both ends by what are known as 'end-locks.' Some H. are made so that they can be placed on the wrists and immediately secured by a single movement. There are sev. appliances, of recent invention, resembling handcuffs, employed by the police, such as 'snaps,' 'nippers,' 'twisters,' etc., differing from H. in that they are meant for one wrist only, the handle part being held by the officer conveying the prisoner.

Handel, Georg Friedrich (1685-1759), b. at Halle of unmusical parentage, was destined for law, but showed such remarkable talent for music that he was finally permitted to adopt it for a career. He studied under the famous organist, Zachau, and made rapid progress in composition, the organ, harpsichord, oboe, and violin. He became organist at Halle cathedral in 1702; the following year he was engaged as second violin in Keiser's orchestra at Hamburg, where in 1705 he produced his first operas, *Almira* and *Nero*. He next visited Florence, Venice, Rome, and Naples (1706-10), producing operas with considerable success. Similar good fortune awaited him in London, where he produced *Rinaldo* (1711). From this time until his death H. practically remained in England, his closest friends including such men as Pope, Fielding, Arne, and Hogarth, and he was subsequently, in 1726, naturalised. The death of his admiring patron, Queen Anne, the stoppage of his pension (awarded him in recognition of his hue *Utrecht Te Deum*), and the succession of the elector of Hanover, whom he had offended by leaving, caused him much anxiety; but he was restored to favour in 1715, and in 1718 he was made choirmaster to the duke of Chandos. (It should be noted that Newman Flower throws doubts on this story concerning H. and the elector of Hanover.) This post he retained until 1720, composing, meanwhile, the famous serenade *Jess and Galatea* (1720 or 1721), many anthems, and some harpsichord pieces. His first oratorio in Eng., *Ester*, was also produced with great success (1720). The same year saw the foundation of an operatic company under the management of H. and his rival Bononcini; for its productions, H. wrote over a dozen operas, including *Ottone* (1722); *Tamerlane* (1724), and *Scipione* (1726). On the company's failure (1724) H. organised a similar affair, for which he wrote another dozen operas or oratorios, including *Deborah* (1733); *Orlando* (1733); *Arianna* (1734); *Alcina* (1735); and *Uthala* (1736). The failure of this venture (1737) brought on an attack of paralysis, and he was forced to go to Aix-la-Chapelle. Shortly after his return in 1737 he forsook opera and turned to oratorio, and from that time until blindness overtook him (1752) he wrought, in fifteen oratorios of unique, unprecedented splendour, the reformation and development of choral composition on which his claim to greatness principally rests, commencing with *Saul* (1739); *Israel in Egypt* (1739), his finest work; and *L'Allegro* (1740). The year 1742 witnessed the production at Dublin of the wonderful

Messiah, which shares with Mendelssohn's *Elijah* the greatest popularity of any oratorio ever written. His chief subsequent works were *Samson* (1743); *Judas Maccabæus* (1747); *Theodora* (1750), a beautiful work which has never been appreciated, and, last of all, *Jephtha* (1752). Although of Ger. birth and saturated with It. ideas, H. is remembered purely as an Eng. composer, by reason of the tradition of big choral writing which he founded, a peculiarly Eng. tradition, best exemplified in Elgar and Granville Bantock. It was in England, unfettered by Ger. and It. conventions, that he could best express his ideas, dramatic and devotional. With

GEORG FRIEDRICH HANDEL

Engraving after a picture in the collection of His Majesty at Windsor

the exception of J. S. Bach, H. far outshone his contemporaries. For the most part he adhered strictly to accepted forms; he had an excellent sense of balance; and his sure instinct for dramatic values was a predominating feature in his operas and oratorios alike. His writings are marvellously fluent, and his skill in contrapuntal choral writing profound; his music is consequently rich in effects at once broad, massive, noble, and inspiring: the ideals of classical oratorio. H. was a very fine performer on the organ and harpsichord, and his instrumental music is still greatly appreciated, e.g. his *Suites pour le Clavecin* (1720, 1733), the *Concerti grossi* (1710), and the organ concertos (1740). See lives by E. J. Dent, 1934; O. F. Williams, 1931, and P. Young, 1947. See also W. Smith, *Concerning Handel*, 1948.

Handfasting (O.E. *handfastung*), custom long prevalent in Scotland, whereby man and woman could pledge themselves to each other for a year and a day by the joining of hands. If at the end of that time the woman was neither a mother nor pregnant, the man need not make her his

wife. Sir Walter Scott describes the custom in his novel, *The Monastery*. It was the means of bringing about great evils in society, and many injunctions were directed against it by the clergy both before and after the Reformation.

Handicap, in games and sports is a disadvantage placed upon the abler competitor in order to reduce the participants to equality and thus afford a closer contest. There are many methods of handicapping, depending upon the nature of the contest. In foot races the best runner has to cover a greater distance, in billiards the better player to score a greater number of points. In yacht races a shorter time is allowed, while in shooting matches a greater range is fixed. In such games as draughts and chess the better player is deprived of some of his pieces, and loses one or more moves at the beginning of the game. Cricket matches are common in which one side takes the field with more than the usual number of men. Handicapping is general in horse-racing, where the weight a horse has to carry is fixed in proportion to his quality. This practice originated at the beginning of last century and at first took the form of a H. according to the horse's age. The handicappers are licensed by the Jockey Club, and upon the pub. of the weight to be carried owners have the option of withdrawing their horses from the contest without losing their entrance money. The weight to be carried is carefully taken into account in estimating the chances of the horse winning the race.

Handley, Thomas (1894-1919), Brit. radio comedian, b. at Liverpool. At one time a commercial traveller by day and an entertainer by night. During the First World War he served with a kite balloon section of R.N.A.S. After the war he joined a concert party and appeared in music-hall sketch, *The Disorderly Room*, which was given a place in the Royal Command performance of 1923. First radio engagement, 1926, and subsequently took part on the air in revue, vaudeville, operetta, pantomime, and other items. The feature, however, in which he had his greatest success was 'Itma' ('It's That Man Again'—words first applied to Hitler). In this feature, through which his name became known over the whole country, he owed much to the talents of a well-chosen team, and still more to the script-writers; but the feature owed as much to H.'s outstanding personality—a personality humorous, ebullient, kindly, and sincere. His own part was that of an *enfant terrible* in a topsy-turvy world, with an outrageous assurance and an optimistic philosophy at the back of it all. During the Second World War and after, in affliction, in triumph, and in austerity 'Itma' typified the spirit of the Brit. nation. H., the man to whom everything happened, who resourcefully emerged from every ordeal, whose cheerfulness, friendliness, and sanity never failed, was the man that his millions of listeners in their inmost hearts felt themselves to be. This explains his universal popularity and the grief at his sudden death. A

memorial service was held at St. Paul's Cathedral.

Hands, Laying on of, religious ceremony used to accompany various sacramental and other rites. Instances of the ceremonial imposition of hands are numerous both in the O.T. and N.T., and the custom has been continued to the Christian Church. In the Early Church it accompanied confirmation, absolution, ordination, and a number of minor rites and benedictions. The Gk. Church no longer retains it for confirmation, and the Rom. Church does not make use of it in absolution.

Handsworth: 1. Par. and vil. in the W. Riding of Yorkshire, 4 m. S.E. of Sheffield; has quarries, nurseries, and collieries. Pop. 16,000. 2. In Warwickshire, is a suburb of Birmingham, between Birmingham and W. Bromwich.

Hand-tree, see CHEIROSTEMON PLATANOIDES.

Handwriting, see WRITING.

Handwriting, Study of, see GRAPHOLOGY.

Hanford, city in King's co., California, U.S.A., 20 m. W. of Visalia, is the centre of an oil dist. It is also the shipping depot for distributing agric. produce. There are also granite works, mills, and foundries. Pop. 8200.

Hangchow (Hangchowfu), cap. of Chekiang prov., China, on the Tientsin-kiang, which flows into Hangchow Bay. It is the Kinsai, Kintse, or Quinsay of Marco Polo, at the S. terminus of the Imperial or Grand Canal. In Marco Polo's day H., which he calls Kinsai, had a garrison of 30,000 soldiers and contained '600,000 families.' Noted for trade in silk manufs., fans, and gold-embroidered stuffs, and as a literary centre; the port was opened to foreign commerce, 1496 H. was the cap. of the S. Sung dynasty, 1127-1278 and was held by the Taipings, 1861-64. Near by is Lake Sihsu. A railway to Shanghai (110 m. distant) and Ningpo has been constructed. The estuary tides below Hangchow, causing the 'Hangchow bore,' considerably hinder navigation. During the civil war in China H. was occupied during the Lower Yangtze campaign in 1926, and when the Nationalists made Nanking their cap. it became very important as the port of that city. Fell to the Jap. on Dec. 24, 1937. In the civil war following the Second World War H. was abandoned by the Nationalists to Communist troops in May 1949. Pop. (municipal area) (1936) 506,000. See A. P. Moule, *Notes on Hangchow*, 1889; E. R. Seidmore, *China the Long-tired Empire*, 1900; and Marco Polo (Yule's ed.), 1874.

Hanging, see CAPITAL PUNISHMENT.

Hanging Gardens of Babylon, structure of anc. Babylon, famed as one of the Seven Wonders of the World. It was probably made by order of Nebuchadnezzar (604-561 B.C.) to please his Median queen, Amyitis. It appears to have been a kind of tower or pyramid rising in terraces over a square, about 4 ac. in area. The terraces, rested on arches supported by hollow pillars (75-300 ft. high), and were planted with trees, shrubs, groves, and flowers. Fountains and banqueting-halls

were interspersed. Water was pumped up from the Euphrates for a reservoir at the top, from which the gardens were irrigated. The story ascribing them to Semiramis has no historical foundation. Probably the N. portion of the mound Amran ibn Ali is on the site. See Diodorus, II. 1; Strabo, XVI. 1, 5; and G. Rawlinson, *Ancient Monarchies*, II. and III., 1862.

Hangnest, name for birds of the sub-family Icteridae, sometimes called troupals or orloles, resembling finches. (Webster gives the scientific name as *Icterus galbula*.) They are brilliant black and yellow in colour, and good songsters, found especially in the tropical parts of S. America, where the *Cassicus* and *Ostriops* genera abound, and in N. America, where they are known as hang-birds in many parts. Their purse-like nests, sometimes 2 ft. long, hang from branches, with an entrance near the bottom to one side. These passerine birds of America are related to the starlings and weaver-birds of the E. hemisphere.

Hangul, see RED DEER, KASHMIR.

Hanhai (dry sea), Chinese name for a great tract of desert in central Asia. It is an area of inland drainage, divided by hills into the basin of the Tarim and the desert of Gobi.

Hankey, Sir Maurice Pascal Alers, first Baron, Brit. soldier and gov. servant; b. April 1, 1877; third son of Robert Alers H., S. Australia. Educated Rugby. Joined Royal Marine Artillery, 1895. In H.M.S. *Ramillies*, Mediterranean, 1899-1901; naval intelligence dept., 1902-6; intelligence officer, Mediterranean, 1907; secretary Committee of Imperial Defence, 1912-38; secretary, war Cabinet, 1919-38. Retired from fighting service as lieutenant-colonel, 1918; G.C.B., 1919. Secretary-general of Imperial conferences, 1921, 1923, and 1926. Brit. secretary, Peace Conference, 1919; Washington Conference, 1921; Geneva Conference, 1922; and London International Conference on Reparations, 1924. Clerk of Privy Council, 1923-38. Secretary-general, London Naval Conference, 1930. Minister without portfolio in Neville Chamberlain's Cabinet, 1939; chancellor of duchy of Lancaster, 1910. Paymaster-general, 1911-1912.

Hankiang, or **Hangkiang**, riv. in China, rises in the mts. of Tsinling in the Shensi prov. It then flows through Hupe, and enters the Yangtze at Hankow. It is 900 m. long, and navigable for small boats for most of its course. The country it drains is rich in minerals, and thickly populated.

Hankow, **Hankau**, or **Hankeu**, treaty port (since 1861) of Hu-peh prov., China, at the confluence of the Hankiang and the Yangtze. Hanyang (with large iron-works) is opposite across the Han, and Wuchang across the Yangtze. The Tach iron deposits near H. are among the richest in the world. Before the Second World War they were mainly controlled by Jap. and large quantities were exported to Japan. There are also deposits of gold, silver, lead, zinc, antimony, coal,

salt, limestone, etc., in the neighbourhood. It was opened to foreign trade in 1862. The city was walled round in 1863. In normal times H. is the chief emporium of central China, exporting tea, antimony, ore, hides, ramie fibre, beans, silk, tobacco, wood-oil, and Chinese medicines. The railway between H. and Peking was completed in 1905, and that between H. and Canton (768 m.) in 1931. Before the Second World War there was a good daily steamship service between H. and Shanghai and a weekly one between H. and Ichang. The tn. has been submerged (1866, 1869, and 1870), but structures to prevent the rise of the riv. have been built along the riv. frontage of the Brit. settlement. There are telephones and telegraphs in H., and it is lighted by electricity. Ever since the outbreak of revolution H. has been the scene of disturbances and crops have been continually ruined by fighting soldiers—thus decreasing the Yangtze products which are all shipped through the port of H. In 1919 there was a tremendous increase in trade amounting to over 227 million taels. But in 1926-27 H. suffered very much. The port was occupied for some time by the Communists and there was much rioting, and danger to Brit. subjects. A detachment of Brit. marines were landed there for their protection. In Aug. 1938 H. was heavily bombed by Jap. aeroplanes. By mid-Oct. the Jap. had advanced to Sinyang, a keypoint on the Peking-H. railway, only 125 m. N. of the city; and on Oct. 28 Marshal Chiang Kai-shek evacuated H. As the Jap. neared the city a general evacuation was ordered, and the main official buildings, public utility plants, and centres of communication, as well as all Jap. property, were blown up by the Chinese. Jap. forces entered the city on Oct. 25, but were driven out by victorious Chinese and Amer. forces in 1945. In the civil war following the Second World War H. was taken by Communist forces on May 16, 1949. Pop. 778,000. See CHINA.

Hanley, centre of the potteries dist. of Staffordshire, is situated 1 m. N.N.E. of Stoke-upon-Trent; it was made a municipal bor. in 1857, a par. bor. with one member in 1885, and a co. bor. in 1888. In 1910 it amalgamated with neighbouring tns. to form the municipal bor. of Stoke-upon-Trent. Large coal and iron mines are found in the neighbourhood, and extensive steel and iron industries are carried on. The manuf. of earthenware, for which the tn. is famous, includes the finest kinds of porcelain. Pop. 66,000.

Hanna, Marcus Alonso (1837-1904), Amer. politician and steel and coal magnate, b. at Lisbon, Ohio. Delegate to several Republican conventions; was instrumental in securing election of McKinley. Chairman of National Republican Committee, U.S.A. senator, 1897-1901. During the term of President McKinley he was the most powerful politician in the U.S.A., and was at one time talked of as the Republican nominee for president.

Hannah, wife of Elkanah the Ephraimite (1 Sam. I.), to whom, in response to

prayer, a son, Samuel, was given. She had vowed to devote her son to the Lord, and so the child was taken to the temple at Jerusalem.

Hannay, James Owen (George Birmingham) (b. 1865), Anglo-Irish novelist, son of Rev. Robert Hannay, D.D., vicar of Bellast. He was educated at Temple Grove, E. Shoen; Haileybury; Trinity College, Dublin. Took priest's orders in the Irish Protestant Church in 1889; curate of Delgany (co. Wicklow); rector of Westport (Mayo), 1892-1913; canon of St. Patrick's, 1912. Chaplain to Brit. legation, Budapest, 1922-24. Since then rector of Mells. He began his writing with serious novels of Ireland: *The Scelthing Pot* (1905); *Ilyacinth* (1906); *Benedict Kavanagh* and *The Northern Iron* (1907);

the Celtiberian tribes, and before 219 he had reduced all the country S. of the Iberus, with the exception of Saguntum. In the spring of that year he laid siege to Saguntum, which surrendered after a resistance of eight months. The Romans, having made an alliance with that city, regarded H.'s action as an intentional provocation to war, and demanded his surrender, which, being refused, war was formally declared between the two nations. H. prepared his army in the winter of 219, and left Spain in the following spring with some 90,000 foot, 12,000 horse, and fifty elephants (Polybius, iii. 31, 18). In the early summer he performed his brilliant march across the Alps, and on reaching N. Italy defeated Publius Scipio at Ticinus and at Trebia. After spending some

THE ROUTE OF HANNIBAL

The Daily Times (1908). But in the last-named year came also *Spanish Gold*, introducing the Rev. J. J. Meldon, an outrageously eccentric Protestant parson, who was so popular that he returned again and again in Birmingham's lighter stories. His more recent works of fiction are *Wild Justice* (1930); *The Silver-gull Standard* (1932); *Two Fools* (1934); *Mrs. Miller's Aunt* (1936); *Apprehension* (1939); and *Over the Border* (1942). He has also written on Christian monasticism and notable murders. Other pubs. include *Isaiah* (1937); *God's Iron: a Life of the Prophet Jeremiah* (1939); and he ed. *Irish Short Stories* (1949).

Hannibal (247-163 B.C.), celebrated Carthaginian general, the son of Hamilcar Barca. He was educated in his father's camp, and trained in all the arts of military warfare. He was taken to Spain when only nine years old, and there upon an altar made an oath to his father of eternal hostility to Rome. On his father's death (229 B.C., Hasdrubal, the son-in-law and successor of Hamilcar, placed him in command of the troops in Spain, and in 221, on the assassination of Hasdrubal, he was unanimously proclaimed by the soldiers the ruler of Carthaginian Spain, his election being later ratified by Carthage. H. crossed the Tagus and subdued

months in winter quarters, he marched into Etruria early in 217 to the banks of the Arno. The Carthaginian army endured great suffering from the unwholesome swamps, and H. himself lost the sight of one eye. The Rom. army under Flaminius was encamped at Arretium, which H. passed by on his way S. Flaminius hurried in pursuit and fell into an ambush near Lake Trasimene, the Romans being practically wiped out, and the consul slain. Rome now elected dictator Q. Fabius Maximus, who, on account of his caution, won the name of 'Cunctator.' He continually harassed the Punic forces, without risking a general engagement. H. marched S. to Capua and into Apulia. In 216 he encountered Æmilius Paulus and Terentius Varro, and inflicted a most crushing defeat upon the Romans on the r. b. of the Aufidius, below Cannæ. He wintered in Capua, and sev. other S. tns. revolted from Rome to his side. It has been said that the luxury prevailing in Capua enervated his troops; whether this be true or not, 216-215 mark the turning-point of his career. H. obtained some successes in the S., taking Tarentum in 212; but he did not feel himself strong enough to attack the citadel of Rome until his army was reinforced. His brother, Hasdrubal, approached with his troops

from Spain, but at the R. Metaurus met the Rom. army under Ilvius and Claudius, and with most of his men was slain. H. maintained his ground in the wild, mountainous region of Bruttium from 207 to 203, in which year he was recalled to Africa on the success of the younger Scipio. In 202 he met Scipio at Zama, where he was defeated for the first time. He urged his countrymen to make peace with Rome and himself signed the treaty which forbade Carthage to wage war outside her own dominions without permission from Rome (201). The Romans continually urged the banishment of H., and it was felt in Carthage that the family of Barca was too great for the state. In 195, compelled by the jealousy of factions at home as well as by the enmity of Rome, he sought refuge with Antiochus III., king of Syria, who was allied with Egypt against Rome. Antiochus was defeated at Thermopylae (191) and at Myonesus (190), and H., fearing to be given up as a hostage of war, fled to the court of King Prusias of Bithynia. In 183 Rome sent Quintus Flaminius to demand the surrender of the fugitive, and, accordingly, to escape being placed in the hands of his enemy, H. took poison. H. is a great figure in the hist. of the world. His army was composed of mercenaries of many nationalities—Africans, Spaniards, Gauls, and its.—yet he retained their confidence during sixteen years of hardship and privation in a foreign land, never having a single mutiny in camp; and long after the veterans that had followed him over the Alps had dwindled to a mere remnant, his new levies were still as invincible as their predecessors. He was an extraordinary organizer, and trained his mixed bands into a most efficient whole. The second Punic war may more fitly be called the Hannibalic war, for he is the one prominent figure throughout it. For military strategy and statesmanship he can only be compared with another great hero of hist., Napoleon Bonaparte. See 'The Second Punic War,' chap. 42-47 of Thomas Arnold's 3-vol. *History of Rome*, 1838-43 (ed. by W. T. Arnold, 1886); E. Hennebert, *Histoire d'Hannibal*, 1870-92; W. Morris, *Hannibal*, 1897; A. R. Bonus, *Where Hannibal Passed*, 1925; E. Groag, *Hannibal als Politiker*, 1929; and G. P. Baker, *Hannibal*, 1930.

Hannibal, city of Marion co., Missouri, U.S.A., situated on the r. b. of the Mississippi; it is an important railway centre and riv. port, and carries on an extensive trade in lumber, flour, cattle, cement, tobacco, etc. The Atlas Portland Cement plant is situated here. There are also coal mines. It is connected by six important railways, and has a good steamboat service. Mark Twain spent his boyhood in Hill Street. Pop. 20,800.

Hanno the Great (fl. third century B.C.), leader of the peace party at Carthage, and an opponent of Hamilcar and Hannibal. He was unsuccessful in his command over the rebellious Carthaginian mercenaries (241 B.C.), and after the battle of Zama (202 B.C.) went on a deputation to Scipio to sue for peace.

Hanno, Carthaginian navigator, who flourished about 500 B.C. His *Periplus* is an extant Gk. trans. of his account of a coasting voyage he undertook along the W. coast of Africa. The date of the voyage has been assigned to about 470 B.C. H. founded colonies and trading stations, and explored the country. The original account was inscribed in Phœnician on a tablet and placed in the temple of Melkarth. The authenticity of *Periplus* has frequently been discussed. See T. Falconer, *Eng. trans.* (1797); A. Mer, *Mémoire sur le périple d'Hannon*, 1885; and an essay by C. T. Fischer, 1893.

Hanoi, or Ke-cho (i.e. a prov. surrounded by rivers), cap. of Tongking and Fr. Indo-China, on the r. b. of the Song-koi or Red R., about 80 m. from its mouth in the gulf of Tongking. The modern tn. is European in appearance, and lies to the N. of the picturesque native quarter which is built round a lake. Its avenues of flowering trees give to H. its special character. In 1897 the Pont Doumer, a great steel bridge, was constructed to span the Red R., so as to connect H. with the adjacent provs., over 1700 metres of a torrential riv. H. is in communication with Haiphong, both by rail and steamer, and by rail with the Chinese frontier. The development of the railway communications from H. to Saigon and elsewhere owed much to the Fr. governor-general, Paul Doumer (q.v.). There is an airport at H. In 1902 a school of medicine for natives was opened; this, in 1917, with other higher education schools was formed into the univ. of Indo-China or H. H. has (since 1918) a large European college. The H. school of medicine is the best and oldest of the higher educational institutions of Indo-China. The univ. also includes a normal school, and a section of pedagogy. There is also a native *lycée* at H. The law school was instituted as a separate faculty in 1931, previously to which the law had been combined with literary studies. Medicine and law are the only two faculties of H. Univ. with a high standard and of unquestioned utility. The chief industries of H. are cotton spinning, brewing, and distilling, and the manuf. of tobacco, earthenware, and matches, with native metal-work, jewellery, and silk embroideries. A Chinese consulate was estab. in H. in 1936, and in the same year an air service linked H. with Canton. After the capture of H. by the Fr., the Fr. authorities came upon some books in Chinese characters about the great mineral resources of Tongking and revealing that the court at Hué had received revenue from 123 mines. H. has often been the centre of native risings, as in 1905, and again in 1946-47, in which latter period the Viet Minh party which controlled the gov. of the new republic of Viet-Nam, were in conflict with the Fr. forces, the issue, as always, being the Tonkinese desire to be independent. Pop. 120,000. See Virginia Thompson, *French Indo-China*, 1937.

Hanotaux, Albert Auguste Gabriel (1853-1944), Fr. statesman and historian, educated at St. Quentin College. He won

the notice of Gambetta by an article in *La République française*, obtaining a post in the Foreign Office, and later in the Cabinet. He was deputy for Alsno, 1886-89, and minister for foreign affairs, 1894-98. H. wrote *Henri Marlin* (1885); *Études historiques sur les XVI^e et XVII^e siècles en France* (1886); *Histoire du cardinal Richelieu* (vols. I. and II.) (1893-1903), which won the Gobert prize; *L'Énergie française* (1902); *Du choix d'une carrière* (1902); *Histoire de la France contemporaine, 1871-92* (9 vols., 1903-8); *La Paix latine*, (1908); and *Histoire de la nation française* (15 vols., 1920-21).

Hanover: 1. (Ger. Hannover), formerly a separate kingdom in N. Germany, was made a prov. of Prussia in 1866. In 1946 the prov. was assigned to the Brit. zone of occupation as part of Lower Saxony. It lies between Holland on the E., the R. Elbe on the W., the North Sea on the N., and Westphalia and Brunswick on the S. Its area is 14,800 sq. m., and its pop. (1939) 3,211,000. The inhab. are nearly all Lutherans, but before the First World War there were some 300,000 Catholics. H. is mountainous in the S., where elsewhere it is flat, and contains large stretches of moors and heath, including the great Lüneburg Heath between the Elbe and the Aller. Besides these two streams it is also watered by the Weser, Ems, and Leine. Agriculture is carried on in the riv. valleys, where the soil is fertile; cattle-breeding on the heaths and marshes; and mining in the Harz Mts., where coal, iron, zinc, lead, silver, copper, and salt may be obtained. Shipbuilding and other seafaring industries were carried on along the coast. The most important industries before the Second World War were the manuf. of iron and steel goods, textiles, glass, paper, machinery, chemicals. The is. of Nordenev and Borkum serve as seaside resorts. There is a univ. at Göttingen. The cap. is H. (see below). The hist. of H. was extremely disturbed until the year 1705, when George Louis reunited the two duchies of H. and Celle. In 1714 he became king of England as George I., and the duchy belonged to the Eng. kings until 1837, when, upon the accession of Queen Victoria II. went to the next male heir, Ernest Augustus, duke of Cumberland, fifth son of George III. In 1866 H. sided with the Austrians against Prussia, but its army was defeated and captured at Langensalza, and the duchy incorporated with Prussia. 2. The cap. of the former prov., situated close to the Leine, a sub-trib. of the Weser, 82 m. S. of Hamburg, and 162 m. W. of Berlin. It is now the cap. of Lower Saxony. It stands at the junction of the railway lines from Cologne to Berlin and from Hamburg to Frankfurt. The tn. consists of the older portion, dating from the fifteenth and sixteenth centuries, with narrow streets and old-fashioned houses, and the modern additions to the N. and E. On the E. are the extensive woods of Ellenriede, while close to the tn. are the palace and grounds of Herrenhausen. Apart from the old buildings, such as the old tn. hall (1439), the royal palace, and the house of Leibnitz,

H., before the Second World War, had many fine modern buildings, the railway station being considered one of the finest in Germany, while the Kestner museum of archaeology, the tn. hall, and others were worthy of note. The pre-1939 industries were iron-founding, type-founding, india-rubber goods, machinery, hardware, linen, and brewing. During the fourteenth century the tn. was a member of the Hanseatic League, but subsequently declined in importance until the latter half of last century, when its manufs. developed. In the allied air attacks on H. all the important buildings were damaged. All H.'s industrial potential of buna or ersatz rubber, textiles, etc., was destroyed. The huge Gothic Rathaus, an ugly building of the nineties, was badly damaged. One of the few intact objects in the city was the statue of King Ernest Augustus of Hanover, cousin of Queen Victoria, intact even to the plume on his hat. The arrival of the allied forces in 1945 released great numbers of foreign slave workers and Brit. prisoners of war, and probably these together outnumbered the Ger. civilians still remaining in the tn. See K. F. Leonhardt, *Uprising und Entwicklung der Staat Hannover*, 1933. Pop. (1939) 470,900. 3. Magisterial dist. in N.E. of Cape Prov., S. Africa. The chief tn., H., 420 m. E.N.E. of Cape Town, and 40 m. S.E. of De Aar Junction, is known for its sulphur springs. 4. Bor. in York co., Pennsylvania, U.S.A., 42 m. N.W. of Baltimore. It is served by the Pennsylvania and W. Maryland railways. Manufs. of machinery, shoes, and cigars; there are also silk and flour mills, machine shops, ice and canning factories. Surrounded by rich agric. region. It was incorporated as a bor. in 1815. Pop. 423,000.

Hansard, Luke (1752-1828), printer, b. at Norwich, and educated at Boston grammar school. He came to London and entered the office of John Hughes, printer to the House of Commons, as compositor. In 1774 he became a partner and acting-manager, and began to print the journals of the House of Commons. Subsequently his two sons entered the business, and after their father's death they and their sons continued as printers to the House of Commons. Luke II. was buried in the par. church of St. Giles-in-the-Fields.

Thomas Curson H., who printed *Cobden's Parliamentary Debates* (founded in 1800), became the owner of that pub. In 1829, renaming it *Hansard's Parliamentary Debates*. T. C. H. d. in 1833, and was succeeded by his son, T. C. H. the second. The name Hansard disappeared from the *Parliamentary Debates* in 1889, when T. C. H. sold his interest to the Hansard Publishing Union (Bottomley). The *Official Report* of par. debates reverted to its old name of *Hansard* as the result of the recommendation of the House of Commons' Select Committee on Pubs. and Debates Reports, which, in a special report, states that 'the committee passed a resolution that 'the word *Hansard* should appear upon the title page of the *Official Parliamentary Debates*. But irrespective of this reversion, the *Debates* or *Official*

Report had for years been known simply as 'Hansard,' the name being looked upon as a synonym for reports of parl. debates, a fact which is illustrated by the analogy of colonial debates which, in some cases, as, e.g. in Ceylon, have long been known as *Hansard*.

Hanseatic League, medieval federation of N. Ger. cities which for centuries was of great commercial and political importance. Germany's foreign trade dates from very early times: in England, for example, Ethelred II. (978-1016) granted to 'the emperor's men' equality with Eng. merchants in trading privileges, and a 'Gildhalla Teutonicorum' was estab. in London by Rhineland merchants, under Henry II. The rent of this gildhall (two shillings per annum) was remitted by Richard Cœur de Lion as an acknowledgment of the reception given him at Cologne on his way home from captivity. While the Colognians thus prospered in England, other Gers. were busy elsewhere. Early in the fifteenth century Wisby (in Gothland) was the centre of a mercantile association which monopolised the Baltic trade, and extended its operations eastward to Novgorod and westward to England. In 1211 Hamburg and Lübeck formed a league to protect themselves against pirates, robber barons, and the tolls and exactions of feudal nobles. They were joined by other cities, and the II. L. (*Hansa*, a defensive alliance) soon absorbed the Wisby association, and not only became paramount in the Baltic, but rivalled the Colognians in England, obtaining from Henry III. permission to found a new settlement in London. After some years of contention the rivals amalgamated, and their Stahlhof, or Steelyard, became the centre of London's commerce, the Colognians retaining the chief interest. In Germany the league made Lübeck its cap. city; all disputes were referred thither, and from 1260 onward a diet was held there every third year. About eighty-five cities joined the Hansa, and were arranged in four dists. with Lübeck, Cologne, Brunswick, and Danzig as their centres. There were four great 'factories' at London, Bruges, Bergen, and Novgorod, of which Bergen was said to be more Ger. than Norwegian, Bruges more Hansa than the Hansa tns., and in London the Gildhalla, lending money to Edward III. and other kings, received from them valuable privileges and monopolies which led to serious quarrels with Eng. merchants, especially as the latter had no corresponding advantages abroad. About the time of Henry VII. the league export of Eng. cloth was forty times greater than that sent out in Eng. ships. During the fourteenth and fifteenth centuries, the Hansa, though never formally recognised by the empire, was stronger than most of the rulers with whom it had dealings. It had its own financial system and courts of justice, enforcing its decrees by fines, and if necessary, by war. Strict discipline was maintained among its members, any recalcitrant city being liable to exclusion. Some monarchs who defied it were overthrown; for example, Walde-

mar of Denmark (1369). But sov. causes gradually tended to weaken its power; the discoveries of Columbus and Vasco de Gama diverted the course of trade, the Baltic fishery declined, and political changes in Germany made princes stronger and cities weaker. The Dutch after a hard fight secured much of the Baltic and North Sea trade, and S. Germany competed for inland commerce, while the London monopoly was abolished by Elizabeth in 1598. A disastrous war against Scandinavia broke the power of the league, and in the seventeenth century it was finally dissolved.

Hansi, tn. in the Hissar dist. of the Punjab, India, 82 m. N.W. of Delhi. Pop. 16,000.

Hansom, Joseph Aloysius (1803-82), Eng. architect and inventor, was the son of a joiner, to which trade he himself was at first apprenticed. Showing an aptitude for design, he became assistant to a York architect; afterwards he entered the profession himself and designed many important buildings, chiefly Roman Catholic churches. The Birmingham tn. hall is his work. His name is remembered as the inventor of the patent safety cab, for which he received only £300.

Hansom Cab, see CABS.

Hansson, Ola (1860-1925), Swedish author, b. at Hålsinge in S. Sweden. His work includes some excellent criticism: *Der Materialismus in der Literatur* (1892), and *Scher und Deuter* (1894); he also wrote *Friedrich Nietzsche* (1890); *Fru Ester Bruce* (a novel, 1893); *Amors Hæren* (1894); and *Ung Ofegs Fätor*, which was trans. into Eng. by George Egerton, 1895.

Hansteen, Christopher (1784-1873), Norwegian astronomer, b. at Christiania (Oslo). He is noted for his researches in connection with terrestrial magnetism, and in 1816 he was appointed to the chair of astronomy and applied mathematics at the Christiania Univ. His first pub. on the subject was in 1819, and was trans. into Ger. by P. T. Hansen with the title *Untersuchungen über den Magnetismus der Erde*. Later he was made director of a new observatory that had been built at Christiania (1833), and to which he had a magnetic observatory added in 1839. In 1837 he carried out the survey of Norway.

Hanthawadi, or **Hanthawaddy**, dist. in Lower Burma in Pegu div.; forms part of the valley of the Rangoon R. There are important oil refineries at Syriam. Rice is the chief product of the region. The cap. is Rangoon. Pop. 492,000.

Hants, see HAMPSHIRE.

Hanumān, see HANTEMUS MONKEY.

Hanumān (having large jaws), in Hindu mythology, the monkey-king, conspicuous figure in the epic *Ramayana*. He is sometimes called son of Pavana (god of the winds), and was said to have colonised much of the Deccan with his followers. The Sanskrit drama *Hanumannataka* (tenth or eleventh century) deals with his adventures.

Hanway, Jonas (1712-86), Eng. philanthropist, amassed, as a merchant, a considerable fortune, during the acquisition of

which he travelled extensively in Russia and Persia. At the age of thirty-eight he retired from trade, settled in London, and pub. an account of his travels (1753). He now interested himself in social questions, and as a reward for his efforts in this direction he was, in 1762, appointed commissioner of the victualling office. In 1756 he, with the co-operation of Sir John Fielding and others, founded the Marine Society, which was of great use in attracting recruits for the navy. Two years later he became a governor of the Foundling Hospital, and in the same year was instrumental in instituting the Magdalen hospital. He is said to have been the first Londoner habitually to carry an umbrella. Two years after his death a monument was erected to his memory in Westminster Abbey. There is a biography by John Pugh (1787, 1793).

Hanwell, par. in Middlesex, 7 m. W. of Paddington. H. asylum, which serves for the co. of Middlesex, is in the adjoining par. of Norwood. In the cemetery of St. Mary's church is buried Jonas Hanway (q.v.). In pre-Norman times the manor of H. belonged to Westminster Abbey. Pop. 25,000.

Hanyang, city in China, in the prov. of Hupeh, on the r. b. of the Han R., opposite Hankow. It formerly had an arsenal, steel works, and glass factories, besides a smokeless powder factory. With Wuchang it is virtually a suburb of Hankow. Pop. (1936) 100,000.

Haparanda (Aspen coast), seaport tn. in Sweden in the prov. of Pitea, on the N. shore of the gulf of Bothnia. Opposite is the Russian tn. Tornea. It has considerable trade, and has a meteorological station. Pop. 2600.

Hapsburg, or **Habsburg**, former imperial house of Austria-Hungary, called from the ancestral castle on the Aar in the Swiss canton of Aargau, built in the eleventh century by Bishop Werner. At a later period the owners of H. became counts of H., and by degrees extended their territory. The first distinguished member of the race was Count Albert IV., whose son, Rudolph, became emperor in 1273, and it is to this line that the historical celebrity of the house is almost entirely due. Rudolph, Ger. emperor, or holy Rom. emperor, was founder of the house that ruled as dukes of Austria, and after 1439 the Hapsburgs of Austria, up to and including Charles VI., was also always holy Rom. emperor. On the death of Charles VI. in 1740 his daughter, Maria Theresa, who succeeded him, married Francis Stephen of Lorraine, chosen Ger. emperor in 1745, and the house of Hapsburg-Lorraine continued to provide emperors till 1806 when, with the estab. of the new empire, the title of holy Rom. emperor was changed for that of emperor of Austria. A Sp. dynasty was also descended from the Emperor Rudolph beginning with the Emperor Charles V., who united Spain to the H. dominions, but in 1556 it was again placed under a separate ruler, and a further attempt to place a H. on the Sp. throne after the death of Charles II. in 1700 met with no success. The H. dynasty came to an end

after the First World War. The faint hope of restoring the ex-Empress Zita's son, the Archduke Otto, to the throne of Austria vanished after the Austro-Ger. agreement of 1936. See also AUSTRIA-HUNGARY, FRANCIS JOSEPH, and FRANCIS FERDINAND, and HOLY ROMAN EMPIRE. See E. M. Fürst von Lichnowsky, *Geschichte des Hauses Habsburg*, 1836-41; E. von Glaise-Horselenau, *The Collapse of the Austro-Hungarian Empire*, 1930; and A. J. P. Taylor *The Habsburg Monarchy*, 1941, 1948.

Hapur, tn. of India, 20 m. S. of Meerut, has considerable local trade in sugar, grain, cotton, and brass vessels. Pop. 20,000.

Hara, Takashi (1856-1921), Jap. statesman; b. at Morioka. Studied law; but embraced journalism, to which he returned sev. times in his career. In 1886, chargé d'affaires, Paris. Minister, Korea, 1896-97. Minister of communications, 1900-1. Representative of Morioka in Parliament from 1902. Sev. times minister for home affairs. Visited America and Europe, 1908. Became premier of Liberal gov., Sept. 1918. He was assassinated by stabbing at Central railway station, Tokyo.

Harafuras, see ALFURAS.

Hara-kiri, method of suicide which became customary among the Jap. nobility during the Middle Ages. About five centuries ago it was recognised as a national institution, and was either voluntary or obligatory. A Samurai leader might choose this death rather than allow himself to be captured or disgraced; or he might receive an intimation from court that he had incurred the death penalty for some offence, but was permitted to avoid the indignity of a public execution by disembowelling himself with the dagger which accompanied the message. Obligatory H. was abolished in 1868.

Harald, see HAROLD III.

Haram, see HAREM.

Harar, see HARAR.

Harbin, tn. in Manchuria, on the Sungari R., 325 m. N.E. of Mukden. It is situated at an important junction of the Siberian railway, since the construction of which it made great progress. It has flour mills and breweries. Pop. about 660,000.

Harbledown, par. and vil. in Kent, 1 m. W. of Canterbury, was a well-known resting-place for Canterbury pilgrims. It contains an almshouse, formerly a hospital founded by Lanfranc for lepers, and close by is the old church of St. Nicholas. Pop. 1000.

Harborough, see MARKET HARBOROUGH.

Harbour (Middle Eng. *herberge*, from *here*, an army; and *beorg*, shelter; same derivation as Fr. *auberge*, an inn), sheet of water, protected from the action of wind, etc., on the waves, and designed for the protection of ships. All Hs. may be classified either as havens for the protection of ships in storms, or as ports for commercial purposes; according to another classification all Hs. are either natural or artificial.

Natural Harbours, as their name implies,

are those Hs. which are sufficiently protected by their situation, without needing any artificial aid. In determining the value of such Hs., the geological and other physical peculiarities of the shore; the strength, direction, and range of tides; the depth of water in the protected area; the angle at which the heaviest waves impinge on the coast-line; the slope of the foreshore; and the width and shape of the entrance, must all be taken into account. Among the natural Hs. it is only possible to mention a few typical instances: Sydney H. extends 13 m. inland, with a coastline of 188 m.

named Venice, Poole, Wexford, and those at the mouths of various rivers; in many cases works have been carried out to prevent deterioration and increase the depth, when the Hs. more properly come into the category of artificial Hs.

Artificial Harbours are those in which the natural resources of the coast are supplemented by breakwaters. Generally a H. is formed where shelter is provided to a certain extent by the natural configuration of the land, but requires to be made complete by one or more breakwaters. Where the exposure is from one direction only, and some shelter is given by a projecting

Australian News and Information Bureau

A NATURAL HARBOUR: SYDNEY, NEW SOUTH WALES

and an area of 21 sq. m.; geologically it is a 'drowned valley', the depth of water ranging from 30 ft. at the wharves to 80 ft. at the heads; the bay of Rio de Janeiro is one of the largest natural Hs. of the world, being 15 m. in length, from 2 m. to 7 m. in width, protected by headlands on either side, and having an entrance almost 1 m. in width; New York H. is protected by Long Is., as Southampton Water is sheltered by the Isle of Wight, both being very good Hs.; Milford Haven ('haven') having the same significance as 'harbour') has a minimum depth of eight fathoms, and combines facility of entrance with perfect security. At various places there are large enclosed areas which have openings to the sea, but these are as a rule very shallow, save in the main channels, and access is as a rule rendered difficult by the bar which forms at the mouth, where the ocean checks the outgoing current of the river. Among such Hs. may be

headland, one breakwater at right angles to the shore, curving inwards slightly at its extremities, may be sufficient, as is seen at Newhaven. As a rule some abrupt projection from the coast is utilised to provide shelter from one quarter, and breakwaters enclosing the site complete the protection, as at Colombo. Naval Hs., which are required by maritime powers as stations for their fleets, and dockyards for the construction and repair of ships, generally come within the class of artificial Hs. The Dover H. is purely artificial, for instance, the length of the breakwaters being over 2 m. The Takoradi H., on the Gold Coast, built since the First World War, is a good instance of engineering skill triumphing over difficulties, though all precautions have to be taken to prevent silting up at the entrance. *See also* ARROMANCHES, HARBOUR OF.

Harbours of Refuge.—All Hs. can of course be used as Hs. of refuge when a ship

is in need of shelter, but some Hs. are built more for the purpose of protection than for anything else. A refuge H. is occasionally constructed where a long expanse of stormy coast, which is near some route of ships, is without any natural shelter. In such cases breakwaters are carried out from the shore at a considerable distance apart, and converge to a central entrance of suitable width to form the required shelter. Easy approach and a safe entrance, combined with good anchorage, are requisite for a H. of refuge.

Commercial Harbours are those designed primarily for commercial uses. On important trade routes commercial Hs. must be provided for the formation of ports within their shelter, or for the protection from the sea of the approaches of ports near the sea coast, or on large rivers. A greater latitude may be observed in the selection of a site for a H. of refuge or for a naval H. than for a commercial H. The docks of a commercial H. keep the water at the same level for the discharge of cargo, etc. A good commercial H. should have an ample supply of machines for the removal and transport of goods, plenty of quay space, good warehouse accommodation, and navigation aids. By radar aid vessels, suitably equipped, may be brought into harbour in dense fog, and loud-hallers, with a considerable range, may be used to give instructions.

Situation of Harbours, etc.—When the exposure of the H. is great, as when it is situated on a regular coastline, it is essential that there should be either a considerable internal area, or a separate basin opposite the entrance to the inner basin, for the waves to spend their force. If possible such a basin should enclose a portion of the original shore for the waves to break upon; if this is impossible there should be a flat talus wall of a slope of at least 3 or 4 to 1. The same points which determine the value of a natural H. (see above) must be studied in the case of an outer H., the direction of the entrance in relation to the line of maximum exposure, etc. Thomas Stevenson drew up a formula for determining the reduction produced in the enclosed area of waves at any given distance not exceeding 50 ft. from the entrance:

$$x = H \frac{\sqrt{b}}{\sqrt{B}} - \frac{1}{50} \left((H + H \frac{\sqrt{b}}{\sqrt{R}}) \sqrt[4]{D} \right)$$

H = height of wave at entrance; b = breadth of entrance; B = breadth of H. at place of observation; D = distance from mouth of H. to place of observation; x = height of reduced wave at place of observation; all in feet. If H is said to be equal to unity, then x equals a fraction representing the reductive power of the H.

In order to render tranquil Hs. of small reductive power, logs of timber called booms are used. Their heavy ends are secured by projecting into grooves cut in each side in the masonry; and they are warped down or fixed with an iron hasp at the coping course, in order to prevent the swell entering the H. from underneath. Thus a temporary wall is formed which

checks the waves and prevents them from spreading into the interior basin. For further particulars on various points see PIER; BREAKWATER; DOCK; COAST PROTECTION. See also 'Researches in Hydrodynamics,' *Transactions Royal Society of Edinburgh*, xiv., 1837; Sir J. Rennie, *Theory of the Formation and Construction of British and Foreign Harbours*, 1854; T. Stevenson, *Design and Construction of Harbours*, 1874; B. Cunningham, *Dock and Harbour Engineers' Reference Book*, 1923, and *Harbour Engineering*, 1928; E. C. Shankland, *Modern Harbours Conservancy and Operations*, 1928, and *The Dredging of Harbours and Rivers*, 1931.

Harbour Grace, port of entry and second most important tn. in Newfoundland, is situated W. of Conception Bay and 26 m. S. by W. of St. John's, with which it is connected by riv. It does considerable trade in furs, fish, seal-skins, and cod-oil. Pop. 2500.

Harbours, Prefabricated, see under ARROMANCHER, HARBOUR OF.

Harburg, seaport in the prov. of Hanover, Germany, situated on the Elbe, 8 m. S. of Hamburg. Before the Second World War it did considerable trade in gutta-percha, linseed, and coconut oil, jute, chemicals, etc. The tn. was a favourite holiday resort, one of its chief attractions being a castle on the riv. Pop. (with Wilhelmsburg) 105,000.

Harcourt, Lewis Vernon Harcourt, first Viscount (1863-1922), Eng. politician, b. in London, eldest son of Sir Wm. V. Harcourt (q.v.) by his first marriage; educated at Eton. He acted for many years as his father's private secretary during his tenure of the offices of home secretary and chancellor of the Exchequer, and was closely connected with the organization of the Liberal party during its period of opposition from 1895. In 1904 he was elected as Liberal member for N.E. Lancashire (Rossendale), which seat he retained by large majorities. In Sir H. Campbell-Bannerman's first ministry, 1905-8, he was first commissioner of works; and he entered the Cabinet still holding that office, in 1907; he retained it in Asquith's first Cabinet, 1908, and in 1910, and then was promoted to the secretaryship of state for the colonies. He was first commissioner of works again, 1916-1918; raised to the peerage, Jan. 1917. He was a keen opponent of woman's suffrage.

Harcourt Sir William George Granville Venables Vernon (1827-1904), Eng. statesman, b. at York; after a distinguished career at Trinity College, Cambridge, was entered at Lincoln's Inn in 1851, and three years later was called to the Bar. He soon was in the enjoyment of an extensive practice, and made a name for himself at the parl. Bar, the most lucrative branch of the profession. He had early begun to write for the *Morning Chronicle*, and was one of the original staff of the *Saturday Review*. He wrote, generally on international law, as 'Historicus' in *The Times*. He took silk in 1866, and was appointed Whewell prof. of international law at Cambridge, which position he held from 1869 until

1887. As what may be called an Independent Liberal, he entered Parliament in 1868. Five years later he became solicitor-general in (Gladstone's administration, and was knighted. In the following year Disraeli came into office, and H. was in opposition. When Gladstone returned to office H. became home secretary. In 1886 he became chancellor of the Exchequer, and was looked upon as having the reversion to the leadership of the party. When Gladstone retired in 1894, H. expected to be his successor, but to the general surprise the queen sent for Lord Rosebery, under whom H. generously consented to serve. In that year he introduced his famous death-duties budget, which, although fiercely contested at the time, marked a new era in the country's financial policy. In the following year the gov. was defeated. In Dec. 1898, owing to want of support in the party, he resigned the leadership. He was a brilliant speaker, an excellent leader, and a most popular man.

Harda, tn. in the dist. of Hoshangabad, India, 64 m. S.S.W. of Bhopal. Pop. 13,500.

Hardaonut, see **HARDICANUTE**.

Norwegian State Railways

VÖRINGFOSS WATERFALL, HARDANGER DISTRICT, WEST NORWAY

Hardanger Fjord, inlet, 68 m. long, on the S.W. coast of Norway in the prov. of Bergen; its greatest breadth is 3 m., but some of its branches are considerably narrower. The H. Fjord stretches away to the N.E., and the scenery throughout the whole length of the fjord is magnificent, including many cataracts like the Vöringfoss. The many islets and peninsulas divide the opening into various branches as the Sortfjord, Osefjord, Aakrefjord,

Gravtjørd, and Maurangertjørd. See also **NORWAY**.

Harden, Maximilian (1861-1927), Ger. journalist; b. in Berlin. In 1892 he founded the weekly *Die Zukunft*, which ran for thirty years. During the First World War he pub. some daring articles in this periodical, notably one eulogising the Brit. effort in the Gallipoli campaign (trans. in *Foreign Opinion*, 1915). Through H.'s attack on court corruption Prince Eulenburg had to leave the country, 1907. During the First World War articles by H. had worldwide fame. Wrote *My Contemporaries*, 1926.

Harden, see **HAWARDIN**.

Hardenberg, Georg Philipp Friedrich von, see **NOVALIS**.

Hardenberg, Karl August, Prince von (1750-1822), Prussian statesman, in the service of Hanover and Brunswick, 1770-1790. In 1791 he became a Prussian minister of state under Frederick William II., helping to conclude peace between Prussia and the Fr. republic at the conference of Basel, 1795. Under Frederick William III. he became Prime Minister, 1803. At home he aimed at developing Prussia by various economic measures, abolishing serfdom, and improving the condition of the peasants generally, and providing for educational reforms and trade. His foreign policy was to oppose Napoleon, and he allied with Russia (1805), but was soon driven from power by Haugwitz (1806). In 1810 he succeeded Stein as chancellor, and carried on the latter's reforms. H. took part in the war of liberation, and signed the first treaty of Paris (1814). He was plenipotentiary at the congress of Vienna (1815), and became president of the State Council (1817). See C. Klose, *Leben C. A. Fürsten von Hardenberg*, 1851; *Memoirs* (ed. by L. Ranke), 1877; *Cambridge Modern History*, ix., 1907; E. von Meyer, *Die Reform der Verwaltungsorganisation unter Stein und Hardenberg*, 1912; and life by H. von Richthofen, 1933.

Hardenberg: 1. Small tn. in the Netherlands, situated on the R. Vecht, in the prov. of Overijssel. 2. Com. of the Rhineland, Germany, 8 m. E. of Düsseldorf, with manufs. of textiles, machinery, etc. Pop. 12,000.

Harderwijk, seaport of the Netherlands, situated in the prov. of Gelderland, on the S.E. shore of the IJssel Meer (Zuyder Zee), 31 m. E. of Amsterdam. It was a Hanseatic tn., and from 1648 to 1811 the seat of a univ. Derring-curing is the chief industry, with exports of wood and cereals. Ger. resistance in N. Holland collapsed before the Canadian Army in April 1915, the whole area, apart from a small tip in the N.E., being cleared as far S. as H., on the E. shore of the IJssel Meer by April 21. Pop. about 8500.

Hardhead (N. Amer. fish), see **MENHADEN**.

Hardicanute, or **Harthacnut** (c. 1019-42), son of Canute, king of England, and Emma of Normandy. On the death of his father the Eng. Crown was contested by his half-brother, Harold. The Queen Emma and Earl Godwin supported H., and Earl

Leofric assisted Harold. The Witan met at Oxford, and decided that Harold should rule as regent in England and II. remain in Denmark. This was not agreed to, and H. joined Queen Emma and attacked Harold. Harold was elected king, and the queen was driven out. While H. was collecting another army Harold d., and H. peacefully succeeded. His reign was cruel and oppressive. He burnt the city of Worcester for rebelling against an excessive tax. While present at a marriage feast he was seized with a fit and d. a few days later.

Hardie, James Keir (1856-1915), Scottish miner, journalist, and politician. B. of working-class parents in Ayrshire, he had no schooling, but learned to read at home. At eight years old he was doing odd jobs, and at ten was working in a pit. He became honorary secretary of the newly formed Ayrshire Miners' Union, in which he was associated with Andrew Fisher, who became Prime Minister of the Australian Commonwealth. For this he was blacklisted, which fact turned him into an agitator, and he devoted his life thenceforth to persuading his class to work out their own social salvation. In 1900 was returned as Socialist and Labour member for Merthyr-Tydfil, and retained his seat with increased majorities in three subsequent elections. In 1892 he founded, with others, the Independent Labour party (I.L.P.) (q.v.), and was the first chairman of the Parl. Labour party. Was editor of the *Cummock News* from 1882 to 1886, and the following year founded and ed. the *Miner*, afterwards the *Labour Leader*. Wrote considerably on Socialism and Labour topics, including a book on India, which he visited during a world-tour for health reasons in 1907-8. See life by W. Stewart, 1921.

Harding, Warren Gamaliel (1865-1923), twenty-ninth President of U.S.A., b. at Corsica, Morrow co., Ohio; eldest of eight children of George Tyron H., a physician of Scottish descent. He received some education at Iberia, Ohio; but frequently as a boy had to work as farm hand and teamster. In 1884, employed on the *Marion Mirror* weekly, whose proprietor afterwards enabled him to start the *Marion Star*, by which he made himself known. Elected as a Republican to the State Senate in 1898; Lieutenant-governor of Ohio in 1903. A candidate for governorship in 1910. In 1914 he was elected U.S. senator. He supported the policy of President Wilson during the First World War; but was among those who strongly disapproved of Wilson's post-war policy—especially in connection with the League of Nations. On Nov. 2, 1920, he was elected by the Republicans as president by an enormous majority, as against Governor Cox of Ohio. Although opposed to the League, H. favoured an international court of justice. During his term the Conference for Limitation of Armament was held in Washington 1921-1922. In the summer of 1923 he visited Alaska, and on his return lay ill with pneumonia for a week, at San Francisco, California, where he unexpectedly d. of apoplexy, Aug. 2.

Hardinge, Henry, first Viscount Hardinge of Lahore (1785-1856), 131st. general, was b. at Wrotham in Kent. After being gazetted as ensign, he was in active service in the Peninsular war. From 1809 to 1813 he was connected with the Portuguese Army, and was then appointed commissioner at the Prussian headquarters by Wellington, but being wounded at Ligny was unable to fight at Waterloo. After being secretary for war in 1828, secretary for Ireland in 1830, he became governor-general of India in 1844 at the time of the Sutlej campaign against the Sikhs, but in his capacity as a soldier he took the position of second-in-command to Sir H. Gough. After the peace of Lahore he was made a viscount, and in 1852 succeeded Wellington as commander-in-chief, being made a field-marshal in 1855.

Hardinge of Penshurst, Charles, first Baron (1858-1944), Eng. diplomatist and viceroy of India, second son of the second Viscount H., and grandson of first Viscount H. (see article above). Educated at Harrow and Trinity College, Cambridge, and began his career in the diplomatic service in 1880. Received appointments at Teheran and St. Petersburg, becoming Brit. ambas. at the latter place in 1904. His position here was rendered difficult by war between Russia and Japan, but his influence helped to ease the tension, which had become still greater by reason of the Dogger Bank incident. Did valuable work in laying the foundations of the Anglo-Russian agreement of 1907, having, when that instrument was signed, become permanent under-secretary of state. He was viceroy of India from 1910 to 1916. It was in his term that the cap. was moved to Delhi, and the partition of Bengal, enacted by Curzon, revised. But it was a period of much unrest, and in 1912 an attempt was made upon his life when he was severely wounded by a bomb, Lady H., though unscathed, dying later from shock in 1914. H., however, persisted in his policy of friendly relations with the Indian princes, and sympathy with the new W. educated middle classes, as well as with the needs of the masses, notably in the way of provision of public works, sanitation, and education. In response to his appeal, after war had broken out in 1914, the Defence of India Act was passed in 1915, though some of its provisions were opposed by Indian legislators; but £100,000,000 was cordially voted as India's contribution to imperial war funds. It was in his term that a Mohammedan univ. was estab. at Aligarh and a Hindu univ. at Benares. Hist. will remember H. as a devoted friend to the people of India. Returned, under Balfour, to the Foreign Office, but had to bear his share of responsibility for the fall of Kut, for the findings of the commission of inquiry included the ex-viceroy as well as the secretary of state for India in their sweeping censure. Austen Chamberlain at once resigned, but H.'s resignation was not accepted by Balfour and, in 1920, he succeeded Lord Derby as ambas. in Paris, unexpectedly resigning in 1922, probably through the strain of his term as viceroy. His temperament

was too reserved to seek popularity; but he had sound judgment, great determination, and industry, and a thorough knowledge of official affairs.

Hard Labour, see PRISONS and PUNISHMENT.

Hardness, Scale of, in mineralogy. The H. of a mineral is measured according to its power of scratching other minerals. For this purpose Mohs arranged a series of minerals in definite order of H., to form a standard scale for comparative purposes. Those selected were (1) talc; (2) gypsum; (3) calcite; (4) fluorspar; (5) apatite; (6) orthoclase; (7) quartz; (8) topaz; (9) sapphire; (10) diamond. In this scale each member will scratch all those with lower, and will be scratched by those with higher numbers. The test, which is only approximate, is best made with crystals or fragments having smooth, bright faces; a collection of such pieces of the above minerals forms an important part of a mineralogist's equipment; and by means of it the H. of any unknown specimens may be determined, which would otherwise be undistinguishable except by elaborate chemical tests. Minerals often differ in H. on different faces of their crystals, and the same may also have different degrees of H. in different directions. More refined methods are necessary to detect these differences, and for this purpose the sclerometer, an instrument in which a small point of steel or diamond is drawn across the surface under a definite pressure, is used. Useful tests may be made by quite simple means; thus talc (1) will mark paper or cloth; gypsum (2) is scratched by the finger-nail; calcite (3), fluorspar (4), apatite (5) are cut without difficulty by a steel knife; orthoclase (6) can just be scratched, and quartz (7) is harder than steel. Minerals which have a H. above (6), and cannot be scratched with a splinter of quartz, are rare, and are generally precious stones.

Hardoi, chief tn. of a dist. of the same name in the United Prov., India. It is situated about 60 m. N.W. of Lucknow. It has saltpetre works and grain is grown and exported. The dist. is watered by sev. rivs., including the Ganges, Gavia, Gumti, and Kamangan; there are also a number of lakes. Area of dist. 2323 sq. m. Pop. 1,239,279. Pop. of tn. 53,100.

Hard Spelter, see SPALTER.

Hardwar, Hurdwar, or Haridwari, tn. in the dist. of Saharanpur, United Provs., India. It stands on the r. b. of the Ganges, and is visited every year by a large number of pilgrims, owing to its sacred position. Sometimes there are as many as 300,000, especially when, every twelfth year, a greater festival is held. Pop. 31,000.

Hardwicke, Sir Cedric Webster (b. 1893), Eng. actor, b. at Lye, Worcestershire. Educated at Bridgnorth and Academy of Dramatic Art. First appearance, Lyceum, 1912. In Benson's company, 1913. In Shakespearean plays at the Old Vic, 1914. Served in France, 1914-18. In Birmingham Repertory Company, 1922. Played at Malvern festivals, including prominent roles in Shaw's plays, and in the *Barretts of Wimpole Street*, 1934. His

later films include *Peg of Old Drury*, *Things to Come*, *Tudor Rose*, *Laburnum Grove*, *The Moon is Down*, and *Nicholas Nickleby*. Rede Lecturer at Cambridge, 1936. Among his pubs. is *Let's Pretend: Recollections and Reflections of a Lucky Actor* (1932).

Hardwicke, Philip Yorke, first Earl of (1690-1784), Eng. lawyer and lord chancellor, was b. at Dover. After spending some time in the office of a London solicitor, he was called to the Bar in 1715. In 1719 he became a member of Parliament and in the following year was made solicitor-general and knighted. In 1732 he became lord chief justice, and four years later lord chancellor. In 1740 H. assisted in the government of the country during the absence of the sovereign, and was also instrumental in settling affairs after the Jacobite rebellion in 1745. He was created Viscount Royston and earl of H. in 1754.

Hardwood Trees, deciduous trees, as distinguished from evergreens (pines, firs, etc.). The name is especially applied to the oak and the ash and other trees of slow growth. In Australia the name is given to trees with timber like teak (*Bachousia Bancroftii*). The W. Indian shrub *Icora ferrea* is another example. Ebony, walnut, maple, sycamore, and beech are also H. T.

Hardy, Alexandre (c. 1569-c. 1631), Fr. dramatist, was b. in Paris. He was connected for some time with a travelling company of actors, and wrote plays for them. His plays, which he obtained mainly from Sp. and It. sources, numbered probably about 600—the best being *Marianne* (1610). See E. Rigal, *Alexandre Hardy et le théâtre français à la fin du XVI^e et au commencement du XVII^e siècle*, 1889.

Hardy, Sir Charles (1716-80), Eng. admiral, entered the navy about 1730. In 1744 he was charged with the loss of a convoy to Newfoundland, but was eventually acquitted. In 1755 he was made governor of New York, and took part in the siege of Louisburg. In 1759 he was in command under Hawke at Quiberon Bay, and was made an admiral in 1770. He was appointed to be governor of Greenwich Hospital in 1771, and was given the command of the Channel Fleet in 1779.

Hardy, Thomas (1840-1928), Eng. novelist and poet, b. at Upper Beckhampton, near Dorchester. His father was a stonemason, and his mother came of a family which had owned some small landed property in Dorsetshire for many generations. H.'s branch of the family was in modest but tolerably comfortable circumstances, and it is claimed that it was connected with Sir Thomas H., Nelson's flag-captain (whom he is said to have resembled in features), also with the T. H. who founded the Dorchester grammar school in the sixteenth century, and also with John Le H. of Jersey who settled in the W. of England. H., who as a boy was of a studious nature, was educated at a local school, and received private tuition in Lat. and Fr. His

father wished him to follow the profession of an architect, and accordingly he was articled to John Hicks, an ecclesiastical architect in Dorchester, and later with Sir Arthur Blomfield in London. It is easy to trace in his novels his familiarity with this study, notably in the novel *A Pair of Blue Eyes* (1873), in which he makes use of the knowledge of old churches he acquired under Blomfield when the latter was engaged in restoration work. It has been asserted that he was not greatly enamoured of the vocation, but was fonder of music and drama, but it is significant of

THOMAS HARDY

Pencil drawing by W. Strang

his powers that after less than six years' study he became prizeman of the Royal Institute of British Architects and of the Architects' Association. His special bent, however, was towards writing, and, in particular, towards poetry, and when ultimately he embraced writing as a calling he did so with a confidence and sureness which may perhaps be regarded as natural in one who became the greatest man of letters of his time. His first publication was a quaintly humorous article entitled 'How I Built Myself a House,' which appeared in *Chambers's Journal*, March 1865. At this time he was attending evening classes in King's College to complete the academic side of his education, and there he studied eagerly Greek and Latin, theology, literature, and even astronomy. He, if great as a born novelist, was in a sense a novelist *malgré lui*. His earlier and later passion was poetry, and as a poet he revealed a truly original genius—the poems, generally speaking, being the novels in epitome. His literary career

began with verse, but there is not much of his early verse extant, probably for the good reason that he held it back for later development. It was with reluctance that he gave up poetry for the time being and turned to novel writing for a living. In 1871 appeared *Desperate Remedies*, which shows considerable maturity for an author of thirty one years of age, possibly because a certain amount of destroyed fiction had preceded it, and in 1872 *Under the Greenwood Tree*. In 1873 came *A Pair of Blue Eyes*, which first appeared in *Tinsley's Magazine*, and this was followed by a request from Frederick Greenwood, editor of the *Cornhill*, to write a story for that periodical. The *Cornhill* tale was the masterpiece *Far from the Madding Crowd* (pub. as a novel in 1874), which first reveals in ample measure the wonderful sense of the Wessex countryside which H. possessed and his grasp of artistic unity—a grasp preserved throughout the mazes of essentially intricate and baffling plots. In 1876 appeared his one long comedy, *The Hand of Ethelberta*, the one novel with an approximation to the conventional happy ending, and for this reason not one of his best. In that year H. married his first wife, Emma Lavinia Gifford, niece of Mr Gifford, archdeacon of London. This lady died in 1912, and we may accept it that the beautiful character Elfrida in *A Pair of Blue Eyes* (1873) is his literary tribute to her memory, and that the 'Poems of 1912-1913' in *Satires of Circumstances* reflect the poignancy of his grief. In 1878 was pub. *The Return of the Native*, than which no greater Eng. rural novel has been written, the characters in it, albeit rounded and convincing, are yet merged in the still greater portrayal of the milieu, 'Egdon Heath,' which, as has been well said, is the real 'hero' of the story. This novel, too, marks an obvious advance in range of ideas and philosophic depth, and it securely laid the foundation of the impressive array of novels which followed it. The striving—and successful striving—after artistic unity and coherence is manifest from H.'s own classification of his novels into 'Novels of Ingenuity' (*Desperate Remedies*, *The Hand of Ethelberta*, and *A Laodicean* (1881)), 'Romances and Fantasies' (*A Pair of Blue Eyes*, *The Trumpet Major* (1880), *Two on a Tower* (1882), *The Well-Beloved*, and *A Group of Noble Dames* (short stories, 1891)), 'Novels of Character and Environment,' containing all the remaining novels and short stories and among them all his best work *Far from the Madding Crowd*, *The Return of the Native*, *The Mayor of Casterbridge* (1886); *The Woodlanders* (1887); *Tess of the D'Urbervilles*, and *Jude the Obscure* (1895); together with *Under the Greenwood Tree* and 2 vols. of short stories entitled *Wessex Tales* (1888), and *Life's Little Ironies* (1913), and to these may be added the collection entitled *A Changed Man* (1913), somewhat vaguely classified in a fourth category, 'Mixed Novels,' to which none other was added. It need hardly be said that romance characterises many novels besides those so classified; while environment and characterisation are

strong features of most of them. Indeed, all of them may quite well receive the title 'Wessex Tales,' and are indeed commonly classified as the Wessex Novels; a description which most appeals to the reader by reason of the wealth of local colour in them. H.'s treatment of natural features is never irrelevant; it is integrally a part of the story, and the characters seem to spring from the topography with the inevitableness of the development of the plot. *Tess of the D'Urbervilles*, his most popular novel, was written as a serial for the *Graphic*. In it his negative philosophy of the irony of fate is most powerfully and dramatically revealed. This irony is the keynote of the whole of his work, and doubtless sprang partly from H.'s deep sense of compassion for all creatures, human or otherwise. H. is almost obsessed with the insoluble problem of the cruelty of nature, and this recurrent theme is the framework into which all his great prose tragedies are built. Apart from the Schopenhauerian tenets implicit in *The Dynasts* and H.'s claim to the idea of Impiety becoming perceptible (or, in his words, the idea that 'the Unconscious Will of the Universe is growing aware of itself'), there is next to nothing constructive in the philosophy of H., and perhaps the effect of his negative treatment is enhanced by the fact that he makes no attempt to suggest any way out for the victims of fate's satire. In the portrayal of women H. is supreme, or at all events highly individualistic. No author can show so striking a gallery of female characters, all memorable and distinctive, and nearly all poignantly doomed with the necessity of tragedy. It has often been said that H. is a pessimist, but to this charge he himself replied that 'he was a pessimist in so far as that character applies to a man who looks at the worst contingencies as well as the best in the human condition.' His most criticised novel was his last, *Jude the Obscure*, which an undiscerning and unprogressive critic lampooned as 'Jude the Obscene.' Judged by modern standards of 'frankness,' the novel is of Victorian sobriety; but it has been supposed that the attacks on this grim study 'cured him of his interest in novel-writing,' and *The Well-Beloved*, the last novel to be pub., was merely the revised version of a story written some years previously. It is more probable that he was only too glad to find an excuse for returning to poetry. In this direction it was imagined that at his age he must have 'shot his bolt,' yet at the age of sixty-four he startled the literary world with *The Dynasts* (1904), an extraordinary revelation of undimmed intellectual powers. This epic drama, conceived on the grand scale, is an interpretation of the national genius of England in its most heroic aspect, and across its stage pass all the political figures of the period, and in its stately verse H. 're-created the tragic splendour and dignity of the Napoleonic wars.' It reflects a close study of the metaphysical conception of the indivisible and immanent Will, and the curious will find in the work many lines which closely follow lines

in Schopenhauer's *The World as Will and Idea*. From the time of the production of this work H.'s fame as a poet actually continued to increase. His collected poems up to 1918 are *Wessex Poems of the Past and the Present*; *Time's Laughing Stocks*; and *Satires of Circumstance*. If there is a sombre note as of grey and mournful evenings running throughout them, it is agreed that H. made a new poetry, whether lyric or dramatic; new in its bitter speech and in its restrained music. He shows a marked sympathy with the Romantic school of Eng. poets, and this is largely to be explained by his deeply romantic sentiment towards children, animals, and nature generally; and in his self-composed memorial verses *Afterwards* we find his feelings and intentions as a romantic poet reaffirmed. Two collections were pub. after 1918, namely *Late Lyrics and Earlier* (1922) and *Human Shows: Far Fantasies: Songs and Trifles* (1925); posthumous vol. of poems *Winter Words* (1928). Among the most striking of his poems are *The Larkling Thrush*, *On a Fine Morning*, *At a House in Hampstead*, *At Lulworth Cove a Century Back*, *A Singer Asleep* (on Swinburne), *The High School Lawn*, *To an Unborn Pauper*, *Childhood among the Ferns*, *The Tree and the Lady*, *The Last Chrysanthemum*, *Afterwards*, *The Sick Battle-God*, 'There seemed a Strangeness,' *Quid Nic Agis*, *In Tenebris*, *Her Death and After*, *The Alarm*, 'When I set out for Lyonesse,' 'Men who March Away,' *The Blinded Bird*, *The Selfsame Song*. His verse tragedy *The Famous Tragedy of the Queen of Cornwall at Tintagel in Lyonesse*, on the eternally new theme of Tristram and Isolt, was pub. soon after its production at Dorchester in 1923. *Christmas in the Elgin Room*, his last poem, was pub. in *The Times* in 1927. In 1925 he wrote *Life and Art*, his only non-fictional prose work. On his eightieth birthday the representative poets of England under the presidency of Robert Bridges presented him with an address and an album of poems each had written to mark the occasion. H. was awarded the O.M. in 1910, and his other honours of an academic nature were the degrees of D.Litt., Oxford, where he was honorary fellow of Queen's College; Litt.D. of Cambridge, where he was honorary fellow of Magdalene College; and LL.D. of Aberdeen Univ. He resided at 'Max Gate,' a house which was built to his own design and situated outside Dorchester. In 1914 he married Florence Emily Dugdale, who survives him. Mrs. H. has since written a 2-vol. biography which is enriched by entries from H.'s journal and from his letters. He d. on Jan. 11, and his ashes were buried in Westminster Abbey (his heart being buried at Stinsford).

Braybrooke, *Thomas Hardy and his Philosophy*, 1927; Florence Emily Hardy, *The Early Life of Thomas Hardy, 1840-1891*, 1928, and *The Later Years of Thomas Hardy, 1892-1928* (2 vols.), 1928, 1930; A. McDowall, *Thomas Hardy, a Critical Study*, 1931; S. Norman, *Thomas Hardy*, 1932; Sir A. Strong, *Four Studies*, 1933; E. A. Baker, *The History of the English Novel*, 1938; and D. Cecil, *Hardy the Novelist*, 1943.

Hardy, Sir Thomas Duffus (1804-78), Eng. scholar, b. at Port Royal, Jamaica. In 1861 he became deputy keeper at the New Record Office, and in 1869 acted for the Historical MSS. Commission. In 1848 he was the publisher of the *Monumentalia Historica*, and he ed. also many of the Rolls of early times. Among the other works which he ed. are *A Catalogue of the Lords Chancellors, Keepers of the Great Seal, Masters of the Rolls, and Principal Officers of the High Court of Chancery*, (1843); *Descriptive Catalogue of the Materials relating to the History of Great Britain and Ireland to the End of the Reign of Henry VII.* (1862-71); and *The Register of Richard de Kellawe* (1873).

Hardy, Sir Thomas Masterman (1769-1839), Eng. vice-admiral, b. in Dorsetshire. He entered the navy in 1781, and in 1793, after various appointments, was promoted a lieutenant of the *Meleager* frigate, and came under the immediate orders of Capt. Nelson. In 1798 H. joined Nelson near Elba, and was present at the battle of the Nile. In 1803 he was flag-captain of the *Victory* with Nelson, and acted in that capacity in the battle of Trafalgar. H. was with Nelson on the quarter-deck of the *Victory* when he received his mortal wound, and at his funeral in 1806 bore the 'banner of emblems.' H. was created a baronet the same year. He joined the board of admiralty as First Sea Lord in 1830, and in 1837 became a vice-admiral. The last years of his life were spent in peaceful retirement.

Hardyng, John (1378-c. 1465), rhyming chronicler belonging to a N. family, admitted, at the early age of twelve, into the household of Sir Henry Percy (Hotspur), whom he saw fall at the battle of Shrewsbury in 1403. In 1405 he entered the service of Sir Robert Umfraville, and was made constable of Warkworth Castle. He took part in the battle of Agincourt in 1415, and served the Crown in confidential missions to Scotland. H.'s *Chronicle* treats of the hist. of England from the earliest times down to the flight of Henry VI. from Scotland.

Hare, Augustus John Cuthbert (1834-1903), Eng. author, nephew of the churchmen Augustus Wm. and Julius Charles H., b. in Rome, educated at Harrow and Oxford. His works contain accounts of his travels, especially of the cities of Italy and France. They include *A Winter at Mentone* (1861); *Walks in Rome* (1870); *Wanderings in Spain* (1872); *Days near Rome* (1875); *Cities of North and Central Italy* (1875); *Walks in London* (1877); *Cities of South Italy and Sicily* (1882)

Florence (1884); *South-Eastern France* (1890); *North-Eastern France* (1890); *Sussex* (1894); *North-Western France* (1895); *The Riviera* (1898). He also wrote *Memorials of a Quiet Life* (1872-76); a biography of his aunt and uncles; *Life and Letters of Maria Edgeworth* (1894); *Story of my Life* (1896-1900); *Story of Two Noble Lives* (1893); and *The Gurneys of Earham* (1895).

Hare, Sir John (1844-1921), Eng. actor and manager, b. May 16, in Yorkshire; son of Thomas Fairs, of London. His first appearance on the stage was at Liverpool, 1864. He came to the Prince of Wales's Theatre, London, 1865; acting under the Bancrofts; and winning a name in many of Robertson's comedies, especially as Lord Ptermington in *Society*. He was at the Prince of Wales's for about nine years; appearing in *Castle*, 1867; *School*, 1869; *Money*, 1872; *The School for Scandal*, 1874. H. was manager of the Court Theatre, 1875-79; producing *A Quiet Rubber*, 1876. He was in partnership with Kendal at St. James's Theatre, 1879-88, and they introduced a number of Pinero's plays to the public. The Garrick was built for H. by W. S. Gilbert, and opened 1889 with *The Profligate*. *A Pair of Spectacles* was produced 1890, Benjamin Goldfinch being one of his most popular roles. H. also played in *A Scrap of Paper*, 1876, 1883; *The Gay Lord Quex*, 1899; *Money* (at the command performance at Drury Lane), 1911. He toured in America, and was knighted in 1907. His last appearance was in 1917 in *A Pair of Spectacles*. See T. E. Pemberton, *John Hare, Comedian*, 1895; and C. W. Scott, *The Drama of Yesterday and To-day*, 1899.

Hare, William, one of the Irish criminal body-snatchers. See under BURKE, WILLIAM.

Hare, name of all rodent quadrupeds of the family Leporidae, except rabbits, the two chief genera being *Lepus* and *Lagomys*. They have long ears and hind legs, very short upturned tails, and a divided upper lip. Hs. construct 'forms,' or shallow nests on the earth's surface in the grass, and do not burrow like rabbits. They are extraordinarily swift in leaping and running, and their colouring, which much resembles their surroundings, is protective. Hs. are solitary and nocturnal in habit, and feed on vegetable substances, grain, roots, and bark of young trees. They are common to most parts except Madagascar and Australasia, but abound chiefly in the N. hemisphere. Where the common *Lepus europæus* is not found, the smaller *L. timidus* (Alpine or mt. hare) generally replaces it. Two to five leverets are produced sev. times annually. In America the Canadian polar Hs. and the *Lepus americanus* turn practically snow-white in winter. In the W. are to be found a number of long-eared Hs. called jack Hs. Among these are the white-tailed Hs. (*Lepus campestris*) and four species of black-tailed rabbits. See also RABBIT. See E. Coues, *Monograph of the Rodentia*, 1877; E. Thompson, *Wild Animals I have known*, 1898; and F. E. Beddard, *Mammalia*, 1902.

Hare and Hounds, originally a schoolboy pastime in the form of a kind of paper-chase. Two chosen persons, called 'hares,' have about 15 min. start (their 'law') and lay the 'scent' (usually fragments of paper). They are chased by the remainder, called 'hounds,' who have to track out their course. The one who is first to reach the goal wins. Rugby was the cradle of paper-chasing in the early nineteenth century. Since 1877 the game has developed into an organised sport, with recognised rules and clubs. Among noted clubs are the original 'Thames Hare and Hounds,' the S. London, Blackheath, Spartan, Ranelagh, Finchley, Hampton Court, Epsom, Mosely, Highgate, Huddersfield, and Liverpool Harriers, the Essex Beagles, and Oxford and Cambridge Univ. Hare and Hounds. There is a national cross-country championship annually, held in the N., S., or midlands of England.

HAREBELL

Harebell, 'Scotch bluebell,' name now usually applied to the charming perennial wild flower, *Campanula rotundifolia*, with delicate bell-shaped flowers, usually a lovely blue, but sometimes white. Hcs., or 'witches' thimbles,' are found chiefly in the N. hemisphere, growing freely among bracken and heather on open downs and hills. The lower (radical) leaves only are heart-shaped, the others being linear (narrow blades). Lindley (1799-1865) tried to establish the spelling 'hairbell' with reference to the frail stalk, but it seems to be incorrect. H. was originally in England the *Endymion nautans* (wild hyacinth or bluebell). Always a favourite with poets, it is with them an emblem of purity. The juice yields a fine blue colour, sometimes used as ink.

Harefield, vil. of Middlesex, England, 3 m. N. of Uxbridge. At a former H. Hall, Queen Elizabeth was entertained and Milton's *Arcades* was acted. Pop. 3000.

Harefoot, Harold, see HAROLD I.

Harelbeke, Belgian tn. in W. Flanders, on the R. Lys, 3 m. N.E. of Courtrai, engaged in agriculture, the cultivation of tobacco and flax-retting. There are

manufs. of linen, lace, and oil. It is the bp. of Peter Benoit, a Flem. composer. Pop. 13,000.

Harem or **Haram** (Arabic *harim*, prohibited, unlawful, sacred), the name given in the E. to that part of the household set aside for the wives and concubines of a Muslim, called also the seraglio, zenana, or *andarun*. The term is also used collectively for all the female members of the household. It is applied also to the mosques at Mecca and Medina, and to the sacred enclosure round a mosque. The H. system is of very anct. origin, and common to most oriental communities, especially where polygamy is allowed. The Koran allows four wives to a Muslim (the sultan may have seven by unwritten law), but there is no limit to the number of concubines except ability to support them. The rules of the H. vary in the different countries, Turkey, India, Egypt, Arabia, Syria, Persia, Siam. Usually the ruler's mother reigns supreme in the royal Hs. Each wife has a separate suite of apartments, with female slaves and odalisques for attendants. Women must all be veiled in public; they have little occupation, and are supervised by eunuchs. No man, unless a near relative, may enter on pain of death. See E. Lott, *Harem Life in Egypt and Constantinople*, 1869; Annie Harvey, *Turkish Harems and Circassian Homes*, 1871; Barnes, *Behind the Purdah*, 1897; W. Ramsay, *Everyday Life in Turkey*, 1897; Van Sommer and Zwerner, *Our Moslem Sisters*, 1907; P. Loti, *Les Désenchantées*, 1906; M. Driver, *The Englishwoman in India*, 1909; and N. Penzer, *The Harem*, 1936.

Hare's ear, see BUPLEURUM.

Hare Stanes, see HOG-STONES.

Harewood, Earls of, see LASCELLES.

Harfleur (anct. *Harfleurum*, or *Harfloricum*, apparently latinised forms of the medieval name *Herosfloth* or *Harflet*), seaport tn. of Seine-Inférieure, France, near the mouth of the Lozarde, about 3 m. from Havre. By common consent H. is identified with the Caracotium of the *Itinerary* of Antoninus and the neighbourhood is rich in Rom. remains. It has metallurgical works, potteries (for delft and faience ware), distilleries, and sugar-refinery. H. (the harbour on the channel) was captured by the Eng. under Henry V. in 1415. The fine Gothic church is attributed to him. Alternately in the possession of France and England during the early fifteenth century, H. was finally recaptured by Charles VII. in 1450. Its former harbour was silted up by a stream, and Havre replaced it as an important centre. Pop. about 5000.

Hargraves, Edmund Hammond (c. 1816-1891), discoverer of the Australian goldfields, b. in Hampshire, England. Settling in Australia in 1833, he was a sheep farmer at Sydney from 1834 to 1849. He gained experience as a gold-digger in California in 1849, and struck by the similarity in geological formation between California and the Blue Mts. of New S. Wales, determined to seek for deposits there also. He succeeded in finding gold near Macquarie R., at Lewis Ponds Creek

(1851). He received a reward of £15,000 from the colonial gov., and later a pension. H. wrote *Australia and its Goldfields* (1855).

Hargreaves, James (d. 1778), Eng. operative of the eighteenth century. He earned his living as a weaver and carpenter, helping Peel to construct a carding machine in 1760. About 1766 he invented the spinning-jenny used in the manuf. of cotton. His fellow spinners, being strongly prejudiced against machinery and new methods, mobbed him and destroyed his frame. H. removed to Nottingham in 1768, and erected a spinning-mill there. See H. Howe, *Memoirs of the most Eminent American Mechanics*, 1841, and F. Espinasse, *Lancashire Worthies*, 1874.

Haricot, leguminous plant of the genus *Phaseolus*, being a type of dwarf Fr. bean, bearing a seed which is allowed to ripen on the plant, and is widely used, when dried, as a food.

Haridwar, see **HARDWAR**.

Hari-Kiri, see **HARA-KIRI**.

Harrington, Sir Charles Harrington (1872-1940), Brit. general, b. at Chichester, son of E. J. Harrington. Educated at Cheltenham College. After passing out of Sandhurst, entered the King's Liverpool Regiment, 1892. Served on the staff in the S. African war, being mentioned in dispatches. In the First World War he was on the staff of Gen. (later F.-M.) Lord Plumer, commander of the Second Army, operating in the Ypres area, and won high opinions for his resourcefulness and qualities of leadership. Promotion was very rapid, from captain at the outbreak of the war to full general in 1927. After the war he became dept. chief of the general staff at the War Office, and further enhanced his reputation both as soldier and administrator, when general officer commanding the army of the Black Sea, by his masterly handling of the serious situation that arose at Chanak on the straits in 1922 on the eve of the war between Turkey and Greece over ter. mandated to Greece under the treaty of Sévres. His negotiations with Mustafa Kemal resulted in a satisfactory and peaceable settlement of the important question of the internationalisation of the straits, at a time when a collision with the Turkish forces appeared inevitable. General officer commanding N. command, 1923-27, and, later, appointed to the command of the W. dist., India. Commander-in-chief, Aldershot command, 1931; governor of Gibraltar, 1933. Retired 1938. He did much to promote the cause of education in the army; being the first colonel-commandant of the Army Educational Corps formed after the First World War. Always known in the army by his nickname, "Tim." Wrote autobiography, *Tim Harrington Looks Back*, (1940).

Harrington, or Harrington, Sir John (1561-1612), Eng. courtier and miscellaneous writer, b. at Kelston, near Bath. He was a favourite with Henry VIII. and became a servant of Elizabeth, at whose court he was famous for his wit. By command of the queen he translated Ariosto's *Orlando Furioso*, 1591, and he entertained her at his house at Kelston in 1592, but in 1596 he fell into disgrace at court on

account of an innuendo about the earl of Leicester. In 1598 he accompanied Essex to Ireland and afterwards wrote an account of the campaign. He was appointed tutor to Prince Henry, eldest son of James I., for whose instruction he wrote *A Briefe View of the State of the Church* (pub. 1653). Among his other writings are *A Tract on the Succession to the Crown* (1602); *The Englishman's Doctor* (1608); *Nugae anti-quae* (pub. 1779); and the collected *Epigrams* (pub. 1613).

Harlot, Thomas, see **HARRIOT**.

Hariri Abu Mohammed al-Kasem (ul-Qasim) ibn Ali, surnamed Al-Hariri (the silk merchant) (c. 1054-1122), Arabian writer. He wrote two treatises on philology: *Mulhat-ul-irab* (see Pinto's ed. Paris, 1885-89), and *Durrat-ul-Ghaw-wid* (see Thorbecke's ed., Leipzig, 1871). His chief work is the *Macamat* (Assemblies), fifty *maqamas* in prose and verse. It ranks in the E. next to the Koran, and has influenced all the nations of Islam. See eds. of *Macamat* by Silvestre de Sacy, 1822; by F. Steingass, 1896; Ger. trans. by K. Rückert, 1826; Eng. trans. by T. Preston, 1880; by T. Cheney and F. Steingass, 1867 and 1898.

Harirud, see **HERR-RUD**.

Harkness, Edward B. S. (1871-1940), Amer. railway magnate and philanthropist. Both in his own country and in Great Britain he was known for his benefactions to education, and he was a consistent advocate of a closer understanding between Britain and the U.S.A. His largest Brit. benefaction, the Pilgrim Trust, which amounted to about £2,000,000, was made in 1930, and he also enlarged the Commonwealth Fund, which had been created by his mother for providing scholarships for Brit. students to Amer. univs.

Harlaw, locality of Aberdeenshire, Scotland, 18 m. from Aberdeen, noted for the defeat of the Highlanders under Donald, lord of the Isles, by the forces under the earl of Mar, 1411.

Harlebeke, Harlebeke, or Harlebeke, com. and tn. of W. Flanders prov., Belgium, on the Lys, 3 m. from Courtrai. It has tobacco factories. In Oct. 1918 Gen. Plumer's army reached the l. b. of the riv. here, forcing a passage, a few days later, at Beveren. Pop. 9100.

Harlech, coast tn. par., and anct. cap. of Merionethshire, Wales, 10 m. from Barmouth, on the W. Region railway. The castle was captured by the Yorkists from the Lancastrians (1468), the national Cambrian war-song 'March of the Men of Harlech' perhaps originating during this siege. It held out long for Charles I. Its beautiful ruins still remain overlooking the sea. There are mines of manganese ore. Pop. 2000.

Harleian Manuscripts, collection of valuable MSS., books, and pamphlets (including the earliest known copy of Homer's *Odyssey*), originally made by Robert Harley, first earl of Oxford (qv.), and increased by his son Edward (1689-1741). Copies of the classics and of Early Eng. poetry are included, as well as many unique illuminated MSS. A

selection of rare pamphlets was pub. as *The Harleian Miscellany*, 1744-46, ed. by W. Oldys (q.v.), who also catalogued the Harleian Library. Much of the collection was acquired for the Brit. Museum for £10,000, in 1763, from Lady Oxford.

The Harleian Society was founded in 1869 (incorporated 1902), for publishing MSS. dealing with genealogy, heraldry, etc. Some 40 vols. of transactions have been issued.

Harlem, part of New York city, U.S.A., extending about 2 m. N. of Central Park, with East R. on E. and H. on N.E. H. has the most prosperous block of the Negro pop. of America, yet even in H. the Negroes has to pay higher rents and accept lower wages than the equivalent white classes; and although increasingly powerful politically, and therefore cultivated by the local machine politician, the H. Negro has only very recently begun to get his share of public amenities; thus, there was not a single new school built in rapidly expanding H. between 1918 and 1938.

Harlem River, New York city, properly a strait separating Manhattan Is. from the mainland to the N. and N.E. and connecting the Hudson R. with the East R. (i.e. the strait between Manhattan and Long Is. It is crossed by bridges and is navigable.

Harlequin (Fr. *arlequin*, It. *arlecchino*), equivalent to the Eng. clown. It has been suggested that the character is a survival from Gk. comedy or the Rom. *pantomimus*, but it has no ascertainable connection with either. In the fifteenth century the improvised It. comedy (*commedia dell'arte*, q.v.) had crossed the Alps with its company of jovial characters partly borrowed from masked comedy, though also in great part reflecting the various types of regular comedy auct. and modern, and including Pantalone with Arlecchino among other varieties of zanni. But whether the traditional costume of the auct. Rom. *mimi* or mimes—the centunculus or variegated harlequin's coat, shaven head and unshod feet—had before this time become familiar to the provincials has not been decided. The various proposed etymologies of the word H. are mostly speculations; but a long discussion on its origin will be found in Weekley's *Words Ancient and Modern* (consult also Wyld's *Universal English Dictionary*). The character of the early H. was a mixture of extravagant buffoonery with great bodily agility, but in the middle of the sixteenth century his character changed and he became a simple ignorant servant, cowardly, and easily induced to commit tricks and knaveries. In Eng. pantomime he became a lover and magician, whose business it was to protect Columbine from the clown and pantaloons.

Harless, Gottlieb Christoph Adolf von (1806-79). Ger. Lutheran theologian, b. at Nuromberg. His chief works are *Theologische Encyclopädie und Methodologie* (1837); *Die Christliche Ethik* (1842); and his autobiography (1872).

Harley, Robert, Earl of Oxford and Mortimer (1661-1724), son of Sir Edward II., whose family were Whigs in politics.

Robert entered Parliament first for the Cornish bor. of Tregony, but in a short time was elected for New Radnor, which constituency he represented till 1711. In William III.'s reign he acted with the Whigs, but after the accession of Anne, in conjunction with his more celebrated colleague, St. John, afterwards Lord Bolingbroke, he deserted this party and became a leader of the Tories. He was Speaker of the House of Commons in 1701, and chief secretary of state in 1704, which post he resigned four years later. In 1710 he was nominated chancellor of the Exchequer, and in the following year he was invested with the office of lord high treasurer and raised to the peerage with the title of earl of Oxford. He was impeached of high treason in the early part of George I.'s reign, but subsequently acquitted. See *Life and Times of R. Harley, Earl of Oxford* (New York), 1902.

Harlingen, seaport in Holland in the prov. of Friesland, 16 m. W. by S. Leeuwarden. It is intersected by numerous canals, has an excellent harbour, and in normal times carries on an extensive trade with Amsterdam, Norway, the Baltic, and Great Britain. The tn. was overwhelmed by an inundation in 1134 and in 1566, when a dyke was constructed for its future protection. Pop. about 10,400.

Harlington, see under HAYES.

Harlow, mkt. tn. in Essex, England, in the Epping div. $7\frac{1}{2}$ m. from Ware, on the R. Ica. Here it is proposed to build one of the satellite tns. for redistribution of the industrial pop. of the country. Pop. 3000.

Harmattan, hot E. wind blowing periodically from the interior parts of Africa towards the Atlantic Ocean. It is laden with clouds of reddish dust coming off the desert, and is usually accompanied with a fog and haze that conceal the sun for days at a stretch. It is characterised by extreme dryness, and no dew falls during its continuance—the grass, in consequence, becoming like hay, and vegetation withering. It affects the human body likewise, causing the skin to peel off, but cures skin diseases and checks infection. It prevails at intervals during Dec., Jan., and Feb., continuing sometimes for a fortnight, but more commonly from two to three days.

Harmodius, Athenian, who, in conjunction with his devoted friend, Aristogiton, formed a conspiracy in 514 B.C. to slay the brothers Hipparchus and Hippias, tyrants and joint rulers of Athens. They succeeded in killing Hipparchus, but not Hippias, who seized the reins of government alone, and revenged his brother's death by imposing taxes, selling offices, and putting to death all of whom he entertained the least suspicion. H. was killed, but Aristogiton fled, only to be subsequently taken and executed. Afterwards H. and Aristogiton came to be regarded as patriotic martyrs, and received divine honours from the Athenians, who raised statues to their memory.

Harmonica, musical instrument from which the sounds are produced by the friction of moistened fingers on glass or metal tubes, used in the eleventh century, but nowadays a toy. Beethoven and

Mozart wrote music for it. There was a later form with a keyboard. The name H. belongs properly to Benjamin Franklin's mechanised form (c. 1762) of the seventeenth-century musical glasses. See, for a description of his invention, *International Cyclopædia of Music*, and, for a detailed discussion, *Oxford Companion to Music*.

Harmonical Progression, name given to a series of quantities in which any three consecutive terms a, b, c are connected by the relation $\frac{a}{c} = \frac{a-b}{b-c}$. From this it may

be easily proved that $\frac{1}{a}, \frac{1}{b}, \frac{1}{c}$, i.e. that $\frac{1}{a}, \frac{1}{b}, \frac{1}{c}$ are in arithmetical progression.

Hence the reciprocals of the terms of an H. P. form an arithmetical progression. Thus $\frac{1}{a}, \frac{1}{b}, \frac{1}{c}, \dots$ form an A. P. No general formula can be found for the sum of any number of terms, and questions on H. P. are solved generally by the use of the above property. The middle term of any three in H. P. is known as the harmonic mean of the other two, and hence the harmonic mean between a and c is $\frac{2ac}{a+c}$.

Harmonic Engine, instrument invented by Edison, by means of which the energy of an electric current is used to sustain the vibrations of a large, heavily weighted tuning-fork, the arms of which are connected with two pistons, which work a small pump. This pump compresses air, and is able to drive sewing-machines, etc.

Harmonic Motion, general name given to motion of natural vibration and oscillation. Thus it includes the oscillation about the position of equilibrium of a weight supported by a spring or an elastic string, the small oscillations of the bob of a pendulum, the vibration of any point on the string of a musical instrument, and finally wave motion in general, of which the last example is a particular case. Thus, if a series of waves moves regularly over any surface, any point on the surface will move up and down with H. M. If equal and opposite waves move in opposite directions, certain points called *nodes* will remain fixed; and this is the case with the strings of a musical instrument fixed at

FIG. 1. CURVE OF SINES

two ends which are nodes. If a pencil moving vertically up and down with the simplest form of H. M. traced a locus on a piece of paper which moved horizontally with a uniform velocity, it would trace out the curve in the figure known as the *curve of sines*. It will be recognised by the student of trigonometry as the graph of $\sin x$ (Fig. 1). The most elementary form of H. M. known as *Simple Harmonic*

Motion. Let a point X (Fig. 2) move with uniform velocity along the circumference of a circle, and let XP be the perpendicular on any fixed diameter AB. Then P will move with simple H. M. It will be seen that P moves continually backwards and forwards along AB, coming to rest instantaneously and turning back again at

FIG. 2. SIMPLE HARMONIC MOTION

A and also at B, and having its biggest velocity when passing through the centre O. The time taken over one complete journey backwards and forwards is called the *period*. The time to any position since last passing through the middle point O going in a direction previously fixed as positive is called the *phase*, and OA is the *amplitude*. If ω is the constant angular velocity of OX, and t the time from C, the end of the perpendicular diameter to AB, to the point X, then the angle COX is ωt , and OP is $a \sin \omega t$, where a is the radius of the circle. Hence it may be seen why the locus traced in Fig. 1 is a curve of sines. The period is the time for X to go once completely round the circumference, i.e. $\frac{2\pi}{\omega}$, and this result is seen to be independent of the amplitude a . Since X has a velocity $a\omega$ along the tangent to the circle, and by virtue of its circular motion an acceleration $a\omega^2$ along XO, it will be seen that P has a velocity $a\omega \cos \omega t$ along OA and an acceleration towards O, $a\omega^2 \sin \omega t$, i.e. $\omega^2 \times OP$. Thus a point moving with simple H. M. has an acceleration directed towards the centre, which varies directly as its distance from the centre. As the point P passes through O on its backward journey, the acceleration becomes a retardation and is still proportional to the distance from O. This very important property is sometimes taken as the definition of simple H. M. The more complicated forms of H. M. may be obtained by compounding two or more simple H. Ms. Thus any point of a vibrating string fixed at its two ends, where the motion is made up of ten equal and opposite wave motions, moves with two equal and opposite simple H. Ms. in the same straight line. Another simple case occurs in the compounding of two simple H. Ms. of equal periods, but different

amplitudes a and b , along two lines Ox and Oy where the locus of the point is the

$$\text{ellipse } \frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$$

Harmonics, or Partial Tones, as Helmholtz more correctly terms them in his *Sensations of Tone*, are the tones which sound over any pure musical note, their pitch being regular and governed by mathematical laws. If a taut string be plucked, for instance, vibrations are caused and a fundamental or predominating note is given; furthermore, not only does the whole string vibrate, but its all-quot parts also, each part having its corresponding sound according to the 'period' of vibration. Half the same length of string gives a note an octave higher; one-third, a fifth higher; one-quarter, a sixteenth higher, and so on. These notes give the intervals of the common chord of the diatonic major scale, of which they are the theoretical basis. The production of harmonics on both stringed and wind instruments is used as a technical resource. Helmholtz showed that harmonics affect tone-quality.

Harmonium, musical instrument invented in modern times which produces sounds similar to those of an organ by means of an arrangement known as the 'free vibrating reed,' acted upon by a current of air from a bellows worked by the feet. The invention is ascribed to Alexandre Debain of Paris, though he only perfected an instrument previously known, called the *orgue expressif*, and the same principle followed in the construction of this kind of organ was applied to the H. The feet communicate a more or less rapid movement by the action of two pedals, according to the shades of expression which are to be brought out, and the air is made to impinge against thin tongues of

of wind-pressure, the volume being merely increased or decreased. Some Hs. are made with two rows of keys, with pedals for the feet, similar to organ pedals, attached. This instrument may be had in various sizes and qualities. The best known makers are the Alexandres and Mustel in France, and Bauer in England. A similar but inferior instrument is the 'seraphine,' and Messrs. Mason and Hamlin in 1861 introduced a kind of H. called the Amer. organ, which acts by suction and works by exhaustion bellows instead of by force bellows. Since Debain's invention many improvements have been made to the H. the chief of which are the addition of a knee action, serving as an expression stop, or bringing into play at once all the stops; and the percussion action, the invention of Kaufmann of Dresden, which consists of the addition of a small hammer which aids the action of the wind by striking the vibrator as soon as the key is pressed down.

Harmony, science treating of the laws which govern the relation of tones in chord-combinations and of the progressions between such combinations. The earliest attempt at H. seems to have consisted in adding a drone bass, sustained as an accompaniment throughout a melody, somewhat in the style of the modern device of pedal-point, e.g., as in the bagpipes. The Gks. had some knowledge of theoretical H., although for some reason no practical application was attempted; and to understand the development of modern H. it is necessary to discuss in some detail the Gk. Pythagoras may be credited with the origination of the science of musical acoustics; the units derived were the octave and the tetrachord, i.e. the div. of tones in the interval of a fourth. There were three tetrachords, which may be represented thus:

FIG. 1. TETRACHORDS

Of these only the diatonic has survived in three forms

FIG. 2. FORMS OF DIATONIC

metal, and sets them vibrating. Debain's invention of the H. in 1840 became more or less the model of all others that have followed. The H. is about 3 ft. 3 in. high, and 4 ft. broad, and occupies little space. It has a compass of five octaves of keys from C to C, the keyboard being placed on the top, just below the lid. Under this is the bellows-board with the valves for each key, and the different rows of reeds are above the valves. A peculiarity of the free reed is that the pitch of the sound is not altered by the increase or diminution

from these tetrachords the scales were derived. Fig. 3 shows the relation between these scales (or 'species') and the full Pythagorean scale, as far as the disposition of their intervals is concerned, the question of pitch being immaterial in practice, although absolute in theory.

From this system the elaborate medieval church modes shown in Fig. 4 were derived; but the difference between Gk. and ecclesiastic scales bearing the same name is worthy of note. Incidentally,

too, whilst the intervals were read downwards in Gk., the modern practice of reading them upwards was used in church music at this time.

It is unnecessary here to do more than mention the hexachord system, which was later substituted in ecclesiastic music for

ments in the direction of modulation. During the period when these changes were being evolved, an advance was made in the addition of a single part, either in fourth, fifth, or octave, to a canto fermo; and in the eleventh century the method of *discantus* came into vogue, i.e. the singing

FIG. 3 RELATION BETWEEN SCALES (OR SPECIES) AND THE FULL PYTHAGOREAN SCALE

FIG. 4. MEDIEVAL CHURCH MODES

the Gk. tetrachord system. The hexachord, a group of six consecutive notes, regarded as a unit for singing at sight, was introduced by Guido d'Arezzo in the eleventh century. But in Guido's time H. had barely begun and the element of chromaticism (see CHROMATIC SCALE), was entirely wanting, only one inflected note being in use. The addition of B flat to the scale made possible wider experi-

together of two independent subjects or melodies, so constructed as to produce two-part H. Other devices were tried in the course of the next two or three centuries; chords were grouped in some crude classification, and attempts made to formulate their progressional principles. The *discantus* had led to the reduction of subjects to regular rhythm, and had also laid the foundation of counterpoint; and

by the end of the fifteenth century polyphony (i.e. the contrapuntal weaving together of separate melodic parts) was on a fairly sound footing—four-part writing had been attained, and inversions, passing notes, discords, and chromatics had arisen. The sixteenth century was an age of brilliant achievement under such men as Josquin, Lassus, and Palestrina. But before further progress could be made it was necessary that the limitations and prejudices of the Græco-ecclesiastic modes, which still prevailed, should be superseded. So far, chord-combinations had been regarded as incidental to polyphony. It was Monteverdi who early in the seventeenth century broke away, by using unprepared dominant sevenths and other unheard-of discords, thereby forming the transition to the new conception of chord-combinations, i.e. that a chord is a separate entity possessing tonality and value not only relatively, but intrinsically. Rameau (d. 1764) attempted to formulate the principles of root-derivation of chords and the laws of relation between roots which governed chord-progressions; and the efforts of Tartini (d. 1770) must also be

FIG. 5. COMMON CHORD OR TRIAD

mentioned. The great consummation of this period is to be found in the works of J. S. Bach (d. 1750), whose wonderful instinct for H. enabled him to evolve the science of relationship between consonance and dissonance, in such devices as passing notes, to an unprecedented stage of advancement. Meanwhile, the shortcomings of the ecclesiastic modes had been becoming more and more apparent, and the attempts at systematisation had resulted in the evolution of the modern major and minor scales. Bach was chiefly responsible for the practical application of theoretical equalisation of keys (see TEMPERAMENT) in tuning; and in these circumstances great progress was made in modulatory experiments, e.g., the invaluable device of 'enharmonic change.' The fundamental idea of modern H. is that of concord. The common chord (Fig. 5) or triad (A), or either of its inversions (B) and (C), called respectively the first and second, gives a perfect consonance which is correct aesthetically by reason of its finality and completeness, and scientifically according to the laws of harmonics (see H. von Helmholtz, *Sensations of Tone*, 1875). As opposed to concords, we have discords, or dissonant chord-combinations, which must be resolved into their relative concords before a complete idea can be expressed; unresolved discords leave a sense of incompleteness to the ear. The most familiar discord is the dominant seventh which is resolved into the triad of the tonic, i.e. of the keynote on which it is based (Fig. 6). This progression is the

basis of H. To use a graphical illustration, it may be said that the points of a composition are plotted in concords, and the lines filled in by discords. In academic and classical music, the resulting graph is of regular shape; in romantic and modern, less regular, as a general rule. In the most modern music the treatment of

FIG. 6. DOMINANT SEVENTH (PERFECT CADENCE)

discord is carried to very elaborate lengths, and an emotional expressiveness of extreme intensity is often obtained. The aesthetic or practical application of H. has always been ahead of the scientific (except in cases of Gk. music); and every composer of importance has suffered at the hands of critical jurists for breaking academic laws, e.g. Gluck, Haydn, Beethoven, and the later Romantics, Wagner, Scriabin, and Stravinsky. Contemporary harmony is the logical outcome of the practice of preceding generations, and occupies itself more with the harmonic (perpendicular) view than with the contrapuntal (horizontal) one. The number of scales in use is very much larger than of old, important among them being numerous variations of the diatonic scale, the dodecuple, and the whole-tone (Fig. 7).

FIG. 7. VARIATIONS OF THE DIATONIC SCALE

Atonality (the abandonment of a fixed keynote) is practised (e.g. Schönberg), and new chords, built up not only from thirds as in older practice, but also from fourths, fifths (perfect, augmented, diminished), and seconds (major or minor), have passed into currency. Double and triple tonality, whereby two or three keys can be heard

at once, are used (e.g. Bartok, Stravinsky, Holst), and the relations between harmony and rhythmic pattern are becoming better understood and effectively applied (e.g. notably Stravinsky). See Sir H. Parry's article on 'Harmony' in Grove's *Dictionary of Music and Musicians*, and for modern tendencies the authoritative article in Dent's *Dictionary of Modern Music and Musicians*; also Sir D. Tovey's in the *Ency. Brit.*, works by Stainer and Macfarren, and A. Eaglefield-Hull, *Modern Harmony*, 1913.

Harmony term used by Leibnitz to denote the relation existing between the monads or ultimate psychical units of his metaphysical system. He held that substance exists only in the form of atoms, each a self-contained individuality, and that the entire series is so constituted that each is at every moment in perfect II. with all the rest, though at the same time obeying the laws of its own self-determined development. This system pertains to the very highest and to the very lowest, and since God is the contriver of universal II., this world must be the best of all possible worlds. Leibnitz describes the relation of monads as 'a harmony pre-established by a contrivance of the divine foresight.'

Harmony of the Gospels, see NEW TESTAMENT.

Harmsworth, Sir Alfred Charles William, see NORTHCLIFFE, VISCOUNT.

Harmsworth, Sir Harold Sidney, see ROTHERMERE, VISCOUNT.

Harnack, Adolf von (1851-1930), Ger. theologian and historian, b. at Dorpat in Estonia, where his father, Theodosius II., held a professorship of pastoral theology. His lectures dealt with gnosticism and the Apocalypse. The first vol. of his epoch-making work, *Lehrbuch der Dogmengeschichte*, of which there is an Eng. trans. in 7 vols., was pub. in 1885. In this work H. traced the rise of dogma. In 1893 he pub. a hist. of early Christian literature down to Eusebius, entitled *Geschichte der urchristliche Literatur bis Eusebius*; and in 1900 appeared his popular lectures, *Das Wesen des Christentums*. He also wrote *Die Mission und Ausbreitung des Christentums in den ersten drei Jahrhunderten* in 1902, and some interesting and important N.T. studies, which have been trans. into Eng.: *Luke the Physician and The Sayings of Jesus*. II.'s distinctive characteristic is his claim for absolute freedom in the study of church hist. and the N.T. II. occupied a professorship at Marburg, 1886-89; at Berlin, 1889-1924. In 1914 he was ennobled. See life by Agnes von Zahn-Harnack, 1936.

Harold, or Harald (850-933), first king over Norway, surnamed Harfagr (beautiful-haired), son of Halfdan the Black. He vowed not to cut or comb his hair till he was sole king of Norway; ten years later he fulfilled his oath and exchanged the name of Shockhead for Beautiful Hair. In 866 he made his first conquests over the petty states that divided Norway, and in 872 found himself master of the whole kingdom. His opponents fled to the isles of the Orkneys, Shetlands, and Hebrides.

Later he was forced to make an expedition against them. He secured the Scottish isles, and the remaining Vikings fled to Iceland and founded a commonwealth there. At the end of his reign his sons quarrelled over the succession; he assigned them lands and royal titles, leaving the chief power to his favourite son, 'Erik of the bloody ax.'

Harold (936-86), king of Denmark, surnamed Blue-tooth, son of Gorm the Old. He obtained the overlordship of Norway on the death of Harold Harfagr. He was baptised in 960, to conciliate the Emperor Otto, and tried to convert Denmark to Christianity. He was driven from his country by his son, Sweyn I. (Svend Fork-beard), the leader of the pagans. II. d. during his flight. See life by T. Torfæus, 1707.

Harold I. (d. 1040), surnamed Harefoot, the illegitimate son of Canute, king of England. On the father's death (1035) he claimed the crown with the support of Leofric, earl of Mercia. The Witan at Oxford elected him regent, while the rightful king, Hardicanute remained in Denmark; the latter stayed away so long that H. was crowned king in 1037. He d. suddenly at Oxford while Hardicanute was preparing to invade England.

Harold II. (c. 1022-86), king of the Eng., second son of Earl Godwine. While still very young he was made earl of the E. Angles. He was outlawed and banished with his father in 1051, taking refuge with his brother Leofwine in Ireland. The family was recalled, and II. was restored to his earldom. On his father's death (1053), he succeeded to the earldom of the W. Saxons, becoming the first minister to the king. Edward the Confessor d. in 1066, leaving his throne to II., who was immediately crowned. William duke of Normandy challenged the Crown, alleging that Edward left the Eng. throne to him, and that II. was under an oath, extorted from him in Normandy during his exile. H. was now attacked on both sides: Duke Wm. landed at Pevensey in Sussex, and Tostig of Northumberland, II.'s brother, with Harold Hardrada, king of Norway, sailed up the Humber and subdued York; they were defeated at Stamford Bridge, and while the two earls, Edwin and Morcar (Morkere) (q.v.), kept back the N. invaders, II. marched S. and engaged the Normans on the hill of Senlac, near Hastings. II. was defeated and slain with two of his brothers. He was the last of the Saxon kings. See E. Lytton, *Harold, the Last of the Saxon Kings*, 1848, and Hope Muntz, *The Golden Warrior*, 1949.

Harold III. or Harald (1015-86), king of Norway, surnamed Hardrade, or Hardrada (the ruthless), son of King Sigurd and half-brother to Saint Olaf. When fifteen years old he fled from Norway after fighting at the battle of Stiklestad (1030), where King Olaf was slain. He found refuge in Novgorod, and then went to Constantinople, where he commanded the Varangian guard of the Empress Zoë; he won various victories in Italy and N. Africa, and then decided to return home. On his way back he married Elizabeth of

Novgorod. He now allied himself with Sweyn (Svend) of Denmark against his nephew Magnus, king of Norway, but accepted half Norway as a gift from Magnus, and strove to keep the peace. On the death of his nephew he became king and attempted to conquer Denmark; having failed he agreed to peace. He invaded England with Earl Tostig of Northumberland, and was defeated and slain at Stamford Bridge by the Eng. Harold.

Harold's Cross, see DUBLIN.

Haroun al-Raschid, or **Harun al-Rashid** (763-809), b. near Teheran, and succeeded to the caliphate in 786. He made the Barmecide Yahya his grand vizier, and left the entire administration of his extensive dominions to him and his four sons, in whose sagacity his confidence was well placed. Haroun meanwhile devoted himself to the pleasures of life, and his court at Bagdad became a brilliant centre of all the wit, learning, and art of the Moslem world. Towards the close of his reign he developed a hatred of the Barmecides (*q.v.*), and caused the vizier and his four sons to be executed. His affairs immediately fell into confusion, and treason and rebellion broke out. Haroun marched against the rebels, but d. at Tus of an apoplexy. A highly coloured but false picture of his memory is found in the *Arabian Nights* stories. See E. Gibbon, *History of the Decline and Fall of the Roman Empire* (J. B. Bury's ed., 1898, vol. vi.).

Harp (A.-S. *hearpe*, Old High Ger. *harfa*), musical stringed instrument which was greatly esteemed by the ancients. The Egyptians played it from very early times, though there is no reason to suppose that they were its inventors. The Egyptian H. was bow-formed, had no front pillar, and was strung with catgut; it was of great size, often standing over 6 ft. high, and the pedestal was profusely decorated with jewels and carvings; many varieties are found in ancient sculptures and paintings. The Assyrian H. resembled the Egyptian, except that the sound-body was placed uppermost. Nothing definite is known as to the shape of the Heb. or biblical H., but it was probably a small hand instrument bearing more resemblance to the lyre. In the earliest records of Celtic hist., the H. is given a prominent place; the old Scottish instrument was about 3 ft. high and had thirty strings. One of the earliest specimens, known as the *clarsach Lamonnach* or Lamont's clarsach, was taken from Argyllshire by a lady of that family on her marriage, about 1460. Its use has recently been revived. The oldest and finest specimen of the beautiful Irish H. is contained in Trinity College, Dublin, and dates from the fourteenth century; there is a cast of it in the Victoria and Albert Museum. The old Welsh H. resembled the Irish one, but the modern instrument is triple-strung. The ordinary It. H. has two rows of wire strings, but it is an imperfect instrument and now almost obsolete. A Bavarian maker, Hochbrucker, invented the single-action pedal in 1720, but it is to Sébastien Érard that we owe the power and sweetness of the modern

pedal instrument. For many years he worked at the invention of a double-action pedal, and gained a great triumph on the production of his mechanism in Paris, 1810.

HARP

Harpagus, general of Cyrus the Great, the Persian monarch. He conquered the Carians, Lycians, and Asiatic Gks. about 540 B.C.

Harpe, Jean François de la, see LA HARPE.

Harpden, par. and urb. dist., mostly residential, in Hertfordshire, England, 23 m. from London. Sir John Bennett Lawes began his systematic experiments in agriculture at Rothamsted (1843) near by, and in 1859 provided an endowment of £100,000 for the continuance of the experiments. Pop. 1,200.

Harper's Ferry, tn. of Jefferson co., W. Virginia, U.S.A., situated at the confluence of the Rrs. Shenandoah and Potomac. In 1798 a U.S. armoury and arsenal was estab. there. This was seized in 1859 by John Brown (*q.v.*), the abolitionist, but only held till next day. In 1862 the garrison under Col. Miles surrendered after some fighting to Stonewall Jackson (*q.v.*). The Federal loss amounted to 12,500 taken prisoners, and 13,000 small arms. Col. Miles d. of his wounds immediately after the surrender. Pop. 1000.

Harpies, see HARPYIE.

Harpignies, Henri Joseph (1819-1916), Fr. landscape painter, b. at Valenciennes. He became a friend of Corot, and went with him to Italy, and in 1861 he made his first great hit at the Salon with his 'Lisière de bois sur les bords de l'Allier.' He was a fine draughtsman, and his work, though showing something of the influence of Corot, is distinctive. He obtained his first medal in 1886, for 'Le Soir dans la campagne de Rome,' but his most famous picture is perhaps 'Le Saut du Loup'

(1873), in the Luxembourg Gallery. In 1870 he showed a panel at the Salon, 'La Vallée Egerie,' done for the Paris Opéra.

Harpocrates, see HORUS.

Harpocraton, Valerius, Gk. grammarian. He wrote a lexicon, *Λεξικὸν τῶν δεκα ῥητόρων*, containing notes on well known people and events spoken of by the orators, with explanations of legal and commercial terms, and as most works of the kind have been lost this is of considerable value. He was of Alexandria, and may have been the Gk. tutor to Antoninus Verus (second century A.D.), mentioned by Julius Capitolinus (*Life of Verus*), or if, as some authorities aver, he borrowed from Athenæus (q.v.) his date would have been much later.

Harpisichord, musical instrument which was in vogue especially in the seventeenth and eighteenth centuries, and which developed into the invention of the modern grand pianoforte (q.v.). Outwardly it resembled that instrument in shape, though it was also made with two keyboards and stops, but instead of the hammer action of the piano the tones were produced by quills fixed in the centre tongues of wooden uprights called jacks, which when the note was struck twanged or twitched the strings, thus emitting the sounds. The notes thus produced were of necessity sharp and metallic, and, though lending themselves to brilliant technical performance, it was difficult to make them expressive, but a good deal was done by means of stops and the double keyboard, especially that invented by Hans Ruckers about 1640, the Ruckers of Antwerp being the most famous H. makers. Handel possessed one made by this firm, which is now preserved at Buckingham Palace. In 1786 a maker named Tschudi made some beautiful instruments for Frederick the Great. Through him and Kirkman many great improvements were made, pedals being introduced for the first time. The 'harp' stop and the 'swell,' a device worked by a pedal, were the inventions of Roger Plenius, who was the first to make a pianoforte (or lyrischord) in England. The older spinnet and virginal belonged to the same family as the H., but the latter has as many as four strings to a note, while the other had only one. The H. held an important place in the orchestra of its time, being played always by the conductor, and it was first displaced by the composer Gluck. The last recorded occasion of its public use in England was that of the performance of the ann. 'King's Birthday Ode' at St. James's Palace in 1795; but there has, in recent years, been a revival of the instrument.

Harp, The, see LYRA.

Harpy, or **Harpy Eagle** (*Thrasaetus harpyia*), bird of prey which inhabits the tropical regions of S. America from S. Mexico to Brazil, and which is variously referred by ornithologists to the hawk, buzzard, and eagle families (see FALCONIDÆ). Its salient features are its powerful talons, with which it pounces on monkeys, sloths, and fawns, and its enormous hooked beak. The H., so-called after the legendary Hs.

of the Gks., has a white head, breast, and belly, save for one dark pectoral band; a black tail barred with grey, a black back, and grey dusky wings. The face is owl-like, and the head crested. In flight it is slow and heavy, as the soft feathers and small wings would lead one to expect. Too much faith must not be reposed in the fabulous tales of its voracity told by the early naturalists.

Harpyie, or **Harpies**, originally personifications of sudden wind storms which snatched away people (*Iliad*, xvi. 150). Homer mentions one only, Podarge, who in the shape of a mare bore to Zephyrus the horses of Achilles. Hesiod represents them as winged goddesses, but later writers describe them as spirits of evil, half maidens, half birds. In the story of the Argonauts the gods sent them to torment Phineus, by either defiling or carrying off his food. See J. C. Lawson, *Modern Greek Folklore*, 1910.

Harquebus, see ARQUEBUS.

Harar, or **Harar**, tn. and trading centre of Abyssinia, the chief place in the Galla country, connected by railway with Dire-dawa, and with Jibuti, the port of Fr. Somaliland, on the gulf of Aden. It is built on slopes of a hill at an elevation of over 5000 ft. Exports include coffee, ghee, gum, wax, ivory, hides, and skins. It was seriously damaged in aerial bombardment in the Italo-Abyssinian war of 1935. Its capture by the Brit. forces in the It. E. African campaign, in March 1941, marked the beginning of the ultimate collapse of the whole of Mussolini's African colonial empire. Pop. 40,000.

Harrier, breed of dog which hunts the hare by scent. In qualities and general appearance a H. closely resembles a foxhound, from which, indeed, it was probably at first derived. However, it is built on a smaller scale and usually is not taller than 22 in., whereas a foxhound frequently attains to 27 in. Hs. can hunt a much colder scent than their prototype, but are not so swift-footed. There are over 150 packs in the Brit. Isles, and the Hs. are especially a feature of Irish country life, where hare-hunting is a most popular sport.

Harrier (*Circus*), genus of non-arboreal Falconide (q.v.). Hs. are often called hen-harriers, because of their predilection for poultry as their prey. They have long legs and wings, insignificant beaks, an owl-like frill of thick-set feathers round the face, and soft plumage. They live on frogs, birds, snakes, and small mammals, and chiefly frequent marshy districts. At one time the *C. cyaneus*, or hen-harrier, and the *C. aeruginosus*, or marsh-harrier, were common in the Brit. Isles, but they are now more or less rare, the draining of the marshlands having deprived them of so much of their congenial habitat. Hs., including the *C. cinereus* and the *C. cineraceus*, etc., are distributed all over the world. The Amer. marsh hawk (*C. hudsonius*) is very like the hen-harrier, but, in the male bird, the lower markings are rufous.

Harriman, William Averell (b. 1891) Amer. administrator and diplomatist

Graduated from Yale Univ., 1913. Vice-president in chief of purchases and supplies of Union Pacific Railroad Company 1914-18, and chairman of the board of the company from 1932. Member of business advisory council for the Dept. of Commerce, 1933-37, and chairman, 1937-1940. He joined Roosevelt's National Recovery Administration in 1934, becoming special assistant administrator. Associated with Industrial Materials Div., National Defence Advisory Commission, 1940. Chief of the Materials Branch Production Div., Office of Production Management, Jan.-March 1941. Appointed President Roosevelt's special representative in Great Britain with the rank of minister, 1941. Special representative of the President and chairman of the President's special mission to Russia, with rank of ambas., 1941. U.S. representative in London of Combined Shipping Adjustment Board, 1942. In that year he was chief lend-lease officer in London and member of London Combined Production and Resources Board. U.S. ambas. to Russia, 1943-46; to Britain 1946-48. Shared with Paul Hoffmann and Tom Finletter responsibility for the administration of the European Recovery Programme in its application to Britain.

Harrington, or Harrington, James (1611-1677), Eng. political philosopher, b. at Upton, Northamptonshire. He spent some time in the suite of Charles I. during his imprisonment, and on the king's death devoted himself to the composition of *Oceana*, a somewhat dull but very minutely worked-out scheme for an oligarchical republic. In 1659 he formed the 'Rota' Club to try to push the practical application of his theories. In 1661 he was imprisoned by Charles II. on a charge of conspiracy. See his *Works*, ed. with biography by John Toland in 1700. (Toland's ed. was republished with additions by Birch in 1747.) See also H. F. Russell-Smith, *Harrington and his 'Oceana'*, 1914.

Harrington, Sir John, see HARRINGTON.

Harrington, par. and seaport on the W. coast of Cumberland, England, 2 m. S. of Workington. It has shipbuilding yards, coal-mines, blast furnaces, and manufs. iron goods and fire-bricks. Pop. 5000.

Harriot, or Hariot, Thomas (1560-1621), Eng. mathematician and astronomer, b. at Oxford. He became tutor to Sir Walter Raleigh, who appointed him to the post of geographer to the second expedition to Virginia (1585), an account of which voyage was pub. by H. in 1588, and afterwards reprinted in Hakluyt's *Voyages* in 1600. H. virtually gave to algebra its modern form. See H.'s *Ephemeris chrysometra and Artis analyticae praxius ad aequaliones algebraicas resolvendas* (1631). See also J. Wallis, *History of Algebra*, 1685; H. Stevens, *Thomas Hariot*, 1900; and the *Harriot Papers* (ed. by S. Rigaud, 1831).

Harris, Sir Arthur Travers (b. 1892), Brit. air marshal. In the First World War he served with the 1st Rhodesian Regiment on the W. front and in 1919 joined the R.A.F. Group captain, 1933;

air commodore, 1937; air vice-marshal, 1939; deputy chief of air staff, 1940-41; air marshal, 1941; head of R.A.F. delegation to the U.S.A., 1941; air chief marshal, 1943; member of the combined Brit.-Amer. chiefs of staff, 1942. As commander-in-chief, Bomber Command, 1942-45, he was responsible for Brit. policy in the bombing of Germany and Ger.-occupied countries of Europe. Promoted marshal of the R.A.F., 1945. He pub. *Bomber Offensive*, 1947.

Harris, Frank (1854-1931), Brit. author, b. in Galway, Ireland. Went to U.S.A. 1870 and became a naturalised Amer. citizen. Successively editor of the *Fortnightly Review* and *Vanity Fair*. Founder and editor of the *Candid Friend*. His life of Oscar Wilde (1916) was severely criticised for its frankness. Other biographical studies which he pub. were *The Man Shakespeare* (1909); *Contemporary Portraits* (four series, 1915-23); and *G. B. Shaw* (1931). Novels: *The Bomb* (1908); *Great Days* (1914); and *Love in Youth* (1916). His vols. of short stories are *Elder Conklin* (1894); *Montes the Matador* (1900); *The Veils of Isis* (1915); and *A Mad Love* (1920). He also wrote the plays *Mr. and Mrs. Dacentry* (1900); *Shakespeare and His Love* (1910); *Women of Shakespeare* (1911); and *Joan la Romée* (1926). His autobiography, *My Life*, was pub. in 1926.

Harris, George Robert Canning Harris, fourth Baron (1851-1932), Brit. politician, soldier, administrator, and cricketer; b. Feb. 3; son of third baron. Educated Eton, and Christ Church, Oxford. Under-secretary for India, 1885-86; under-secretary for war, 1886-89; and governor of Bombay, 1890-95. It was largely due to his efforts and influence as a cricketer that Kent reached a high position among the cos. He was elected president of the Marylebone Cricket Club (M.C.C.) in 1893. Pub. *A Few Short Runs* (1921).

Harris, James, see under MALMESBURY. EARL OF.

Harris, James Rendel (1852-1941), Eng. biblical scholar, b. at Plymouth; educated at Plymouth grammar school and at Cambridge Univ. In 1882 he went to the U.S.A., where he was prof. of N.T. Gk. at Johns Hopkins Univ. 1882-85, and of biblical languages at Haverford College, 1886-92. Curator of MSS. at the John Rylands Library, 1918-25. He was lecturer of paleontology at Cambridge Univ. from 1893 to 1903, prof. of theology at Leyden 1903-4, and was made Haskell lecturer at Oberlin College in 1910. His studies and works, which gave him a place among the leading N.T. scholars, included *Study of Codex Bezae* (1890); the lost *Apology of Aristides* (1891), an important Syriac MS. of the seventh century which he discovered in a convent on Mt. Sinai in 1889; *The Cult of the Heavenly Twins* (1906), and *Bomberges* (1913), two books on the Diodorus legend; *Side-lights on New Testament Research* (1909) *The Odes and Psalms of Solomon* (1910), a collection of primitive Christian hymns; *The Origin of the Prologue to St. John's Gospel*; and *Testimonies* (1917-20). In his *Eucharistic*

Origins (1927) he maintained that the Christian Eucharist was taken over almost bodily from the Egyptian mysteries of Isis and Osiris, and he also advanced the theory that the Egyptians built Stonehenge. Other pub.: *The Teaching of the Apostles and the Sibylline Books* (1900); *Fragments of Philo*; *The Acts of Perpetua* (1887); *Some Syrian and Palestinian Inscriptions*; *Lectures on the Western Text of the New Testament* (1894); *Letters from Armenia* (1897); *Double Text of Tobit*; *The Dioscuri in Christian Legend* (1903); *Taron's Breastplate*; *Origin of the Cult of Dionysus* (1915); *Further Traces of Hittite Migration* (1927); and books about the *Mayflower*.

Harris, Joel Chandler (1848-1908), Amer. author, b. at Eatonton, Georgia. His father's name is not recorded in his daughter-in-law's biography of H., H. being the family name of his mother who had eloped with his father and was then deserted. The mother supported H. by sewing. As a youth he was ambitious to write and it is said that this desire was fostered by Joseph Turner, publisher of the *Countryman*, an enterprising and successful plantation paper, to which H. contributed articles of interest to juveniles. When the civil war devastated Turner's plantation and ruined him, H. found work in a newspaper office at Macon. Thenceforward he was a journalist—a writer of light articles, a paragrapher, and inventor of 'stunts.' Later an article in Lippincott's magazine on the subject of Negro folklore suggested his famous Remus stories which first appeared in the *Atlanta Constitution* in 1878, and were pub. in 1880 as *Uncle Remus: his Songs and Sayings*. For the next twenty-five years he returned ever and again to this character as the mouthpiece for such Negro legends as he could gather, though in the meantime he wrote other books which were not negligible, such as *The Old Plantation* (1889) and *Free Joe* (1887), all useful as records of life in Georgia but not of the universal interest of the famous Remus stories. The pub. of the first book of Remus stories let loose on H. a flood of correspondence, suggesting that the Negroes had acquired them from the Redskins, that variants of the stories could be found among the natives of Brazil, India, or Siam, or yet again that they were universal myths. But as well as correspondence, the stories enriched H. and this gave him leisure to interest himself in the ethnological side of the legends he diligently gathered for the rest of his life, though he always disclaimed any higher status than that of a recorder—albeit one with a rare skill in catching and reproducing the diction and rhythms of the Negro. He also wrote a hist. of Georgia from the *Invasion of De Soto to Recent Times* (1899). See lives by R. L. Higgins, 1918, and Julia C. Harris, 1918.

Harris, John (c. 1666-1719), Eng. scientific writer, divine, and topographer, b. probably in Shropshire. He held the livings of Icklesham and Winchelsea in Sussex, St. Margaret Moses, and St. Mildred, Bread Street, and was a prebendary of

Rochester (1707). He was best known as the editor of the *Dictionary of the Arts and Sciences* (1704); and as the compiler of a *Collection of Voyages and Travels* (1705).

Harris, William Torrey (1835-1909), Amer. educationist, b. at N. Killingley, Connecticut. In 1873 he opened the first public school kindergarten in America, and from 1889 to 1906 was state commissioner for education. He founded in 1867 the *Journal of Speculative Philosophy*, and pub. *An Introduction to the Study of Philosophy* (1889) and *Psychologic Foundations of Education* (1898). See J. S. Roberts, *William Torrey Harris: a Critical Study of his Educational and Related Philosophic Views*, 1944.

Harris, par. in the Outer Hebrides, Inverness-shire, Scotland, comprising the S. part of the is. of Lewis, the adjacent is. of Killigray, Pabbay, Scarp, and Tarsnays, and the distant is. of St. Kilda. H.-Lewis is separated from the mainland by the Minch, and to the S. is the sound of H., the only navigable channel through the Hebrides. H. is separated from Lewis by a long range of hills, and is nearly cut in two by the lochs of Tarbert. The pop. is engaged in crofting, fishing, and sheep-farming; the wool-weaving connected with the latter is done on handlooms, and the material is the noted H. tweed. Some is. weavers, though still using handlooms, are importing yarn, and their cloth does not qualify for the official stamp—an orb applied only when the tweed is woven by hand in the Outer Hebrides from virgin Scottish wool spun in the is. There are 1600 looms at work in the is. and the ann. production is over 4,500,000 yds. Area 123,757 ac. Pop. 296.

Harrisburg: 1. Cap. of Pennsylvania, U.S.A., on the Susquehanna R., 105 m. W.N.W. of Philadelphia. It is named after John Harris, Quaker, who settled here in 1704. Sev. railroad bridges cross it. Among the chief buildings in the city are the court-house, gov. buildings, state arsenal, state asylum, opera-house, and sev. handsome public monuments. It became the cap. of Pennsylvania in 1812, and was incorporated as a city in 1860. It is also the see of a Rom. Catholic bishop. Coal and iron are extensively worked in the neighbourhood, and it has manufacturing of railroad cars, carriages, typewriters, boilers, bricks, cotton and woollen goods, silks, etc. Pop. 83,800. 2. Banking post tn., cap. of Saline co., Illinois, 110 m. S.E. by E. of St. Louis, Missouri, on the Cleveland, Cincinnati, Chicago, and St. Louis railway. It has coal- and iron-mines, flour-mills, and carriage factories. Pop. 11,400.

Harrismith, tn. in Orange Free State, cap. of the H. dist., named after Sir Harry Smith (soldier). Has an altitude of 5250 ft. and is connected by rail with Durban, Natal, 170 m. to the N.W. A prosperous trading centre for a large part of the country lying W. of the Drakensberg Range. Has a large woollen factory. It is a leading health resort of S. Africa, and is one of the best points whence to visit the Kruger National Park, the Mont-aux-Sources, and N. Basutoland. Has golf

links and race-course. Most of the streets are planted with trees. The Dutch church is a five-storey building with spire. H. high school has 700 pupils. In a cave not far distant from the tn. are some well-known bushman paintings. Pop. (1945): white 3250; all races 9200.

Harrison, Benjamin (1740-91), Amer. patriot, b. in Virginia. He was a delegate to Congress, 1774, and one of the signers of the Declaration of Independence, and was appointed governor of Virginia, 1782-85.

Harrison, Benjamin (1833-1901), twenty-third president of the U.S.A., b. at N. Bend, near Cincinnati, Ohio. He was educated at Miami Univ., and pursued the study of law, being called to the Bar in 1853. He took part in the Civil war, serving in the Union army, and was breveted a brigadier-general in 1865. After the war he resumed his legal work, and was reporter of the supreme court of Indiana in 1860-62 and 1864-68. He also took an interest in the campaign which resulted in the election of James Garfield as president, and in 1881 was elected a member of the U.S. Senate. He was nominated for the presidency in 1888 by the Republican party, and elected, and after his term of office America was in a condition of prosperity and on friendly terms with foreign nations. The settlement of the Bering Sea fur-seal question with Great Britain, the negotiation of a Hawaiian annexation treaty, the passing of the McKinley Tariff Bill, the meeting of Pan-Amer. Congress at Washington, were all events of his presidency. He was again nominated in 1892, but failed to secure election. In 1899 he was leading counsel for Venezuela in its boundary dispute with Great Britain, and was the member for the U.S.A. at The Hague Conference the same year. He wrote *This Country of Ours* (1897) and *Views of an Ex-President* (1901).

Harrison, Frederic (1831-1923), Eng. author and philosopher, b. in London. He was educated at King's College School, London, and at Wadham College, Oxford, where he became a fellow and tutor. He was called to the Bar in 1858, and was prof. of jurisprudence and international law to Inns of Court 1877-1889. He also worked at a codification of the law with Lord Westbury, and was placed upon the Trades Union Commission of 1867-69, becoming secretary to the commission for the digest of the law, 1869-1870. He was president of the Eng. Positivist Committee, 1880-1905, as well as editor of the Positivist *New Calendar of Great Men*; writing much on Comte, of whom he was a follower. He was Hede lecturer, Cambridge, in 1900; Washington lecturer, Chicago, in 1901; Herbert Spencer lecturer, Oxford, in 1905; and later vice-president of the Royal Historical Society, and London Library. His pubs. include *The Meaning of History* (1862); *Order and Progress* (1875); *The Choice of Books* (1880); *Oliver Cromwell* (1888); *Annals of an Old Manor House* (1893, in which he gives an account of his home, near Guildford); *William the Silent* (1897);

The Millenary of King Alfred (1897); *Tennyson, Ruskin, Mill, and others* (1899); *Byzantine History in the Early Middle Ages* (1900); *Life of Ruskin* (1902); *Theophano* (1904, a 'romantic monograph' of the tenth century); *Nicephorus, a Tragedy of New Rome* (1906); *The Creed of a Layman* (1907); *My Alpine Jubilee* (1908); *Autobiographic Memoirs* (1911); *Among My Books* (1912); *The Positive Evolution of Religion* (1912); and *The German Peril* (1915).

Harrison, Jane Ellen (1850-1928), Eng. writer on Gk. art and religion, b. at Cottenham, Yorkshire. Lecturer in classical archaeology, Newnham College, from 1898. Her pubs. include *Myths of the Odyssey in Art and Literature* (1882); *Introductory Studies in Greek Art* (1885); *Mythology and Monuments of Ancient Athens* (with Mrs. A. W. Verrall) (1890); and *Themis: A Study of the Social Origins of Greek Religion* (1912).

JOHN HARRISON

Engraving after a painting by King

Harrison, John (1693-1776), Eng. mechanician and inventor, b. at Foulby, near Pontefract, Yorkshire. In 1715 he invented a clock with wooden wheels and in 1726 his famous 'gridiron pendulum' which maintains its length unaltered in spite of changes of temp. In 1762 he claimed the reward of £20,000 offered by the gov. for a satisfactory method of determining long. when at sea. He invented a chronometer which, by means of the application of a compensation curb to the balance wheel, determined the long. within 18 m. during a voyage to Jamaica. It was not until 1773, after the direct intervention of the king, that H. received the £20,000. He was also the inventor of the full recoil escapement.

Harrison, Mary St. Leger, see MALET LUCAS.

Harrison, Thomas (1606-60), Puritan, signatory to the death-warrant of Charles I., was b. at Newcastle-under-Lyme. In 1642 he enlisted in Essex's bodyguard, and was major in Fleetwood's horse at Marston Moor (1644). He entered the 'new model' with Fleetwood, and was present at Naseby and Langport and at the captures of Winchester and Basing. From 1650 to 1651 he held chief command in England during Cromwell's absence, and after the battle of Worcester (1651) was charged with the pursuit of the fleeing royalists. He assisted in expelling the Long Parliament in 1653, and was a leading spirit in the Barebone Parliament the same year. He was deprived of his commission in 1653 under the Instrument of Gov., and suffered imprisonment, 1655-56 and 1659-59, for his relations with the Anabaptists. At the Restoration he was executed because he would neither leave the country nor acknowledge the new monarch.

Harrison, William (1534-93), Eng. historian and chronicler, b. in London. He was rector of Radwinter in Essex from 1560 until his death, and also rector of Wimbold in Essex (1571-82), and canon of Windsor from 1586. His amusing *Description of England*, was intended to form part of an universal cosmographie, planned by Reginald Wolfe, which was finally confined to the description and histories of England, Scotland, and Ireland, of which the topographical section was supplied by H., while Holinshed provided the historical. It was finally pub. in 1577 as *The Chronicles of England, Scotland, and Ireland*, and is an invaluable view of the life and customs of Elizabethan England. Dr. Furnivall gives some extracts from H.'s *Chronologie*, as well as the second and third books of the *Description*, in his *Shakespeare's England*, 1871-78.

Harrison, William Henry (1773-1841), ninth president of the U.S.A., b. at Berkeley, Charles City co., Virginia. He entered the army in 1791 and served till 1798, when he was elected governor of the N.W. ter. In 1800 he was created governor of Indiana, but did not enter office until 1801; and while governor he tried to prevent the sale of alcohol to the Indians. Having had sev. fruitless conferences with the Indian chiefs, he advanced against them in 1811, and gained a complete victory at Tippecanoe. From 1811 to 1813 he was actively engaged in the war with England. From 1819 to 1821 he was a member of the Ohio Senate, and of the U.S.A. Senate from 1825 to 1828. In 1841 he was elected president, but only acted for one month, dying of pneumonia. One of his addresses survives in *A Discourse on the Aborigines of the Ohio*. See life by D. B. Goebel, 1926.

Harrison, tn. in New Jersey, U.S.A., in Hudson co., ad. joining Newark on the E., with which it is connected by bridges. Here is located the state Soldiers' Home. It has steel and iron works, and manufs. cutlery, leather, etc. Pop. 14,100.

Harrogate, municipal bor., inland holiday resort, and watering-place in the W. Riding of Yorkshire, England, about 17 m. N. of Leeds. Area 8314 ac. As a

holiday resort it is notable for its fine hotels, extensive parks, and open spaces (353 ac., including the 'Stray' of 200 ac.), as a centre for music and drama, and for the generous provision for every kind of sport and pastime. In recent years H. has also become very popular as a conference tn., as, besides the amenities mentioned above, it has some fine meeting halls, particularly the Royal and Lounge halls, and the Sun Pavilion in the Valley Gardens. As a health resort it is famous for the natural mineral springs (sulphurous, saline, and chalybeate) which are used both for drinking and bathing, in the treatment of rheumatic, skin, heart, and allied complaints. The Royal Baths, where all waters and treatments are available, as well as all the latest methods of physiotherapy, is a superbly equipped modern building, which was further extended in 1939. For in-patients there is the Royal Bath Hospital, which is a centre for research into the cause and cure of rheumatism. Included amongst the ann. events which attract large numbers of visitors are the open tennis tournament (May), the festival of music (July), and the professional golf tournament (July). Queen Ethelburga's school and Harrogate College are schools for girls. The bor. was incorporated in 1881, and the boundaries extended in 1900, and again in 1938. Pop. (1947) 49,300.

Harrow, or **Harrow-on-the-Hill**, urb. dist. in the H. parl. div. of Middlesex, situated about 19 m. N.W. of London. It is on a hill about 350 ft. high, and has a fine old church (St. Mary's), said to have been founded by Lanfranc, archbishop of Canterbury, in William I.'s reign; at any rate traces of Norman work can be seen on the tower, and there are, too, some old monuments and interesting brasses (one of them to John Lyon). But the tn. is chiefly famous for its school, which was founded in 1571 by John Lyon, to whom Queen Elizabeth granted a charter. It was originally intended for the education of poor boys of the par., but the statute drawn up by the founder in 1590 provided also for the admission of 'so many foreigners as that place can conveniently contain,' which provision has led to the present position of the institution, one of the great schools of England. The building was first opened for scholars in 1611, and since then various new buildings have been added, the chief being the chapel, 1875, containing a glass in memory of the Harrovians who d. in the Crimean war (a memorial has also been added to those who fell in the S. African war); the Vaughan Memorial Library, 1863; and the speech-room, 1877, where a brilliant ceremony is held every summer term. The fourth form room, dating from 1611, contains the names, cut in the panels, of famous pupils, such as Byron, Robert Peel, R. B. Sheridan, and Lord Palmerston (Temple). Among celebrated headmasters may be mentioned Thackeray, Sumner, Butler, Longley, Christopher Wordsworth, and Vaughan. The education afforded is a general one, and includes

the study of classics, mathematics (made compulsory in 1837), modern languages (introduced 1851-55), Eng. literature and hist. (begun about 1869), etc. The old div. into Classical and Modern sides has been superseded by a system in which the subjects are taught in forms and divs., but full provision is made for the study of the subjects of both the former sides. Archery, which was encouraged by the founder who instituted a prize of a silver arrow to be shot for annually on Aug. 4, was abolished in 1776, and cricket, football, etc., have taken its place; the cricket match played every year at Lord's between Eton and Harrow dating back to 1818. Since the passing of the Public Schools Act in 1868, the gov. of the school has been in the hands of a council composed of persons chosen by the lord chancellor, the univs. of Oxford, Cambridge, and London, the Royal Society, and the assistant masters. The number of boys averages 650-700. Pop. (1931) 26,400.

Harry, Blind, or Henry the Minstrel (fl. 1470-92), Scottish poet, was the author of a poem on Wm. Wallace. He was blind from birth, and earned his livelihood by reciting poems and historical tales about Wallace to the nobility. He is mentioned by Wm. Dunbar in the *Lament for the Makaris* along with Sandy Traill, so he must have been dead when that poem was written, 1508, and his own work was probably composed about 1450-65, at any rate a MS. dated 1488 is in the Advocates' Library, Edinburgh. It is written in the Lothian dialect, and is entirely devoted to a description of Wallace, but the poem may be in part a trans. from John Blair who was Wallace's chaplain and whose life in Lat. prose was written by H. There have been numerous printed eds. of it, and the modern Scottish version by Wm. of Gilbertfield, 1722, was reprinted thirteen times, and became more familiar than the original. Gilbertfield's version is much praised by Burns. See G. Neilson, *Blind Harry's Wallace*, 1910.

Hart, Sir Robert (1835-1911), inspector-general of customs in China, b at Portadown, co. Armagh, Ireland. He was nominated for the consular service in China in 1854. In 1859 he joined the new Chinese imperial maritime customs service, and became inspector-general in 1863, a post he held nominally till his death, having resigned in 1906. H. was a friend of Gordon's, and was largely responsible for the reconciliation between Li Hung Chang and Gordon in 1864, and to him was due the settlement of China's troubles in Formosa, and on the Tongking frontier with France in 1885. He pub. *These from the Land of Sinim* (1901, a description of China and its people).

Hart, Solomon Alexander (1806-81), Eng. artist, b. in Plymouth; spent early years as engraver's apprentice and miniature painter. Made his name as a painter of historical scenes and characters. R.A. 1840. Appointed prof. of painting in the Royal Academy in 1854, and subsequently librarian. Works include 'Henry I. receiving Intelligence of the Death of his Son'; 'Milton Visiting Galileo in

Prison'; 'Wolsey and Buckingham'; and 'Lady Jane Grey in the Tower.'

Hartal, form of political boycott in India, including the closing of all shops, as a sign of national mourning. Gandhi (q.v.) organised a H. in Bombay in 1923 and, later, in other places, by way of protest against what he regarded as Brit. oppression.

Harte, Francis Bret (1839-1902), author, had, as a lad, an adventurous career, during which he served as a schoolmaster, a miner, and a compositor. His leanings, however, were always towards journalism, and at the age of eighteen he obtained an engagement on a San Francisco paper, to which he contributed his early stories. In 1864 he began to write his *Condensed Novels*, and four years later he founded the *Overland Monthly*, in which he printed his best-known short tales. Secretary of the Mint at San Francisco from 1864 until 1870; in 1878 he entered the gov. service again and went as U.S.A. consul to Orefield, two years later being transferred to Glasgow. In 1885 he retired, and spent his remaining years in London. The *Condensed Novels* pub. in book form in 1867 were much appreciated, and still rank as masterpieces of parody, his skit on Disraeli being second only to Thackeray's *Codlingsby*. The *Heathen Chinee* (correct title, *Plain Language from Truthful James*, and first pub. in *The Overland Monthly*, in Sept. 1870) won him a high place as a humorous poet, but it is as the author of short sketches of mining life that he became famous and is still best remembered. He threw over the rough Californian life of those days a glamour that fascinated the whole world, and *The Luck of Roaring Camp* (1870); *Masaja* (1885); *The Outcasts of Poker Flat*; and *Tennessee's Partner*; are but a few of those that evoked high praise. While not disguising the evil in men, he had the gift of showing that even villains had good in them, and this he brought out without outraging nature or being mawkish. His later work was poor, but these stories will long keep his name fresh. His *Guy Ravestone* is a parody of the 'muscular hero' of the novels of G. A. Lawrence. There are biographies by T. E. Pemberton, 1903 and H. C. Merwin, 1911. See also J. Erskine, 'Bret Harte,' in *Leading American Novelists*, 1910; and L. L. Hazard, *The Frontier in American Literature*, 1927.

Hartebeest, Boer name applied throughout S. Africa to a large antelope of the genus *Huhalis*, on account of its fancied resemblance to a stag. It is characterised by its reddish colour, with black markings on the forehead and nose, long horns, which diverge from each other in the form of a V with tips turned backwards at right angles, and long face with a naked muzzle. It stands about 4 ft. at the withers, and is one of the swiftest of the antelope family. This antelope is really the *Huhalis* or *Akela*, *laphus caama*, and is found in S. Africa and as far N. as Mashonaland and Matabeleland, but the name is extended to include all the numerous members of the same genus found throughout Africa and even in Syria. See ANTELOPE.

Hartford: 1. State cap. and seat of H. co., Connecticut, situated on the Connecticut R., 60 m. from Long Is. Sound. It is the head of navigation, and the distributing point for the Connecticut valley, and is important as a centre of wholesale trade; it is also noted for its insurance business, being one of the leading centres in the world. There are various manufs., firearms, including the Gatling guns, at the famous Colt works, electric machinery and vehicles, bicycles, cyclometers, steam-engines and boilers, typewriters, etc. The tn. has also one of the largest printing houses in New England, besides a large number of handsome and notable buildings. The first settlement was made by the Dutch in 1633, and, in 1635 and 1636, Eng. from New Town (now Cambridge, Massachusetts), settled here. The city was chartered in 1784. Pop. (1940) 166,200. 2. Cap. of Blackford co., Indiana, U.S.A., situated about 60 m. N.E. of Indianapolis. The natural gas supply, the oil fields, and the products from the surrounding agric. country, contribute largely to its commercial interests. Pop. 6900.

Hartford Convention, gathering held in 1814 to discuss measures for securing New England interests against the S. and W., especially with regard to the war of 1812. The Federalists opposed the war on sov. grounds, their chief objection being that it was destroying all Amer. commerce in order to punish Great Britain for crippling a part of it. Thus, all through the war they harassed the gov., but by 1814 the destruction of New England industries had become intolerable, and a convention was called. This met at Hartford, and George Cabot, of Massachusetts, was chosen president. Various proposals were made, but before anything definite could be arranged a satisfactory peace was made and all disasters were forgotten in the blaze of the battle of Orleans. But the fact remains that the delegates practically advocated that for which the S. slave-holding states fought years later—the right to secede. Their programme brought them and their party into odium.

Harthau, vil. of Saxony, Germany, 3 m. S. of Chemnitz. Pop. 7100.

Hartington, Lord, see DEVONSHIRE, DUKE OF.

Hartland, vil. of N. Devonshire, England, 13 m. N.W. of Bideford. Close by is H. Point, at the S. end of Barnstaple Bay. There is a lighthouse.

Hartlepool, municipal bor. and port in the S.E. corner of the co. of Durham, England. The tn. stands on a headland (Hertness) nearly surrounded by the sea, and has an excellent harbour and fine docks, the harbour being protected by a breakwater, 1320 ft. long. The prin. trades of the port are coal exporting and timber importing, and the chief industries have been shipbuilding, fishing, and heavy engineering. In recent years a trading estate has been estab., partly in H. and partly in the neighbouring W. H. on a site of some 100 ac., and a number of new light industries have been estab. The tn. possesses excellent facilities for the fishing

industry, and all types of trawlers and other fishing craft are able to enter the harbour, and approach the quay at all states of the tide. There is excellent access to the quay both by road and rail, and good facilities for repair work, coaling, supply of stores, etc. There is an up-to-date ice factory on the quayside. A new lighthouse was built on the Hough promontory after the First World War on the site of one built in 1817 which had been removed in the war. There are also two other lighthouses at W. Harbour and the old pier head respectively.

The feature of H. is the par. church of St. Hilda, erected about 1185–1215 near the site of a religious house founded in the seventh century. There are many traces of an earlier church or churches on its site, and the Norman doorway is undoubtedly earlier than the rest of the church. The exterior is remarkable for its heavy tower and huge flying buttresses. The nave consists of six unequal arches on each side, supported by magnificent columns, and a clerestory runs the length of both chancel and nave, the arcade in the chancel being particularly beautiful and the capitals of the shafts of exquisite design. The chancel was restored in 1927. The de Brus chapel is, from the historic standpoint, the most important part of the church; for here stands the tomb which is believed to hold the remains of the fourth Robert de Brus or his son Wm. The church registers date back to Elizabeth's reign. Other churches include Holy Trinity, which serves a new par. created in the middle of the nineteenth century in consequence of the growth of the tn., and a Rom. Catholic church built in 1850. St. John's Presbyterian Church (1852) was destroyed in the Second World War.

The name 'Hartlepool' is explained on the assumption that it is derived from Teutonic 'hart' or forest (discoveries of large buried oaks have been made), with the addition of 'in-pol,' i.e. 'in' or 'near' 'the pool or sea,' to distinguish it from the still more ant. par. of Hart. According to Bede, an Irish princess, later called St. Bega or Hilda, founded a monastery near the site of the present par. church c. A.D. 640, under the auspices of St. Aidan. At the Conquest large properties at Hart and Hertness passed to Robert de Brus, one of William I.'s followers. Wm. de Brus, lord of Annandale, and son of the fourth Robert de Brus, obtained a grant from King John empowering him to hold 'a market upon Wednesday every week at this manor of Hertlepole.' H. received its charter of incorporation from King John in 1200, which made it the only corporate tn. in the co. palatine of Durham to receive its charter direct from the Crown. The right to elect a mayor was granted in 1230, but the record of mayors does not date back beyond 1315. In 1593 Queen Elizabeth granted a new charter, and Queen Victoria granted one in 1841 and another in 1850. In the eighteenth century H. sank to the state of a mere fishing vil., and even the par. church was allowed to fall partly into ruins. A century later, however, the coming of the railway

brought great prosperity to the tn. In the First World War, when Ger. vessels bombarded the coast of Yorkshire and Durham on a misty morning of Dec. 1914 H. suffered great damage. The war memorial in Heddegh Close shows that 351 men of the navy, army, and mercantile marine, and fifty-two men, women, and children were killed in this bombardment. Although essentially an industrial tn., H. has a fine promenade, open-air bathing pool, and facilities for games, etc. With W. H. (q.v.) the bor. forms the parl. constituency of the Hs. Pop. 16,000.

Hartley, David (1705-57), Eng. philosopher, b. near Halifax. He was intended for the Church, but took up medicine, practising as a physician at Newark, Bury St. Edmunds, London, and Bath. He is chiefly remembered by his *Observations on Man* (1749), in which he upheld the theory that the phenomena of the mind, memory, emotions, and reasoning were the direct result of molecular nervous vibrations. In his elaborate treatise he may be said also to have founded a school of thought based upon the theory of association of ideas. Though his system has long been discarded, its main ideas have continued to influence thought and investigation. See life by his son, prefixed to the 1801 ed. of his works; also L. Stephen, *History of English Thought in the Eighteenth Century* (3rd ed.), 1902.

Hartley, tn. in S. Rhodesia, S. Africa, on the main route through the Tati hills, N.-eastwards through Bulawayo and Umhlanjini. H. Hill has an altitude of 3800 ft., and consists largely of rich iron deposits. Gold-mining operations are carried on in the dist. Pop. (European) 142.

Hartlib, Samuel (c. 1600-c. 1670), Eng. writer on education and an agriculturist the son of a Polish merchant, b. at Elking in Prussia. He came to England about 1626, and became acquainted with Milton, who dedicated his *Treatise on Education* (1644) to H., and with Sir Win. Petty, of whose *Two Letters* (1647 and 1648) he was the occasion. See H. Dircks, *Biographical Memoir*, 1865; G. H. Turnbull, *Samuel Hartlib*, 1920; and *Hartlib, Dury, and Comenius: Gleanings from Hartlib's Papers*, 1917.

Hartmann, Karl Robert Eduard von (1812-1906), Ger. philosopher, b. in Berlin. He was educated for the army, but was obliged to quit the service in 1863, and turned his attention to philosophy. His first book, *The Philosophy of the Unconscious*, appeared in 1869, and met with great success, owing to its originality as well as its interesting contents. H.'s Unconscious is the Absolute of Ger. metaphysicians, and is a combination of the metaphysics of Hegel, Schopenhauer, and Schelling, his Unconscious playing the role of creator and of providence. H. pub. books on ethical consciousness, the development of the religious consciousness and Ger. aesthetics, as well as criticisms of contemporary philosophies and defences of his own system, among which may be mentioned *Ethical Consciousness* (1879); *The Crisis of Christianity in Modern Theology* (1880); *Judaism in the Present and the*

Future (1885); *Aesthetics* (1886-87); *Lotze's Philosophy* (1888); *The Philosophy of Religion* (2nd ed.) (1888); *The Ghost Theory in Spiritism* (1891); *The Fundamental Social Questions* (1894); and *Critical Grounds of Transcendental Realism* (1896). He was a pessimist as regards the inevitable misery of existence, thinking that happiness is neither attainable here, now, nor hereafter, but an optimist in that he was a champion of evolutionary progress. See L. Ziegler, *Das Weltbild Hartmanns*, 1910; K. O. Petraschek, *Die Logik die Unbeurteilten*, 1926; and D. Brinkmann, *Probleme des Unbeurteilten*, 1943.

Hartmann von Aue (c. 1170-c. 1210), Ger. poet, b. in Swabia. He took part in a crusade in 1197, and is mentioned by Gottfried von Strassburg about 1210 as being alive, but both the date of his birth and that of his death are uncertain. He pub. four poems: *Erec*, which relates the legend reproduced in Tennyson's 'Geraint and Enid' in *Idylls of the King*; *Iwein*, a better work than the former, and also taken from the Arthurian cycle; *Gregorius*, a narrative poem of the early life of Pope Gregory the Great; and *Der arme Heinrich*, one of the most delightful specimens of medieval Ger. poetry. His work was largely adapted from the Fr., *Erec* and *Iwein* being trans. of epics by Chrétien de Troyes, and *Gregorius*, too, was taken from a Fr. epic; but, in spite of this fact, H. ranks high as a poet of the Middle High Ger. period, and his works exhibit a delicacy of feeling and a beauty of diction rarely found in writers of the time. See H. Drube, *Hartmann und Chrétien*, 1930.

Harty, Sir Herbert Hamilton (1880-1941), Irish composer and conductor, b. at Lilliborough, co. Down. Mainly self-taught. Appointed organist in an Antrim church at the age of twelve. Later, in Dublin, he came under the influence of Signor Esposito at the Royal Irish Academy of Music and, in London, he soon became famous as an accompanist. At the Feis Ceoil or Irish music festival, he obtained many successes in the composers' competitions and soon became recognised as one of the most individual of the younger composers. His wife, Miss Agnes Nicholls, was chiefly instrumental in making his songs popular; his setting of Keats's *Ode to a Nightingale* was sung by her with great success at the Cardiff Festival, 1907. His works at first showed the influence of Irish folk melodies, notably in his *Irish Symphony* (an early work, revised in 1923), and *With the Wild Geese*, performed in 1910 (inspired by a poem of Emily Lawless dealing with the departure of Irish soldiers into exile after the collapse of the Stuart cause in Ireland); but he became more cosmopolitan and modern in later years. His concerts with the London Symphony Orchestra proved him one of the most brilliant conductors in England, and he afterwards became permanent conductor of the Hallé Orchestra, Manchester, earning a reputation as one of the foremost of European conductors. Knighted 1925. Resigned from the Hallé Orchestra, 1933. Elected F.R.C.M. in 1921. Other works include a violin

concerto in D minor (1909), *The Mystic Trumpeter* for voices and orchestra (1913), an orchestration of Handel's *Water Music*, and *A John Field Suite* (1939)

Hartzenbusch, Juan Eugenio (1806-80), Sp dramatic poet *b* at Madrid, and educated for the Church. He began dramatic work by translating and recasting existing plays and became famous with his first play produced in 1837. This was *Los Amantes de Leruel*. His next productions were *Doña Mencía* (1839), *Alfonso el Casto*, (1841), and in 1845 *La Jura en Santa Gadea*. He became director of the National Library at Madrid in 1862, and

Harvard, John (1607-38), Amer clergyman, founder of Harvard Univ. *B* in England, was entered as a pensioner of Cambridge Univ., 1628, graduated B A, 1631, M A 1635. Very little is known of his life, but he emigrated to America and was made a freeman of the colony of Massachusetts 1637. Allotted a site for his church in Charlestown, in which tn he d on Sept 24 1638. In his last year he was made a member of a committee 'to consider of some things tending toward a body of laws'. Of his fortune of £1600 one half was left for the founding of the famous college which bears his name, but

Haruspices, class of soothsayers of auct Rome, wh^o foretold events chiefly by the observation of the entrails of animals. They also interpreted all portents or unusual phenomena of nature and were especially employed to deal with cases not mentioned in the pontifical or Sibylline books, prescribing the offering necessary to propitiate the god. They were of Etruscan origin, and were introduced into Rome by Romulus about 750 B C, and abolished by Constantine in A D 337. As a class they ranked below the augurs, being paid, and although the art was of great importance, it never formed part of the state religion.

it is said that part of his bequest was diverted from its original purpose. H also left to the college a library of 300 books, the quality of which point to the taste of a scholar. A monument to his memory was laid in the burial ground of Charlestown by the alumni of the univ., and formally inaugurated on Sept 26, 1828, by the Amer statesman and orator, and one time governor of Massachusetts, Edward Everett.

Harvard University, oldest institution of learning in the U S A, was founded in Cambridge Massachusetts, by the general court at Boston on Oct 28, 1636. It received its name from John Harvard (*q v*), who bequeathed to it £2750 and his library. The first building was erected in 1637, and the first graduating class was estab in 1642. There were immense difficulties to be overcome at the time of the foundation of the college, especially those dealing with

religion, but the authorities persevered, and the heroic courage necessary was never found wanting. Between 1642 and 1782 Harvard College conferred only the degrees of bachelor and master of arts, but in 1782-83 three professorships of medicine were estab., the first degree of bachelor of medicine being conferred in 1788 (the school is now removed to Boston). H., by the richness of its endowments, by the wide scope of its schools, colleges, and museums, by its intimate connection with the life and literature of New England, has in many ways filled in the U.S.A. the combined place held in Eng. life by Oxford and Cambridge. It numbered among its profs. in the first half of the nineteenth century three men who were among the brightest stars in the Amer. literary firmament of the period, H. W. Longfellow, Oliver Wendell Holmes, and James Russell Lowell. Many of the most famous New Englanders, including authors, historians, and statesmen, were graduates from H. Another famous literary graduate from H. is T. S. Eliot. In the fullest sense of the word it became a univ. rather than a mere academic college, adding to its curriculum constantly and keeping abreast of the times. Thus it had a medical school as early as 1782. It added a law school in 1817, and a divinity school in 1819 (the Hollis professorship of divinity was estab. in 1721). When dentistry became an important branch of Amer. practice, it estab., in 1867, a school of dentistry. There followed the Bussey school for agriculture at Jamaica Plain in 1871, the Graduate School of Arts and Sciences in 1872, the Graduate School for Business Administration and the engineering school in 1908. It not only estab. these various additions to the univ., but was quick to recognise that the pupils must have the advantage of great collections which they could study. It thus came about that it estab. its own botanic gardens in 1807; the Asa Gray Herbarium, 1884; the Arnold Arboretum, 1872; the zoological museum, 1859; the Peabody museum of ethnology and archaeology, 1866; the Fogg art museum, 1895; the Semitic museum, 1889; the Germanic museum, 1902. It maintains a big astronomical observatory and its library is the largest univ. library in the U.S.A. Co-education, such as is known in many of the W. states, is unknown at Harvard, but Radcliffe College, estab. in 1879 for women students, has the same high standards of teaching and examinations as Harvard, and the diplomas are issued and signed by Harvard officials. It has over 8000 students and 2000 profs.

Many of its pubs. are world-famous among experts, particularly those dealing with oriental studies. It is not behind-hand in the Amer. zeal for college athletics, the ann. baseball and football contests between Harvard and Yale being among the starred events of the year.

Harvest and its Customs. H. (from the A.-S. *hærfest*, autumn) is the season for the gathering in of the crops, and has always been regarded as a time of rejoicing from time immemorial. The Jews

celebrated the feast of Pentecost as their H. festival, the Romans held feasts in honour of Ceres, and the Druids kept their feast on Nov. 1. Before the Reformation Aug. 1, or Lammas Day, was generally considered the first day of the H. festival in England, and was marked by the presentation of a loaf made of new wheat, in the churches, by every member of the congregation. Afterwards the feast of ingathering, known in Scotland as the 'kern,' was a peculiar secular method of celebrating the close of the H. This still survives in some places, but the modern general H. festival is rapidly superseding it. It is recorded in the *Folk-lore of North England*, 1879, that in the N. part of Northumberland at the close of the H., when the last sheaf of corn is set on end, the 'kern' is celebrated. An image is crowned with wheat-ears and dressed in a white frock and coloured ribbons, and hoisted on to a pole. All the reapers then crowd round their 'kern-baby,' or 'harvest-queen,' and go to the barn where a supper awaits them. In Scotland the last sheaf is called the 'maiden,' and the youngest girl in the H.-field is supposed to have the privilege of cutting it. But in the N.E. of Scotland, it is known as the 'cailleach' (old woman), and is dressed up as such, being placed at the head of the table at the H. feast. Then there is the custom, once prevalent in E. Anglia, known as 'hollering largess.' The reapers form a ring in front of the house, bow their heads very low towards the centre of the circle saying 'Hoo-Hoo-Hoo,' then jerk their heads backward shrieking 'Ah! Ah!' After this the leader of the band cries 'Holla largess!' which is echoed by the company. In Herefordshire a final handful of grain was left uncut, but was tied up and given the name of a 'mare.' The reapers then threw their sickles at it to cut it down, the successful one crying out 'I have her! A mare, a mare, a mare!' A similar practice to that of crying the 'mare' was that of the 'cripple goat' in the Isle of Skye, and in Devonshire the last handful of the standing grain is still called the 'nack,' or 'neck.' The worship of the last sheaf seems to have been the main feature of the festival throughout the world; in Russia it is or was known as the 'bastard,' and a boy is wrapped in it, the woman who binds it being the 'corn-mother.'

Harvest-bug, or Harvest-mite, common name for mites of the family of Trombididae, of the order Acari of the class Arachnida. At one time they were regarded as a distinct species (*Leptus autumnalis*), but are now known to be the six-legged larval forms of sev. species of the genus *Trombidium*. They are minute, scarlet, or rusty-brown mites, which are found in enormous numbers on gooseberry bushes, grass, and low herbage in the summer and autumn. They are parasitic, and especially liable to attack man, causing intense irritation by lodging in places where the skin is thin, such as behind the knees or between toes. After a certain time they leave their host and drop to the ground when they feed upon minute

insects. The best remedy is to destroy them by applying turpentine, ammonia, or spirits of wine to the affected part. See MITES.

Harvester-spiders, or **Harvest-men**, so called on account of their abundance in the late summer or early autumn, are Arachnids of the order Opiliones, referable to various species of the family Phalangidae. They can easily be distinguished from spiders because they have no waist between the cephalothorax and abdomen, and have extremely long thin legs. They feed upon small insects and spiders, and lay their eggs in autumn, which hatch out in the following spring or early summer. H. especially abound in temperate countries of the N. hemisphere, but are also common in India.

Harvest-fly, species of *Cicada* (q.v.).

Harvest Mouse, see under MOUSE.

Harvey, Gabriel (c. 1545-1630), Eng. writer, b. at Saffron Walden in Essex. In 1570 he was elected fellow of Pembroke Hall, Cambridge, when he became an intimate friend of Edmund Spenser, for whose *Hobbinol* in the *Shepheards Calender* he served as model. H. was an excellent scholar and an elegant Lat. writer, but his bitter controversies with Greene and Nashe, the dramatist, who made him the butt of two brilliant satires, *A Quip for an Upstart Courtier* (Greene), 1592, and *Have with you to Saffron Walden* (Nashe), 1596, brought on him general contempt. After H.'s retort to the latter in *The Trimming of Thomas Nashe* (1597), Archbishop Whitgift forbade all such books of satire (but the attribution of this last-named work to H. is doubtful. See *Works* (editor A. B. Grosart), 1884-85; and I. Disraeli, *Calamities of Authors*, 1840).

Harvey, Sir George (1806-76), Scottish painter. He painted pictures illustrating the hist. and daily life of the Scottish nation, among which is 'Covenanters Preaching.' Also a painter of landscape, his finest being 'Ferragon.'

Harvey, George Brinton McClellan (1861-1928), Amer. publisher and diplomatist, b. at Peacham, Vermont, U.S.A. Began work as a newspaper reporter. He then went into the electric railway business in the U.S.A. and Cuba, and made a fortune. In 1899 he bought the *North American Review* and ed. it until 1915. He became president of the book-publishing firm of Harper & Bros., and from 1902 to 1913 ed. *Harper's Weekly*. His friends have made the claim for him that he was a sort of Amer. Warwick who made presidents. In 1910 he helped bring about the nomination and election of Woodrow Wilson as governor of New Jersey. He then began an active campaign to bring his name before the nation as a possible president. But in 1916 H. opposed the election of Wilson when he sought to bring the U.S.A. into the League of Nations, starting *Harvey's Weekly*, which indulged in bitter criticism of the president. H. was instrumental in bringing about the nomination of Senator Harding for the presidency by the Republicans in 1920. Harding showed his gratitude by naming H. as ambas. to the Court of St. James's in 1921.

Harvey, Sir John Martin, see MARTIN-HARVEY, SIR JOHN.

Harvey, William (1578-1657), physician and discoverer of the circulation of the blood, b. at Folkestone, Kent. He was educated at Canterbury and Cambridge, and travelled through France and Germany to Padua, the most famous school of physic of that time. In 1607 he was elected a fellow of the College of Physicians, and in 1609 was made assistant physician at St. Bartholomew's Hospital.

WILLIAM HARVEY

In 1615 he was made Lumleian lecturer at the College of Physicians, where he made known his theory of the circulation of the blood, publishing his essay on the subject in 1628. In his essay he shows that the blood coming into the right auricle from the vena cava, and passing thence to the right ventricle, is pumped out to the lungs through the pulmonary artery and comes thence by the pulmonary veins to the left ventricle. It is then pumped out to the body. It is carried out by the arteries and comes back by veins, so performing a complete circulation. H. is famous as being the first to give an exact explanation of this theory. See R. Willis (trans.), *Anatomical Disquisition on the Motion of the Heart and Blood* (1848; Everyman's Library, 1907).

Harvey, banking city of Cook co., Illinois, U.S.A., on the Illinois Central and other railroads, and a suburb of Chicago. Manufs. stoves, machinery, etc. Pop. 17,800.

Harveyised Steel, see under STEEL.

Harwich, municipal bor., seaport, andarkt. tn. in Essex, England, on a small peninsula at the confluence of the Stour and the Orwell, 70 m. N.E. of London. Dovercourt is the residential quarter of

II., and is a favourite seaside resort. There is a large trade in shipbuilding, cement, and fish, and it is one of the chief Eng. ports for continental passenger traffic. It has been a fortified port since the time of James I., and was the scene of a naval engagement between the Dutch and Eng. in 1666. It has been an important trading centre since the fourteenth century. Pop. 14,000.

Harwood, Basil (1859-1940), Brit. organist and organ-music composer, b. in Gloucestershire, and educated at Charterhouse School and Trinity College, Oxford. After a period as organist at St. Barnabas, Ilmlico, and at Ely Cathedral, he became organist of Christ Church Cathedral, retiring in 1909. He was also an orchestral and choral conductor, being the first conductor of the Oxford Bach choir. He wrote much Anglican church music, including his popular Service in A flat. Various choral-orchestral works were performed at festival programmes. Among his most notable organ compositions are a Sonata in C sharp, Paganini, and Dithyramb, which, together with later works are distinguished for their dignity and for their vigorous and rhapsodic character.

Harwood, Sir Henry Fawcett (b. 1888), Brit. sailor. Entered the navy as a midshipman, 1904. Lieutenant, 1908; Commander, 1921; Captain, 1928. Commanded H.M.S. *Warwick* and 9th Destroyer Div., 1929. Imperial Defence College, 1931-32. Appointed to H.M.S. *London*, 1932-34. On staff of Royal Naval College, 1934-36. Commodore commanding S. Amer. Div., and H.M.S. *Exeter*, 1936-39. Rear-admiral commanding Brit. forces in action against the Ger. pocket battleship, *Graf Spee* (q.v.) Dec. 1939. Promoted rear-admiral and knighted. A Lord commissioner of the Admiralty and an assistant chief of naval staff, 1940-42. Commander-in-chief Mediterranean, with the acting rank of admiral, 1942; in similar capacity in the Levant, 1943. Promoted vice-admiral, 1943. Flag-officer in Orkneys and Shetlands, 1944-45. Retired with rank of admiral (medically unfit).

Harwood, tn. in the co. of Lancashire, England, 2 m. N.E. of Bolton. Pop. 2000.

Harzburg, summer resort in the Harz Mts., Germany, at the N. foot of the Brocken in Brunswick. It lies in the shadow of Burgberg (1520 ft.), 28 m. S. of the tn. of Brunswick, and includes the neighbouring hamlets of Neustadt, Bündheim, and Schlawecke. On the Burgberg are the ruins of a castle built in 1065 by the Emperor Henry IV., and the 'Canossa pillar,' erected in 1877 in honour of Bismarck. The tn. is now famous for its brine and carbon springs. Pop. 6000.

Harz Mountains, most northerly mt. system of Germany, extending between the Rs. Weser and Elbe. Their greatest length is 57 m., from S.E. to N.W.; their greatest breadth about 20 m., from N. to S.; and their total area about 784 sq. m. The range consists of an elevated plateau rising steeply on all sides, more especially on the N., and divided into the Upper and

Lower Harz, with a general elevation of from 2000 to 3000 ft.; the Brocken, which separates them, belongs to the former and reaches a height of 3750 ft. The range is heavily wooded, and its wild and melancholy beauty has given rise to numerous legendary tales in Ger. folklore, the chief of which, connected with the Brocken (q.v.), has been immortalised by Goethe in his *Faust*. The H. M. are a favourite summer resort of the Gers., Harzburg, Thale, Bodethal, Alexisbad, Hubersbad, and other places having, in addition to their natural charm, the advantages of mineral springs, pine-needle and other baths, whey cures, etc. The dist. is particularly rich in metals and minerals, silver, lead, iron, copper, sulphur, arsenic, marble, granite, and gypsum all being found. The chief mining centres are St. Andreasberg and Klausthal, the 'Samson' mine, near the former, being one of the deepest shafts (2790 ft.) in Europe. Vitriol is also manufactured, and there is a large timber industry. A rack-railway up the Brocken was opened in 1898, the observatory on the top of the mt. dating from 1895. In the W. front campaign of 1945 the First (Amer.) Army offensive, S. of the H. M., got under way by April 11. On April 14 an armoured div. of the 7th Corps reached Dessau, S. of the confluence of the Elbe and Mulde Rs. In the course of this thrust the H. M., containing some 10,000 Ger. troops, were almost encircled, but attempts to reduce this enemy 'pocket' met with strong resistance. The garrison succeeded for some time, with the aid of the difficult terrain, in holding the allied inroads to a minimum, while striving to keep open a corridor to the E. near Bernburg. The encirclement was nevertheless completed when this corridor was severed on April 18. A desperate attempt by the von Clausewitz Panzer Div. to relieve the garrison by a dash across some 50 m. of allied-held ter. was foiled, and opposition within the 'pocket' soon weakened. The last organised resistance in the Harz finished on April 21. See H. Hoffmann, *Der Harz*, 1899, and *Harzwandlungen*, 1902; and C. Marlowe, *Harz Mountains*, 1930.

Hasa, El, dist. in the E. of Arabia, stretching for some 360 m. along the shore of the Persian Gulf. In the spring of 1914 H. prov. was taken from the Turks by the Arabs, and since then it has remained an Arabian possession, and has prospered. Its cap., Hufuf (pop. 30,000) is one of the prin. trading centres of Nejd, of which kingdom (before its union with the Hejaz) it was the headquarters. Dates, rice, cotton, and indigo are cultivated, and camels are bred; it also shares in the valuable pearl fishery of Bahrain. Other tns. are Kattif, Ujer, the port of El H., and Mubarratz, famous for its hot springs. Most of the pop. consists of nomads, but it is estimated at about 150,000.

Hasbaya, or Hasbaya, tn. in Syria, 22 m. E.S.E. of Sidon. In 1846 a Protestant mission was estab. here, and during the Druse massacre of 1860 the tn. was nearly destroyed, most of the Christians fleeing

to Tyre or Sidon for refuge. Pop. numbers about 5600, 4000 of whom are Druse or Christians.

Hasdeu, Bogdan Petriceicu (1838-1907), Rumanian historian and philologist. His *Critical History of the Roumanians* (2 vols., 1875) is valuable, chiefly on account of his broad and original views. Among his other pub's. are *Curentele den Bătrani* (1878-1881); *Etymologicum Magnum Romaniae*, the chief dictionary of the Rumanian language (1887-93); and *Strai si Substrai* (1893), an account of the origin of the Balkan peoples.

Hasdrubal, name of two Carthaginians: (1) (d. 231 B.C.). The son-in-law of Hamilcar Barca, on whose death in 229 he be-

came leader of the Carthaginian forces in Spain. He founded the city of New Carthage, and agreed to the treaty with Rome which forbade him to pass the Iberus (Ebro). He was assassinated by a slave, whose master he had killed. (2) (d. 207 B.C.). The son of Hamilcar Barca, the brother of Hannibal. When Hannibal set out with his troops for Italy (218), H. was left in command in Spain, where he had to contend with the two Scipios. In 207 he marched into Italy with reinforcements for his brother, but was defeated on the Metaurus by the consuls M. Livius Salinator and C. Claudius Nero. He was slain in battle, and his head was thrown into Hannibal's camp.
